American National Standard
for Hazardous Industrial Chemicals –

Material Safety Data Sheets –
Preparation

Secretariat
American Chemistry Council

Approved March 31, 2004
American National Standards Institute, Inc.
Approval of an American National Standard requires review by ANSI that the requirements for due process, consensus, and other criteria for approval have been met by the standards developer.

Consensus is established when, in the judgement of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that a concerted effort be made towards their resolution.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether he has approved the standards or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standards.

The American National Standards Institute does not develop standards and will in no circumstances give an interpretation of any American National Standard. Moreover, no person shall have the right or authority to issue an interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretations should be addressed to the secretariat or sponsor whose name appears on the title page of this standard.

CAUTION NOTICE: This American National Standard may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken periodically to reaffirm, revise, or withdraw this standard. Purchasers of American National Standards may receive current information on all standards by calling or writing the American National Standards Institute.

Foreword  (This foreword is not part of American National Standard ANSI Z400.1-2004.)

ANSI Z400.1-2004, American National Standard for Hazardous Industrial Chemicals - Material Safety Data Sheets - Preparation was developed by a technical committee of the American Chemistry Council (ACC) and was submitted for approval under ACC's ANSI-approved canvass method operating procedures.

The first American National Standard for Hazardous Industrial Chemicals - Material Safety Data Sheets - Preparation, ANSI Z400.1-1993, was developed in recognition of the need for guidance to help preparers of material safety data sheets (MSDSs) develop consistent and understandable documents that provide useful information to a variety of audiences. At that time, the standard introduced several items that had not been part of MSDSs in the past, including: the headings and order of the sections; the emergency overview; and sections 11 through 16.

The 1998 revision included: the addition of the OSHA product status; elements to improve consistency with international standards, internal consistency; and revisions of the annexes.

The 2004 revision includes the following significant changes:

• Improving hazard communication and aligning the Standard with the recommendations for safety data sheets in the Globally Harmonized System for Hazard Classification, Communication and Labeling (GHS) adopted by the United Nations in 2002;

• Improving readability and consistency and minimizing redundancy;

• Reordering the MSDS sections so Hazards Identification appears before Composition Information;

• Eliminating the option to list exposure guidelines in the Composition Information;

• Including a requirement that flammable properties appear in the physical and chemical properties section with an option to repeat them in the fire fighting measures section;

• Including required physical and chemical properties;

• Increasing consistency between the sections for Toxicological Information and Ecological Information, and including more complete and accurate lists of data types;

• Adding transportation elements that may be needed for transporting a chemical by various modes, to meet international regulations and for improved emergency response.

This standard contains 4 annexes, all of which are informative and are not considered part of the standard.

The following organizations, recognized as having an interest in the standardization of material safety data sheets, were contacted prior to the approval of this standard. Inclusion in this list does not necessarily imply that an organization concurred with the version of the proposed standard submitted to ANSI.

Adhesive and Sealant Council, Inc.
Aerospace Industries Association
AFL-CIO
Air and Waste Management Association
Air Conditioning Contractors of America, Inc.
American Academy of Clinical Toxicology
The Working Group that developed this revision of the standard had the following members

Jayne Clifton, Chair  
(Chevron Phillips Chemical Company)

Chapter 1
Scope and Purpose
1 Introduction

The development of new chemicals, the re-evaluation of existing chemicals and the ever-widening use of chemicals and chemical processes in a variety of applications have accentuated a need to provide information to people who use, handle or store hazardous industrial chemicals. As per the United States Occupational Safety and Health Administration (OSHA) Hazard Communication Standard (HCS), a Material Safety Data Sheet (MSDS) is one means of providing this information.

MSDSs are an important resource and provide a wide range of information. Details on material identity, manufacturer information, hazard identity, emergency information, instructions on what to do if a hazardous situation has occurred, information on the prevention of hazardous situations, as well as other technical information are contained in an MSDS. It is imperative that this information be provided in a manner that is accurate, clear and concise.

The HCS provides little information regarding the format of an MSDS. In 1993, the American National Standard for Hazardous Industrial Chemicals – Material Safety Data Sheets – Preparation was developed to address the need for an MSDS format that was comprehensive, understandable and consistent. A complete, logical and internally consistent MSDS is more likely to result from an orderly approach. This Standard is organized to present concepts and guidance to those involved in the preparation of MSDSs.

2 Scope, purpose and application

2.1 Scope

This Standard applies to the preparation of MSDSs for chemicals and materials used under occupational conditions. It presents basic information on how to develop and write MSDSs that are complete, clear and consistent. It also identifies information that must be included to comply with the HCS. Additional information is provided to help comply with state and federal environmental and safety laws and regulations. With the addition of certain data elements, this Standard is also acceptable for international use. This Standard is not intended to address the distribution of MSDSs.

This Standard is not intended to provide a rote specification for complying with the HCS or any other government requirements. Requirements change. It is the responsibility of the MSDS preparer to be aware of current HCS requirements.

1 OSHA requires that an MSDS be prepared for chemicals that are hazardous according to the criteria described in the HCS. This Standard recognizes that MSDSs may be prepared for nonhazardous chemicals as well as hazardous chemicals. This Standard uses the term, material, to denote this wider scope of coverage.
