Tolerance Specification for Shaper Cutters

ANSI/AGMA 1104-A09

Approval of an American National Standard requires verification by ANSI that the requirements for due process, consensus and other criteria for approval have been met by the standards developer.

Consensus is established when, in the judgment of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that a concerted effort be made toward their resolution.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether he has approved the standards or not, from manufacturing, marketing, purchasing or using products, processes or procedures not conforming to the standards.

The American National Standards Institute does not develop standards and will in no circumstances give an interpretation of any American National Standard. Moreover, no person shall have the right or authority to issue an interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretation of this standard should be addressed to the American Gear Manufacturers Association.

CAUTION NOTICE: AGMA technical publications are subject to constant improvement, revision or withdrawal as dictated by experience. Any person who refers to any AGMA Technical Publication should be sure that the publication is the latest available from the Association on the subject matter.

Approved May 14, 2009

ABSTRACT

The purpose of this standard is to provide specifications for nomenclature, dimensions, tolerances, and inspection of shaper cutters, and thereby establish a basis for mutual understanding in this respect in the use and manufacture of these tools.

Foreword

[The foreword, footnotes and annexes, if any, in this document are provided for informational purposes only and are not to be construed as a part of ANSI/AGMA Standard 1104-A09, *Tolerance Specification for Shaper Cutters*]

This standard was developed after intensive study of existing practices, standards and literature. In general, the information in this standard is a consolidation of the most common practices and standards currently in existence.

An effort was made to incorporate ANSI/AGMA 2015-1-A01 gear tolerances in the development of this standard.

The first draft of ANSI/AGMA 1104-A09 was made in April, 2004. It was approved by the AGMA membership in March, 2009. It was approved as an American National Standard on May 14, 2009.

Suggestions for improvement of this standard will be welcome. They should be sent to the American Gear Manufacturers Association, 1001 N. Fairfax Street, 5th Floor, Alexandria, Virginia 22314.

American National Standard

Tolerance Specification for Shaper Cutters

1 Scope

This standard covers types, sizes, tolerances, marking and nomenclature for finishing and pre-finishing type shaper cutters for generating involute spur and helical gears, splines and serrations.

Also provided are informational annexes containing reference tolerance tables, shaper cutter tool tolerance tables, suggested rack shaper cutter specifications, and gear shaping manufacturing terminology.

1.1 Equations for tolerances

Equations for tolerances and their ranges of validity are provided in clause 6 for the defined accuracy of shaper cutters. In general, these tolerances cover the following ranges:

$$5 \leq z_c \leq 200$$

$$5 \text{ mm} \leq d_T \leq 350 \text{ mm}$$

$$0.5 \leq m_n \leq 35$$

$$4 \text{ mm} \leq b_c \leq 50 \text{ mm}$$

$$\beta \leq 45^\circ$$

where

d_T is reference diameter, mm;

m_n is normal module;

b_c is facewidth (axial);

z_c is number of teeth in cutter;

β is helix angle.

2 Normative references

The following standards contain provisions which, through reference in this text, constitute provisions of this American National Standard. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this American National Standard are encouraged to investigate the possibility of applying the most recent editions of the standards indicated below.

3 Terminology and definitions

3.1 Shaper cutter nomenclature

The terms used in this standard are, wherever possible, consistent with ANSI/AGMA 1012-G05 and other approved AGMA documents. However, some symbols and definitions used in this standard
