AGMA STANDARD

American National Standard

Gear Materials, Heat Treatment and Processing Manual ANSI/AGMA 2004-C08

Approval of an American National Standard requires verification by ANSI that the requirements for due process, consensus, and other criteria for approval have been met by the standards developer.

Consensus is established when, in the judgment of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that a concerted effort be made toward their resolution.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether he has approved the standards or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standards.

The American National Standards Institute does not develop standards and will in no circumstances give an interpretation of any American National Standard. Moreover, no person shall have the right or authority to issue an interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretation of this standard should be addressed to the American Gear Manufacturers Association.

CAUTION NOTICE: AGMA technical publications are subject to constant improvement, revision, or withdrawal as dictated by experience. Any person who refers to any AGMA technical publication should be sure that the publication is the latest available from the Association on the subject matter.

Approved January 8, 2008

ABSTRACT

This standard provides information pertaining to ferrous and nonferrous materials used in gearing. Factors in material selection, including material forms, properties, and associated processing and heat treatments are discussed. Manufacturing procedures to prepare materials for machining and final heat treatment are included. Heat treating procedures used for gearing are covered in detail, including process descriptions, product specifications, process controls, and characteristics of heat treated gearing. Post-heat treatment processes to meet gearing requirements are discussed. Product inspection methods and documentation are covered. Term definitions, test methods, distortion and residual stress, sources for additional information, and a bibliography are included.

Contents

Foreword	iv
1 Scope	1
2 Normative references	1
3 Materials	2
4 Manufacturing – material preparations	18
5 Heat treating of ferrous materials	21
6 Post heat treatment processes – metallurgical effects	37
7 Inspection and certification	39

Bibliography	67
--------------------	----

Annexes

A Definition of terms	45
B Test methods and test coupons	53
C Distortion and residual stress	64
D Sources for additional information	66

Tables

1 Common SAE steel designations and their nominal alloy contents	9
2 Typical heat treatments and associated steel grades	9
3 Maximum recommended controlling section size for oil quenched and tempered gearing	11
4 Tensile requirements for standard ductile iron grades per ASTM A536	15
5 Tensile requirements for gray iron per ASTM A48/A48M	16
6 ASTM A897/897M minimum property specifications for ADI castings	17
7 Malleable iron tensile requirements per ASTM A47 and A220	18
8 Chamfer sizes for gear teeth to be case hardened or surface hardened ...	20
9 Approximate minimum core hardness of carburized gear teeth	25
10 Pressure unit conversions	28
11 Approximate minimum surface hardness – nitrided steels	31
12 Approximate minimum core hardness – nitrided steels	31

Figures

1 Material selection factors	2
2 Steel processing flow chart	7
3 Directionality of forging properties	8
4 Case hardenability of carburizing grades of steel	12
5 Cast iron processing flow chart	15
6 Vibration characteristics of steel and cast irons	15
7 Gearing blank features that increase distortion during carburizing	26
8 Typical distortion characteristics of carburized gearing	27
9 Variations in hardening pattern obtainable on gear teeth with flame or induction hardening	33
10 Surface hardness versus carbon content for 99% martensite microstructure	34

Foreword

[The foreword, footnotes and annexes, if any, in this document are provided for informational purposes only and are not to be construed as a part of AGMA Standard 2004-C08, *Gear Materials, Heat Treatment and Processing Manual*.]

ANSI/AGMA 2004-C08 provides a broad range of information on gear materials, gear heat treatment, and associated processing. This information is intended to assist the designer, the process and manufacturing engineer, and the heat treater to effectively produce the gearing required for the application. Data contained herein represents a consensus from metallurgical representatives of member companies of AGMA.

The goal of ANSI/AGMA 2004-C08 is to present information in a sequence that can be used to make the necessary technical decisions when producing gearing. ANSI/AGMA 2004-C08 includes updated and extensively revised information from ANSI/AGMA 2004-B89 along with additional information needed to achieve this goal.

ANSI/AGMA 2004-B89 superseded AGMA 240.01, *Gear Materials Manual*, October 1972, because of a Metallurgy and Materials Committee decision to revise the document format. On January 23, 1989, ANSI/AGMA 2004-B89 was approved as an American National Standard.

This standard has been updated to reflect current technology in the area of steel making and heat treatment, and edited to include cross references to relevant AGMA standards and information sheets.

The first draft of AGMA 2004-C08 was completed in May 2001. It was approved by the AGMA membership in October, 2007. It was approved as an American National Standard on January 8, 2008.

Suggestions for improvement of this standard will be welcome. They should be sent to the American Gear Manufacturers Association, 500 Montgomery Street, Suite 350, Alexandria, Virginia 22314.

American National Standard – Gear Materials, Heat Treatment and Processing Manual

1 Scope

This manual was developed to provide basic information and recommend sources of additional information pertaining to metallic gear materials, their treatments, and other considerations related to the manufacture and use of gearing.

The gearing application conditions, including allowable stresses, environment, component geometry, and component weight limitations, must be understood to select the proper gear material.

Metallurgical aspects of gearing as related to rating (allowable contact stress number and allowable bending stress number) are not included, but are covered in AGMA rating standards.

2 Normative references
