Important Notice about this Document

This voluntary standard has been developed under the published procedures of the American National Standards Institute (ANSI). The ANSI process brings together volunteers representing varied viewpoints and interests to achieve consensus. APSP does not write the standards. Rather, APSP facilitates a forum for its members, and others interested in pool and spa design and safety, to develop standards through the consensus procedures of the American National Standards Institute (ANSI). While the APSP administers the process and establishes rules to promote fairness in the development of consensus, it does not independently test, evaluate, or verify the accuracy of any information or the soundness of any judgments contained in its codes and standards.

In issuing and making this document available, the APSP is not undertaking to render professional or other services for or on behalf of any person or entity. Nor is the APSP undertaking to perform any duty owed by any person or entity to someone else. The APSP disclaims liability for any personal injury, property, or other damages of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly resulting from the publication of, use of, or reliance on this document.

The APSP has no power, nor does it undertake, to police or enforce compliance with the contents of this document. The APSP does not list, certify, test, or inspect products, designs, or installations for compliance with this document. Any certification or other statement of compliance with the requirements of this document shall not be attributable to the APSP. Any certification of products stating compliance with requirements of this document is the sole responsibility of the certifier or maker of the statement. The APSP, its members, and those participating in its activities do not accept any liability resulting from compliance or noncompliance with the provisions given herein, for any restrictions imposed on materials, or for the accuracy and completeness of the text.

Anyone using this document should rely on his or her own independent judgment or, as appropriate, seek the advice of a competent professional in determining the exercise of reasonable care in any given circumstance. It is assumed and intended that pool users will exercise appropriate personal judgment and responsibility and that public pool owners and operators will create and enforce rules of behavior and warnings appropriate for their facility.

American National Standard

Approval of an American National Standard requires verification by ANSI that the requirements for due process, consensus, and other criteria for approval have been met by the standard developer.

Consensus is established when, in the judgment of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered and that a concerted effort be made toward their resolution.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether he has approved this standard or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standards.

The American National Standards Institute does not develop standards and will in no circumstances give an interpretation of any American National Standard. Moreover, no person shall have the right or authority to issue an interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretations should be addressed to the secretariat or sponsor whose name appears on the title page of this standard.

NOTICE: This American National Standard may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken periodically to reaffirm, revise, or withdraw this standard.

Foreword

This Foreword is not a part of the American National Standard ANSI/APSP-11 2009 Provisional Amendment (PA).

The ANSI/APSP-11 2009, Standard for water quality in public pools and spas, was approved by ANSI as a new standard on May 4, 2015. Some of the information contained in this document has been processed in accordance with ANSI's requirements for a Provisional Amendment (PA) to an American National Standard (ANS).

The objective of this voluntary standard is to provide recommended minimum guidelines for the specifications for water quality parameters. It is intended to meet the need for incorporation into national or regional health codes, and also for adoption by state and/or local municipalities as a local code or ordinance. It is understood that for the sake of applicability and enforceability, the style and format of the standard may need adjustment to meet the code or ordinance style of the jurisdiction adopting this document.

This standard was drafted by the Recreational Water Quality Committee of The Association of Pool and Spa Professionals (APSP) in accordance with the American National Standards Institute's (ANSI) *Essential Requirements: Due process requirements for American National Standards*.

Consensus approval was achieved by a ballot of the ANSI Consensus Voting Body below and through an ANSI Public Review process. The ANSI Public Review provided an opportunity for additional input from industry, academia, regulatory agencies, safety experts, state code and health officials, and the public at large.

Suggestions for improvement of this standard should be sent to The Association of Pool and Spa Professionals, 2111 Eisenhower Avenue, Alexandria, VA 22314.

Inclusion in this list does not necessarily imply that the organization concurred with the submittal of the proposed standard to ANSI.

Organization Represented

Name of Representative

Consensus approval in accordance with ANSI procedures was achieved by ballot of the following ANSI consensus voting body. Inclusion in this list does not necessarily imply that the organization concurred with the submittal of the proposed standard to ANSI.

Anne Arundel County, MD, Health Department	Lucy Goszkowski
Aquatic Consulting Services	Alison Osinski
Aquatic Development Group	
Arch Chemicals Inc.	
Belleair Pool Supply	David Oxley
Busch Entertainment Corp.	John Linn
Carson City (NV) Health and Human Services	Neil Fox

Jeanette Smith

Introduction

This standard is the first comprehensive, data-driven, and knowledge-based national standard available for pool and spa water quality and chemistry. This standard was developed in response to the need expressed by public health officials for a national standard for water quality in public pools and spas. A 2004 survey of more than 5000 public health officials and sanitarians nationwide provided an overwhelming endorsement for the development of a national water quality standard.

The Recreational Water Quality (RWQ) Committee of The Association of Pool and Spa Professionals (APSP) actively partnered with public health officials during the development of this draft standard by visiting with key sanitarians and asking for feedback on the standard. Public health and code officials also played an important role in the development of consensus necessary for this standard to be published as an American National Standard.

Since APSP has been accredited by the American National Standards Institute (ANSI), its standards are developed according to ANSI's published requirements. Since 1983, APSP has published nine ANSI standards for the pool and spa industry. When this standard is published as an American National Standard, it will enable state and local health and code officials to adopt a uniform, national code governing the maintenance of swimming pools, spas, and other treated recreational water venues.

The ANSI process requires consensus approval through a uniform national public review and balanced-interest voting process. It affords a rigorous third-party process for standards development, providing due process, openness, and consensus agreement among a diversified group of stakeholders. These include public health and code officials, architects, regulatory agencies, academicians, representatives of safety organizations, consultants, subject matter experts, as well as pool and spa professionals. The balance of interests represented by voters is another key component of ANSI's requirements. During the ANSI process all objections are considered with an effort toward resolution. On account of the universal scope and depth of this unique standard, APSP encourages state and local public health and code officials to adopt it into their state laws and local codes.

The standards developed by APSP are the benchmark for the pool and spa industry because they are based on science, verifiable data, and best practices. The ANSI/APSP standards are voluntary minimum stan-

dards. Their goal is to provide for all viable technologies. APSP standards promote aquatic safety, provide consistency in design, provide construction and installation requirements for the nation, and provide the basis for adoption into law by state and local jurisdictions. For example, the International Code Council (ICC) in 2008 adopted ANSI/APSP-7 2006 Standard for Suction Entrapment Avoidance in Swimming Pools, Wading Pools, Spas, Hot Tubs, and Catch Basins into the body of the International Building Code (IBC, public pools and spas) and, by reference, into Appendix G of the International Residential Code (IRC, residential pools and spas). The IBC code has been adopted by all 50 states and 46 states have adopted the IRC.

During development of the standard, the RWQ Committee decided that in addition to writing a uniform national consensus standard, it wanted to provide readers with explanatory information about the values for the requirements listed in the body of the standard. In developing the Appendix A material, the committee questioned many standard practices in the industry and sought to provide scientific justification for the values in the body of the standard. The resulting Appendix A took over two years to write.

Many water quality parameters that do not have a direct impact on public health, but that can severely influence the operation of the pool, such as the effect of low calcium levels on corrosion, were included in the standard. The standard is primarily health and safety related and operating within the allowed ranges of all the parameters would be a minimum requirement and may not be sufficient to protect pool surfaces from damage. Further information on the protection of pool surfaces may be found in Appendix A. For purposes of public health, the requirements in the body of the standard generally reference a minimum or a maximum value, or both. It is important to remember that there is a range of values that are acceptable for pool and spa operation. Appendix A should be consulted for recommendations on the ideal ranges of operation in those instances when the body of the standard lists minimums/maximums. In order to distinguish the operational factors from the factors that could represent an immediate danger to public health, the section on pool closure was added. In this special section each of the highlighted factors — clarity, sanitizer level, pH, and temperature were included because of their direct impact on public health.

ANSI/APSP-11 2009 Standard for Water Quality in Public Pools and Spas

1 Scope

- 1.1 Public swimming pools and spas. This standard covers public swimming pools and spas to be used for bathing and operated by an owner, licensee, or concessionaire, regardless of whether a fee is charged for use.
- 1.1.1 Public swimming pools covered by this standard. Public swimming pools covered by this standard include Class A pools, Class B pools, Class C pools, Class D pools, Class E pools, and Class F pools. See section 2 for definitions.
- **1.1.2** Pools designed for interaction with marine life have special requirements and are not covered by this standard.
- **1.2 Variation in methods.** This standard provides specifications for water quality parameters, but does not specify the technologies needed to achieve these values.

2 Definitions

Class A Pool: Class A pools are intended for use for accredited competitive aquatic events such as Federation Internationale de Natation Amateur (FINA), USA Swimming, USA Diving, National Collegiate Athletic Association (NCAA), National Federation of State High School Associations (NFSHSA), etc. The use of the pool is not limited to competitive events.

Class B Pool: Any pool intended for public recreational swimming not otherwise classified.

Class C Pool: Pools operated solely for and in conjunction with lodgings such as hotels and motels and pools intended for use for apartments, condominiums, property owners associations, and multi-family owned pools.

Class D, Other Pool: Any pool operated for medical treatment, therapy, exercise, lap swimming, recreational play, and other special purposes, in-

cluding, but not limited to, wave or surf action pools, activity pools, splasher pools, kiddie pools, and play areas.

Class D-1, Wave Action Pools: Wave action pools include any pool designed to simulate breaking or cyclic waves for purposes of general play or surfing.

Class D-2, Activity Pools: Activity pools are those pools designed for casual water play ranging from simple splashing activity to the use of attractions placed in the pool for recreation.

Class D-3, Catch Pools: Catch pools are bodies of water located at the termination of a manufactured waterslide attraction provided for the purpose of terminating the slide action and providing a means for exit to a deck or walkway area.

Class D-4, Leisure Rivers: Manufactured streams of near-constant depth in which the water is moved by pumps or other means of propulsion to provide a river-like flow that transports bathers over a defined path that may include water features and play devices.

Class D-5, Vortex Pools: Circular pools equipped with a method of transporting water in the pool for the purpose of propelling riders at speeds dictated by the velocity of the moving stream.

Class D-6, Interactive Play Attractions: Only water treatment and filtration for these attractions are within the scope of this standard. A manufactured water play device or a combination of water-based play devices in which water flow volumes, pressures, or patterns are intended to be varied by the bather without negatively influencing the hydraulic conditions of other connected devices. Class D-6 attractions may incorporate devices or activities such as slides, climbing and crawling structures, visual effects, user-actuated mechanical devices and other elements of bather-driven and bather-controlled play. Class D-6 attractions do not incorporate captured or standing water greater than 12 inches deep as part of the bather activity area.
