This standard was developed by a consensus standards development process that has been accredited by the American National Standards Institute (ANSI). Accreditation by ANSI, a voluntary accreditation body representing public and private sector standards development organizations in the United States and abroad, signifies that the standards development process used by ASCE has met the ANSI requirements for openness, balance, consensus, and due process.

While ASCE's process is designed to promote standards that reflect a fair and reasoned consensus among all interested participants, while preserving the public health, safety, and welfare that is paramount to its mission, it has not made an independent assessment of and does not warrant the accuracy, completeness, suitability, or utility of any information, apparatus, product, or process discussed herein. ASCE does not intend, nor should anyone interpret, ASCE's standards to replace the sound judgment of a competent professional, having knowledge and experience in the appropriate field(s) of practice, nor to substitute for the standard of care required of such professionals in interpreting and applying the contents of this standard.

ASCE has no authority to enforce compliance with its standards and does not undertake to certify products for compliance or to render any professional services to any person or entity.

ASCE disclaims any and all liability for any personal injury, property damage, financial loss, or other damages of any nature whatsoever, including without limitation any direct, indirect, special, exemplary, or consequential damages, resulting from any person's use of, or reliance on, this standard. Any individual who relies on this standard assumes full responsibility for such use.

In 2014, the Board of Direction approved revisions to the ASCE Rules for Standards Committees to govern the writing and maintenance of standards developed by ASCE. All such standards are developed by a consensus standards process managed by the ASCE Codes and Standards Committee (CSC). The consensus process includes balloting by a balanced standards committee and reviewing during a public comment period. All standards are updated or reaffirmed by the same process every 5 to 10 years. Requests for formal interpretations shall be processed in accordance with Section 7 of ASCE Rules for Standards Committees, which is available at [www.asce.org](http://www.asce.org). Errata, addenda, supplements, and interpretations, if any, for this standard can also be found at [www.asce.org](http://www.asce.org).

This standard has been prepared in accordance with recognized engineering principles and should not be used without the user's competent knowledge for a given application. The publication of this standard by ASCE is not intended to warrant that the information contained therein is suitable for any general or specific use, and ASCE takes no position respecting the validity of patent rights. The user is advised that the determination of patent rights or risk of infringement is entirely their own responsibility.

A complete list of currently available standards is available in the ASCE Library (<http://ascelibrary.org/page/books/s-standards>).

This Standard is an updated and expanded version of ASCE Standard 19-10, which it replaces. Development of Standard ASCE 19 can be traced to the *Tentative Criteria for Structural Applications of Steel Cables for Buildings* published by the American Iron and Steel Institute (AISI) in 1966. Later influential publications were *Design Fundamentals of Cable Roof Structures* published by AISI in 1969; the paper entitled "Cable-Suspended Roof Construction State-of-the-Art" in the *Journal of the Structural Division, ASCE*, 1971; the *Manual for Structural Applications of Steel Cables for Buildings*, AISI,

1973; and the prior editions of this Standard, ASCE 19-96 and ASCE/SEI 19-10. References used to develop particular provisions of this Standard are included in the Selected Bibliography to be found in the Commentary.

Standard ASCE/SEI 19-16 includes a new appendix to address small diameter cables used for seismic bracing of nonstructural building elements, updates the nomenclature for consistency with industry standards, and incorporates other miscellaneous additions and rearrangements.

The American Society of Civil Engineers acknowledges the devoted efforts of the Structural Applications of Steel Cables for Buildings Standards Committee (the Committee) of the Codes and Standards Activities Division of the Structural Engineering Institute. This group consists of individuals from many backgrounds, including consulting engineering, research, manufacturing, fabrication, education, and government.

This edition of Standard ASCE 19 supersedes Standard ASCE 19-96 and Standard ASCE/SEI 19-10. It was prepared through the standards process by balloting in compliance with procedures of ASCE's Codes and Standards Committee.

## CHAPTER 1 GENERAL

### 1.1 SCOPE

This standard provides requirements for the structural design, contract documents, shop drawings, fabrication, and installation of cables for use as static structural elements for the support and bracing of buildings and other cable-supported structures not subjected to vehicle loads. Parts of buildings to which this standard is applicable include roofs, floors, curtain walls, masts, and nets. In addition, Appendix A addresses cables and fittings, Appendix B discusses saddles, Appendix C addresses clamps, and Appendix D reviews cable fatigue. Guyed utility towers and vehicular bridges are not covered by this standard. This standard applies to carbon-steel and stainless-steel cables. Requirements for earthquake load resistant sway bracing design for nonstructural components of buildings are contained in Appendix E.

### 1.2 GLOSSARY

**Anchorage**—The structural connection at which the cable is terminated

**Cable**—A flexible tension member, either strand or rope

**Cable Assembly**—A cable with all permanent shop attached fittings

**Cable Assembly Strength**—The minimum breaking strength multiplied by the fitting reduction factor or by the deflector reduction factor

**Clamp**—A cable fitting that transfers force by friction

**Damper**—An active or passive device attached to the cable structure that modifies the structural response to dynamic loads

**Deflector**—See Saddle

**End Fitting**—A device, also known as a Termination, attached to a cable to transfer tension between the cable and its supporting anchorage

**Fitting**—Any accessory used as an attachment to or support for the cable or its components

**Grade**—Classification of cable by minimum breaking strength and/or metallic composition of wire

**Minimum Breaking Force**—See Minimum Breaking Strength

**Minimum Breaking Strength**—Strength of a cable in units of force, as given in ASTM or other applicable standards; also known as Minimum Breaking Force or Nominal Cable Strength (see Fig. 1-1)

**Modulus of Elasticity**—The slope of the secant to the stress-strain curve between the stress at 10% of the minimum breaking strength and 90% of the prestressing force

**Nominal Cable Strength**—See Minimum Breaking Strength

**Prestressing**—Tensioning a cable at installation

**Prestretching**—Tensioning and detensioning a cable according to a predetermined program to minimize subsequent constructional (in-service) stretch

**Prestretching Force**—Tensile force applied to a cable one or more times and held for a specified duration during prestretching

**Proof Load**—A predetermined load prescribed by the engineer and applied in the shop to the cable assembly in performance of the proof test during the fabrication process

**Proof Test**—A nondestructive tension test to verify integrity and workmanship of an individual cable assembly

**Rope**—A plurality of strands twisted about an axis or about a core that may be a strand or another wire rope

**Saddle**—A grooved cable support used to create an angle change in the cable; also known as a Deflector

**Strand**—A plurality of wires helically twisted about an axis

**Termination**—See End Fitting

**Wire**—A single continuous length of steel with a circular or noncircular cross section; wires of circular cross section cold-drawn from rod; wires of noncircular cross section either cold-drawn or cold-rolled from rod

### 1.3 SYMBOLS AND NOTATION

$C$  = erection or temporary load during construction

$D$  = dead load due to weight of the structure and the permanent features on the structure

$D_i$  = weight of ice

$E$  = earthquake load

$E_s$  = modulus of elasticity (secant)

$L$  = live load due to occupancy and movable equipment

$L_r$  = roof live load

$N_d$  = deflector reduction factor

$N_f$  = fitting reduction factor

$P$  = prestress force

$R$  = rain load
