ANSI X9.100-20-2015

Foreword

Approval of an American National Standard requires verification by ANSI that the requirements for due process, consensus, and other criteria for approval have been met by the standards developer.

Consensus is established when, in the judgment of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that a concerted effort be made toward their resolution.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether he has approved the standards or not from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standards.

The American National Standards Institute does not develop standards and will in no circumstances give an interpretation of any American National Standard. Moreover, no person shall have the right or authority to issue an interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretation should be addressed to the secretariat or sponsor whose name appears on the title page of this standard.

CAUTION NOTICE: This American National Standard may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken to reaffirm, revise, or withdraw this standard no later than five years from the date of approval.

Introduction

This standard presents the character set "E-13B" which can be read by certain magnetic ink character recognition (MICR) and optical character recognition (OCR) systems. The character set includes numerals 0 through 9 and four special symbols. The standard also specifies the shape, dimensions, and tolerances for printed MICR "E-13B" characters and specifications regarding print quality.

This standard is a refinement of, and supersedes, American National Standard Print Specifications for Magnetic Ink Character Recognition, ANS X9.27-2000. Changes made in the previous revision included updating references and removal of references and figures relating to punched card checks.

ANSI X9.100-20 is presented in three parts for ease of use. Part 1 is the MICR Print Specifications itself while Part 2 includes informative compliance testing to guide the practitioner in a uniform way how to determine actual conformance with these specifications. Part 3 contains the specification for secondary reference documents and Signal Level testing equipment for maintaining the signal level accuracy and reproducibility of secondary reference documents.

The "E-13B" Magnetic Ink Character Recognition font was developed as the result of a lengthy and concentrated effort by an American Bankers Association (ABA) technical committee. The font received unanimous approval of the ABA in 1958. In April 1959 the American Bankers Association issued publication 147, "The Common Machine Language for Mechanized Check Handling." This document was subsequently revised in 1962, 1963, and 1967. The document is no longer in print because the Association refers the industry to this and other MICR standards.

The Accredited Standards Committee on Information Processing Systems, X3, formed X3A7 (formerly X3-7), as the Subcommittee on Magnetic Ink Character Recognition. This sub-committee developed the American National Standard Print Specifications for Magnetic Ink Character Recognition (ANSI X3.2-1963). Much of the information presented in this standard was taken from the original ABA publications. ANSI X3.2-1963 was revised and published as ANSI X3.2-1970. ANSI X3.2-1970 was reaffirmed in 1976.

In 1982, X3 assigned responsibility for the maintenance of X3.2-1970 to its Sub-Committee X3A1 CHARACTER RECOGNITION. In 1983, Sub-Committee X3A1 enlisted the assistance of American National Standards Committee, Financial Services-X9, and its Sub-Committee X9B-Checks, in order that a detailed review of X3.2-1970 could be accomplished with input from all interested groups. In 1987 X3 approved transfer of this publication to X9 and that resulting revision became X9.27-1988.

The revision of 1988 was a major revision because significant changes occurred in the MICR printing industry which had been addressed by the ASC X9B Ad Hoc Print Quality Group regarding permanence and other print quality issues associated with non-impact technologies thus requiring clarifications and additions which reflect the uniqueness of those technologies. In addition, significant effort was spent on re-establishing the requirements for an instrument used to measure and calibrate signal level of secondary reference documents in order to provide uniformity and transportability of signal level with repeatability for multiple MICR print technologies.

With the revision in 2006, this Standard was updated to incorporate the new numbering system and the informative Annex B has been added that provides detailed information regarding the generation of reference waveforms and their use. See ASC X9/TG-6-2000 (X9 TR 6-200x), Quality Control of MICR Documents as a companion to this standard for tips on improving quality control and measurements of MICR documents.

In June 2010, during the normal 5-year review required of a periodically maintained standard, the X9AB subcommittee agreed to reaffirm the 2006 Standard. As required by X9 policy for reaffirmation, no substantive changes to the main text were made and the few non-substantive changes in the text are noted here as required. The copyright dates and appropriate reference to the title were changed to reflect 2010. The member's lists for

ANSI X9.100-20-2015

X9, X9AB and the X9AB7 Work Group were updated to reflect the members in 2010. The references in clause 3 were updated to reflect any appropriate name changes to the equivalent standard already listed but no additional references were added. In the terms and definitions, clause 4, only the parenthetical reference to the parent standard for the respective term or definition was updated to reflect equivalent current title, as needed.

Finally, in 2013 minor editorial mistakes in Annex B (Informative) were reported and corrected using the corrigendum process and two revised pages were published. These are now being incorporated into this revision: Clause B.1 (General), Clause B.3 (Magnetic peak displacement) and related Table B.1 have been updated. No substantive changes have been made since the 2006 revision, neither the 2011 revision, nor this 2015 update.

It should be noted that the application of this standard is not limited to the financial industry. The "E-13B" MICR concept is employed in other applications such as sales promotion coupons, credit cards, airline passenger tickets, insurance premium receipts, billings, and so forth.

A note on reading and interpretation of standards: In standards, the use of the word "shall" in a specification requires conformance to that specification in order to be in conformance with the standard. When the word "should" or "recommended" is used conformance testing is not required.

While the techniques specified in this Standard are designed to provide for automated processing of financial documents, the Standard does not guarantee that a particular implementation (meets the requirement of the standard and prudent practices). It is the responsibility of the financial institution to put an overall process in place with the necessary controls to ensure that the process is securely implemented. Furthermore, the controls should include the application of appropriate audit tests in order to verify compliance with this Standard.

This Standard is used and referenced in many X9.100 paper based standards for financial documents besides forming the basis for several international standards involving the E-13B MICR character set.

Suggestions for the improvement or revision of this Standard are welcome. They should be sent to the X9 Committee Secretariat, Accredited Standards Committee X9, Inc., Financial Industry Standards, 275 West Street, Suite 107, Annapolis, MD 21401 USA.

This Standard was processed and approved for submittal to ANSI by the Accredited Standards Committee on Financial Services, X9. Committee approval of the Standard does not necessarily imply that all the committee members voted for its approval.

The **X9** committee had the following members:

- Roy DeCicco, X9 Chairman
- ~~Claudia Swendseid~~, X9 Vice-Chairman
- Steve Stevens, Executive Director
- Janet Busch, Program Manager

Under ASC X9, Inc. procedures, a working group may be established to address specific segments of work under the ASC X9 Committee or one of its subcommittees. A working group exists only to develop standard(s) or guideline(s) in a specific area and is then disbanded. The individual experts are listed with their affiliated organizations. However, this does not imply that the organization has approved the content of the standard or guideline. (Note: Per X9 policy, company names of non-member participants are listed only if, at the time of publication, the X9 Secretariat received an original signed release permitting such company names to appear in print.)

Working Group **X9AB7, MICR Print & Quality Standards** working group, which revised this standard, had the following members:

John McCleary, Work Group Chair
 Carl Tinch, Recording Secretary

This document replaces ANSI X9.100-20-2011.

American National Standard for Financial Services - Print and Test Specifications for Magnetic Ink Printing (MICR)

Part 1: Print Specifications

1. Scope

Part 1 of this standard specifies the shape, dimensions, magnetic signal level, and tolerances for the E-13B characters which include ten numerals and four special symbols printed in magnetic ink and used for the purpose of character recognition. It describes the various known types of printing defects and other printing considerations, together with the tolerances permitted.

Part 2 provides informative conformance testing requirements for the Part 1 specifications.

Part 3 specifies the requirements for secondary reference documents and the test equipment for calibrating and maintaining their signal level.

2. Purpose

The characters specified in this standard were developed initially for use in banks to permit automatic document handling for financial institution data processing, but they have application to other automatic handling systems as well.
