

American National Standard for Financial Services

ANSI X9.8-1-2015/ISO 9564-1-2011 (Identical Adoption)

Financial Services – Personal identification number (PIN) management and security — Part 1: Basic principles and requirements for PINs in card-based systems

Adopted by
Accredited Standards Committee X9, Incorporated
Financial Industry Standards

Date Approved: June 2, 2015

American National Standards Institute

American National Standards, Technical Reports and Guides developed through the Accredited Standards Committee X9, Inc., are copyrighted. Foreword

Approval of an American National Standard requires verification by ANSI that the requirements for due process, consensus, and other criteria for approval have been met by the standards developer.

Consensus is established when, in the judgment of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that a concerted effort be made toward their resolution.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether he has approved the standards or not from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standards.

The American National Standards Institute does not develop standards and will in no circumstances give an interpretation of any American National Standard. Moreover, no person shall have the right or authority to issue an interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretation should be addressed to the secretariat or sponsor whose name appears on the title page of this standard.

CAUTION NOTICE: This American National Standard may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken to reaffirm, revise, or withdraw this standard no later than five years from the date of approval.

Introduction

Suggestions for the improvement or revision of this Standard are welcome. They should be sent to the X9 Committee Secretariat, Accredited Standards Committee X9, Inc., Financial Industry Standards, 275 West Street, Suite 107, Annapolis, MD 21401 USA.

This Standard was processed and approved for submittal to ANSI by the Accredited Standards Committee on Financial Services, X9. Committee approval of the Standard does not necessarily imply that all the committee members voted for its approval.

At the time this standard was approved, the **X9** committee had the following members:

Roy C. DeCicco, X9 Chairman
Claudia Swendseid, X9 Vice Chairman
Steve Stevens, X9 Executive Director
Janet Busch, Managing Director

<u>Organization Represented</u>	<u>Representative</u>
ACI Worldwide	Grote, Doug
American Bankers Association	Poole, C. Diane

Under ASC X9, Inc. procedures, a working group may be established to address specific segments of work under the ASC X9 Committee or one of its subcommittees. A working group exists only to develop standard(s) or guideline(s) in a specific area and is then disbanded. The individual experts are listed with their affiliated organizations. However, this does not imply that the organization has approved the content of the standard or guideline. (Note: Per X9 policy, company names of non-member participants are listed only if, at the time of publication, the X9 Secretariat received an original signed release permitting such company names to appear in print.) This standard was jointly developed by the X9F4 and X9F6 workgroups.

At the time this standard was approved, the **X9F6 Cardholder Authentication and Integrated Circuit Card (ICC)** workgroup which jointly developed this standard had the following active members:

Scott Spiker, X9F6 Chairman
Darlene Kargel, X9F6 Vice-Chairman

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 9564-1 was prepared by Technical Committee ISO/TC 68, *Financial services*, Subcommittee SC 2, *Security management and general banking operations*.

This third edition cancels and replaces the second edition (ISO 9564-1:2002) and the first edition of ISO 9564-3:2003, which have been technically revised.

ISO 9564 consists of the following parts, under the general title *Financial services — Personal Identification Number (PIN) management and security*:

- *Part 1: Basic principles and requirements for PINS in card-based systems*
- *Part 2: Approved algorithm(s) for PIN encipherment¹⁾*
- *Part 3: Requirements for offline PIN handling in ATM and POS systems* [Withdrawn and incorporated into Part 1]
- *Part 4: Guidelines for PIN handling in open networks* [Technical Report]¹⁾

¹⁾ It is intended that, upon revision, the main element of the titles of Parts 2 and 4 will be aligned with the main element of the title of this part of ISO 9564.

This is a preview of "ANSI X9.8-1-2015/ISO...". [Click here to purchase the full version from the ANSI store.](#)

This ANSI Standard is based on ISO 9564-1:2011(E) **Banking — Personal Identification Number (PIN) management and security — Part 1: PIN protection principles and techniques for online PIN verification in ATM and POS systems**. The ISO 9564-1:2011(E) has been reproduced in its entirety with the addition of "ANSI NOTE"s where required to adapt the text for use as an ANSI Standard. Where applicable, references to ANSI standards have been added.

"ANSI NOTE"s have been added to the following sections of ISO 9564-1:2011(E):

Foreward	2	5.3.1	6.2	8.2.1
8.2.2	8.2.3	8.5.1	8.5.4	9.3.6
9.3.6 g	9.3.6 h (two Notes)	Annex B		

Annexes B and C are informative Annexes, presented for informational purposes only.

ANS X9.8 consists of the following parts, under the general title Banking - Personal Identification Number (PIN) Management and Security:

- Part 1: PIN protection principles and techniques for online PIN verification in ATM & POS systems
- Part 2: Approved algorithm(s) for PIN encipherment

This is a preview of "ANSI X9.8-1-2015/ISO...". [Click here to purchase the full version from the ANSI store.](#)

Introduction

A Personal Identification Number (PIN) is used in financial services as one method of cardholder verification.

The objective of PIN management is to protect the PIN against unauthorized disclosure, compromise and misuse throughout its life cycle and, in so doing, to minimize the risk of fraud occurring within electronic funds transfer (EFT) systems. The secrecy of the PIN needs to be assured at all times during its life cycle, which consists of its establishment, issuance, activation, storage, entry, transmission, validation, deactivation and any other use made of it.

In this part of ISO 9564, the following terms are used for the types of communication of the PIN:

- a) conveyance: reference PIN to the integrated circuit (IC) card or cardholder selected PIN to the issuer;
- b) delivery: PIN to the cardholder;
- c) transmission: transaction PIN to the issuer or IC reader for subsequent PIN verification;
- d) submission: transaction PIN to the IC card.

PIN security in part depends upon sound key management. Maintaining the secrecy of cryptographic keys is of the utmost importance because the compromise of any key allows the compromise of any PIN ever enciphered under it.

PINs can be verified online or offline. Since online PIN verification can be performed independent of the card itself, any type of payment card or device can be used to initiate such a transaction. However, there are special card requirements for those cards that perform offline PIN verification on the card itself.

Financial transaction cards with embedded IC can support offline PIN verification using the IC of the card. Issuers can choose whether to have PIN verification performed online or offline. Offline PIN verification does not require that a cardholder's PIN be sent to the issuer host for verification and so security requirements relating to PIN protection differ from online PIN verification security requirements. However, many general PIN protection principles and techniques are still applicable even though a PIN can be verified offline.

This part of ISO 9564 is designed so that issuers can uniformly make certain, to whatever degree is practical, that a PIN, while under the control of other institutions, is properly managed. Techniques are given for protecting the PIN-based customer authentication process by safeguarding the PIN against unauthorized disclosure during the PIN's life cycle.

In ISO 9564-2, approved encipherment algorithms for use in the protection of the PIN are specified. Application of the requirements of this part of ISO 9564 requires the making of bilateral agreements, including the choice of algorithms specified in ISO 9564-2.

ISO 9564 (all parts) is one of several series of International Standards which describe requirements for security in the retail banking environment; these include ISO 11568 (all parts), ISO 13491 (all parts) and ISO 16609.

Additionally, it is intended to develop an extended PIN block in order to support the use of block ciphers with longer block lengths and key sizes (e.g. AES).

ANSI NOTE 1: The Extended PIN Block, in support of AES, will be published as an Amendment to this document.

Financial services — Personal Identification Number (PIN) management and security —

Part 1: Basic principles and requirements for PINs in card-based systems

1 Scope

This part of ISO 9564 specifies the basic principles and techniques which provide the minimum security measures required for effective international PIN management. These measures are applicable to those institutions responsible for implementing techniques for the management and protection of PINs during their creation, issuance, usage and deactivation.

This part of ISO 9564 is applicable to the management of cardholder PINs for use as a means of cardholder verification in retail banking systems in, notably, automated teller machine (ATM) systems, point-of-sale (POS) terminals, automated fuel dispensers, vending machines, banking kiosks and PIN selection/change systems. It is applicable to issuer and interchange environments.

The provisions of this part of ISO 9564 are not intended to cover:

- a) PIN management and security in environments where no persistent cryptographic relationship exists between the transaction-origination device and the acquirer, e.g. use of a browser for online shopping (for these environments, see ISO/TR 9564-4);
- b) protection of the PIN against loss or intentional misuse by the customer;
- c) privacy of non-PIN transaction data;
- d) protection of transaction messages against alteration or substitution;
- e) protection against replay of the PIN or transaction;
- f) specific key management techniques;
- g) offline PIN verification used in contactless devices;
- h) requirements specifically associated with PIN management as it relates to multi-application functionality in IC cards.
