## ANS X9.97-2009 (R2017)

### Foreword

Approval of an American National Standard requires verification by ANSI that the requirements for due process, consensus, and other criteria for approval have been met by the standards developer.

Consensus is established when, in the judgment of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that a concerted effort be made toward their resolution.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether he has approved the standards or not from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standards.

The American National Standards Institute does not develop standards and will in no circumstances give an interpretation of any American National Standard. Moreover, no person shall have the right or authority to issue an interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretation should be addressed to the secretariat or sponsor whose name appears on the title page of this standard.

**CAUTION NOTICE:** This American National Standard may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken to reaffirm, revise, or withdraw this standard no later than five years from the date of approval.

This ANSI Standard is based on ISO 13491-1:2007(E) **Financial Services — Secure cryptographic devices (retail) — Part 1: Concepts, requirements and evaluation methods**. The ISO 13491-1:2007(E) has been reproduced in its entirety with the addition of "ANSI Note's" and other changes highlighted via dotted underlining (sample underlining) where required to adapt the text for use as an ANSI Standard. Where applicable, references to ANSI standards have been added and internal reference to this standard have been changed from ISO 13491-1:2007 to ANS X9.97-1:2008.

Annex A is an informative annex, unchanged from the original ISO standard.

Annex B is an informative annex, summarizing the changes made to this standard from the original ISO 13491-1:2007 standard.

ANS X9.97 consists of the following parts; under the general title Financial Services — Secure cryptographic devices (retail):

- Part 1: Concepts, requirements and evaluation methods
- Part 2: Security compliance check-lists for devices used in financial transaction environments

## ANS X9.97-2009 (R2017)

## Introduction

ANS X9.97 describes both the physical and logical characteristics and the management of the secure cryptographic devices (SCDs) used to protect messages, cryptographic keys and other sensitive information used in a retail financial services environment.

The security of retail electronic payment systems is largely dependent upon the security of these cryptographic devices. This security is based upon the premise that computer files can be accessed and manipulated, communications lines can be "tapped" and authorized data or control inputs into system equipment can be replaced with unauthorized inputs. When Personal Identification Numbers (PINs), Message Authentication Codes (MACs), Cryptographic Keys and other sensitive data are processed, there is a risk of tampering or other compromise to disclose or modify such data. It must be ensured that the risk of financial loss is reduced through the appropriate use of cryptographic devices that have proper characteristics and are properly managed.

Suggestions for the improvement or revision of this Standard are welcome. They should be sent to the X9 Committee Secretariat, Accredited Standards Committee X9, Inc., Financial Industry Standards, 275 West Street, Suite 107, Annapolis, MD 21401 USA.

This Standard was processed and approved for submittal to ANSI by the Accredited Standards Committee on Financial Services, X9. Committee approval of the Standard does not necessarily imply that all the committee members voted for its approval.

### The X9 committee had the following members:

**Roy DeCicco, X9 Chairman**  
**Vincent DeSantis, X9 Vice-Chairman**  
**Steve Stevens, Executive Director**  
**Janet Busch, Program Manager**

**ANS X9.97-2009 (R2017)**

Under ASC X9, Inc. procedures, a working group may be established to address specific segments of work under the ASC X9 Committee or one of its subcommittees. A working group exists only to develop standard(s) or guideline(s) in a specific area and is then disbanded. The individual experts are listed with their affiliated organizations. However, this does not imply that the organization has approved the content of the standard or guideline. (Note: Per X9 policy, company names of non-member participants are listed only if, at the time of publication, the X9 Secretariat received an original signed release permitting such company names to appear in print.)

**The X9F6 group on Cardholder Authentication and ICC's which developed this standard had the following members:**

John Sheets, Chairman

# Financial services — Secure cryptographic devices (retail) — Part 1: Concepts, requirements and evaluation methods

## 1 Scope

This part of ANS X9.97 specifies the requirements for Secure Cryptographic Devices which incorporate the cryptographic processes defined in ISO 9564, ISO 16609 and ISO 11568.

This part of ANS X9.97 has two primary purposes:

- 1) to state the requirements concerning both the operational characteristics of SCDs and the management of such devices throughout all stages of their life cycle,
- 2) to standardize the methodology for verifying compliance with those requirements.

Appropriate device characteristics are necessary to ensure that the device has the proper operational capabilities and provides adequate protection for the data it contains. Appropriate device management is necessary to ensure that the device is legitimate, that it has not been modified in an unauthorized manner, e.g., by "bugging", and that any sensitive data placed within the device (e.g., cryptographic keys) has not been subject to disclosure or change.

Absolute security is not practically achievable. Cryptographic security depends upon each life cycle phase of the SCD and the complementary combination of appropriate management procedures and secure cryptographic characteristics. These management procedures implement preventive measures to reduce the opportunity for a breach of SCD security. These aim for a high probability of detection of any unauthorized access to sensitive or confidential data should device characteristics fail to prevent or detect the security compromise.

Annex A provides an informative illustration of the concepts of security levels described in this part of ANS X9.97 as being applicable to SCDs.

This part of ANS X9.97 does not address issues arising from the denial of service of an SCD.

Specific requirements for the characteristics and management of specific types of SCD functionality used in the retail financial services environment are contained in ANS X9.97-2.
