## Foreword

Approval of an American National Standard requires verification by ANSI that the requirements for due process, consensus, and other criteria for approval have been met by the standards developer.

Consensus is established when, in the judgment of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that a concerted effort be made toward their resolution.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether he has approved the standards or not from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standards.

The American National Standards Institute does not develop standards and will in no circumstances give an interpretation of any American National Standard. Moreover, no person shall have the right or authority to issue an interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretation should be addressed to the secretariat or sponsor whose name appears on the title page of this standard.

**CAUTION NOTICE:** This American National Standard may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken to reaffirm, revise, or withdraw this standard no later than five years from the date of approval.

## Introduction

This standard defines a common interface for the food retailer systems that accept smart cards as the benefit delivery mechanism for participants in the Special Supplemental Nutrition Program for Women, Infants and Children, commonly referred to as the WIC Program. The interface provides the food retailer card readers and associated payment and electronic cash register systems a means to accept and transact benefits from access devices, such as smart cards, issued by different WIC State Agencies. It does not allow WIC participants to purchase food items in all states, which is the case with Supplemental Nutrition Assistance Program (SNAP) EBT program.

The interface defined in this standard provides for a POS system/device to invoke an action on a smart card where the device and the smart card are independently developed. This standard allows the flexibility to add other applications than WIC to a smart card as well as allows for a WIC EBT application to be detected on an access device issued by some other entity.

A typical configuration for a smart card system consists of a host computer with one or more smart card readers attached via hardware communications ports. Smart cards are inserted into the card readers, and software running on the host computer communicates with these cards using a protocol defined by ISO 7816-4. The ISO standard smart card communications protocol defines Application Protocol Data Units (APDUs) that are exchanged between smart cards and host computers. This APDU based interface is referred to as the card edge, and the two terms are used interchangeably.

Client applications have traditionally been designed to communicate with ISO smart cards using the APDU protocol through low-level software drivers that provide an APDU transport mechanism between the client application and a smart card. Smart card families may implement the APDU protocol in a variety of ways, so client applications must have intimate knowledge of the APDU set of the smart cards they are communicating with. This is generally accomplished by programming a client application to work with a specific card, since it would not be practical to design a client application to accommodate the different APDU sets of a large number of smart card families.

The tight coupling between client applications and smart card APDU sets has several drawbacks for the ISO card technology's use in WIC, both in WIC-authorized retail stores and in local agencies and clinics. Application programmers must be thoroughly familiar with smart card technology and the complex APDU protocol. If the cards that an application is hard coded to use become commercially unavailable, the application must be redesigned to use different cards. Customers also have less freedom to select different smart card products, since their applications will only work with one or a small number of similar cards.

For national and regional grocers authorized by more than one WIC State Agency, this standard substantially reduces the level of effort (programming) required to integrate WIC functionality within existing store POS system/devices. Retailers authorized to accept WIC for more than one WIC State Agency will be able to program once all core WIC EBT retail system functionality and the smart card to POS system/device interface. It is anticipated that the programming required to accept WIC cards issued by another WIC State Agency(s) will be greatly reduced. This standard, by itself, does not encompass all aspects of the integration. It does not dictate specific hardware or software architecture to the retailer community nor does it restrict the WIC State Agencies to specific WIC EBT schemes on a smart card.

## ANS X9.131 – 2015

The source documents for this standard were developed by the Offline WIC EBT Interoperability Specifications workgroup during meetings in Dallas, Texas in 2003 sponsored by the U.S. Department of Agriculture, Food and Nutrition Services, and hosted by the Texas Department of Health, Special Supplemental Nutrition Program for Women, Infants and Children. MAXIMUS Intelligent Technologies Division, in cooperation with Booz Allen Hamilton, consulting firms supporting TDH and USDA/FNS, respectively, facilitated the development of the source document.

**NOTE** The user's attention is called to the possibility that compliance with this standard may require use of an invention covered by patent rights.

By publication of this standard, no position is taken with respect to the validity of this claim or of any patent rights in connection therewith. The patent holder has, however, filed a statement of willingness to grant a license under these rights on reasonable and non-discriminatory terms and conditions to applicants desiring to obtain such a license. Details may be obtained from the standards developer.

Suggestions for the improvement or revision of this Standard are welcome. They should be sent to the X9 Committee Secretariat, Accredited Standards Committee X9, Incorporated, Financial Industry Standards, 275 West Street, Suite 107, Annapolis, Maryland 21401 USA.

This Standard was processed and approved for submittal to ANSI by the Accredited Standards Committee on Financial Services, X9. Committee approval of the Standard does not necessarily imply that all the committee members voted for its approval.

At the time this standard was approved, the X9 committee had the following members:

Roy DeCicco, X9 Chairman  
Claudia Swendseid, X9 Vice Chairman  
Harden (Steve) Stevens, Executive Director  
Janet Busch, Managing Director

Under ASC X9, Inc. procedures, a working group may be established to address specific segments of work under the ASC X9 Committee or one of its subcommittees. A working group exists only to develop standard(s) or guideline(s) in a specific area and is then disbanded. The individual experts are listed with their affiliated organizations. However, this does not imply that the organization has approved the content of the standard or guideline.

*X9AB11 Electronic Benefits Transactions* working group had the following members:

Annex A, Annex E and Annex F form an integral part of this standard. Annex B, Annex C and Annex D are for information only.

# Financial transaction messages — Electronic Benefits Transfer (EBT) — WIC retailer interface

## 1 Scope

This standard defines a common set of Application Programming Interface (API) functions to access the WIC benefits on an integrated circuit (smart) card in the retailer environment; a common method (card discovery mechanism) to identify the issuer of the WIC EBT benefits and the WIC EBT scheme present on the smart card and, an interface to the card reader device that transmits and receives data from the WIC EBT smart card. The reference or model implementation provided by the WIC State Agency shall utilize this standard. This standard does not specify the reader driver used by the retailer application but it defines interfaces that may be implemented for the WIC module to access functions of the Reader Driver Module (RDM). The specific requirements of the Reader Driver Interface to the integrated circuit (smart) card are dependent on the card design chosen by the WIC State Agency and may be obtained from them.

The use of pseudo Interface Definition Language (IDL) in this standard allows simpler definition of the API functions and their interface in a language independent manner. This standard does not define how WIC-EBT benefits are arranged on the card, the movement of security data or key management.

## 2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.
