

**ANSI/ASHRAE Standard 143-2007**  
(Supersedes ANSI/ASHRAE Standard 143-2000)

# ASHRAE STANDARD

## Method of Test for Rating Indirect Evaporative Coolers

Approved by the ASHRAE Standards Committee on June 23, 2007; by the ASHRAE Board of Directors on June 27, 2007; and by the American National Standards Institute on June 28, 2007.

ASHRAE Standards are scheduled to be updated on a five-year cycle; the date following the standard number is the year of ASHRAE Board of Directors approval. The latest copies may be purchased from ASHRAE Customer Service, 1791 Tullie Circle, NE, Atlanta, GA 30329-2305. E-mail: [orders@ashrae.org](mailto:orders@ashrae.org). Fax: 404-321-5478. Telephone: 404-636-8400 (worldwide) or toll free 1-800-527-4723 (for orders in US and Canada).

**SPECIAL NOTE**

This American National Standard (ANS) is a national voluntary consensus standard developed under the auspices of the American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE). *Consensus* is defined by the American National Standards Institute (ANSI), of which ASHRAE is a member and which has approved this standard as an ANS, as "substantial agreement reached by directly and materially affected interest categories. This signifies the concurrence of more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that an effort be made toward their resolution." Compliance with this standard is voluntary until and unless a legal jurisdiction makes compliance mandatory through legislation.

ASHRAE obtains consensus through participation of its national and international members, associated societies, and public review.

ASHRAE Standards are prepared by a Project Committee appointed specifically for the purpose of writing the Standard. The Project Committee Chair and Vice-Chair must be members of ASHRAE; while other committee members may or may not be ASHRAE members, all must be technically qualified in the subject area of the Standard. Every effort is made to balance the concerned interests on all Project Committees.

The Assistant Director of Technology for Standards and Special Projects of ASHRAE should be contacted for:

- a. interpretation of the contents of this Standard,
- b. participation in the next review of the Standard,
- c. offering constructive criticism for improving the Standard, or
- d. permission to reprint portions of the Standard.

**DISCLAIMER**

ASHRAE uses its best efforts to promulgate Standards and Guidelines for the benefit of the public in light of available information and accepted industry practices. However, ASHRAE does not guarantee, certify, or assure the safety or performance of any products, components, or systems tested, installed, or operated in accordance with ASHRAE's Standards or Guidelines or that any tests conducted under its Standards or Guidelines will be nonhazardous or free from risk.

**ASHRAE INDUSTRIAL ADVERTISING POLICY ON STANDARDS**

ASHRAE Standards and Guidelines are established to assist industry and the public by offering a uniform method of testing for rating purposes, by suggesting safe practices in designing and installing equipment, by providing proper definitions of this equipment, and by providing other information that may serve to guide the industry. The creation of ASHRAE Standards and Guidelines is determined by the need for them, and conformance to them is completely voluntary.

In referring to this Standard or Guideline and in marking of equipment and in advertising, no claim shall be made, either stated or implied, that the product has been approved by ASHRAE.

#### NOTE

**When addenda, interpretations, or errata to this standard have been approved, they can be downloaded free of charge from the ASHRAE Web site at <http://www.ashrae.org>.**

**(This foreword is not part of this standard. It is merely informative and does not contain requirements necessary for conformance to the standard. It has not been processed according to the ANSI requirements for a standard and may contain material that has not been subject to public review or a consensus process. Unresolved objectors on informative material are not offered the right to appeal at ASHRAE or ANSI.)**

## FOREWORD

*First published in 2000, ASHRAE Standard 143 provides procedures for testing indirect evaporative cooling devices under laboratory conditions to obtain rating information. As an ASHRAE method-of-test standard, it is intended to offer recommended practices and accurate measurement procedures.*

*This revision makes two key changes to Standard 143-2000. First, the difference between the primary dry-bulb temperature and secondary wet-bulb temperature has been decreased from 25°F to 20°F (14°C to 11°C). This reduction will increase the times when testing can be accomplished using unconditioned air without reducing the accuracy of the test. Second, to provide greater flexibility, temperature measurement in Section 8.1.1 is no longer limited to specific types of instruments as long as they meet the requirements of ANSI/ASHRAE Standard 41.1, Standard Method for Temperature Measurement.*

*Various other improvements were made as well. All references were updated to the latest editions, and several typographical errors were corrected. Mandatory language was clarified by changing "will" to "shall."*

## 1. PURPOSE

This standard provides test procedures and calculations for establishing the cooling capacities and power requirements for indirect evaporative cooling equipment.

## 2. SCOPE

**2.1** This standard covers testing under steady-state conditions for rating of indirect evaporative coolers that

- a. sensibly cool a primary airstream through heat exchanger(s) by the evaporation of water into a secondary airstream and
- b. are self-contained or are components of packaged systems.

**2.2** This standard does not cover

- a. devices that use mechanical refrigeration or thermal storage to cool the primary airstream, the secondary airstream, or the water provided for evaporation or
- b. devices that dry the primary or secondary airstream.

## 3. DEFINITIONS

**adiabatic saturation:** evaporating water into air without external gain or loss of heat. Sensible heat in both air and water becomes latent heat in entrained vapor, and temperatures fall and equalize.

**air density:** the mass per unit volume of the air.

**application rating:** a rating based on tests performed at application rating conditions (other than standard rating conditions).

**component indirect evaporative cooler (IEC module):** an indirect evaporative cooling device consisting of an indirect evaporative cooling heat exchanger, a means of delivering and distributing water to the wet passages of the heat exchanger, a basin for collecting water, a recirculating water pump, and the piping that connects the basin and the water distribution system. (See Figure 3.)

**cooling effectiveness:** the primary air dry-bulb temperature reduction divided by the primary air entering dry-bulb temperature less the entering secondary wet-bulb temperature.

**determination:** a complete set of measurements for a particular point of operation of an IECU. The measurements must be sufficient to determine all IECU performance variables as defined in this standard.

**IECU:** an acronym created for use in this document, which stands for a packaged, semi-packaged, or component indirect evaporative cooling unit. The term *cooling unit* is also used interchangeably throughout this document for evaporative cooling unit or evaporative cooler.

**IECU air boundaries:** indirect evaporative cooling unit inlet and outlet boundaries are defined as the interface between the cooling unit and the remainder of the system and are at a plane perpendicular to the airstream where it enters or leaves the indirect evaporative cooling unit. Various appurtenances, such as filter media assemblies, inlet boxes, inlet vanes, inlet cones, silencers, screens, rain hoods, dampers, discharge cones, and eaves, may be included as part of the cooling unit between the inlet and outlet boundaries.

**IECU air density:** the density of the air corresponding to the total pressure and dry- and wet-bulb temperatures at the cooling unit inlet.

**IECU inlet area:** the gross inside area measured in the plane(s) of the inlet connection(s). For converging inlets without connection elements, the inlet area shall be considered to be where a plane, perpendicular to the airstream, first meets the bell mouth or cone.

**IECU input power boundary:** the interface of the wiring entering electrically powered equipment. Drive or coupling losses are included as part of the input power.

**IECU outlet area:** the gross inside area measured in the plane(s) of the outlet opening(s).

**IECU total power:** the sum of the power in watts supplied to the electrical components of the indirect evaporative cooler tested. This includes fan motors, pump motors, and other devices needed to produce the cooling effect. The power to control devices such as thermostats, transformers providing low voltage to control mechanisms, and freeze protection devices need not be included in total power.

**IECU total pressure:** the difference between the total pressure at the cooling unit outlet and the total pressure at the cooling unit inlet.
