

ANSI/ASHRAE Standard 93-2003

ASHRAE[®] STANDARD

Methods of Testing to Determine the Thermal Performance of Solar Collectors

Approved by the ASHRAE Standards Committee January 29, 2003; by the ASHRAE Board of Directors January 30, 2003; and by the American National Standards Institute April 22, 2003.

ASHRAE Standards are updated on a five-year cycle; the date following the standard number is the year of ASHRAE Board of Directors approval. The latest copies may be purchased from ASHRAE Customer Service, 1791 Tullie Circle, NE, Atlanta, GA 30329-2305. E-mail: orders@ashrae.org. Fax: 404-321-5478. Telephone: 404-636-8400 (worldwide) or toll free 1-800-527-4723 (for orders in U.S. and Canada).

SPECIAL NOTE

This American National Standard (ANS) is a national voluntary consensus standard developed under the auspices of the American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE). Consensus is defined by the American National Standards Institute (ANSI), of which ASHRAE is a member and which has approved this standard as an ANS, as "substantial agreement reached by directly and materially affected interest categories. This signifies the concurrence of more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that an effort be made toward their resolution." Compliance with this standard is voluntary until and unless a legal jurisdiction makes compliance mandatory through legislation.

ASHRAE obtains consensus through participation of its national and international members, associated societies, and public review.

ASHRAE Standards are prepared by a Project Committee appointed specifically for the purpose of writing the Standard. The Project Committee Chair and Vice-Chair must be members of ASHRAE; while other committee members may or may not be ASHRAE members, all must be technically qualified in the subject area of the Standard. Every effort is made to balance the concerned interests on all Project Committees.

The Manager of Standards of ASHRAE should be contacted for:

- a. interpretation of the contents of this Standard,
- b. participation in the next review of the Standard,
- c. offering constructive criticism for improving the Standard,
- d. permission to reprint portions of the Standard.

DISCLAIMER

ASHRAE uses its best efforts to promulgate Standards and Guidelines for the benefit of the public in light of available information and accepted industry practices. However, ASHRAE does not guarantee, certify, or assure the safety or performance of any products, components, or systems tested, installed, or operated in accordance with ASHRAE's Standards or Guidelines or that any tests conducted under its Standards or Guidelines will be nonhazardous or free from risk.

ASHRAE INDUSTRIAL ADVERTISING POLICY ON STANDARDS

ASHRAE Standards and Guidelines are established to assist industry and the public by offering a uniform method of testing for rating purposes, by suggesting safe practices in designing and installing equipment, by providing proper definitions of this equipment, and by providing other information that may serve to guide the industry. The creation of ASHRAE Standards and Guidelines is determined by the need for them, and conformance to them is completely voluntary.

In referring to this Standard or Guideline and in marking of equipment and in advertising, no claim shall be made, either stated or implied, that the product has been approved by ASHRAE.

(This foreword is not part of this standard but is included for information only.)

FOREWORD

This standard is a reaffirmation of ANSI/ASHRAE Standard 93-1986, but because the ANSI approval for the 1986 version of the standard expired in 2001, the current reaffirmed standard has been approved by ANSI as a “new” standard.

The standard provides a test procedure whereby solar energy collectors can be tested both indoors and outdoors to rate the collectors in accordance with their thermal performance and to determine their time constant and the variation of their efficiency with changes in the angle of incidence between the sun’s direct rays and the normal to the collector aperture. This standard carefully defines its applicability to both liquid-cooled nonconcentrating and concentrating collectors and collectors that use air as the heat transfer fluid.

1. PURPOSE

The purpose of this standard is to provide test methods for determining the thermal performance of solar energy collectors that use single-phase fluids and have no significant internal energy storage.

2. SCOPE

2.1 This standard applies to nonconcentrating and concentrating solar collectors in which a fluid enters the collector through a single inlet and leaves the collector through a single outlet.

2.1.1 Collectors containing more than one inlet and more than one outlet may be tested according to this standard provided that the external piping or ducting can be connected so as to provide effectively a single inlet and a single outlet.

2.2 The heat transfer fluid may be either a liquid or a gas but not a mixture of the two phases.

2.3 This standard contains methods for conducting tests outdoors under natural solar irradiance and for conducting tests indoors under simulated solar irradiance.

2.4 This standard provides test methods and calculation procedures for determining steady-state and quasi-steady-state thermal performance, time, and angular response characteristics of solar collectors.

2.5 This standard is not applicable to those collectors in which the thermal storage unit is an integral part of the collector to such an extent that the collection process and the storage process cannot be separated for the purpose of making measurements of these two processes.

2.6 This standard does not apply to:

- (a) those unglazed solar collectors that can be tested in accordance with *ASHRAE Standard 1980 (RA 89)*¹ and
- (b) those collectors in which the heat transfer fluid changes phase and can be tested in accordance with *ASHRAE Standard 109-1986 (RA 2003)*.² However, a suggested test procedure is given in Appendix I

for those phase-change collectors with an integral heat exchanger that satisfy specifications 2.1 and 2.2 and are excluded in the scope of *ASHRAE Standard 109-1986 (RA 2003)*.²

3. DEFINITIONS AND NOMENCLATURE

3.1 Definitions

absorber: the absorber is that part of the solar collector that receives the incident radiation energy and transforms it into thermal energy. It may possess a surface through which energy is transmitted to the transfer fluid; however, the transfer fluid itself can be the absorber.

absorber area: the absorber area is the total heat transfer area from which the absorbed solar irradiance heats the transfer fluid or the area of the absorber medium if both transfer fluid and solid surfaces jointly perform the absorbing function.

air mass: the air mass is the ratio of the mass of atmosphere in the actual earth-sun path to the mass that would exist at sea level if the sun were directly overhead.

angle, acceptance: the angular zone within which radiation is accepted by the receiver of a concentrator. Radiation is said to be accepted because radiation incident within this angle reaches the absorber after passing through the aperture.

angle of incidence: the angle of incidence is the angle between the direct solar irradiance and the normal to the aperture plane.

apparent solar time: time based on the apparent angular motion of the sun across the sky, with solar noon the time the sun crosses the meridian of the observer.

area, aperture: the aperture area is the maximum projected area of a solar collector through which the unconcentrated solar radiant energy is admitted.

area, gross: the gross collector area is the maximum projected area of the complete collector module including integral mounting means. (*Note:* The “complete collector module” is the collector unit shipped by the manufacturer for installation on a structure or in an array. However, if the manufacturer requires that additional insulation be placed in any manner along all or any part of the perimeter (edge) of the collector module in order that the performance characteristics, determined with the test procedures herein, will be indicative of those that would occur when the collector is part of an installed system, the gross area will have to be adjusted. If the installed array is specified as a one-row array, then the dimensions are the centerline-to-centerline distance between two adjacent collectors installed in the array times the collector height. If the installed array is specified as a two-row or larger array, the gross area is determined by the horizontal and longitudinal centerline-to-centerline distances of four adjacent collectors installed in the array.)
