

STANDARD

**ANSI/ASHRAE Standard 130-2016**  
(Supersedes ANSI/ASHRAE Standard 130-2008)

# Laboratory Methods of Testing Air Terminal Units

Approved by ASHRAE on October 31, 2016, and by the American National Standards Institute on November 1, 2016.

ASHRAE Standards are scheduled to be updated on a five-year cycle; the date following the Standard number is the year of ASHRAE approval. The latest edition of an ASHRAE Standard may be purchased on the ASHRAE website ([www.ashrae.org](http://www.ashrae.org)) or from ASHRAE Customer Service, 1791 Tullie Circle, NE, Atlanta, GA 30329-2305. E-mail: [orders@ashrae.org](mailto:orders@ashrae.org). Fax: 678-539-2129. Telephone: 404-636-8400 (worldwide) or toll free 1-800-527-4723 (for orders in US and Canada). For reprint permission, go to [www.ashrae.org/permissions](http://www.ashrae.org/permissions).

**SPECIAL NOTE**

This American National Standard (ANS) is a national voluntary consensus Standard developed under the auspices of ASHRAE. *Consensus* is defined by the American National Standards Institute (ANSI), of which ASHRAE is a member and which has approved this Standard as an ANS, as "substantial agreement reached by directly and materially affected interest categories. This signifies the concurrence of more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that an effort be made toward their resolution." Compliance with this Standard is voluntary until and unless a legal jurisdiction makes compliance mandatory through legislation.

ASHRAE obtains consensus through participation of its national and international members, associated societies, and public review.

ASHRAE Standards are prepared by a Project Committee appointed specifically for the purpose of writing the Standard. The Project Committee Chair and Vice-Chair must be members of ASHRAE; while other committee members may or may not be ASHRAE members, all must be technically qualified in the subject area of the Standard. Every effort is made to balance the concerned interests on all Project Committees.

The Senior Manager of Standards of ASHRAE should be contacted for

- a. interpretation of the contents of this Standard,
- b. participation in the next review of the Standard,
- c. offering constructive criticism for improving the Standard, or
- d. permission to reprint portions of the Standard.

**DISCLAIMER**

ASHRAE uses its best efforts to promulgate Standards and Guidelines for the benefit of the public in light of available information and accepted industry practices. However, ASHRAE does not guarantee, certify, or assure the safety or performance of any products, components, or systems tested, installed, or operated in accordance with ASHRAE's Standards or Guidelines or that any tests conducted under its Standards or Guidelines will be nonhazardous or free from risk.

**ASHRAE INDUSTRIAL ADVERTISING POLICY ON STANDARDS**

ASHRAE Standards and Guidelines are established to assist industry and the public by offering a uniform method of testing for rating purposes, by suggesting safe practices in designing and installing equipment, by providing proper definitions of this equipment, and by providing other information that may serve to guide the industry. The creation of ASHRAE Standards and Guidelines is determined by the need for them, and conformance to them is completely voluntary.

In referring to this Standard or Guideline and in marking of equipment and in advertising, no claim shall be made, either stated or implied, that the product has been approved by ASHRAE.

(This foreword is not part of this standard. It is merely informative and does not contain requirements necessary for conformance to the standard. It has not been processed according to the ANSI requirements for a standard and may contain material that has not been subject to public review or a consensus process. Unresolved objections on informative material are not offered the right to appeal at ASHRAE or ANSI.)

## FOREWORD

First published in 1996 and reaffirmed in 2006, Standard 130 specifies instrumentation, test installation methods, and procedures for determining the capacity and related performance in a laboratory controlled environment of constant-volume and variable-volume air terminal units. The standard is classified as an ASHRAE standard method of measurement. This standard is required for compliance with AHRI Standard 880.

The 2016 revision of the standard includes updates and revisions to all parts of the standard, including its title, purpose, and scope. It updates definitions, redefines airflow sensor performance testing, and adds a method to determine terminal-unit total pressure loss coefficients and the relationship between terminal-unit casing leakage and pressure.

## 1. PURPOSE

The standard specifies instrumentation, test installation methods, and procedures for measuring the capacity and related performance of constant-volume, variable-volume, and modulating integral diffuser air terminals.

## 2. SCOPE

**2.1** The methods of test in this standard apply to air control devices used in air distribution systems. These devices provide control of air volume with or without temperature by one or more of the following means and may or may not include a fan:

- a. Fixed or adjustable directional vanes (i.e., bypass terminal)
- b. Pressure-dependent volume dampers or valves (including air induction nozzles and dampers)
- c. Pressure-independent volume dampers or valves (including air induction nozzles and dampers)
- d. Integral heat exchanger
- e. On/off fan control
- f. Variable-speed fan control
- g. Modulating integral diffuser terminals

**2.2** This standard covers test methods for use in determining the following performance characteristics:

- a. Sound power
- b. Temperature mixing and stratification
- c. Minimum operating pressure
- d. Air leakage
- e. Induced airflow
- f. Fan airflow
- g. Fan motor electrical power
- h. Condensation
- i. Airflow sensor performance

**2.3** This standard shall not be used for field testing.

## 3. DEFINITIONS AND SYMBOLS

### 3.1 Definitions

**accuracy:** degree of conformity of an indicated value to an accepted standard value, or true value. The degree of inaccuracy is known as “total measurement error” and is the sum of bias error and precision error.

**acoustically isolated duct:** ductwork for which, in all frequency bands of interest, the breakout sound level is at least 10 dB less than the transmitted sound level of the terminal unit under test. Refer to Informative Appendix G for a detail of an acoustically isolated duct.

**air terminal unit:** device that automatically modulates the volume of air delivered to or removed from a defined space.

**amplification factor ( $F$ ):** ratio of sensor output ( $P_{sensor}$ ) to velocity pressure ( $P_v$ ) as defined by Equation 1:

$$F = \frac{P_{sensor}}{P_v} \quad (1)$$

where

$F$  = amplification factor, dimensionless

$P_{sensor}$  = sensor output, in. of water (Pa)

$P_v$  = velocity pressure at sensor location, in. of water (Pa)

**Example:** a sensor with a reading of 1.0 in. of water (250 Pa) pressure at a velocity pressure of 0.43 in. of water (108 Pa) has an amplification factor of 2.3.

**bias error:** difference between the true value to be measured and the indicated value from the measuring system that persists and is usually due to the particular instrument or technique of measurement.

**bypass terminal unit:** a terminal unit, typically having more than one outlet, that uses a method of volume modulation whereby airflow is varied by distributing the volume required to meet the space requirements, the balance of supply/exhaust air being diverted away from the space.

**discharge sound power level:** sound power that is transmitted from the terminal outlet.

**dual-duct terminal unit:** air terminal that mixes varying portions of two independent sources of primary air.

**equivalent diameter:** diameter of a circular-duct equivalent that has a cross-sectional area equal to a particular rectangular duct. Equivalent diameter is calculated by the following equation:

$$D_e = \left( \frac{4A}{\pi} \right)^{0.5} \quad (2)$$

**exhaust sound power level:** sound power that is transmitted from an exhaust terminal inlet back to the room (counter to the airflow).

**exhaust terminal unit:** terminal unit for regulating exhaust or return airflow.
