Metallic and Nonmetallic Gaskets for Pipe Flanges

Standards for Engineers Worldwide

ASME B16.20-2007

ASME B16.21-2011

Upon request from industry and government, ASME has been defining piping safety since 1922.

ASME B16.20 covers metal ring-joint gaskets, spiral-wound gaskets, and metal-jacketed gaskets for use with raised-face and flat-face flanges. ASME B16.21 covers nonmetallic flat gaskets.

Both product standards offer comprehensive solutions applying to materials, dimensions, tolerances and marking. Both product standards address gaskets that are dimensionally suitable for use with flanges described in reference flange standards ASME B16.5, ASME B16.47, API Specification 6A, and ISO 10423 as well as with other ASME standards, such as the Boiler and Pressure Vessel Code and the B31 Piping Codes.

Careful application of these B16 standards will help users to comply with pertinent regulations within their jurisdictions, while achieving the operational, cost and safety benefits to be gained from the many industry best-practices detailed within these volumes.

Intended for manufacturers, owners, employers, users and others concerned with the specification, buying, maintenance, training and safe use of metallic and non-metallic gaskets with pressure equipment, plus all potential governing entities.

ASME Codes and Standards

ASME is the leading international developer of codes and standards associated with the art, science, and practice of mechanical engineering. Starting with the first issuance of its legendary Boiler & Pressure Vessel Code in 1914, ASME's codes and standards have grown to nearly 600 offerings currently in print.
