American National Standard

Approval of an American National Standard requires verification by ANSI that the requirements for due process, consensus, and other criteria for approval have been met by the standards developer. Consensus is established when, in the judgment of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that a concerted effort be made toward their resolution. The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether he/she has approved the standards or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standards. The American National Standards Institute does not develop standards and will in no circumstance give an interpretation of any American National Standard. Moreover, no person shall have the right or authority to issue an interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretation should be addressed to the secretariat or sponsor whose name appears on the title page of this standard.

Caution Notice: This American National Standard may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken periodically to reaffirm, revise, or withdraw this standard. Purchasers of American National Standards may receive current information on all standards by calling or writing the American National Standards Institute.

Foreword (This Foreword is not a part of American National Standard Z359.4-2007.)

Individuals engaged in rescue operations in areas where exposure to a fall hazard exists will benefit from the information contained in this standard. This standard addresses equipment and performance criteria for systems, subsystems and components used in preplanned assisted-rescue and self-rescue where a fall hazard exists. Requirements for adequate training and thorough pre-planning efforts prior to the initiation of rescue or self-rescue operations address the needs of both the rescuer and the rescue subject. This standard establishes criteria for equipment marking, testing, care and use.

This standard is part of a series of American National Standards for Fall Protection for all occupational and non-occupational activities except those in SIC Division C (construction). It is not intended to apply to sports activities such as mountaineering, nor to specialized rescue efforts that may be associated with such activities. The first ANSI standard of this series, Z359.1 published in 1992 and reaffirmed in 1999, addresses personal fall arrest systems. Other standards planned for the Z359 series will address the related subjects of climbing, manriding, positioning, and the overall fall protection program. The complete Z359 standards series will apply to the hazards of moving and supporting people that exists below and above ground and in confined as well as unconfined spaces.

Whenever fall arrest systems are used, indeed, whenever a fall hazard exists, it is necessary to plan for the effective rescue of persons who have experienced a fall event, whether it be a self-rescue application or assisted rescue application. Considering the diverse technical and environmental circumstances that can be presented to rescue personnel, development of a comprehensive rescue plan is integral to the safety of rescue personnel, the rescue subject, and the eventual success of the rescue effort.

The comprehensive rescue predicts circumstances that might require rescue activities, anticipates hazards associated with rescue operations, identifies methods to control those hazards, recommends the appropriate response measures and identifies the fall arrest and retrieval equipment to be used. The rescue plan may call for methods or equipment that are outside the scope of this standard, such as technical rope rescue, when such methods are reasonable and feasible and estimated to be the most effective rescue method.

The Z359 Committee solicits public input that may suggest the need for revisions to this standard. Such input should be sent to the Secretariat, ASC Z359, American Society of Safety Engineers, 1800 E. Oakton Street, Des Plaines, IL 60018-2187.

This standard was developed and approved for submittal to ANSI by the American National Standard Committee on Standards for Fall Protection, Z359. Committee approval of the standard does not necessarily imply that all Committee members voted for its approval. At the time it approved this standard, the Z359 Committee had the following members:

Randall Wingfield, Chairman
Basil Tominna, P.E., Vice Chairman
J. Thomas Wolner, P.E., Z359.4 Subgroup Chair
Timothy R. Fisher, CSP, ARM, CPEA, Secretary
Jennie Dalesandro, Administrative Technical Support

STANDARD REQUIREMENTS

1. SCOPE, PURPOSE, APPLICATION, EXCEPTIONS, AND INTERPRETATIONS

1.1 Scope. This standard establishes requirements for the performance, design, marking, qualification, instruction, training, use, maintenance, and removal from service of connectors, harnesses, lanyards, anchorage connectors, winches/hoists, descent control devices, rope tackle blocks, and self-retracting lanyards with integral rescue capability comprising rescue systems, utilized in pre-planned self-rescue and assisted-rescue applications for one to two persons.

1.2 Purpose and Application. The purpose of this standard is to establish criteria to ensure suitability of the equipment and methods defined herein for use in rescue situations where a fall hazard exists.

Rescue system elements, components, or subsystems meeting the requirements of this standard may not be represented as complying with or used in personal fall arrest systems (PFAS) claiming compliance with ANSI/ASSE Z359.1 unless the requirements of that standard are additionally met.

1.3 Exceptions.

1.3.1 The requirements of this standard do not address the construction industry (SIC Division C), sport-related activities, rope access rescue techniques utilized by certified rescue technicians, or other tasks that have established national consensus standards. However, this does not preclude use of equipment addressed within this standard for such activities where appropriate.

1.3.2 The competent person shall determine the suitability of equipment addressed within this standard for activities conducted in hazardous atmospheres.

1.4 Interpretations. Requests for interpretations of this standard shall be in writing and addressed to the Secretariat of this standard.

EXPLANATORY INFORMATION

(Not part of American National Standard Z359.4)

E1.3.2 For a definition of competent person refer to the ANSI/ASSE Z359.0, *Definitions and Nomenclature Used for Fall Protection and Fall Arrest*, and for additional information refer to ANSI/ASSE Z359.2, *Accepted Practices for Fall Protection*.
