**An American National Standard**

**Approved by the**  
**American National Standards Institute**  
**October 30, 2012**

# **Guide for Verification and Validation in Computation Weld Mechanics**

**1st Edition**

Prepared by the  
American Welding Society (AWS) A9 Committee on Computerization of Welding Information

Under the Direction of the  
AWS Technical Activities Committee

Approved by the  
AWS Board of Directors

## **Abstract**

This standard provides guidelines for assessing the capability and accuracy of computational weld mechanics (CWM) models. This standard also provides general guidance for implementing verification and validation (V&V) of computational models for complex systems in weld mechanics.

## Statement on the Use of American Welding Society Standards

All standards (codes, specifications, recommended practices, methods, classifications, and guides) of the American Welding Society (AWS) are voluntary consensus standards that have been developed in accordance with the rules of the American National Standards Institute (ANSI). When AWS American National Standards are either incorporated in, or made part of, documents that are included in federal or state laws and regulations, or the regulations of other governmental bodies, their provisions carry the full legal authority of the statute. In such cases, any changes in those AWS standards must be approved by the governmental body having statutory jurisdiction before they can become a part of those laws and regulations. In all cases, these standards carry the full legal authority of the contract or other document that invokes the AWS standards. Where this contractual relationship exists, changes in or deviations from requirements of an AWS standard must be by agreement between the contracting parties.

AWS American National Standards are developed through a consensus standards development process that brings together volunteers representing varied viewpoints and interests to achieve consensus. While AWS administers the process and establishes rules to promote fairness in the development of consensus, it does not independently test, evaluate, or verify the accuracy of any information or the soundness of any judgments contained in its standards.

AWS disclaims liability for any injury to persons or to property, or other damages of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly resulting from the publication, use of, or reliance on this standard. AWS also makes no guarantee or warranty as to the accuracy or completeness of any information published herein.

In issuing and making this standard available, AWS is neither undertaking to render professional or other services for or on behalf of any person or entity, nor is AWS undertaking to perform any duty owed by any person or entity to someone else. Anyone using these documents should rely on his or her own independent judgment or, as appropriate, seek the advice of a competent professional in determining the exercise of reasonable care in any given circumstances. It is assumed that the use of this standard, and its provisions is entrusted to appropriately qualified and competent personnel.

This standard may be superseded by new editions. This standard may also be corrected through publication of amendments or errata, or supplemented by publication of addenda. Information on the latest editions of AWS standards including amendments, errata, and addenda is posted on the AWS web page ([www.aws.org](http://www.aws.org)). Users should ensure that they have the latest edition, amendments, errata, and addenda.

Publication of this standard does not authorize infringement of any patent or trade name. Users of this standard accept any and all liabilities for infringement of any patent or trade name items. AWS disclaims liability for the infringement of any patent or product trade name resulting from the use of this standard.

AWS does not monitor, police, or enforce compliance with this standard, nor does it have the power to do so.

Official interpretations of any of the technical requirements of this standard may only be obtained by sending a request, in writing, to the appropriate technical committee. Such requests should be addressed to the American Welding Society, Attention: Managing Director, Technical Services Division, 8669 Doral Blvd., Suite 130, Doral, FL 33166 (see Annex C). With regard to technical inquiries made concerning AWS standards, oral opinions on AWS standards may be rendered. These opinions are offered solely as a convenience to users of this standard, and they do not constitute professional advice. Such opinions represent only the personal opinions of the particular individuals giving them. These individuals do not speak on behalf of AWS, nor do these oral opinions constitute official or unofficial opinions or interpretations of AWS. In addition, oral opinions are informal and should not be used as a substitute for an official interpretation.

This standard is subject to revision at any time by the AWS A9 Committee on the Computerization of Welding Information. It must be reviewed every five years, and if not revised, it must be either reaffirmed or withdrawn. Comments (recommendations, additions, or deletions) and any pertinent data that may be of use in improving this standard are required and should be addressed to AWS Headquarters. Such comments will receive careful consideration by the AWS A9 Committee on the Computerization of Welding Information and the author of the comments will be informed of the Committee's response to the comments. Guests are invited to attend all meetings of the AWS A9 Committee on the Computerization of Welding Information to express their comments verbally. Procedures for appeal of an adverse decision concerning all such comments are provided in the Rules of Operation of the Technical Activities Committee. A copy of these Rules can be obtained from the American Welding Society, 8669 Doral Blvd., Suite 130, Doral, FL 33166.

## Personnel

### **AWS A9 Committee on the Computerization of Welding Information**

S. S. Babu, Chair	<i>The Ohio State University</i>
S. N. Borrero, Secretary	<i>American Welding Society</i>
F. Brust	<i>EMC2</i>
D. J. Dewees	<i>The Equity Engineering Group, Incorporated</i>
Z. Feng	<i>Oak Ridge National Laboratory</i>
J. A. Fleming	<i>Bridgestone Americas</i>
J. Goldak	<i>Goldak Technologies Inc.</i>
S. P. Khurana	<i>Axon Innovations LLC</i>
P. Michaleris	<i>Pennsylvania State University</i>
C. Schwenk	<i>BMW Group</i>
G. Sonnenberg	<i>Huntington Ingalls Industries, Incorporated</i>
W. Zhang	<i>Oak Ridge National Laboratory</i>

### **Advisors to the AWS A9 Committee on the Computerization of Welding Information**

A. J. Buijk	<i>Simufact-Americas, LLC</i>
R. Ganta	<i>Westinghouse Electric Company</i>
J. E. Jones	<i>EnergYnTech/N.A. Tech, Inc.</i>
D. Killian	<i>Areva NP, Incorporated</i>
J. S. Noruk	<i>Servo Robot Corporation</i>
H. Porzner	<i>ESI GmbH</i>
E. F. Rybicki	<i>University of Tulsa</i>
B. T. Alexandrov	<i>The Ohio State University</i>
F. Arnold	<i>SIMULIA Erie Region (Abaqus)</i>
P. Dong	<i>University of New Orleans</i>
J. C. Kennedy	<i>Engineering Mechanics Corp of Columbus</i>
P. F. Mendez	<i>University of Alberta</i>
D. H. Roarty	<i>Westinghouse Electric Corporation</i>

## Foreword

This foreword is not part of AWS A9.5:2013, *Guide for Verification and Validation in Computation Weld Mechanics*, but is included for informational purposes only.

A task group was formed in 2007 under the AWS technical committee structure to investigate the need for computational weld mechanics standards. The task group was reorganized as the AWS A9 Technical Committee on the Computerization of Welding Information and began work in 2008. This is the first standard publication by this committee with more related topics on computational weld mechanics (CWM) planned.

Program managers need assurance that computational models of weld mechanics are sufficiently accurate to support programmatic decisions. As there are multiple acceptable approaches to analyzing the welding process using computational models, a step-by-step Verification and Validation (V&V) process is not practical. However, this guide will provide the CWM community with a common language and conceptual framework to enable communication to non-users of CWM to gain a sense of credibility of the CWM models. This guide will cover a wide range of V&V activities, including simplistic and complex model development, verification of numerical solutions, attributes of validation experiments, accuracy requirements, and quantification of uncertainties. Remaining issues for further development of a V&V protocol are identified.

The AWS A9 Committee plans to pursue the publication of additional standards on computation weld mechanics after this standard. Among those planned are:

- Recommended Practice for Describing Thermal Boundary Conditions
- Recommended Practice for Modeling Thermo-Mechanical Phenomena
- Recommended Practice for Describing Clamps and Fixtures
- Recommended Practice for Modeling Microstructure
- Recommended Practice for Integrated Models
- Recommended Practice for Verification, Uncertainty Estimation, and Sensitivity
- Recommended Practice for Documentation
- Exceptions and Modifications with reference to Materials 1: Steels
- Exceptions and Modifications with reference to Materials 2: Aluminum
- Exceptions and Modifications with reference to Fusion Welding—Arc
- Exceptions and Modifications with reference to Fusion Welding—Laser
- Exceptions and Modifications with reference to Fusion Welding—Resistance
- Exceptions and Modifications with reference to Thin and Thick Plate Geometry
- Exceptions and Modifications with reference to Large Scale Geometries

It is noteworthy that this document is in alignment with similar activities pursued by other international standards organizations such as the German Institute for Standardization (DIN) and the International Institute of Welding (IIW). For example, the readers of this standard are also requested to refer to DIN SPEC 32534–1, *Numerical welding simulation—Execution and documentation—Part 1: Overview*, published in 2011.

Annex A lists the in-text citations referenced throughout this document.

Comments and suggestions for the improvement of this standard are welcome. They should be sent to the Secretary, AWS A9 Committee on the Computerization of Welding Information, American Welding Society, 8669 Doral Blvd., Suite 130, Doral, FL 33166.

# Guide for Verification and Validation in Computation Weld Mechanics

## 1. General Requirements

**1.1 Scope.** This guide introduces computational weld mechanics methodology through an overview of the current technology. It presents current practices for heat transfer, microstructure, residual stress, and distortion calculations. In addition, a framework for developing verification and validation (V&V) procedures for these models is presented through an example related to the prediction of thermo-mechanical conditions. This document establishes the foundation for future V&V operations to allow for other emerging computational weld mechanics tools.

**1.1.1 Preface.** Computational models have been used routinely to great advantage for more than three decades. This technology has been used in many industries to analyze and assist in the design of many items. From architecture to telecommunications, computational analyses (structural to thermal to fluid) have been used to develop objects from the most complex to commonplace everyday items. Numerical analysis has given engineers the capability to make products better, safer, and more functional with less development costs. The growth in the use of computational models shows that commercial industries have confidence in the accuracy of the codes to reduce costs and delivery times while improving quality. In manufacturing, computational solid mechanics (CSM) and computational fluid mechanics (CFM) have been fully adopted; yet, the use of computational weld mechanics (CWM) has not. It has been suggested that the same level of confidence in CWM analyses does not exist due to relative newness of the tools and the lack of experience in their use. In comparison CWM is quite complex involving a coupled phenomena of thermal and nonlinear, transient structural analyses. Information regarding material responses due to thermal inputs, microstructure evolution, and to stresses and strains are needed to perform this type of analysis. It is for these reasons that CWM has emerged about two decades later than CSM.

The process to develop confidence in computational modeling can be expedited by a process called verification and validation (V&V). Verification testing ensures that a computational code solves the mathematical state equations that describe the phenomenon with sufficient accuracy, robustness, and reliability. Validation tests that a particular computational model predicts a particular event with accuracy and reliability. Such V&V has been developed for computational solid mechanics [1]<sup>1</sup> with Figure 1 illustrating a typical methodology used to develop V&V documents for creating models throughout the design process. This approach can be applied to CWM as well. In welding, the relevant phenomenon might be distortion, residual stress, microstructure, or risk of in-service failure. Once through this process, a computational model can be used repeatedly without physical experimentations with confidence that the output will be accurate and reliable.

Computational models fitted to experimental data before being used are called calibrated models. These types of models cannot be used to predict a particular outcome unless the input values are the same range as the original 'calibrated' model. Any changes in the model require the repetition of the calibration process resulting in multiple computational models and experimental tests. As one can easily see, computational approaches that utilize validated codes and verified approaches are much more expansive and usable in multiple cases than their calibrated computational model counterparts.

**1.2 Units of Measurement.** This standard does not require units of measure. Therefore, no equivalents or conversions are contained except when they are cited in examples.
