Residual direct current detecting device (RDC-DD) to be used for mode 3 charging of electric vehicles
National foreword

This British Standard is the UK implementation of IEC 62955:2018.

The UK participation in its preparation was entrusted to Technical Committee PEL/23/1, Circuit breakers and similar equipment for household use.

A list of organizations represented on this committee can be obtained on request to its secretary.

This publication does not purport to include all the necessary provisions of a contract. Users are responsible for its correct application.

Residual direct current detecting device (RDC-DD) to be used for mode 3 charging of electric vehicles

Dispositif de détection à courant différentiel résiduel continu (DD-CDC) à utiliser pour la charge en mode 3 des véhicules électriques
CONTENTS

FOREWORD ................................................................................................................... 11
INTRODUCTION ................................................................................................................ 13
1 Scope ......................................................................................................................... 14
2 Normative references .............................................................................................. 15
3 Terms, definitions and symbols ............................................................................... 15
  3.1 Definitions relating to RDC-DD design ................................................................. 16
  3.2 Symbols .................................................................................................................. 16
4 Classification RDC-DD (RDC-MD, RDC-PD) .......................................................... 16
  4.1 RDC-DDs are classified according to the type of construction ......................... 16
  4.1.1 RDC-MD ........................................................................................................... 17
  4.1.2 RDC-PD ........................................................................................................... 18
  4.2 According to the number of poles ......................................................................... 18
  4.3 According to the method of connection ............................................................... 18
  4.4 According to the type of terminals ........................................................................ 18
  4.5 According to range of ambient air temperature .................................................... 18
5 Characteristics of RDC-DDs .................................................................................... 18
  5.1 Summary of characteristics .................................................................................. 18
  5.2 Rated quantities and other characteristics ............................................................ 19
    5.2.1 Rated voltage ($U^n$) ...................................................................................... 19
    5.2.2 Rated current ($I^n$) ...................................................................................... 19
    5.2.3 Rated DC residual operating current ($I^\Delta_{dc}$) .............................................. 19
    5.2.4 Rated DC residual non-operating current ($I^\Delta_{ndc}$) .................................... 19
    5.2.5 Rated frequency ............................................................................................ 19
    5.2.6 Rated making and breaking capacity ($I^m$) ..................................................... 19
  5.3 Standard and preferred values ............................................................................... 20
    5.3.1 Preferred values of rated voltage ($U^n$) ......................................................... 20
    5.3.2 Preferred values of rated current ($I^n$) .......................................................... 20
    5.3.3 Standard value of rated DC residual operating current ($I^\Delta_{dc}$) .................. 20
    5.3.4 Standard value of DC residual non-operating current ($I^\Delta_{ndc}$) .................. 20
    5.3.5 Preferred values of rated frequency ............................................................... 20
    5.3.6 Minimum value of the rated making and breaking capacity ($I^m$) ................... 20
    5.3.7 Minimum value of the rated residual making and breaking capacity
          ($I^\Delta_m$) .......................................................................................................... 21
    5.3.8 Standard and preferred values of the rated conditional short-circuit current
          ($I^\Delta_n$) ........................................................................................................... 21
    5.3.9 Standard values of the rated conditional residual short-circuit current
          ($I^\Delta_C$) .......................................................................................................... 21
    5.3.10 Limiting values of break time ....................................................................... 21
    5.3.11 Standard value of rated impulse withstand voltage ($U^{imp}$) ......................... 22
  5.4 Coordination with short-circuit protective devices (SCPDs) ............................... 22
    5.4.1 General ............................................................................................................ 22
    5.4.2 Rated conditional short-circuit current ($I^\Delta_n$) .............................................. 23
    5.4.3 Rated conditional residual short-circuit current ($I^\Delta_C$) .............................. 23
  6 Marking and other product information ................................................................... 23
  7 Standard conditions for operation in service and for installation ......................... 25
    7.1 Standard conditions ............................................................................................ 25
    7.2 Conditions of installation .................................................................................. 25

INTERNATIONAL ELECTROTECHNICAL COMMISSION

RESIDUAL DIRECT CURRENT DETECTING DEVICE (RDC-DD)
TO BE USED FOR MODE 3 CHARGING OF ELECTRIC VEHICLES

FOREWORD

1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.

2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.

3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.

4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.

5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.

6) All users should ensure that they have the latest edition of this publication.

7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.

8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.

9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

International Standard IEC 62955 has been prepared by subcommittee 23E: Circuit-breakers and similar equipment for household use, of IEC technical committee 23: Electrical accessories.

The text of this International Standard is based on the following documents:

<table>
<thead>
<tr>
<th>FDIS</th>
<th>Report on voting</th>
</tr>
</thead>
<tbody>
<tr>
<td>23E/1042/FDIS</td>
<td>23E/1047/RVD</td>
</tr>
</tbody>
</table>

Full information on the voting for the approval of this International Standard can be found in the report on voting indicated in the above table.

This document has been drafted in accordance with the ISO/IEC Directives, Part 2.

The following differing practices of a less permanent nature exist in the countries indicated below.
Specific rules in several countries are introduced in:
- Clause 5.3.8.1, Table 4 and 8.1.2 Note 1,
- Annex I Note 1,
- Annex J Note 1,
- Annex J Note 1 and in Clause 8.3.2.

In this standard, the following print types are used:
- Requirements proper: in roman type.
- Test specifications: in italic type.
- Explanatory matter: in smaller roman type.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under "http://webstore.iec.ch" in the data related to the specific document. At this date, the document will be
- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.
INTRODUCTION

According to IEC 60364-7-722, each connecting point is protected by its own RCD of at least type A, having a rated residual operating current not exceeding 30 mA.

Protective measures against DC fault currents need to be taken. The appropriate measures are:
- RCD type B, or
- RCD type A and appropriate equipment that ensures the switching of the supply in case of a DC fault current above 6 mA.

It is the purpose of this document to specify this type of detecting equipment to ensure that the proper functionality of RCDs type A or type F is not impaired by DC residual currents above 6 mA.
RESIDUAL DIRECT CURRENT DETECTING DEVICE (RDC-DD) TO BE USED FOR MODE 3 CHARGING OF ELECTRIC VEHICLES

1 Scope

This International Standard applies to residual direct current detecting devices (RDC-DD) for permanently connected AC electric vehicle charging stations (mode 3 charging of electric vehicles, according to IEC 61851-1 and IEC 60364-7-722), hereafter referred to as RDC-MD (residual direct current monitoring device) or RDC-PD (residual direct current protective device), for rated voltages not exceeding 440 V AC with rated frequencies of 50 Hz, 60 Hz or 50/60 Hz and rated currents not exceeding 125 A.

NOTE 1 This document can also be used as guidance for devices for voltages up to and including 690 V AC 50 Hz, 60 Hz or 50/60 Hz, at a rated current not exceeding 250 A.

RDC-DDs are intended to remove or initiate removal of the supply to the EV in cases where a smooth residual direct current equal to or above 6 mA is detected.

NOTE 2 The value of 6 mA for smooth residual direct current was chosen to prevent impairing the correct operation of an upstream type A or type F RCD.

This document covers two different classes of residual direct current detecting device (RDC-DD) to be used for mode 3 charging of electric vehicles (see classification in 4.1):

- RDC-MD (monitoring devices), and
- RDC-PD (protective devices).

This document applies to devices performing simultaneously the functions of detection of the residual direct current, of comparison of the value of this current with the residual operating value, and initiating the opening of the circuit when the residual direct current exceeds 6 mA.

RDC-PDs according to this document are suitable for isolation.

RDC-DDs are intended to be used for single-phase or multi-phase circuits in TN-, TT- and IT-systems.

RDC-DDs are intended to be used within the fixed installation.

RDC-DDs are intended to be used in AC circuits only. RDC-DDs according to this document are not intended for bilateral power flow between electric vehicle and fixed installation.

For RDC-DDs with integrated AC, pulsating DC and 6 mA DC detection, evaluation and mechanical switching in one unit, Annex O applies.

For RDC-MD consisting of a RDC-M-unit with a mechanical interface to a separate protective device (circuit breaker or RCD), Annex M applies.

For RDC-MD consisting of a RDC-M-module with separated residual current detection and evaluation with an electrical interface to a switching device (e.g. contactor) or a protective device (circuit breaker or RCD), Annex N applies.
