BSI Standards Publication

Industrial communication networks — Network and system security

Part 1-1: Terminology, concepts and models

bsi.

National foreword

This Published Document is the UK implementation of IEC/TS 62443-1-1:2009.

The UK participation in its preparation was entrusted to Technical Committee GEL/65, Measurement and control.

A list of organizations represented on this committee can be obtained on request to its committee manager.

Contractual and legal considerations

This publication has been prepared in good faith, however no representation, warranty, assurance or undertaking (express or implied) is or will be made, and no responsibility or liability is or will be accepted by BSI in relation to the adequacy, accuracy, completeness or reasonableness of this publication. All and any such responsibility and liability is expressly disclaimed to the full extent permitted by the law.

This publication is provided as is, and is to be used at the recipient's own risk.

The recipient is advised to consider seeking professional guidance with respect to its use of this publication.

This publication is not intended to constitute a contract. Users are responsible for its correct application.

This publication is not to be regarded as a British Standard.

Compliance with a Published Document cannot confer immunity from legal obligations.

This Published Document was published under the authority of the Standards Policy and Strategy Committee on 31 May 2023.

Part 1-1: Terminology, concepts and models

FOREWORD

1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.

2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.

3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.

4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.

5) IEC provides no marking procedure to indicate its approval and cannot be rendered responsible for any equipment declared to be in conformity with an IEC Publication.

6) All users should ensure that they have the latest edition of this publication.

7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.

8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.

9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

The main task of IEC technical committees is to prepare International Standards. In exceptional circumstances, a technical committee may propose the publication of a technical specification when

• the required support cannot be obtained for the publication of an International Standard, despite repeated efforts, or

• the subject is still under technical development or where, for any other reason, there is the future but no immediate possibility of an agreement on an International Standard.

Technical specifications are subject to review within three years of publication to decide whether they can be transformed into International Standards.

IEC 62443-1-1, which is a technical specification, has been prepared by IEC technical committee 65: Industrial-process measurement, control and automation.

This technical specification is derived from the corresponding US ANSI/S99.01.01 standard.

The text of this technical specification is based on the following documents:

Enquiry draft	Report on voting
65/423/DTS	65/432A/RVC

Full information on the voting for the approval of this technical specification can be found in the report on voting indicated in the above table.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 2.

A list of all parts of the IEC 62433 series, published under the general title *Industrial communication networks – Network and system security*, can be found on the IEC website.

The committee has decided that the contents of this publication will remain unchanged until the maintenance result date indicated on the IEC web site under "http://webstore.iec.ch" in the data related to the specific publication. At this date, the publication will be

- transformed into an International standard,
- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

A bilingual version of this publication may be issued at a later date.

NOTE   The revision of this technical specification will be synchronized with the other parts of the IEC 62443 series.

IMPORTANT – The "colour inside" logo on the cover page of this publication indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this publication using a colour printer.

INTRODUCTION

The subject of this technical specification is security for industrial automation and control systems. In order to address a range of applications (i.e., industry types), each of the terms in this description have been interpreted very broadly.

The term "Industrial Automation and Control Systems" (IACS), includes control systems used in manufacturing and processing plants and facilities, building environmental control systems, geographically dispersed operations such as utilities (i.e., electricity, gas, and water), pipelines and petroleum production and distribution facilities, and other industries and applications such as transportation networks, that use automated or remotely controlled or monitored assets.

The term "security" is considered here to mean the prevention of illegal or unwanted penetration, intentional or unintentional interference with the proper and intended operation, or inappropriate access to confidential information in IACS. Cybersecurity which is the particular focus of this technical specification, includes computers, networks, operating systems, applications and other programmable configurable components of the system.

The audience for this technical specification includes all users of IACS (including facility operations, maintenance, engineering, and corporate components of user organizations), manufacturers, suppliers, government organizations involved with, or affected by, control system cybersecurity, control system practitioners, and security practitioners. Because mutual understanding and cooperation between information technology (IT) and operations, engineering, and manufacturing organizations is important for the overall success of any security initiative, this technical specification is also a reference for those responsible for the integration of IACS and enterprise networks.

Typical questions addressed by this technical specification include:

a) What is the general scope of application for IACS security?

b) How can the needs and requirements of a security system be defined using consistent terminology?

c) What are the basic concepts that form the foundation for further analysis of the activities, system attributes, and actions that are important to provide electronically secure control systems?

d) How can the components of an IACS be grouped or classified for the purpose of defining and managing security?

e) What are the different cybersecurity objectives for control system applications?

f) How can these objectives be established and codified?

Each of these questions is addressed in detail in subsequent clauses of this technical specification.

**INDUSTRIAL COMMUNICATION NETWORKS –
NETWORK AND SYSTEM SECURITY –**

Part 1-1: Terminology, concepts and models

1   Scope

1.1   General

This part of the IEC 62443 series is a technical specification which defines the terminology, concepts and models for Industrial Automation and Control Systems (IACS) security. It establishes the basis for the remaining standards in the IEC 62443 series.

To fully articulate the systems and components the IEC 62443 series address, the range of coverage may be defined and understood from several perspectives, including the following:

a) range of included functionality;

b) specific systems and interfaces;

c) criteria for selecting included activities;

d) criteria for selecting included assets.

Each of these is described in the following subclauses:

1.2   Included functionality

The scope of this technical specification can be described in terms of the range of functionality within an organization's information and automation systems. This functionality is typically described in terms of one or more models.

This technical specification focuses primarily on industrial automation and control, as described in a reference model (see Clause 6). Business planning and logistics systems are not explicitly addressed within the scope of this technical specification, although the integrity of data exchanged between business and industrial systems is considered.

Industrial automation and control includes the supervisory control components typically found in process industries. It also includes SCADA (Supervisory Control and Data Acquisition) systems that are commonly used by organizations that operate in critical infrastructure industries. These include the following:

a) electricity transmission and distribution;

b) gas and water distribution networks;

c) oil and gas production operations;

d) gas and liquid transmission pipelines.

This is not an exclusive list. SCADA systems may also be found in other critical and non-critical infrastructure industries.

1.3   Systems and interfaces

In encompassing all IACS, this technical specification covers systems that can affect or influence the safe, secure, and reliable operation of industrial processes. They include, but are not limited to:
