This document provides a technique for the collection of diagnostic capillary blood specimens, including recommendations for collection sites and specimen handling and identification. Specifications for disposable devices used to collect, process, and transfer diagnostic capillary blood specimens are also included.

A standard for global application developed through the Clinical and Laboratory Standards Institute consensus process.
Clinical and Laboratory Standards Institute

Setting the standard for quality in clinical laboratory testing around the world.

The Clinical and Laboratory Standards Institute (CLSI) is a not-for-profit membership organization that brings together the varied perspectives and expertise of the worldwide laboratory community for the advancement of a common cause: to foster excellence in laboratory medicine by developing and implementing clinical laboratory standards and guidelines that help laboratories fulfill their responsibilities with efficiency, effectiveness, and global applicability.

Consensus Process

Consensus—the substantial agreement by materially affected, competent, and interested parties—is core to the development of all CLSI documents. It does not always connote unanimous agreement, but does mean that the participants in the development of a consensus document have considered and resolved all relevant objections and accept the resulting agreement.

Commenting on Documents

CLSI documents undergo periodic evaluation and modification to keep pace with advancements in technologies, procedures, methods, and protocols affecting the laboratory or health care.

CLSI’s consensus process depends on experts who volunteer to serve as contributing authors and/or as participants in the reviewing and commenting process. At the end of each comment period, the committee that developed the document is obligated to review all comments, respond in writing to all substantive comments, and revise the draft document as appropriate.

Comments on published CLSI documents are equally essential, and may be submitted by anyone, at any time, on any document. All comments are addressed according to the consensus process by a committee of experts.

Appeals Process

If it is believed that an objection has not been adequately addressed, the process for appeals is documented in the CLSI Standards Development Policies and Process document.

All comments and responses submitted on draft and published documents are retained on file at CLSI and are available upon request.

Get Involved—Volunteer!

Do you use CLSI documents in your workplace? Do you see room for improvement? Would you like to get involved in the revision process? Or maybe you see a need to develop a new document for an emerging technology? CLSI wants to hear from you. We are always looking for volunteers. By donating your time and talents to improve the standards that affect your own work, you will play an active role in improving public health across the globe.

For further information on committee participation or to submit comments, contact CLSI.

Abstract

Clinical and Laboratory Standards Institute document GP42-A6—Procedures and Devices for the Collection of Diagnostic Capillary Blood Specimens; Approved Standard—Sixth Edition provides a technique for the collection of diagnostic capillary blood specimens, including recommendations for collection sites and specimen handling and identification. Specifications for disposable devices used to collect, process, and transfer diagnostic capillary blood specimens are also included.

The Clinical and Laboratory Standards Institute consensus process, which is the mechanism for moving a document through two or more levels of review by the health care community, is an ongoing process. Users should expect revised editions of any given document. Because rapid changes in technology may affect the procedures, methods, and protocols in a standard or guideline, users should replace outdated editions with the current editions of CLSI documents. Current editions are listed in the CLSI catalog and posted on our website at www.clsi.org. If your organization is not a member and would like to become one, and to request a copy of the catalog, contact us at: Telephone: 610.688.0100; Fax: 610.688.0700; E-Mail: customerservice@clsi.org; Website: www.clsi.org.

Foreword

Since this standard was first proposed in 1977, CLSI has periodically assembled working groups and charged them with the responsibility of updating and maintaining a standardized capillary blood collection procedure for all health care professionals who have capillary blood specimen collection responsibilities. Each working group is composed of members representing industry, government, and the professions.

This latest revision builds on the efforts of past working groups in establishing and maintaining the standardized procedure for skin puncture specimen collection for the health care industry. The Working Group on Capillary Blood Collection functions under the CLSI Area Committee on Quality Systems and Laboratory Practices.

In revising this standard, the working group has reviewed the various comments on the previous standard (H4-A5) received by CLSI, and incorporated changes where appropriate based on new information and studies published since the last revision. This version of the document includes recommendations regarding proper patient identification procedures consistent with other pertinent CLSI documents such as H03\(^1\) and was reorganized for clarity.

Key Words

Calcaneus, capillary, first-drop elimination, heelstick, hemolysis, latex allergy, microdilution, microhematocrit, milking, newborn, order of draw, prewarm, scooping, scorers, sealants
Procedures and Devices for the Collection of Diagnostic Capillary Blood Specimens; Approved Standard—Sixth Edition

1 Scope

This standard describes general procedures for collecting diagnostic capillary blood specimens. It is intended for phlebotomists or other health care providers responsible for obtaining specimens from patients, as well as for manufacturers of skin puncture and incision devices and microcollection containers.

In addition, this document describes and recommends several disposable devices for collecting, processing, and transferring diagnostic capillary blood specimens. The recommendations are strictly limited to disposable products, which are used once per specimen or as defined by the manufacturer’s detailed test technique.

This document does not address skin puncture procedure for self-testing or collection procedures for capillary blood gases. (For information on capillary blood gas collection, see CLSI/NCCLS document H11.)

2 Introduction

2.1 Pediatric Patients

Blood specimens obtained by skin puncture are especially important in pediatrics, because small but adequate amounts of blood for laboratory tests can be obtained with this technique. Obtaining blood by venipuncture from infants may be difficult and potentially hazardous, and obtaining large quantities of blood, especially from premature infants, may result in anemia (see Figure 1). Puncturing deep veins in children may cause:

- cardiac arrest;
- hemorrhage;
- venous thrombosis;
- reflex arteriospasm and gangrene of an extremity;
- damage to surrounding tissues or organs (eg, puncturing the apex of the lung or piercing the trachea);
- infection; and
- injury from restraining the infant or child during the collection procedure.
