INTERNATIONAL ELECTROTECHNICAL COMMISSION

FIBRE OPTIC INTERCONNECTING DEVICES AND PASSIVE COMPONENTS – BASIC TEST AND MEASUREMENT PROCEDURES –

Part 3-35: Examinations and measurements – Visual inspection of fibre optic connectors and fibre-stub transceivers

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

IEC 61300-3-35 has been prepared by subcommittee SC 86B: Fibre optic interconnecting devices and passive components, of IEC technical committee 86: Fibre optics. It is an International Standard.

This third edition cancels and replaces the second edition published in 2015. This edition constitutes a technical revision.

This edition includes the following significant technical changes with respect to the previous edition:

- a) adding of a statement that visual inspection is not a substitute for optical qualification such as attenuation and return loss measurement;
- b) adding of some terms and definitions;
- c) adding requirements for SM 35 dB connectors;

This is a preview of "IEC 61300-3-35 Ed. 3...". Click here to purchase the full version from the ANSI store.

- d) adding of a sentence in Clause 5 concerning the susceptibility of the methods to system variability and variability within systems from same supplier;
- e) removal of inspection requirements for zones C and D;
- f) insertion of a generic cleanliness specification for whole rectangular ferrule and 250 µm area around every fibre;
- g) adding a cleaning recommendation for rectangular and cylindrical ferrules;
- h) outer edge of inspection zone B has changed from 115 µm to 110 µm to meet manufacturing tolerances of fixture for microscopes;
- i) change that defects that are partly in core are only to be judged for the part they are in the core. The remainder of the defect is considered to be located in the cladding.
- j) adding a statement that a connector cannot be rejected by just failing visual inspection. Meeting the specified optical performance determines the use of this connector.

The text of this International Standard is based on the following documents:

Draft	Report on voting
86B/4643/FDIS	86B/4665/RVD

Full information on the voting for its approval can be found in the report on voting indicated in the above table.

The language used for the development of this International Standard is English.

This document was drafted in accordance with ISO/IEC Directives, Part 2, and developed in accordance with ISO/IEC Directives, Part 1 and ISO/IEC Directives, IEC Supplement, available at www.iec.ch/members_experts/refdocs. The main document types developed by IEC are described in greater detail at www.iec.ch/standardsdev/publications.

A list of all parts in the IEC 61300 series, published under the general title *Fibre optic interconnecting devices and passive components – Basic test and measurement procedures*, can be found on the IEC website.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under webstore.iec.ch in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

IMPORTANT – The "colour inside" logo on the cover page of this document indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

FIBRE OPTIC INTERCONNECTING DEVICES AND PASSIVE COMPONENTS – BASIC TEST AND MEASUREMENT PROCEDURES –

Part 3-35: Examinations and measurements – Visual inspection of fibre optic connectors and fibre-stub transceivers

1 Scope

This part of IEC 61300 is concerned with the observation and classification of debris, scratches and defects. The inspection requirements are based on IEC TR 62627-05. Advice for cleaning of contamination from fibres/ferrule is found in IEC TR 62627-01 and a recommendation is given in Annex D. IEC TR 62572-4 provides the cleaning method for a stub for optical transceivers. Visual inspection is in addition to, and does not replace measurement of performance parameters such as attenuation and return loss, or end face parameters. The dimensions specified are chosen such that they can be easily estimated. Not only the zones A and B on the fibre are inspected for defects and scratches but the whole contact area (where the two fibres/ferrules meet when mated) needs to be inspected for contamination (this is up to 250 µm diameter for cylindrical ferrules and the whole ferrule surface for rectangular ferrules).

The objectives of this document are the following:

- specify the minimum criteria for a microscope to be compliant to this document;
- specify the procedure and criteria for inspecting fibre-optic end faces for cleanliness to determine if the end faces are fit for use. All connector optical interfaces (IEC 61755 series and IEC 63267 series) are based on physical contact between fibre cores;
- provide quantitative criteria for the analysis of end face images.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

IEC 60825-2, *Safety of laser products – Part 2 Safety of optical fibre communication systems (OFCSs)*

For each type, there are optical/hardware requirements to be met and procedures to be followed. As these processes are in support of the inspection criteria defined in Clause 5, all three are expected to result in a "pass" or "fail".

The minimum optical requirements for all types of microscopes to be compliant with this document are given in 4.5 and 4.6.

The microscopes described in this document, with the exception of large field of view (LFOV), are capable of being used for inspection for contamination (cleanliness) prior mating in the field and factory and after polishing SM and MM, single-fibre and multifibre connectors in the factory.

LFOV microscopes can be used for inspection of contamination of the entire ferrule surface of multifibre connectors in the field and in the factory.

For methods A and B, visual gauge tools should be used to facilitate the estimation procedure. For method A, an eyepiece reticule should be used. For method B, a transparent overlay should be used.

WARNING – All methods are susceptible to system variability: methods A and B are operator and equipment hardware dependent. Method C is less operator dependent but exhibits from software irregularities and variations in hardware and, in case of field use, operator handling differences can cause a variation in results that might appear even when equipment from the same brand is compared. Method C has an inherent uncertainty when defects or scratches are located near test limits, as described in Annex A tables.

4.2 Method A: Direct view optical microscopy

This method uses an optical microscope in which a primary objective lens forms a first image that is then magnified by an eyepiece that projects the image directly to the user's eye. It shall have the following features and capabilities:

- a suitable ferrule or connector adapter;
- a light source and focussing mechanism;
- a built-in laser safety filter;
- a means to compare dimension of defects or scratches observed in the image with a sufficient reliability (i.e. eyepiece reticule with certified dimension according the magnification).

Laser safety is of particular concern when using direct view microscopes, as any energy in the optical path is directed into the eye of the observer. When method A is used, the user shall ensure there is no laser active on the link prior to inspection. IEC 60825-2 shall be used for laser safety of optical fibre communication systems.

4.3 Method B: Video microscopy

This method uses an optical microscope in which a lens system forms an image on a sensor that, in turn, transfers the image to a display. The user views the image on the display. It shall have the following features and capabilities:

- a suitable ferrule or connector adapter;
- a light source and focussing mechanism;
- a means for creating an image (display);
- a means to estimate surface dimensions defects and/or scratches observed in the image (e.g. overlay with certified dimension according the image on the screen).

4.4 Method C: Automated analysis microscopy

This method uses an optical microscope in which a digital image is acquired or created and is subsequently analysed via an algorithmic process. The purpose of such a system is to reduce the effects of human subjectivity in the analysis process. It shall have the following features and capabilities:

- a suitable ferrule or connector adapter;
- a light source and focussing mechanism;
- a means for acquiring and creating a digital image;
- algorithmic analysis of the digital image;
- a means to compare the analysed image to programmable acceptance criteria.

4.5 Requirements of validation

Microscope systems for methods A, B and C shall be validated for use as compliant with this document. This validation shall be conducted with a purpose-built validation artefact that can serve to validate a system's ability to detect surface defects or scratches of relevant size and/or the required system response. Such (an) artefact(s) shall be provided with instructions on its use and shall be manufactured in a method such that it can be measured in a traceable manner. The related validation procedure is found in Annex C.

4.6 Minimum requirements for standard field of view microscope

This requirement for the standard field of view microscope (SFOV) is a minimum total magnification offering a field of view of at least 250 μm (for methods B and C, this dimension shall be measured in the vertical, or most constrained axis) capable of detecting defects of 2 μm in diameter and scratches of 3 μm wide in the whole field of view.

The minimum requirements for systems for methods A, B and C are as follows:

- particle size detection: 2 μm diameter;
- scratch detection: 3 μm wide.

4.7 Minimum requirements for large field of view microscope

Microscopes with large field of view are only capable of being used for cleanliness inspection of the complete ferrule of single-mode (SM) and multimode (MM) array type connectors like MPO. This requirement is a minimum total magnification offering a LFOV of at least 6,4 mm \times 2,5 mm and capable of detecting debris of 10 μm in diameter in the whole field of view.

The minimum requirement for very large field of view systems for methods A,B and C is 10 μm diameter for particle size detection.

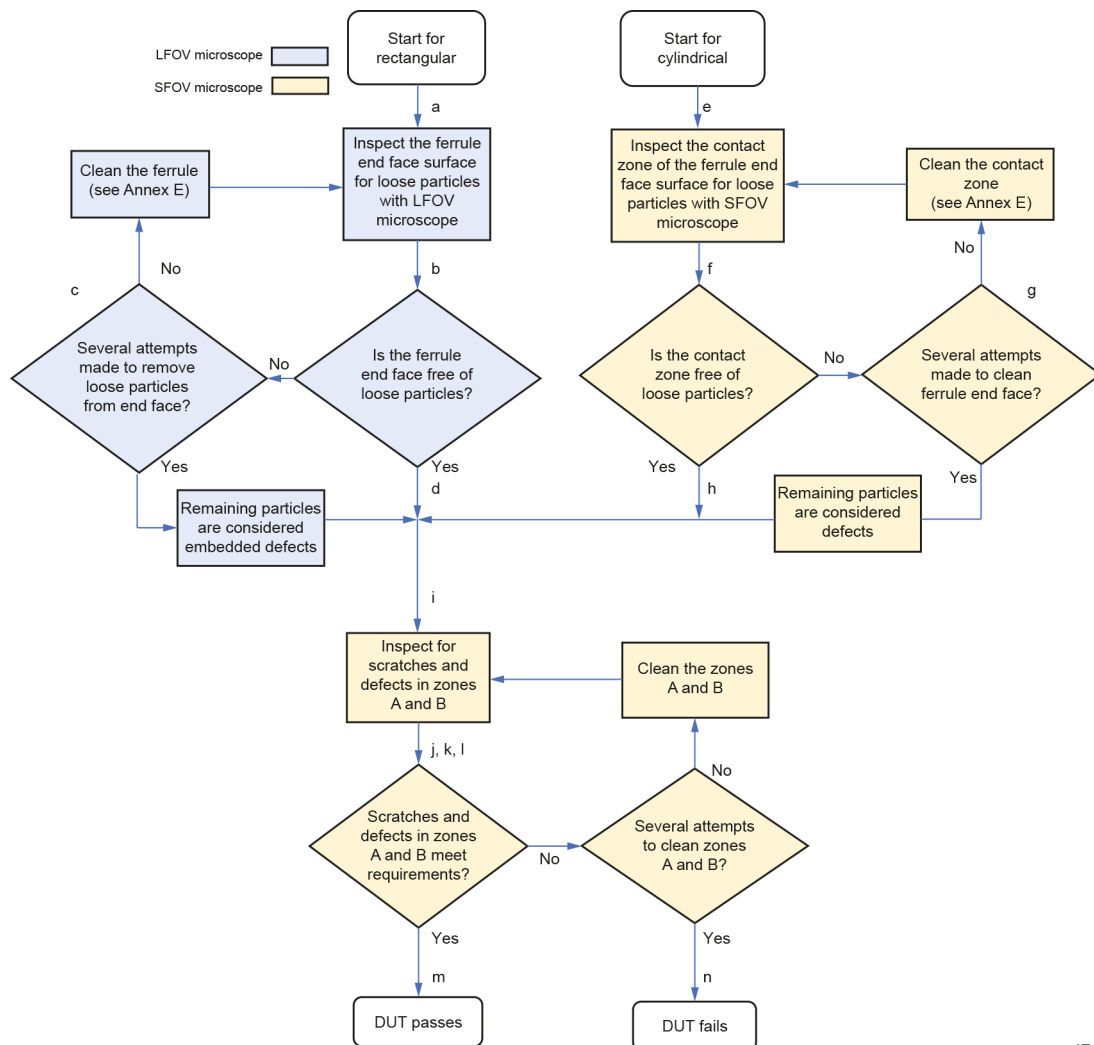

5 Inspection procedure

The inspection for cleanliness of ferrules shall take place prior to any other inspection of the polished parts of the end faces. For cylindrical ferrules, at least an area of 250 μm diameter shall be inspected and cleaned when necessary. Cylindrical ferrules should be inspected and cleaned beyond the 250 μm area.

For rectangular ferrules, the entire ferrule surface (6,4 mm \times 2,5 mm) shall be inspected for cleanliness and cleaned when necessary. Use of inspection equipment with LFOV and oblique illumination eases the detection of contamination on the rectangular ferrules.

SFOV may also be used for cleanliness inspection of the entire rectangular ferrule surface. It requires scrolling over the entire 6.4×2.5 mm ferrule surface. During the scrolling action, care should be taken not to miss any part of ferrule surface and maintain ferrule surface in focus.

The flowchart in Figure 1 shows the procedure to be employed.

IEC

NOTE Letters a, b, ... to n correspond to procedure in Clause 5.

Figure 1 – Flowchart of inspection procedure

The following cleanliness for rectangular ferrules shall apply.

- Using a LFOV microscope as defined in 4.7, focus the microscope so that a crisp image of the ferrule end face of rectangular ferrules can be seen.
- Inspect the entire end face for contamination. For APC ferrules, only the angled area needs to be inspected; the small flat non-angled area, if present, does not require inspection.

A maximum of 10 particles between $10 \mu\text{m}$ and $25 \mu\text{m}$ are the recommended limit. There is no limit for particles below $10 \mu\text{m}$, and no particles larger than $25 \mu\text{m}$ should appear. The defect size is the diameter of the smallest circle that can encompass the entire defect.

- All loose particles should be removed; several attempts at cleaning may be required. Debris remaining after cleaning shall be considered as a defect(s). Consult IEC TR 62627-01:2016, Annex E of this document, and IEC TR 62572-4 for recommendations on cleaning methods for connectors and transceivers.

- d) If the rectangular ferrule end face meets the limits for cleanliness, the inspections of zones A and B of all fibres of the rectangular ferrule against the requirements of the relevant table in Annex A can start.

The following cleanliness for cylindrical ferrules shall apply.

- e) Using a microscope as defined in 4.6, focus the microscope so that a crisp image of the cylindrical ferrule end face can be seen.
- f) Inspect the 250 µm diameter central zone of the end face for contamination. A maximum of 10 particles between 5 µm and 10 µm are the recommended limit in the ring between 135 µm to 250 µm diameter. There is no limit for particles smaller than 5 µm, and no particles larger than 10 µm should appear.
- g) All loose particles shall have been removed, and any remaining particles shall be considered as defects. Debris remaining after cleaning shall be considered as defects. Consult IEC TR 62627-01:2016, Annex E of this document, and IEC TR 62572-4 for recommendations on cleaning methods for connectors and transceivers.
- h) If the cylindrical ferrule end face meets the limits for cleanliness, the inspection of zones A and B of the fibre against the requirements in the relevant table in Annex A can start.

The visual inspection of zones A and B for cylindrical and rectangular ferrules is as follows.

- i) Focus the microscope so that a crisp image of the fibres can be seen.
- j) Locate all defects and scratches (see Annex B for examples of defects and scratches) within the zones specified in the relevant table in Annex A. Classify and count defects and scratches within zones A and B.
- k) If a defect or scratch is found in both the zones A and B, classify the part of the scratch or defect only for zone A that falls in zone A and only for zone B that falls in zone B.
- l) Once all defects and scratches have been classified and counted, the results shall be totalled and compared with the appropriate acceptance criteria (Table A.1 to Table A.5).
- m) If the scratches and defects are less than or equal to the criteria, then the DUT passes.
- n) If the scratches and defects are greater than the criteria and several attempts at cleaning have been made, the DUT fails.

If a connector fails after executing the inspection procedure and no loose debris is present, the connector shall be tested against its optical performance specification (typically attenuation and/or return loss). If the connector meets the specified optical performance, the connector is suitable for use.

Consult IEC TR 62627-01:2016, Annex E of this document, and IEC TR 62572-4 for recommendations on cleaning methods for connectors and transceivers.

NOTE It is possible than an optical assembly that has not been verified to be clean pass an optical performance test but have reduced performance in the future due to debris migration towards the fibre core. It is possible an optical assembly with debris on the end face become damaged and potentially damage the mating connector.

AVANT-PROPOS

- 1) La Commission Electrotechnique Internationale (IEC) est une organisation mondiale de normalisation composée de l'ensemble des comités électrotechniques nationaux (Comités nationaux de l'IEC). L'IEC a pour objet de favoriser la coopération internationale pour toutes les questions de normalisation dans les domaines de l'électricité et de l'électronique. A cet effet, l'IEC – entre autres activités – publie des Normes internationales, des Spécifications techniques, des Rapports techniques, des Spécifications accessibles au public (PAS) et des Guides (ci-après dénommés "Publication(s) de l'IEC"). Leur élaboration est confiée à des comités d'études, aux travaux desquels tout Comité national intéressé par le sujet traité peut participer. Les organisations internationales, gouvernementales et non gouvernementales, en liaison avec l'IEC, participent également aux travaux. L'IEC collabore étroitement avec l'Organisation Internationale de Normalisation (ISO), selon des conditions fixées par accord entre les deux organisations.
- 2) Les décisions ou accords officiels de l'IEC concernant les questions techniques représentent, dans la mesure du possible, un accord international sur les sujets étudiés, étant donné que les Comités nationaux de l'IEC intéressés sont représentés dans chaque comité d'études.
- 3) Les Publications de l'IEC se présentent sous la forme de recommandations internationales et sont agréées comme telles par les Comités nationaux de l'IEC. Tous les efforts raisonnables sont entrepris afin que l'IEC s'assure de l'exactitude du contenu technique de ses publications; l'IEC ne peut pas être tenue responsable de l'éventuelle mauvaise utilisation ou interprétation qui en est faite par un quelconque utilisateur final.
- 4) Dans le but d'encourager l'uniformité internationale, les Comités nationaux de l'IEC s'engagent, dans toute la mesure possible, à appliquer de façon transparente les Publications de l'IEC dans leurs publications nationales et régionales. Toutes divergences entre toutes Publications de l'IEC et toutes publications nationales ou régionales correspondantes doivent être indiquées en termes clairs dans ces dernières.
- 5) L'IEC elle-même ne fournit aucune attestation de conformité. Des organismes de certification indépendants fournissent des services d'évaluation de conformité et, dans certains secteurs, accèdent aux marques de conformité de l'IEC. L'IEC n'est responsable d'aucun des services effectués par les organismes de certification indépendants.
- 6) Tous les utilisateurs doivent s'assurer qu'ils sont en possession de la dernière édition de cette publication.
- 7) Aucune responsabilité ne doit être imputée à l'IEC, à ses administrateurs, employés, auxiliaires ou mandataires, y compris ses experts particuliers et les membres de ses comités d'études et des Comités nationaux de l'IEC, pour tout préjudice causé en cas de dommages corporels et matériels, ou de tout autre dommage de quelque nature que ce soit, directe ou indirecte, ou pour supporter les coûts (y compris les frais de justice) et les dépenses découlant de la publication ou de l'utilisation de cette Publication de l'IEC ou de toute autre Publication de l'IEC, ou au crédit qui lui est accordé.
- 8) L'attention est attirée sur les références normatives citées dans cette publication. L'utilisation de publications référencées est obligatoire pour une application correcte de la présente publication.
- 9) L'attention est attirée sur le fait que certains des éléments de la présente Publication de l'IEC peuvent faire l'objet de droits de brevet. L'IEC ne saurait être tenue pour responsable de ne pas avoir identifié de tels droits de brevets.

L'IEC 61300-3-35 a été établie par le sous-comité SC 86B: Dispositifs d'interconnexion et composants passifs à fibres optiques, du comité d'études 86 de l'IEC: Fibres optiques. Il s'agit d'une Norme internationale.

Cette troisième édition annule et remplace la deuxième édition parue en 2015. Cette édition constitue une révision technique.

Cette édition inclut les modifications techniques majeures suivantes par rapport à l'édition précédente:

- a) ajout d'une mention stipulant qu'un examen visuel ne remplace pas une qualification optique telle qu'une mesure d'affaiblissement et d'affaiblissement de réflexion;
- b) ajout de plusieurs termes et définitions;
- c) ajout d'exigences concernant les connecteurs SM 35 dB;
- d) ajout d'une phrase à l'Article 5 concernant la susceptibilité des méthodes à la variabilité du système et à la variabilité au sein des systèmes provenant d'un même fournisseur;
- e) suppression des exigences d'examen pour les zones C et D;
- f) insertion d'une spécification générique concernant la propreté de la totalité d'une férule rectangulaire et d'une zone de 250 µm autour de chaque fibre;
- g) ajout d'une recommandation de nettoyage des férules rectangulaires et cylindriques;
- h) changement du bord extérieur de la zone d'examen B de 115 µm à 110 µm pour satisfaire aux tolérances de fabrication des microscopes;
- i) modification concernant les défauts en partie situés dans le cœur à considérer uniquement comme étant dans cette partie. Le reste du défaut est considéré comme étant situé dans la gaine;
- j) ajout d'une mention stipulant qu'un connecteur ne peut pas être rejeté après un simple examen visuel. Si la performance optique spécifiée de ce connecteur est satisfaite, il convient d'utiliser ce dernier.

Le texte de cette Norme internationale est issu des documents suivants:

Projet	Rapport de vote
86B/4643/FDIS	86B/4665/RVD

Le rapport de vote indiqué dans le tableau ci-dessus donne toute information sur le vote ayant abouti à son approbation.

La langue employée pour l'élaboration de cette Norme internationale est l'anglais.

Ce document a été rédigé selon les Directives ISO/IEC, Partie 2, il a été développé selon les Directives ISO/IEC, Partie 1 et les Directives ISO/IEC, Supplément IEC, disponibles sous www.iec.ch/members_experts/refdocs. Le comité a décidé que le contenu de ce document ne sera pas modifié avant la date de stabilité indiquée sur le site web de l'IEC sous webstore.iec.ch dans les données relatives au document recherché. A cette date, le document sera:

- reconduit,
- supprimé,
- remplacé par une édition révisée, ou
- amendé.

IMPORTANT – Le logo "colour inside" qui se trouve sur la page de couverture de ce document indique qu'elle contient des couleurs qui sont considérées comme utiles à une bonne compréhension de son contenu. Les utilisateurs devraient, par conséquent, imprimer cette publication en utilisant une imprimante couleur.

DISPOSITIFS D'INTERCONNEXION ET COMPOSANTS PASSIFS FIBRONIQUES – PROCÉDURES FONDAMENTALES D'ESSAIS ET DE MESURES –

Partie 3-35: Examens et mesures – Examen visuel des connecteurs fibroniques et des émetteurs-récepteurs à embase fibrée

1 Domaine d'application

La présente partie de l'IEC 61300 porte sur l'observation et la classification des débris, des éraflures et des défauts. Les exigences d'examen sont fondées sur l'IEC/TR 62627-05. L'IEC/TR 62627-01 fournit des conseils pour le nettoyage de la contamination des fibres/férules et l'Annexe D donne une recommandation. L'IEC/TR 62572-4 fournit la méthode de nettoyage d'une embase pour émetteurs-récepteurs optiques. L'examen visuel s'ajoute à la mesure des paramètres de performance tels que l'affaiblissement et d'affaiblissement de réflexion, ou les paramètres aux extrémités, et ne les remplace pas. Les dimensions spécifiées ont été choisies de manière à faciliter leur estimation. Non seulement les zones A et B de la fibre sont examinées afin de déterminer l'éventuelle présence de défauts et d'éraflures, mais il est également nécessaire d'examiner la totalité de la surface de contact (l'endroit où les deux fibres/férules se rencontrent une fois accouplées) afin de détecter une éventuelle contamination (c'est-à-dire jusqu'à un diamètre de 250 µm pour les férules cylindriques et la totalité de la surface des férules rectangulaires).

Le présent document a pour objectifs de:

- spécifier les critères minimaux pour qu'un microscope soit conforme au présent document;
- spécifier la procédure et les critères d'examen de la propreté des extrémités des fibres optiques afin de déterminer si ces extrémités sont aptes à l'emploi. Toutes les interfaces optiques des connecteurs (séries IEC 61755 et IEC 63267) reposent sur un contact physique entre les cœurs des fibres;
- fournir des critères quantitatifs pour l'analyse des images des extrémités.

2 Références normatives

Les documents suivants sont cités dans le texte de sorte qu'ils constituent, pour tout ou partie de leur contenu, des exigences du présent document. Pour les références datées, seule l'édition citée s'applique. Pour les références non datées, la dernière édition du document de référence s'applique (y compris les éventuels amendements).
