|-------------------------------|-------------------|
| FOREWORD                      | 11                |
| 1 Scope                       | 13                |
| 2 Normative references        | 13                |
| 3 Terms and definitions       | 15                |
| 4 Symbols and units           | 21                |
| 5 Abbreviated terms           | 24                |
| 6 Lightning environment for wind turbine | 25 |
| 6.1 General                   | 25                |
| 6.2 Lightning current parameters and lightning protection levels (LPL) | 25 |
| 7 Lightning exposure assessment| 26                |
| 7.1 General                   | 26                |
| 7.2 Assessing the frequency of lightning affecting a single wind turbine or a group of wind turbines | 28 |
| 7.2.1 Categorization of lightning events | 28 |
| 7.2.2 Estimation of average number of lightning flashes to a single or a group of wind turbines | 28 |
| 7.2.3 Estimation of average annual number of lightning flashes near the wind turbine \(N_M\) | 31 |
| 7.2.4 Estimation of average annual number of lightning flashes to the service lines connecting the wind turbines \(N_L\) | 32 |
| 7.2.5 Estimation of average annual number of lightning flashes near the service lines connecting the wind turbine \(N_I\) | 32 |
| 7.3 Assessing the risk of damage | 33 |
| 7.3.1 Basic equation | 33 |
| 7.3.2 Assessment of risk components due to flashes to the wind turbine \(S_1\) | 34 |
| 7.3.3 Assessment of the risk component due to flashes near the wind turbine \(S_2\) | 34 |
| 7.3.4 Assessment of risk components due to flashes to a service line connected to the wind turbine \(S_3\) | 35 |
| 7.3.5 Assessment of risk component due to flashes near a service line connected to the wind turbine \(S_4\) | 35 |
| 8 Lightning protection of subcomponents | 36 |
| 8.1 General                    | 36                |
| 8.1.1 Lightning protection level (LPL) | 36 |
| 8.1.2 Lightning protection zones (LPZ) | 37 |
| 8.2 Blades                     | 37                |
| 8.2.1 General                  | 37                |
| 8.2.2 Requirements             | 37                |
| 8.2.3 Verification             | 38                |
| 8.2.4 Protection design considerations | 38 |
| 8.2.5 Test methods             | 41                |
| 8.3 Nacelle and other structural components | 42 |
| 8.3.1 General                  | 42                |
| 8.3.2 Hub                      | 42                |
| 8.3.3 Spinner                  | 42                |
| 8.3.4 Nacelle                  | 43                |
| 8.3.5 Tower                    | 43                |
| 8.3.6 Verification methods     | 44                |
8.4 Mechanical drive train and yaw system ........................................... 44
8.4.1 General .......................................................................................... 44
8.4.2 Bearings ......................................................................................... 44
8.4.3 Hydraulic systems ........................................................................... 45
8.4.4 Spark gaps and sliding contacts ......................................................... 46
8.4.5 Verification ...................................................................................... 46
8.5 Electrical low-voltage systems and electronic systems and installations ........................................................................ 46
8.5.1 General .......................................................................................... 46
8.5.2 Equipotential bonding within the wind turbine ................................. 50
8.5.3 LEMP protection and immunity levels ............................................. 51
8.5.4 Shielding and line routing ................................................................. 52
8.5.5 SPD protection ................................................................................. 53
8.5.6 Testing methods for system immunity tests ....................................... 57
8.6 Electrical high-voltage (HV) power systems ........................................ 57
9 Earthing of wind turbines ......................................................................... 59
9.1 General ............................................................................................. 59
9.1.1 Purpose and scope ........................................................................... 59
9.1.2 Basic requirements .......................................................................... 59
9.1.3 Earth electrode arrangements ......................................................... 59
9.1.4 Earthing system impedance .............................................................. 60
9.2 Equipotential bonding ........................................................................... 60
9.2.1 General .......................................................................................... 60
9.2.2 Lightning equipotential bonding for metal installations ..................... 60
9.3 Structural components .......................................................................... 61
9.3.1 General .......................................................................................... 61
9.3.2 Metal tubular type tower ................................................................ 61
9.3.3 Metal reinforced concrete towers ...................................................... 61
9.3.4 Lattice tower .................................................................................. 61
9.3.5 Systems inside the tower ................................................................ 62
9.3.6 Concrete foundation ....................................................................... 62
9.3.7 Rocky area foundation .................................................................... 62
9.3.8 Metal mono-pile foundation .............................................................. 63
9.3.9 Offshore foundation ......................................................................... 63
9.4 Electrode shape dimensions ................................................................. 63
9.5 Execution and maintenance of the earthing system ............................... 64
10 Personal safety ......................................................................................... 64
11 Documentation of lightning protection system ....................................... 66
11.1 General ............................................................................................. 66
11.2 Documentation necessary during assessment for design evaluation ....... 66
11.2.1 General .......................................................................................... 66
11.2.2 General documentation .................................................................. 66
11.2.3 Documentation for rotor blades ....................................................... 66
11.2.4 Documentation of mechanical systems .......................................... 67
11.2.5 Documentation of electrical and electronic systems ......................... 67
11.2.6 Documentation of earthing and bonding systems ............................ 67
11.2.7 Documentation of nacelle cover, hub and tower lightning protection systems ........................................................................... 67
11.3 Site-specific information ...................................................................... 68
11.4 Documentation to be provided in the manuals for LPS inspections .......... 68

### Annex F (informative) Selection and installation of a coordinated SPD protection in wind turbines

- **F.1** Location of SPDs ................................................................. 146
- **F.2** Selection of SPDs ................................................................. 146
- **F.3** Installation of SPDs ............................................................... 146
- **F.4** Environmental stresses of SPDs ........................................ 147
- **F.5** SPD status indication and SPD monitoring in case of an SPD failure ......................................................... 148
- **F.6** Selection of SPDs with regard to protection level \( U_p \) and system level immunity ................................................................. 148
- **F.7** Selection of SPDs with regard to overvoltages created within wind turbines ......................................................... 148
- **F.8** Selection of SPDs with regard to discharge current \( I_n \) and impulse current \( I_{imp} \) ................................................................. 148

### Annex G (informative) Information on bonding and shielding and installation technique

- **G.1** Additional information on bonding ........................................ 150
- **G.2** Additional information on shielding and installation technique ................................................................. 151

### Annex H (informative) Testing methods for system level immunity tests

- **H.1** General ............................................................................. 154
- **H.2** Types of arrangement .......................................................... 161
- **H.3** Frequency dependence on earthing impedance ................. 163
- **H.4** Earthing resistance expressions for different electrode configurations ................................................................. 164

### Annex I (informative) Earth termination system

- **I.1** General ............................................................................. 159
- **I.1.1** Types of earthing systems .................................................. 159
- **I.1.2** Construction .................................................................... 159
- **I.2** Electrode shape dimensions .................................................. 161
  - **I.2.1** Type of arrangement .......................................................... 161
  - **I.2.2** Frequency dependence on earthing impedance ................. 163
- **I.3** Earthing resistance expressions for different electrode configurations ................................................................. 164

### Annex J (informative) Example of defined measuring points

- **J.1** General ............................................................................. 167

### Annex K (informative) Classification of lightning damage based on risk management

- **K.1** General ............................................................................. 169
- **K.2** Lightning damage in blade .................................................. 169
  - **K.2.1** Classification of blade damage due to lightning ................. 169
  - **K.2.2** Possible cause of blade damage due to lightning ................. 170
  - **K.2.3** Countermeasures against blade damage due to lightning ................. 171
- **K.3** Lightning damage to other components ................................ 173
  - **K.3.1** Classification of damage in other components due to lightning ................................................................. 173
  - **K.3.2** Countermeasures against lightning damage to other components ................................................................. 173
- **K.4** Typical lightning damage questionnaire ............................... 173
  - **K.4.1** General ............................................................................. 173
  - **K.4.2** Sample of questionnaire .................................................. 173

### Annex L (informative) Monitoring systems

- **L.1** General ............................................................................. 177

### Annex M (informative) Guidelines for small wind turbines

- **M.1** General ............................................................................. 179
  - **M.2** Similarity constraints .......................................................... 180

### Annex N (informative) Guidelines for verification of blade similarity

- **N.1** General ............................................................................. 180
  - **N.2** Similarity constraints .......................................................... 180

### Annex O (informative) Guidelines for validation of numerical analysis methods

- **O.1** General ............................................................................. 183
  - **O.2** Blade voltage and current distribution .......................................................... 183
  - **O.3** Indirect effects analysis .......................................................... 184
Annex P (informative)  Testing of rotating components ....................................................... 185

P.1 General............................................................................................................... 185
P.2 Test specimen .................................................................................................... 185
P.2.1 Test specimen representing a stationary / quasi stationary bearing ............. 185
P.2.2 Test specimen representing a rotating bearing ............................................ 185
P.3 Test setup ........................................................................................................... 185
P.3.1 Test set-up representing a stationary/quasi-stationary bearing .................... 185
P.3.2 Test set-up representing a rotating bearing .................................................. 186
P.4 Test procedure.................................................................................................... 187
P.5 Pass/fail criteria .................................................................................................. 188

Annex Q (informative)  Earthing systems for wind farms ..................................................... 189

Bibliography........................................................................................................................ 190

Figure 1 – Collection area of the wind turbine .............................................................. 30
Figure 2 – Example of collection area for a complete wind farm (A_DWF) with 10 wind
turbines (black points) considering overlapping ............................................................ 31
Figure 3 – Collection area of wind turbine of height $H_a$ and another structure of height
$H_b$ connected by underground cable of length $L_c$ ......................................................... 33
Figure 4 – Examples of possible SPM (surge protection measures) ................................. 49
Figure 5 – Interconnecting two LPZ 1 using SPDs ......................................................... 50
Figure 6 – Interconnecting two LPZ 1 using shielded cables or shielded cable ducts ......... 50
Figure 7 – Magnetic field inside an enclosure due to a long connection cable from
enclosure entrance to the SPD ......................................................................................... 53
Figure 8 – Additional protective measures .................................................................... 54
Figure 9 – Examples of placement of HV arresters in two typical main electrical circuits
of wind turbines .............................................................................................................. 58
Figure A.1 – Processes involved in the formation of a downward initiated cloud-to-
ground flash .................................................................................................................. 74
Figure A.2 – Typical profile of a negative cloud-to-ground flash ................................. 75
Figure A.3 – Definitions of short stroke parameters (typically $T_2 < 2$ ms) .............. 75
Figure A.4 – Definitions of long stroke parameters (typically $2$ ms < $T_{long} < 1$ s) ......... 76
Figure A.5 – Possible components of downward flashes (typical in flat territory and to
lower structures) ............................................................................................................ 78
Figure A.6 – Typical profile of a positive cloud-to-ground flash .................................. 79
Figure A.7 – Processes involved in the formation of an upward initiated cloud-to-
ground flash during summer and winter conditions ..................................................... 79
Figure A.8 – Typical profile of a negative upward initiated flash .................................. 80
Figure A.9 – Possible components of upward flashes (typical to exposed and/or higher
structures) ..................................................................................................................... 80
Figure B.1 – Winter lightning world map based on LLS data and weather conditions ...... 81
Figure B.2 – Detailed winter lightning maps based on LLS data and weather conditions .. 86
Figure B.3 – Ratio $h/d$ description .............................................................................. 87
Figure C.1 – Types of wind turbine blades ................................................................. 101
Figure C.2 – Lightning protection concepts for large modern wind turbine blades ......... 104
Figure C.3 – Voltages between lightning current path and sensor wiring due to the
mutual coupling and the impedance of the current path .............................................. 107
Figure D.1 – Example of initial leader attachment test setup A ....................................... 115
Figure D.2 – Possible orientations for the initial leader attachment test setup A
Figure D.3 – Definition of the blade length axis during strike attachment tests
Figure D.4 – Example of the application of angles during the HV test
Figure D.5 – Example of leader connection point away from test specimen
Figure D.6 – Initial leader attachment test setup B
Figure D.7 – Typical switching impulse voltage rise to flashover (100 µs per division)
Figure D.8 – Subsequent stroke attachment test arrangement
Figure D.9 – Lightning impulse voltage waveform
Figure D.10 – Lightning impulse voltage chopped on the front
Figure D.11 – HV electrode positions for the subsequent stroke attachment test
Figure D.12 – High-current test arrangement for the arc entry test
Figure D.13 – Typical jet diverting test electrodes
Figure D.14 – Example of an arrangement for conducted current tests
Figure E.1 – Examples of generic blade lightning environment definition
Figure E.2 – Rolling sphere method applied on wind turbine
Figure E.3 – Mesh with large mesh dimension for nacelle with GFRP cover
Figure E.4 – Mesh with small mesh dimension for nacelle with GFRP cover
Figure E.5 – Two cabinets both defined as LPZ 2 connected via the shield of a shielded cable
Figure E.6 – Example: division of wind turbine into different lightning protection zones
Figure E.7 – Example of how to document a surge protection measures (SPM) system by division of the electrical system into protection zones with indication of where circuits cross LPZ boundaries and showing the long cables running between tower base and nacelle
Figure F.1 – Point-to-point installation scheme
Figure F.2 – Earthing connection installation scheme
Figure G.1 – Two control cabinets located on different metallic planes inside a nacelle
Figure G.2 – Magnetic coupling mechanism
Figure G.3 – Measuring of transfer impedance
Figure H.1 – Example circuit of a SPD discharge current test under service conditions
Figure H.2 – Typical test set-up for injection of test current
Figure H.3 – Example circuit of an induction test for lightning currents
Figure I.1 – Minimum length ($l_1$) of each earth electrode according to the class of LPS
Figure I.2 – Frequency dependence on the impedance to earth
Figure J.1 – Example of measuring points
Figure K.1 – Recommended countermeasures schemes according to the incident classification
Figure K.2 – Blade outlines for marking locations of damage
Figure N.1 – Definitions of blade aerofoil nomenclature
Figure O.1 – Example geometry for blade voltage and current distribution simulations
Figure O.2 – Example geometry for nacelle indirect effects simulations
Figure P.1 – Possible test setup for a pitch bearing
Figure P.2 – Possible injection of test current into a pitch bearing
Figure P.3 – Possible test setup for a main bearing
Figure P.4 – Example measurement of the series resistance of the test sample
Table 1 – Maximum values of lightning parameters according to LPL (adapted from IEC 62305-1) ........................................................................................................................ 25
Table 2 – Minimum values of lightning parameters and related rolling sphere radius corresponding to LPL (adapted from IEC 62305-1) ........................................................................................................ 26
Table 3 – Collection areas $A_L$ and $A_I$ of service line depending on whether aerial or buried .................................................................................................................. 33
Table 4 – Parameters relevant to the assessment of risk components for wind turbine (corresponds to IEC 62305-2) .................................................................................................................. 36

INTERNATIONAL ELECTROTECHNICAL COMMISSION

WIND ENERGY GENERATION SYSTEMS –

Part 24: Lightning protection

FOREWORD

1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as “IEC Publication(s)”). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.

2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.

3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.

4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.

5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.

6) All users should ensure that they have the latest edition of this publication.

7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.

8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.

9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

International Standard IEC 61400-24 has been prepared by IEC technical committee 88: Wind energy generation systems.

This second edition cancels and replaces the first edition, published in 2010. This edition constitutes a technical revision.

This edition includes the following significant technical changes with respect to the previous edition:

a) it is restructured with a main normative part, while informative information is placed in annexes.
The text of this International Standard is based on the following documents:

<table>
<thead>
<tr>
<th>FDIS</th>
<th>Report on voting</th>
</tr>
</thead>
<tbody>
<tr>
<td>88/709/FDIS</td>
<td>88/713/RVD</td>
</tr>
</tbody>
</table>

Full information on the voting for the approval of this International Standard can be found in the report on voting indicated in the above table.

This document has been drafted in accordance with the ISO/IEC Directives, Part 2.

A list of all parts in the IEC 61400 series, published under the general title Wind energy generation systems, can be found on the IEC website.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under "http://webstore.iec.ch" in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

A bilingual version of this publication may be issued at a later date.

**IMPORTANT –** The 'colour inside' logo on the cover page of this publication indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.
WIND ENERGY GENERATION SYSTEMS –

Part 24: Lightning protection

1 Scope

This part of IEC 61400 applies to lightning protection of wind turbine generators and wind power systems. Refer to Annex M guidelines for small wind turbines.

This document defines the lightning environment for wind turbines and risk assessment for wind turbines in that environment. It defines requirements for protection of blades, other structural components and electrical and control systems against both direct and indirect effects of lightning. Test methods to validate compliance are included.

Guidance on the use of applicable lightning protection, industrial electrical and EMC standards including earthing is provided.

Guidance regarding personal safety is provided.

Guidelines for damage statistics and reporting are provided.

Normative references are made to generic standards for lightning protection, low-voltage systems and high-voltage systems for machinery and installations and electromagnetic compatibility (EMC).

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

IEC 60364-4-44, Low-voltage electrical installations – Part 4-44: Protection for safety – Protection against voltage disturbances and electromagnetic disturbances

IEC 60364-5-53, Electrical installations of buildings – Part 5-53: Selection and erection of electrical equipment – Isolation, switching and control

IEC 60364-5-54, Low-voltage electrical installations – Part 5-54: Selection and erection of electrical equipment – Earthing arrangements and protective conductors

IEC 60364-6, Low-voltage electrical installations – Part 6: Verification

IEC TS 60479-1, Effects of current on human beings and livestock – Part 1: General aspects

IEC TR 60479-4, Effects of current on human beings and livestock – Part 4: Effects of lightning strokes

IEC 60664-1, Insulation coordination for equipment within low-voltage systems – Part 1: Principles, requirements and tests

IEC 61000 (all parts), Electromagnetic compatibility (EMC)
