INTERNATIONAL STANDARD

Safety of machinery - Application of protective equipment to detect the presence of persons

FOREWORD	6
INTRODUCTION	8
1 Scope	10
2 Normative references	10
3 Terms, definitions and abbreviated terms	11
3.1 Terms and definitions	11
3.2 Abbreviated terms	20
4 General overview	20
4.1 General	20
4.2 Selection of active SPE	23
4.2.1 General	23
4.2.2 Machine characteristics	23
4.2.3 User interaction	24
4.2.4 Environmental characteristics	24
4.2.5 Characteristics of the hazard zone	25
4.2.6 Dimensions and characteristics of the human body	25
4.2.7 Suitability of SPE	25
4.2.8 Safety integrity characteristics of SPE	26
4.2.9 Properties and application requirements for specific SPE	28
4.3 Possibility of defeating	37
4.4 Positioning of SPE or detection zone(s)	37
5 Operational functions of sensitive protective devices	37
5.1 General	37
5.2 Trip function	37
5.2.1 General	37
5.2.2 Determination of the separation distance	38
5.2.3 Suitability of SPE as a trip device	41
5.2.4 Additional requirements	42
5.3 Presence sensing function	42
5.4 Combination trip and presence sensing function	43
5.5 Functional testing to detect fault accumulation and undetected faults	43
6 Optional functions associated with the application of SPE	43
6.1 General	43
6.1.1 Overview	43
6.1.2 Performance monitoring systems	43
6.1.3 Start interlock	43
6.1.4 Restart interlock	44
6.1.5 Muting	44
6.1.6 Reinitiating of machine operation by the SPE	44
6.1.7 External device monitoring (EDM)	44
6.1.8 Automatic selection of active detection zones	44
6.2 Requirements for optional functions	45
6.2.1 General	45
6.2.2 Performance monitoring systems	45
6.2.3 Start interlock	45
6.2.4 Restart interlock	46

6.2.6	Reinitiating of machine operation by an AOPD	50
6.2.7	Automatic selection of active detection zones	52
7	Integration with the safety-related control system	53
8	Inspection and test	53
8.1	General.....	53
8.2	Functional checks	53
8.3	Periodic inspection.....	54
8.4	Initial inspection and test	55
8.5	Application-specific tests	56
9	Information for use	57
Annex A (informative)	Application examples of ESPE	58
A.1	General.....	58
A.2	ESPE used as a trip device.....	58
A.3	Use of ESPE to provide a combination trip and presence sensing function.....	59
A.3.1	Example 1: Horizontal AOPD with combined trip and presence sensing function	59
A.3.2	Example 2: Angled AOPD with combined trip and presence sensing function	60
A.3.3	Example 3: Horizontal AOPD	61
A.3.4	Example 4: Vertical AOPD	62
A.3.5	Example 5: Vertical AOPD	63
A.4	Perimeter safeguarding to establish a safeguarded space.....	65
Annex B (informative)	Additional recommendations for the application of AOPDDRs	66
B.1	General.....	66
B.2	AOPDDR used for the detection of the body or parts of a body with orthogonal approach	69
B.2.1	General	69
B.2.2	Detection of a whole body.....	69
B.2.3	Detection of parts of the body	69
B.3	Examples of the use of an AOPDDR as a whole body trip device	70
B.4	Examples for the use of an AOPDDR as parts of a body trip device	72
Annex C (informative)	Vision based protective devices using stereo vision techniques (VBPDS), additional information - Application example of VBPDS	74
Annex D (informative)	Possible approach for the calculation of the separation distance for SPE using volumetric detection	76
D.1	General.....	76
D.2	Application considerations	76
D.3	Examples	76
D.4	Separation distance calculation when $H_{VT} \geq 900$ mm	80
D.5	Separation distance calculation when $H_{VT} < 900$ mm	81
Annex E (informative)	Examples of AOPD muting for applications where whole body access is possible.....	82
E.1	General.....	82
E.2	Four muting sensors	85
E.2.1	Four parallel beam muting sensors – Positioning	85
E.2.2	Four parallel beam muting sensors – Sequence control	89
E.2.3	Four parallel beam muting sensors – Timing control	90

Safety of machinery - Application of protective equipment to detect the presence of persons

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) IEC draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). IEC takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, IEC had not received notice of (a) patent(s), which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at <https://patents.iec.ch>. IEC shall not be held responsible for identifying any or all such patent rights.

IEC 62046 has been prepared by IEC technical committee 44: Safety of machinery – Electrotechnical aspects. It is an International Standard.

This second edition cancels and replaces the first edition published in 2018. This edition constitutes a technical revision.

This edition includes the following significant technical changes with respect to the first edition:

- a) restructuring of the document to aid the user;
- b) additional information on vision and radar systems;
- c) muting requirements have been updated;
- d) information on whole body access has been added;
- e) whole body access has also been covered in more detail;
- f) alignment to changes in ISO 13855.

This is a preview of IEC 62046 Ed. 2.0 en:2026. Click here to purchase the full version from the ANSI store.

Draft	Report on voting
44/1080/FDIS	44/1088/RVD

Full information on the voting for its approval can be found in the report on voting indicated in the above table.

The language used for the development of this International Standard is English

This document was drafted in accordance with ISO/IEC Directives, Part 2, and developed in accordance with ISO/IEC Directives, Part 1 and ISO/IEC Directives, IEC Supplement, available at www.iec.ch/members_experts/refdocs. The main document types developed by IEC are described in greater detail at www.iec.ch/publications.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under webstore.iec.ch in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn, or
- revised.

This document provides requirements and information on the application of sensitive protective equipment (SPE), which employs sensing devices to detect persons, in order to reduce or minimize a risk from hazardous parts of machinery, without providing a physical barrier.

The objective of this document is to assist standards writing committees responsible for developing machine standards (type-C Standards), machine designers, manufacturers and refurbishers, machine safety certification organizations, workplace authorities and others on the proper application of sensitive protective equipment to machinery.

Figure 1 shows the general context and the intended use of this document.

Clause 1 to Clause 5, Clause 7 and Clause 8 of this document apply to all sensitive protective equipment included in the scope, Clause 6 contains guidance for the application of specific kinds of sensitive protective equipment.

The principles of this document can be useful in the application of devices using other detection technologies but this document does not give specific requirements for those devices.

This document considers devices standardized in the IEC 61496 series and the ISO 13856 series. Unless a product-specific safety-related standard for devices using other sensing technologies is published, their suitability as the sole means of protection from machine hazards is unknown. The selection and use of devices for which there is no product-specific safety-related standard because their behaviour, particularly under fault conditions, is not known to be sufficiently predictable should be selected only after adequate research.

A SIL (safety integrity level, as described in IEC 62061 or IEC 61508) or PL (performance level, as described in ISO 13849-1) is not sufficient as an indication of a device's suitability for use as a safeguard. Suitability depends on appropriate sensing means, environmental conditions especially those that can affect the detection capability, behaviour under fault conditions, etc.

IEC

Figure 1 – Relationship of this document to other standards

This document specifies requirements for the selection, positioning, configuration and commissioning of sensitive protective equipment (SPE) to detect the momentary or continued presence of persons in order to protect those persons from dangerous part(s) of machinery in industrial applications. This document covers the application of electro-sensitive protective equipment (ESPE) specified in the IEC 61496 series and pressure-sensitive mats and floors specified in ISO 13856-1.

It takes into account the characteristics of the machinery, the sensitive protective equipment, the environment and human interaction by persons of 14 years and older.

This document includes informative annexes to provide guidance on the application of sensitive protective equipment to detect the presence of persons. These annexes contain examples to illustrate the principles of this document. These examples are not intended to be the only solutions to a given application and are not intended to restrict innovation or advancement of technology. The examples are provided only as representative solutions to illustrate some of the concepts of integration of sensitive protective equipment, and have been simplified for clarity, so they can be incomplete.

It is intended that this document is used in conjunction with ISO 13855.
