American National Standard  
for Information Technology –  
**SCSI-3 Stream Commands (SSC)**

Secretariat

**Information Technology Industry Council**

Approved April 25, 2000

**American National Standards Institute, Inc.**

**Abstract**

This standard specifies functional requirements for SCSI-3 Stream Commands (SSC). SSC permits SCSI streaming devices such as tape and printer devices to attach to computers and provides the definitions for their use.

This standard does not contain material related to any service delivery subsystem that is used to transport the commands, command parameter data, command response data, and status specified in this standard.

## American National Standard

Approval of an American National Standard requires review by ANSI that the requirements for due process, consensus, and other criteria for approval have been met by the standards developer.

Consensus is established when, in the judgement of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that a concerted effort be made towards their resolution.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether he has approved the standards or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standards.

The American National Standards Institute does not develop standards and will in no circumstances give an interpretation of any American National Standard. Moreover, no person shall have the right or authority to issue an interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretations should be addressed to the secretariat or sponsor whose name appears on the title page of this standard.

**CAUTION NOTICE:** This American National Standard may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken periodically to reaffirm, revise, or withdraw this standard. Purchasers of American National Standards may receive current information on all standards by calling or writing the American National Standards Institute.

**CAUTION:** The developers of this standard have requested that holders of patents that may be required for the implementation of the standard disclose such patents to the publisher. However, neither the developers nor the publisher have undertaken a patent search in order to identify which, if any, patents may apply to this standard. As of the date of publication of this standard and following calls for the identification of patents that may be required for the implementation of the standard, no such claims have been made. No further patent search is conducted by the developer or publisher in respect to any standard it processes. No representation is made or implied that licenses are not required to avoid infringement in the use of this standard.

**Foreword** (This foreword is not part of American National Standard NCITS 335-2000.)

The SCSI-3 Stream Commands (SSC) standard specifies the external behavior of a device server that defines itself as either a Sequential-access device or a Printer device in the device type field of the INQUIRY command response data. Together, these device types are known as Stream Devices. The SSC standard conforms to SCSI-3 Architectural Model (ANSI X3.270-1996) standard.

Requests for interpretation, suggestions for improvement and addenda, or defect reports are welcome. They should be sent to the NCITS Secretariat, Information Technology Industry Council, 1250 Eye Street NW, Suite 200, Washington, DC 20005-3922.

This standard was processed and approved for submittal to ANSI by National Committee for Information Technology Standardization (NCITS). Committee approval of this standard does not necessary imply that all committee members voted for approval. At the time it approved this standard, NCITS had the following members:

Karen Higginbottom, Chair  
David Michael, Vice-Chair  
Monica Vago, Secretary

## **Introduction**

The SCSI-3 Stream Commands (SSC) standard specifies a protocol for command-level communications between an application client and a device server that has identified itself as a stream device.

The SCSI-3 Stream Commands (SSC) standard encompasses the following:

- Clause 1 describes the scope.
- Clause 2 lists the normative references.
- Clause 3 provides descriptions, symbols and abbreviations used in this standard.
- Clause 4 provides an overview of the stream device class and command set.
- Clause 5 specifies a model (including the TapeAlert interface definition), command set, and parameters for sequential-access devices.
- Clause 6 specifies a model, command set, and parameters for printer devices.
- Annex A provides the density code list for sequential-access devices.
- Annex B provides a list of TapeAlert log page parameter codes (flags).

American National Standard  
for Information Technology –

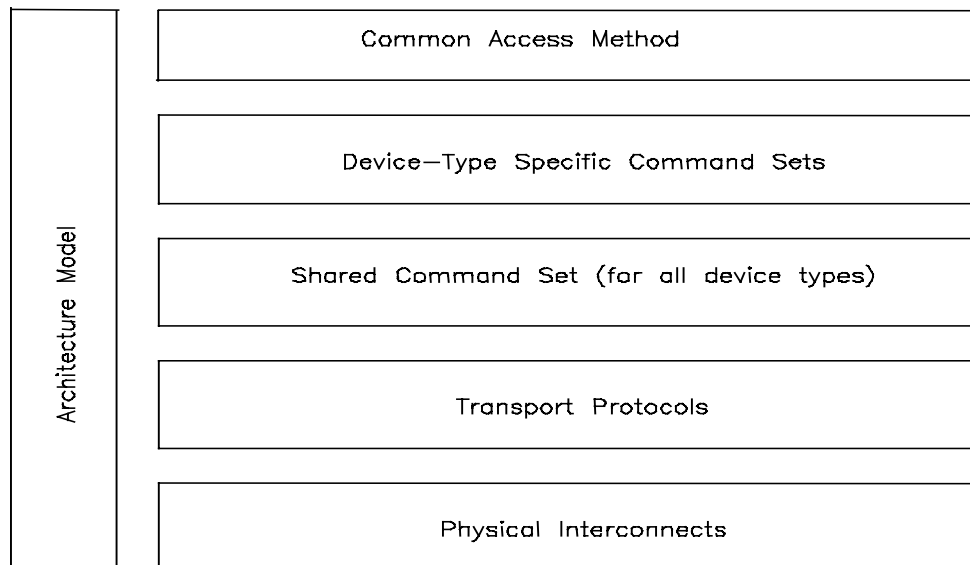

# SCSI-3 Stream Commands (SSC)

## 1 Scope

This standard defines the command set extensions to facilitate operation of SCSI stream devices. The clauses of this standard, implemented in conjunction with the applicable clauses of the SCSI Primary Commands - 2 standard, fully specify the standard command set for the SCSI stream device class.

The objectives of the SCSI-3 Stream Commands standard (SSC) is to provide the following:

- a) Permit an application client to communicate over a SCSI service delivery subsystem, with a logical unit that declares itself to be a sequential access device or printer device in the device type field of the INQUIRY command response data;
- b) define commands unique to each type of SCSI stream device;
- c) define commands to manage the operation of SCSI stream devices; and
- d) define the differences between the types of SCSI stream devices.

**Figure 1 — SCSI standards - General structure**

Figure 1 shows the general structure of SCSI standards. The figure is not intended to imply a relationship such as a hierarchy, protocol stack, or system architecture.
