Table of Contents

1 SCOPE AND DESIGNATION	1	4.3 Use of Salt Solutions	17
1.1 Scope	1	4.4 Acceleration Factors	17
1.2 Purpose	1	4.4.1 Arrhenius Model	17
1.3 How is SIR Testing Used?	1	4.4.2 Eyring Model	17
2 APPLICABLE DOCUMENTS	2	5 SETTING UP FOR SIR TESTING	17
2.1 IPC	2	5.1 Data Acquisition and Associated Hardware	17
2.2 Joint Industry Standards	2	5.2 Fixturing	18
2.3 International Electrotechnical Commission (IEC)	2	5.2.1 Fixturing Internal to Chamber	18
2.4 American Society for Testing and Materials (ASTM)	2	5.2.2 Fixturing External to Chamber	19
3 SURFACE INSULATION RESISTANCE	2	5.3 Chamber Design and Configuration	19
3.1 Terms and Definitions	2	5.4 System Verification and Calibration	20
3.1.1 Metal Migration/Filament Formation	5	5.4.1 SIR Test Chamber	20
3.1.2 Electrochemical Corrosion	6	5.4.2 The Data Acquisition System	21
3.2 Basic Concepts	7	5.4.3 Test Supplies	21
3.2.1 Sheet Resistance	7	5.4.4 Power Supplies	21
3.2.2 A "Square"	7	6 RUNNING A TEST AND TEST CONSISTENCY	21
3.2.3 Series/Parallel Resistance	8	6.1 Substrate Preparation Important Notes	21
3.2.4 Ohms Per Square	8	6.1.1 Test Specimen Marking	22
3.2.5 Conduction Mechanisms	10	6.2 Test Specimen Controls	22
3.3 Test Factors Affecting Results	10	6.3 Pretest Checks	22
3.3.1 Wiring	10	6.3.1 Chamber	22
3.3.3 Sample Orientation in the Chamber	11	6.3.2 Test Specimens	23
3.3.4 Voltage	11	6.3.3 Sample Randomization and Placement	24
3.3.5 Test Temperature	12	6.4 Starting the Test	24
3.3.6 Test Humidity	13	6.5 Test Chamber Monitoring	25
3.3.7 Rate of Change, Ambient to Elevated	13	6.6 Post-Test Operations	25
3.3.8 Test board Design	13	6.7 Data Analysis Example	26
3.3.9 Frequency of Measurement	14	6.8 Treatment of "Anomalous" Data	28
3.3.10 Conformal Coating	15	7 QUALIFICATION PHASES	
3.4 Known Process Effects on SIR Levels	15	7.1 Materials vs. Process Qualification	28
3.4.1 Precleaning	15	7.2 Determining Acceptance Criteria	29
3.4.2 Developing Process Effects	15	7.2.1 Readings Vs. Visual Examination	29
3.4.3 Curing Effects	15	7.2.2 Temperature and Humidity Variations	29
3.4.4 Hot Air Solder Leveling (HASL)	15	7.2.3 Discussion of Test Specimen Design	30
4 ASSESSMENT OF SIR TEST METHODS	16	7.2.4 Available SIR Test Vehicles	30
4.1 Test Methods - General	16	8 RECOMMENDATIONS FOR PREVENTION OF SIR FAILURES	30
4.1.1 Cyclical Test Environments	16	8.1 Typical SIR Failures	30
4.1.2 Harsh Static Environments	16	8.2 Contingencies	31
4.1.3 Measurement Frequency	16	8.3 Other Recommendations	32
4.2 Description of Test Methods	17	9 SIR TESTING ON NONPRINTED BOARD MATERIALS	32

9.1 Alternative Substrates 32
 9.2 Testing Other Printed Board Materials 32
 9.3 High Resistance Measurements 33
 9.4 Integrated Circuits (Wafers) 33

Surface Insulation Resistance Handbook

1 SCOPE AND DESIGNATION

Surface Insulation Resistance (SIR) testing has been with the electronics industry since the advent of the transistor and the printed board. It has been used as a tool for incoming inspection, materials investigations and qualifications, quality conformance, prediction of long-term failure mechanisms and as a predictive tool for estimated service life.

SIR testing is a quantitative and not qualitative test method and should be viewed as an essential tool that requires understanding in order to use properly.

Electrochemical reactions at or below the surface of electronic circuits will affect their SIR. These reactions require the presence of humidity, electrical bias and ionic contaminants. The VENN diagram shown in Figure 1-1 illustrates how these reactions may be influenced.

Figure 1-1 VENN Diagram Illustrating Variables Affecting Electrochemical Failure

Historically, SIR testing has been the subject of much technical argumentation; however recent science research has highlighted several significant issues that now demand modification to both this document and prevailing specifications. In particular, these are:

- Test conditions should be 40 °C, 93% Relative Humidity (RH) for no-clean regimes and 85 °C, 85% RH for other regimes.

- SIR Measurements should be taken at 20 minute intervals.
- The test voltage should be 5V.
- Voltage Gradient: 25V/mm.
- The test patterns should be 200 μm [0.0079 in] spacings and 400 μm [0.016 in] width.
- New Coupons should be employed for:
 - Materials Characterization Testing.
- Process Characterization Testing.
- Current limiting resistors should be used by the measurement system so as to preserve any electrochemical reactions (dendrite formations) to aid any further analysis.

Furthermore, and resulting from the same research program, SIR can now be employed for process characterization as well as materials characterization testing.

The IPC 5-32b SIR Task Group was formed to undertake a mission of education and technical refinement of this testing into a better, more accurate and predictive tool.

1.1 Scope This document is intended to cover the broad spectrum of temperature-humidity (TH) testing, associated terminology, and suggested techniques for proper testing. This edition of the IPC-9201 has been revised in an attempt to reflect all international test specifications such as IEC and ISO.

1.2 Purpose The purpose of this document is to educate individuals who must deal with TH or temperature-humidity-bias (THB) testing. The target audience for this work ranges from the technicians running the test to engineers who must interpret the data, and those individuals responsible for specifications and standards that may call out these tests.

The guidance presented here represents the experience and technical input from many of the most knowledgeable testers in the IPC, and incorporates much of the science research that has been carried out since the document was first published. Although this handbook does not go into great depth on the underlying physics of many of the mechanisms found in SIR testing, there are references at the back of this document that may be helpful to those requiring substantiation of the issues involved.

TH and THB testing may also be related to other forms of testing, such as noise factor, corrosion testing, determination of bandwidth, characteristic impedance, etc.

1.3 How is SIR Testing Used? There are two ways in which this protocol may be used. The traditional use is in
