Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 3.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this part of ISO 11698 may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

International Standard ISO 11698-1 was prepared by Technical Committee ISO/TC 171, *Document imaging applications*, Subcommittee SC 1, *Quality*.

ISO 11698 consists of the following parts, under the general title *Micrographics — Methods of measuring image quality produced by aperture card scanners*:

- *Part 1: Characteristics of the test images*
- *Part 2: Quality criteria and control*

Annex A of this part of ISO 11698 is for information only.

Introduction

Scanning of microimages in aperture cards for use in CAD and electronic information systems is of great importance. This International Standard describes a series of test aperture card microimages, which can be used to evaluate the output quality resulting from aperture card scanning systems.

The procedures for the use of these microimages is described in ISO 11698-2.
