Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 15531-43 was prepared by Technical Committee ISO TC184/SC4, Industrial automation systems and integration, Subcommittee SC4, Industrial data.

A complete list of parts of ISO 15531 is available from the Internet:

Introduction

The information generated about the manufacturing process of an industrial product is very important for the life cycle of this product, notably in a context of sustainable development. Manufacturing may be defined as the transformation of raw material or semi-finished components leading to goods production. Manufacturing management is the function of directing or regulating the flows of goods through the entire production cycle from requisitioning of raw materials to the delivery of the finished product, including the impact on resources management.

A manufacturing management system manages the flow of information and materials through the whole production chain, from suppliers, through to manufacturers, assemblers, distributors, and sometimes customers.

The relations among those partners may be identified and structured in an electronic form with a view to facilitating electronic exchanges. Information handled during these exchanges is identified, modelled and represented in such a way that may be shared by a maximum of partners through the usage of standards for product and manufacturing data modelling.

The production planning functions within the supplier plants are assumed to have strong relationships with the master production scheduling functions of the main plant, which shares information with them, on the likely pattern of the future demands to allow suppliers to plan in turn their production. On a day-to-day basis, the operational planning system of the main plant sends orders to the suppliers to ensure the availability of components, sub-assemblies and others, such as resources needed for its manufacturing and assembly process.

ISO 15531 addresses the type of information described above. It is does not standardise the model of the manufacturing process. The aim of ISO 15531 is to provide a standardised data model for representing manufacturing management data. Its purpose is to facilitate the integration between the numerous industrial applications by means of common, standardised software that is able to represent these three sets of data.

ISO 15531 is organised as a series of parts, each published separately. The parts of ISO 15531 fall into the following series: production data for external exchange, manufacturing resources usage management data, time model management and manufacturing flow management data.

This part of ISO 15531 addresses the representation of data related to manufacturing flow and process management, through the development of a data model of the manufacturing flows and processes. Particular attention has been paid in the development of this part of ISO 15531 to the relation with the other standards developed in ISO TC184/SC4, such as ISO 10303, ISO 13584, ISO 15926. In addition to the fact that this part of ISO 15531 is developed using EXPRESS language (see ISO 10303-11: 2004) Edition 2, it makes extensive use of several constructs of ISO 10303-41, and references ISO 13584 dictionaries.
