Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 150, *Implants for surgery*.

A list of all parts in the ISO 17327 series can be found on the ISO website.

Introduction

A wide variety of coatings are applied to numerous types of non-active surgical implant substrates. These coated implant substrates have a diversity of functionalities and intended uses and exhibit a plurality of mechanical, physical, chemical, biological and morphological/structural properties. Even though there are diversities among the types of coating applied to surgical implants, there are common attributes that can be used to define, evaluate and understand these implant coatings within a surgical implant application. This document defines general principles to be followed by manufacturers of coatings for non-active surgical implants. As the coating can represent the direct interface of the implant with the human body, the coating and its interface with the substrate can contribute to the potential failure of the intended function of the implant. A coating possesses unique features, properties and risks for its interaction with the tissue, which may not have been considered in detail in existing standards.

The role of this document is to provide a framework of design principles and evaluation guidelines for coatings on non-active surgical implants, hereafter referred to as implant coatings. Because similar basic principles can be applied to different technologies for implant coatings, this is a comprehensive document and is not limited to specific types of non-active surgical implants or to particular materials. Accordingly, this document can be applied, yet is not restricted to, metallic, ceramic, drug and polymeric coatings used in implants across a variety of applications.

This document provides guidance on generic coating properties and the potential methods that can be used to assess them. This document is not intended as a performance standard and provides neither a set of device performance criteria nor rigidly held test methods, including pass/fail criteria, as this might result in either an unnecessary constraint on the development and use of novel implant coatings, or a false sense of security in their general use for implants.

In some cases, national and international standards are available and can be used to show compliance with essential requirements for specific coating/substrate combinations, and these standards are referenced in [Annex C](#). Beyond these available application and performance standards, this document provides general guidance and generic principles for the evaluation of non-standardized implant coating combinations.
