Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT) see the following URL: [Foreword - Supplementary information](#)

The committee responsible for this document is ISO/TC 106, *Dentistry*, Subcommittee SC 8, *Dental implants*.

Introduction

The emergence of dental implant treatment as a viable and widely utilized procedure has created a requirement for a system for indicating the presence and location of such devices within the jaws which is compatible with existing schemes. Dental implant bodies do not have the characteristics of an individual tooth other than those which are acquired by virtue of the restoration(s) which they support. They can, thus, be described as having a location with an implied crown form. In contrast, a designated tooth has a defined form and an implied location. In both cases, this information may be supplemented with additional comments.

A wide range of devices may be implanted in and around the jaws therapeutically, accidentally or for social reasons, many of which are not endosseous dental implants. Given that these form the majority of implants in the oro-facial region and that the over-riding current need of the professions is a standard method of designating their presence and location, a scheme has been developed to meet this requirement. The inclusion of infrequently used implants of other types and in alternative locations would make the system more complex for the potential benefit currently obtained. The possibility of doing so in the future is not however excluded.
