## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 21669 was prepared by Technical Committee ISO/TC 105, *Steel wire ropes*.

## **Introduction**

This International Standard is intended to provide rope manufacturers, suppliers and independent testing bodies with a standard method of test for determining the rotational properties of steel wire rope.

While the test method specified in this International Standard has essentially been developed to assist in deciding whether a swivel can be used with a crane hoist rope, it may also be used for other crane rope duties and other steel wire rope applications where the machinery/equipment designer or user requires to know the rotational properties as part of the rope selection process.
