Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2. www.iso.org/directives

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received. www.iso.org/patents

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO’s adherence to the WTO principles in the Technical Barriers to Trade (TBT) see the following URL: Foreword - Supplementary information

The committee responsible for this document is ISO/TC 34, Foods products, Subcommittee SC 17, Management systems for food safety.

This first edition of ISO 22004 cancels and replaces ISO/TS 22004:2005, which has been technically revised.
0  Introduction

0.1  General

This International Standard provides guidance on the use of ISO 22000 in four parts: planning, implementation, verification and improvement (Plan, Do, Check, Act). The clauses of ISO 22000 link together to form a food safety management system (FSMS).

Correspondence with the relevant clauses of ISO 22000 is given in the headings as well as in Annex A (see Tables A.1 and A.2).

0.2  Food chain approach

Establishing an FSMS is a tool used to mitigate the risk to public health associated with the organization’s products; it is also useful for ensuring compliance with statutory/regulatory requirements and/or those specified by customers.

ISO 22000 promotes the adoption of a systematic approach for developing, documenting, implementing and maintaining an FSMS. Integral to this approach are supply chain management (supplier evaluation and approval) and ensuring the safety of products during distribution.

0.3  Process approach

ISO 22000 also follows the “process approach” (i.e. management of a system of interrelated processes with identified interactions).

An advantage of the process approach is the ongoing control it provides between the individual processes within the system.

When used within an FSMS, the process approach emphasizes the importance of:

a) understanding and fulfilling the ISO 22000 requirements;

b) considering food safety as a process;

c) considering traceability as a process;

d) monitoring of process performance and effectiveness;

e) continual improvement of processes based on objective measurement(s).

Any and all parties, as defined by internal and external communication, can play a role in defining process requirements. Evaluating the satisfaction of these entities requires the collection and analysis of information to determine whether or not the organization has been able to meet these demands.

0.4  The ISO 22000-related documents

The ISO 22000 family of documents comprises of a number of individual International Standards and Technical Specifications, which are interrelated and supplementary to each other (see Figure 1). ISO 22000 is the primary International Standard, which defines the requirements and to which the other International Standards and Technical Specifications within the family are linked.

ISO/TS 22002 (all parts)[6] provides guidance to meet the requirements for prerequisite programmes (PRPs). It is intended to be used in support of the requirements for PRPs specified by ISO 22000. PRP documents of the ISO/TS 22002 series address food chain categories according to ISO/TS 22003:2013, Clause A.1, and potentially related categories.[2]

ISO/TS 22003 provides guidance for the accreditation of certification bodies, that is, those groups which can audit organizations in the food chain under ISO 22000. It also defines the basic requirements for companies applying for ISO 22000 certification, the rules applicable to audit and certification, and provides for customers the necessary information and confidence in the certification process regarding suppliers.
ISO 22005 provides guidance on the establishment and operation of traceability systems including traceability for food safety purposes. Some of this guidance is also included in this International Standard (see 5.12 and Reference [8]).

Reference [10] on ISO 22000, also referred to as the “fitness checker”, is a handbook first published in 2006, which specifically targets small businesses that are not familiar with ISO and its standards. It provides these organizations with guidance for future certification.

Reference [11] on how to use ISO 22000 is a handbook providing generic guidance to assist organizations, in particular small- and medium-sized organizations, on how to develop, document, implement and maintain an FSMS in accordance with ISO 22000.

Figure 1 — Overview of ISO 22000-related documents

0.5 Relationship with ISO 9001

ISO 22000 has been designed to work in harmony with ISO 9001[1] and its supporting standards.

ISO 9001 provides requirements for a quality management system, which can be used internally by organizations, for certification or for contractual purposes. It focuses on the effectiveness of the quality management system in meeting customers’ requirements.

ISO 22000 provides the essential elements of an FSMS for similar purposes.
0.6 Compatibility with other management systems

An FSMS is most effective when developed, documented, implemented and maintained within the framework of a structured management system, which is incorporated into the overall management activities of the organization.

ISO 22000 enables an organization to align or integrate its own FSMS with other related ISO management systems (e.g. ISO 9001, ISO 14001, ISO 28000).

It is possible for an organization to adapt the management part of its existing ISO 22000 system(s) so as to facilitate the implementation of other ISO management system Standards. For example, the following system elements might be common to any other ISO management system, however, managed differently and/or independently, when needed:

— policy;
— management responsibilities (commitment, resources and objectives);
— competencies (training);
— management review;
— monitoring and measurement;
— document control;
— audit of the system;
— corrective actions;
— continual improvement;
— traceability;
— communication.
