## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see [www.iso.org/patents](http://www.iso.org/patents)).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: [www.iso.org/iso/foreword.html](http://www.iso.org/iso/foreword.html)

This document was prepared by Technical Committee ISO/TC 22, *Road vehicles*, Subcommittee SC 31, *Data communication*.

Annex A, B and C of this document are normative and Annex D is for information only.

A list of all the parts in the ISO 22901 series can be found on the ISO website.

## Introduction

### 0.1 Overview

This document has been established in order to define a new format called FXD (Fault symptom eXchange Description) which has been developed for provision of machine-readable descriptions of mainly fault symptom algorithms which are implemented as diagnostic software in an Electronic Control Unit (ECU).

The main business case is the data exchange from a function and software supplier to a vehicle manufacturer in a standardized format (FXD XML-Schema) in order to enable a tool based processing.

The software supplier will provide software related raw data, which have to be extended and refined by the vehicle manufacturer for different use cases. Based on the FXD content and associated calibration values, several end user documents can be generated such as the summary table for OBD documentation.

The expected main benefits of the FXD approach are an overall improved efficiency as well as an independency of system supplier and vehicle manufacturer-specific format handling.

FXD is an extension of ODX in order to support the documentation and fault symptom data exchange use cases for type approval and repair and maintenance information (RMI).

A normative annex will include the FXD XML-Schema which represents the data model for the digital exchange of the FXD data.

### 0.2 Motivation

The complexity of OBD monitoring systems is continuously evolving. Technological progress and regulatory updates drive the complexity of both engine systems themselves and the related OBD monitoring systems. For instance, the number of monitors and thereby also Diagnostic Trouble Codes (DTC) has considerably increased over time as shown here for a 6-cylinder gasoline application from calendar year 2000 up to 2012.

In addition to the pure number of monitors, also the OBD monitors themselves have become more and more sophisticated.

[Figure 1](#) shows the evolving complexity of OBD systems.

#### Key

1 6-cyl gasoline engine

**Figure 1 — Evolving complexity of OBD systems**

0.3 Project complexity

Today's project complexity (e.g. variants) at the vehicle manufacturers is also an important aspect for diagnostic documentation. For all OBD-relevant monitoring strategies, the corresponding OBD documentation is generated. When these monitors are integrated by often different project teams, they may need to be specifically adapted and calibrated in order to operate properly in the different projects.

To ensure accurate OBD documentation across all projects, considerable efforts for synchronization and manual adjustment are necessary. Obviously, this specific approach will provide only a limited reuse potential.

Figure 2 shows the project complexity and accurate OBD documentation.

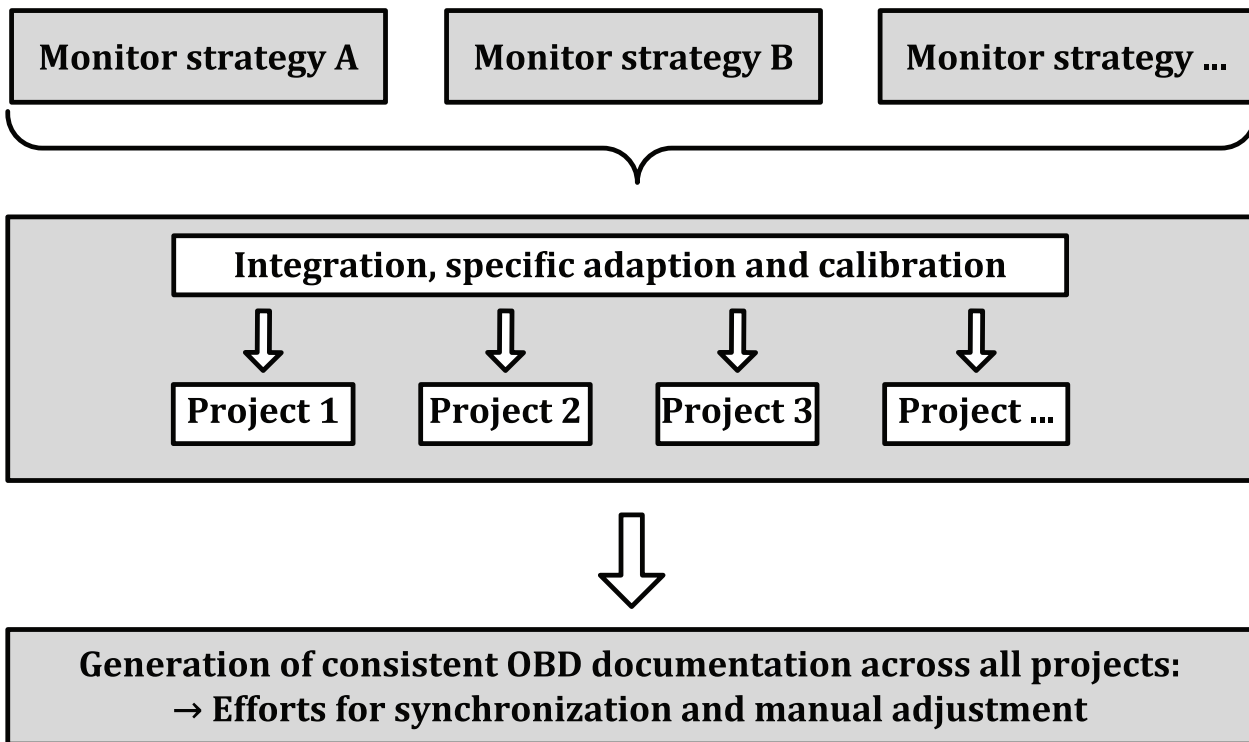

Figure 2 — Project complexity and accurate OBD documentation

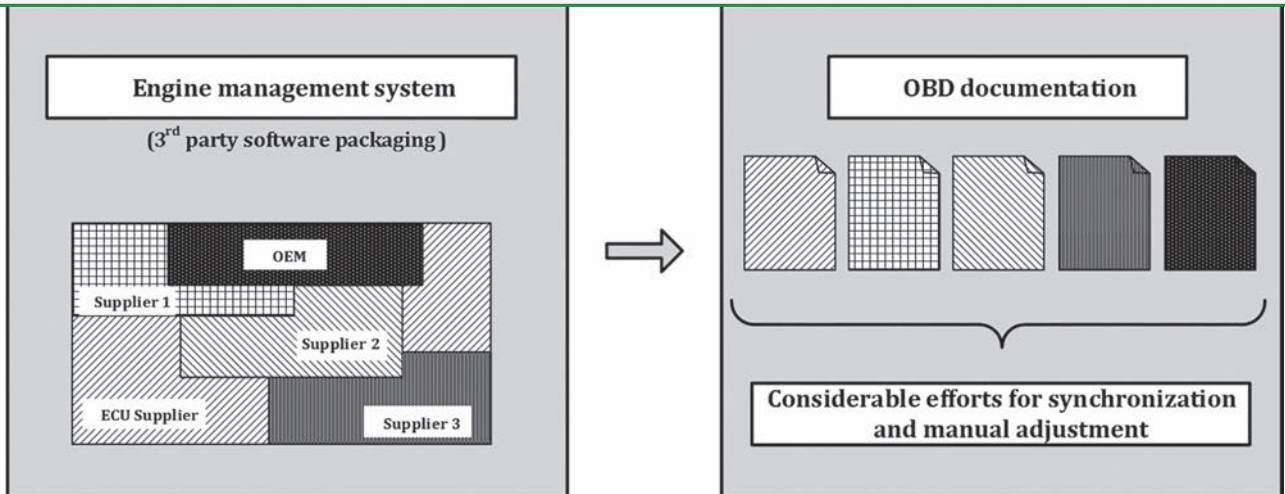

In addition more complicated business models (multiple job shares across companies) challenge the OBD documentation process.

In the past, typically one ECU supplier also supplied most of the corresponding software. Nowadays and even more in future with the Autosar approach, the trend towards software packages from vehicle manufacturer and 3rd parties will increase.

As a consequence, multiple suppliers provide the information for the generation of OBD documentation with different format, structure and content. For understanding, it is often necessary to dig into the details of the complete software documentation itself. This is why the efforts for the integration and generation of OBD relevant information increases due to manual analysis and adjustment. Obviously this scenario will allow only a limited reuse.

Figure 3 shows the challenging job share and consistent OBD documentation.

This is a preview of "ISO 22901-3:2018". Click here to purchase the full version from the ANSI store.

**Figure 3 — Job sharing challenge and consistent OBD documentation**

Scheduling constraints for generating OBD documentation during the development phase also represent a motivating factor for the introduction of the FXD approach. As the OBD development has become more and more extensive, the documentation is established as early as possible, but on the other hand late changes will cause iterations. Without efficient management of the corresponding OBD-relevant information, it is nearly impossible to answer to the challenging engineering targets and tight project schedules of today.
