Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for whom a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization. In the field of conformity assessment, the ISO Committee on conformity assessment (CASCO) is responsible for the development of International Standards and Guides.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights.

ISO 28003 was prepared jointly by the ISO *Committee on conformity assessment* (ISO/CASCO) and ISO/TC 8, *Ships and marine technology*.

This first edition cancels and replaces ISO/PAS 28003:2006, which has been technically revised.

ISO 28003 encompasses the requirements from ISO/IEC 17021, *Conformity assessment — Requirements for bodies providing audit and certification of management systems*. When assessing security supply chain security management systems, a number of requirements need to be met which go beyond what is required for the assessment and certification of supply chain security management systems covering other operational aspects of organizations. To formulate these additional requirements, ISO/IEC 17021 has been amended or modified where needed.

Introduction

This International Standard is intended for use by bodies that carry out audit and certification of supply chain security management systems. Certification of supply chain security management systems is a third party conformity assessment activity (see clause 5.5 of ISO/IEC 17000:2004). Bodies performing this activity are therefore third party conformity assessment bodies, named 'certification body/bodies' in this International Standard. This wording should not be an obstacle to the use of this International Standard by bodies with other designations that undertake activities covered by the scope of this International Standard. Indeed, this International Standard will be usable by any body involved in the assessment of supply chain security management systems.

Certification of supply chain security management systems of an organization is one means of providing assurance that the organization has implemented a system for supply chain security management in line with its policy.

Certification of supply chain security management systems will be delivered by certification bodies accredited by a recognized body, such as IAF members.

This International Standard specifies requirements for certification bodies. Observance of these requirements is intended to ensure that certification bodies operate supply chain security management systems certification in a competent, consistent and reliable manner, thereby facilitating the recognition of such bodies and the acceptance of their certifications on a national and international basis. This International Standard will serve as a foundation for facilitating the recognition of supply chain security management systems certification in the interests of international trade.

Certification of a supply chain security management system provides independent verification that the supply chain security management system of the organization

- a) conforms to specified requirements;
- b) is capable of consistently achieving its stated policy and objectives;
- c) is effectively implemented.

Certification of a supply chain security management system thereby provides value to the organization, its customers and interested parties.

This International Standard aims at being the basis for recognition of the competence of certification bodies in their provision of supply chain security management system certification. This International Standard can be used as the basis for recognition of the competence of certification bodies in their provision of supply chain security management system certification (such recognition may be in the form of notification, peer assessment, or direct recognition by regulatory authorities or industry consortia).

Observance of the requirements in this International Standard is intended to ensure that certification bodies operate supply chain security management system certification in a competent, consistent and reliable manner, thereby facilitating the recognition of such bodies and the acceptance of their certifications on a national and international basis. This International Standard will serve as a foundation for facilitating the recognition of supply chain security management system certification in the interests of international trade.

Certification activities involve the audit of an organization's supply chain security management system. The form of attestation of conformity of an organization's supply chain security management system to a specific standard (for example ISO 28000) or other specified requirements is normally a certification document or a certificate.

This is a preview of "ISO 28003:2007". [Click here to purchase the full version from the ANSI store.](#)

It is for the organization being certified to develop its own supply chain security management systems (including ISO 28000 supply chain security management system, other sets of specified supply chain security management system requirements, quality systems, environmental supply chain security management systems or occupational health and safety supply chain security management systems) and, other than where relevant legislative requirements specify to the contrary, it is for the organization to decide how the various components of these are to be arranged. The degree of integration between the various supply chain security management system components will vary from organization to organization. It is therefore appropriate for certification bodies that operate in accordance with this International Standard to take into account the culture and practices of their clients in respect of the integration of their supply chain security management system within the wider organization.
