Foreword	v
Introduction	vi
1 Scope	1
2 Normative references	1
3 Terms and definitions	1
4 Principles of the test	3
5 Suitability of a material or product for testing	3
5.1 Material or product geometry.....	3
5.2 Surface characteristics.....	3
5.3 Asymmetrical products.....	3
6 Specimen construction and preparation	4
6.1 Number of specimens.....	4
6.2 Size of specimens.....	4
6.3 Specimen preparation.....	4
6.4 Conditioning.....	5
6.5 Wrapping of specimens.....	5
6.6 Dimensionally unstable materials.....	5
7 Apparatus and ancillary equipment	6
7.1 General.....	6
7.2 Test chamber.....	6
7.2.1 Construction.....	6
7.2.2 Chamber pressure control facilities.....	7
7.2.3 Chamber wall temperature.....	10
7.3 Specimen support and heating arrangements.....	11
7.3.1 Radiator cone.....	11
7.3.2 Framework for support of the radiator cone, specimen holder and heat flux meter.....	11
7.3.3 Radiation shield.....	14
7.3.4 Heat flux meter.....	14
7.3.5 Specimen holder.....	14
7.3.6 Pilot burner.....	15
7.4 Gas supply.....	15
7.5 Photometric system.....	16
7.5.1 General.....	16
7.5.2 Light source.....	16
7.5.3 Photo detector.....	16
7.5.4 Additional equipment.....	18
7.6 Chamber leakage.....	18
7.7 Cleaning materials.....	19
7.8 Ancillary equipment.....	19
7.8.1 Balance (optional).....	19
7.8.2 Timing device.....	19
7.8.3 Linear measuring devices.....	19
7.8.4 Auxiliary heater.....	19
7.8.5 Protective equipment.....	19
7.8.6 Recorder.....	19
7.8.7 Water-circulating device.....	19
7.8.8 Oxygen meter (optional).....	19
8 Test environment	20
9 Setting-up and calibration procedures	20
9.1 General.....	20

	9.2.2	Beam collimation	20
	9.2.3	Beam focusing	20
	9.3	Selection of compensating filter(s)	21
	9.4	Linearity check	21
	9.5	Calibration of range-extension filter	21
	9.6	Chamber leakage rate test	22
	9.7	Burner calibration	22
	9.8	Radiator cone calibration	22
	9.9	Cleaning	23
	9.10	Frequency of checking and calibrating procedure	23
10	Test procedure		24
	10.1	General	24
	10.2	Preparation of test chamber	24
	10.3	Tests with pilot flame	24
	10.4	Preparation of the photometric system	24
	10.5	Loading the specimen	25
	10.6	Recording of light transmission	25
	10.7	Observations	25
	10.8	Termination of test	25
	10.9	Testing in different modes	26
11	Expression of results		26
	11.1	Specific optical density, D_s	26
	11.2	Clear-beam correction factor, D_c	27
12	Precision		27
13	Test report		27
Annex A	(normative) Calibration of heat flux meter		29
Annex B	(informative) Variability in the specific optical density of smoke measured in the single-chamber test		30
Annex C	(informative) Determination of mass optical density		32
Annex D	(informative) Precision data from tests on intumescent materials		37
Annex E	(informative) Guidance on optical density testing		39
Annex F	(informative) Specific sample preparation		46
Annex G	(informative) Background to standard reference materials		49
Bibliography			50

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

ISO draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents. ISO shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 61, *Plastics*, Subcommittee SC 4, *Burning behaviour*, in collaboration with the European Committee for Standardization (CEN) Technical Committee CEN/TC 249, *Plastics*, in accordance with the Agreement on technical cooperation between ISO and CEN (Vienna Agreement).

This first edition of ISO 5659 cancels and replaces ISO 5659-2:2017, which has been technically revised.

The main changes are as follows:

- [Annex G](#) has been added as background information.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Fire is a complex phenomenon; its development and effects depend upon a number of interrelated factors. The behaviour of materials and products depends upon the characteristics of the fire, the method of use of the materials and the environment in which they are exposed to (see also ISO/TS 3814^[1] and ISO 13943).

A test such as is specified in this document deals only with a simple representation of a particular aspect of the potential fire situation, typified by a radiant heat source, and it cannot alone provide any direct guidance on behaviour or safety in fire. A test of this type may, however, be used for comparative purposes or to ensure the existence of a certain quality of performance (in this case, smoke production) considered to have a bearing on fire behaviour generally. It would be wrong to attach any other meaning to results from this test.

The term “smoke” is defined in ISO 13943 as a visible suspension of solid and/or liquid particles in gases resulting from incomplete combustion. It is one of the first response characteristics to be manifested and should almost always be taken into account in any assessment of fire hazard as it represents one of the greatest threats to occupants of a building or other enclosure, such as a ship or train, on fire.

The responsibility for the preparation of ISO 5659 was transferred during 1987 from ISO/TC 92 to ISO/TC 61 on the understanding that the scope and applicability of the standard for the testing of materials should not be restricted to plastics but should also be relevant to other materials where possible, including building materials. See [Annex G](#) for further information.
