Fourth edition
2018-08

Corrected version
2018-11

Corrosion of metals and alloys — Stress corrosion testing —

Part 6:

Preparation and use of precracked specimens for tests under constant load or constant displacement

*Corrosion des métaux et alliages — Essais de corrosion sous
contrainte —*

*Partie 6: Préparation et utilisation des éprouvettes préfissurées pour
essais sous charge constante ou sous déplacement constant*

Foreword	iv
1 Scope	1
2 Normative references	1
3 Terms and definitions	1
4 Principle	4
5 Specimens	5
5.1 General	5
5.2 Specimen design	7
5.3 Stress intensity factor considerations	17
5.4 Specimen preparation	23
5.5 Specimen identification	25
6 Initiation and propagation of fatigue cracks	25
7 Procedure	27
7.1 General	27
7.2 Environmental considerations	27
7.3 Environmental chamber	28
7.4 Environmental control and monitoring	29
7.5 Determination of K_{ISCC} by crack arrest	29
7.6 Determination of K_{ISCC} by crack initiation	32
7.7 Measurement of crack velocity	34
8 Test report	35
Annex A (informative) Use of notched specimens for stress corrosion tests	36
Annex B (informative) Determination of crack growth velocity	39
Bibliography	40

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 156, *Corrosion of metals and alloys*, in collaboration with the National Physical Laboratory (United Kingdom).

This fourth edition cancels and replaces the third edition (ISO 7539-6:2011), which has been technically revised to revise [Figure 14](#).

This corrected version of ISO 7539-6:2018 incorporates the following corrections:

— in [Figure 2](#), the symbol “^” has been corrected to “≥” in two places.

A list of all parts in the ISO 7539 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.
