## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see [www.iso.org/patents](http://www.iso.org/patents)).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see [www.iso.org/iso/foreword.html](http://www.iso.org/iso/foreword.html).

This document was prepared by Technical Committee ISO/TC 70, *Internal combustion engines*, in collaboration with the European Committee for Standardization (CEN) Technical Committee CEN/TC 270, *Internal combustion engines*, in accordance with the Agreement on technical cooperation between ISO and CEN (Vienna Agreement).

This second edition cancels and replaces the first edition (ISO 8528-10:1998), which has been technically revised.

The main changes are as follows:

- the normative references have been updated;
- the latest requirements of ISO 3744:2010 and ISO 3746:2010 have been included, respecting ISO 12001:1996 requirements;
- the measurement surfaces have been updated;
- the definition of the reference box in special cases has been added;
- the guaranteed sound power level has been added;
- requirements concerning variable speed engine gensets, fans and lighting towers have been added;
- the requirements for welding generators have been updated;
- the determination of the emission sound pressure level at workstation has been updated.

A list of all parts in the ISO 8528 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at [www.iso.org/members.html](http://www.iso.org/members.html).

## Introduction

This document specifies noise test codes for determining the basic noise emission descriptors.

For many manufacturers of generating sets, the control of noise is a major issue that requires effective exchange of acoustical information, in particular on noise emission. The basic noise emission descriptors are the sound power level of the generating set itself and the emission sound pressure level at the workstation.

In this context, the main flow of information goes from the manufacturer to the purchaser. However, installers and users of the generating sets also desire comprehensive information about the generating sets' ability to generate airborne sound.

Thus, measuring the basic noise emission descriptors allows the generating set manufacturer to determine, declare and verify the noise emission values.

Therefore, the sound power level, as the major parameter to characterize machines as sound sources, is determined by measurements. The sound power level is a major parameter because it represents an intrinsic characteristic of generating sets as noise sources. It is useful, for example, in noise-abatement programmes or when designing a building where the generating set is intended to be used.

The emission sound pressure level at the workstation is also measured. This enables an assessment of the risk of exposure to the airborne sound of the operators. This assessment is essential for health and safety reasons.

In this document, the generating sets are considered as steady noise sources as per ISO 12001:1996. The generating sets concerned and the extent to which noise is covered are indicated in this document. This document allows measurements to be made in many different test environments. [Clause 5](#) can be used as a general guideline to assist in the selection of the right noise test code. The selection mainly depends on the test environment and the desired grade of accuracy.

This document contains two methodologies for determining the measurement uncertainty. In [Clause 12](#), the uncertainty U is determined by considering measurements on a single generating set. In [Clause 13](#), the uncertainty K is determined by considering a batch of generating sets, which can be useful for control of production purpose.

This document is a C-type standard as stated in ISO 12001:1996. When provisions of this C-type standard are different from those stated in A or B standards, the provisions of this C-type standard take precedence.
