Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1. Draft international Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.

International Standard ISO/IEC 12088-4 was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 24, *Computer graphics and image processing*.

ISO/IEC 12088 consists of the following part, under the general title *Information technology — Computer graphics and image processing — Image processing and interchange — Application program interface language bindings*:

— *Part 4: C*

Other parts may follow.

Annexes A to D of this part of ISO/IEC 12088 are for information only.

Introduction

The Image Processing and Interchange (IPI) functional specification, ISO/IEC 12087, upon which this binding is based, emerged as an International Standard in 1994. It consists of three parts: Part 1: Common Architecture for Imaging (IPI-CAI), Part 2: Programmer's Imaging Kernel System (IPI-PIKS) Application Program Interface and Part 3: Image Interchange Facility (IPI-IIF).

The functional description of ISO/IEC 12088 is specified in a language independent manner and needs to be embedded in language dependent layers (language bindings) for use with particular programming languages.

The purpose of this part of ISO/IEC 12088 is to define a standard binding for the Image Processing and Interchange Standard in the C programming language.

Information technology — Computer graphics and image processing — Image processing and interchange — Application program interface language bindings —

Part 4:

C

1 Scope

ISO/IEC 12087 consists of the three parts which define the functional aspects of this part of ISO/IEC 12088. The Common Architecture for Imaging (IPI-CAI) defines the overall architecture. The Programmer's Imaging Kernel System (IPI-PIKS) and the Image Interchange Facility (IPI-IIF) each specify a language independent, image processing Application Program Interface (API) within the Image Processing and Interchange Standard. Either API may be implemented independently or both may be combined in one implementation. For integration into a programming language, IPI-PIKS and IPI-IIF APIs are embedded in a language dependent layer obeying the particular conventions of that language. This part of ISO/IEC 12088 specifies such a language dependent layer for the C language.
