Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: www.iso.org/iso/foreword.html.

This document was prepared by ISO/IEC JTC 1, *Information technology, SC 39, Sustainability for and by Information Technology*.

A list of all the parts in the ISO 30134- series can be found on the ISO website.

Introduction

The global economy is now reliant on information and communication technologies and the associated generation, transmission, dissemination, computation and storage of digital data. All markets have experienced exponential growth in that data, for social, educational and business sectors and, whilst the internet backbone carries the traffic there are a wide variety of data centres at nodes and hubs within both private enterprise and shared/collocation facilities.

The historical data generation growth rate exceeds the capacity growth rate of the information and communications technology hardware and, with less than half (in 2014) of the world's population having access to an internet connection, that growth in data can only accelerate. In addition, with many governments having 'digital agendas' to provide both citizens and businesses with ever-faster broadband access, the very increase in network speed and capacity will, by itself, generate ever more usage (Jevons Paradox). Data generation and the consequential increase in data manipulation and storage are directly linked to increasing power consumption.

With this background it is clear that data centre growth, and power consumption in particular, is an inevitable consequence and that growth will demand increasing power consumption despite the most stringent energy efficiency strategies. This makes the need for Key Performance Indicators (KPIs) that cover the effective use of resources (including but not limited to energy) and the reduction of CO₂ emissions essential.

In order to determine the overall resource effectiveness or efficiency of a data centre, a holistic suite of metrics is required. For the resource effectiveness or efficiency of data centre infrastructure, power usage effectiveness (PUE) was defined as ISO/IEC 30134-2. PUE will be utilized to measure and improve energy efficiency of data centre infrastructure, such as cooling systems and power supply systems. For data centres which own not only infrastructure but also IT equipment, it is also necessary to measure and improve resource effectiveness or efficiency of IT equipment. A data centre, which provides only infrastructure to the customer, can be called a co-location data centre or housing service provider. For these data centres, PUE is essential. However, a data centre which owns and provides a server, storage, and network equipment is called a hosting or cloud service provider. These service providers can manage IT equipment and improve resource effectiveness or efficiency of a data centre by improving energy effectiveness or efficiency of IT equipment which they own. This document specifies the IT Equipment Energy Efficiency for servers (ITEESv) in a data centre which specifies a method for measuring the energy effectiveness or efficiency of server equipment in a data centre. A data centre which owns servers can use this document to determine the energy effectiveness or efficiency of their current server equipment and to improve energy effectiveness or efficiency by including energy effectiveness or efficiency in their procurement requirements when replacing servers or expanding server capacity. IT equipment installed in a data centre consists of servers, storage systems, and network equipment. But it is difficult to calculate the summarized value of the energy effectiveness or efficiency among different types of IT equipment since the metrics for measuring their performance are different and simple addition or average is not an appropriate method for summarizing. ITEESv defines the method to obtain average energy effectiveness or efficiency for servers.

This document is part of a series of International Standards for such KPIs and has been produced in accordance with ISO/IEC 30134-1, which defines common requirements for a holistic suite of KPIs for data centre resource usage effectiveness or efficiency.

The ISO/IEC 30134- series does not specify limits or targets for any KPI and does not describe or imply, unless specifically stated, any form of aggregation of individual KPIs into a combined nor an overall KPI for data centre resource usage effectiveness or efficiency.
