Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO/IEC documents should be noted. This document was drafted in accordance with the rules given in the ISO/IEC Directives, Part 2 (see www.iso.org/directives or www.iec.ch/members_experts/refdocs).

IEEE Standards documents are developed within the IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Association (IEEE-SA) Standards Board. The IEEE develops its standards through a consensus development process, approved by the American National Standards Institute, which brings together volunteers representing varied viewpoints and interests to achieve the final product. Volunteers are not necessarily members of the Institute and serve without compensation. While the IEEE administers the process and establishes rules to promote fairness in the consensus development process, the IEEE does not independently evaluate, test, or verify the accuracy of any of the information contained in its standards.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents) or the IEC list of patent declarations received (see <https://patents.iec.ch>).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html. In the IEC, see www.iec.ch/understanding-standards.

This document was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 7, *Software and systems engineering*, in cooperation with the Systems and Software Engineering Standards Committee of the IEEE Computer Society, under the Partner Standards Development Organization cooperation agreement between ISO and IEEE.

This second edition cancels and replaces the first edition (ISO/IEC 15026-2:2011), which has been technically revised.

The main changes are as follows:

- Clause 2 of the previous edition was deleted.
- The title of Clause 5 of the previous edition was changed and became [Clause 4](#) of this edition.
- Revised contents of Clause 6 can be found in [Clause 5](#) of this edition.
- Clause 7 was deleted and its revised contents can be found in [4.2](#) and [5.2](#) of this edition.

A list of all parts in the ISO/IEC/IEEE 15026 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html and www.iec.ch/national-committees.

Introduction

The purpose of this document is to define assurance case structure terminology, thereby improving consistency and comparability among instances of assurance cases and facilitating stakeholder communications, engineering decisions, and other uses of assurance cases.

This document does not place requirements on the quality of the contents but describes the structure and meaning of assurance cases with the necessary level of precision and detail so as to avoid inconsistent and subjective use of the terms.

Existing standards addressing different application areas and topics related to assurance cases possibly uses differing terminology and concepts when addressing common themes. This document is based on experience drawn from these specialized standards and guidelines.

While several notations and slightly varying terminologies are currently used in practice, this document does not require the use of any particular concrete representation including graphical representation. Likewise, it places no requirements on physical implementation of the data; in particular, it includes no requirements for redundancy or co-location.

Assurance cases are generally developed to support claims in areas such as safety, reliability, maintainability, human factors, operability, and security. They are applicable to any property of a system. These assurance cases are often called by more specific names, e.g. safety case or dependability case. ISO/IEC/IEEE 15026-1 provides concepts, terminology, background and a list of standards related to assurance cases.

This document uses the terminology and concepts consistent with ISO/IEC/IEEE 12207,^[1] ISO/IEC/IEEE 15288,^[5] and ISO/IEC/IEEE 15289.^[6] This document does not presume or require that it is applied in conjunction with ISO/IEC/IEEE 12207^[1] or ISO/IEC/IEEE 15288^[5].
