## Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see [www.iso.org/patents](http://www.iso.org/patents)).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT), see the following URL: [Foreword — Supplementary information](#).

The committee responsible for this document is ISO/IEC JTC 1, *Information technology, SC 27, Security techniques*.

## Introduction

The protection of sensitive information does not rely solely on the implementation of software mechanisms employing cryptographic techniques, but also relies significantly on appropriate hardware implemented security devices that employ tamper detection and protection of critical security parameters (e.g. cryptographic keys, authentication data, etc.).

This is especially relevant for devices that may be installed, deployed or operated in hostile, untrusted, or non-secure environments, or for devices that contain high-value data assets.

An attacker may not be motivated by the economic value or the successful access to sensitive information, but simply the challenge of compromising a design or system that has been advertised as “secure”. The challenge to break the design gives such an attacker instant fame and recognition amongst peer groups.

Currently, much of the information in this area originates from disparate sources, may not be presented consistently, and may not address appropriate evaluation and testing techniques.
