Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: www.iso.org/iso/foreword.html

The committee responsible for this document is ISO/TC 199, *Safety of machinery*.

ISO/TR 22100 consists of the following parts, under the general title *Safety of machinery — Relationship with ISO 12100*:

- *Part 1: How ISO 12100 relates to type-B and type-C standards*
- *Part 2: How ISO 12100 relates to ISO 13849-1*
- *Part 3: Implementation of ergonomic principles in safety standards*

Introduction

The primary purpose of this document is to provide designers with an overall framework and guidance for decisions about ergonomic aspects during the development of machinery, to help them design machines that are safe for their intended use. As mentioned in ISO 12100:2010, 6.2.8, failure to follow ergonomic principles in design can result in the inadequate adaptation of machines to the capacities and skills of the intended user population and hence place their health or safety at risk.

ISO 12100 describes an iterative process to reduce risks. This document describes the main ergonomic factors influencing the safety of machinery and gives a framework for incorporating them into this design process.

Mental (cognitive) aspects are also to be considered. For example, machines which are operated in an inappropriate manner or whose control devices are not clearly identifiable can lead to human error.

This document is intended to guide users to make effective use of ergonomics standards within the context of machinery design.

This document will help both ergonomics and machinery standards writers to incorporate the structure specified in ISO Guide 78.
