Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

ISO draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents. ISO shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 82, *Mining*, Subcommittee SC 7, *Mine closure and reclamation management*.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at <https://www.iso.org/members.html>

Introduction

This document includes case studies and a bibliography provided by working group members and has been separated from the standard so that development of the two documents proceeded in parallel. These resources provide supporting information and illustration of various aspects of the managing mining legacy standard. While expanding upon some of the content of the guidance of the standard, it cannot be assumed that a particular strategy that was applied in one context is directly applicable to another. Not every clause in the standard has a corresponding case study. Instead, clause activities are revealed in an integrated way as they occur in practice within these cases. In addition to descriptive case studies, there are some table-format case studies toward the end, that illustrate how inventories can be structured and developed. The bibliography expands the resources available to those applying ISO 24419-1. This bibliography is not fully comprehensive of all global regions but instead are important and relevant at the time of preparation of the standard. As management of mining legacies evolves, further resources are likely to emerge. It is up to the user to adapt and apply their understandings of the ISO 24419-1 standard and this Technical Report to local circumstances.
