#### **STANDARDPRACTICE**

SP-119

This **MSS** Standard Practice was developed under the consensus of the **MSS** Technical Committee **113** and the **MSS** Coordinating Committee. The content of this Standard Practice is the result of the efforts of competent and concerned volunteers to provide an effective, clear, and non-exclusive specification that will benefit the industry as a whole. This **MSS** Standard Practice is intended as a basis for common practice by the manufacturer, the user, and the general public. The existence of an **MSS** Standard Practice does not in itself preclude the manufacture, sale, or use of products not conforming to the Standard Practice. Mandatory conformance is established only by reference in a code, specification, sales contract, or public law, as applicable.

Non-toleranced dimensions in this Standard Practice are nominal, and unless otherwise specified, shall be considered "for reference only".

Unless otherwise specifically noted in this **MSS** SP, any standard referred to herein **is** identified by the date of issue that was applicable to the referenced standard(s) at the date of issue of this **MSS** SP. (See Annex A)

This document has been substantially revised from the previous **1996** edition. It is suggested that if the user is interested in knowing what changes have been made, that direct page by page comparison should be made of this document.

SP-119

#### FORWARD

ASME B16.9 is the American Standard for steel butt-welding fittings and although not *so* stated, it is implied that its scope deals primarily with standard (Schedule 40) wall and heavier as it was developed for carbon steel and those grades of alloy steel piping that are selected for pressure and temperature considerations. In 1949 ASME approved standard B36.19 for Stainless Steel Pipe in which Schedule 10S was established. Schedule 5S pipe was recognized in the 1952 publication of B36.19. The companion fittings for Schedule 10S pipe used B16.9 shapes and proportions and were standardized by MSS SP-43 which was first published in 1950. In anticipation, the original 1950 edition of MSS SP-43 also standardized Schedule 5S fittings.

Since **1950** the use of lighter than standard wall stainless steel piping in new construction has become predominant. The reasons for this evolution include the rapid expansion of the process industries in the fields of chemicals, plastics, textiles, paper, etc.

Coincident with the greater utilization of light wall pipe and of more capable metal forming machinery, the need to reduce pipe assembly fabrication times brought about by world market competition led to the development of belled end socket welding fittings. As with the development of MSS SP-43, the shapes and proportions for B16.9 were reused for the belled end fitting bodies to the maximum extent possible.

In **1992** first work on belled end fittings for this standard included socket proportions, socket to fitting body transition geometry, fitting thickness, and the ability of **U.S.** industry to support manufacturing. Some of this work only standardized service proven relationships used in belled end fittings made for the pulp and paper industry without standards for over **20** years. In **1994** the **U.S.** Navy funded burst and fatigue testing prototype fittings in the first of a two-phase program. The second phase was for an increased thickness fitting and was never done. In **1995** mid-way through testing, the Navy directed that these belled end fittings be used **on** ship systems in new construction followed shortly thereafter by direction to use them on the repair of ship systems. The quality and configuration control of these fittings was done by **an** interim document, the requirements of which, with some improvements, are contained herein.

In keeping with recent trends wherein military procurement activities have been using more commercial material standards and because of recognized fabrication economies related to the use of these fittings, the U.S. Navy sponsored the writing of this Standard Practice in cooperation with fitting manufacturers.

This Standard Practice establishes dimensional uniformity for light wall belled end socket welding fitting designs qualified by burst and fatigue testing for Military Service and qualified by burst testing for Commercial Code Practice.

The most significant changes in the **2003** revision include the following: **1**) A new definition for allowable pressure ratings **for** MP fittings (Section **6**), which adopts the B16.9 format rating the fitting the same as the connecting pipe of the same schedule. **2**) The addition of titanium **and aluminum fitting** materials, and **3**) The addition of the Supplementary Requirements (Section **18**), which supports the Navy and their needs for special dimensions.

SP-119

#### FACTORY-MADE WROUGHT BELLED END SOCKET-WELDING FITTINGS

# 1. SCOPE

1.1 This Standard Practice covers stainless steel, copper nickel and titanium, *NPS* 1/4 through 12, and aluminum **NPS** 1/2 through 12 belled end socket welding fittings, including dimensions, tolerances, materials, socket end details, heat treating and marking requirements for use with the following pipe standards:

a) ASTM A 312

b) ASTM B 466

c) ASTM B 467

d) MIL-T-16420

e) ASTM B 861 or B 862

f) ASTM B 241

1.2 Design and manufacturing requirements are specified for factory-made, wrought, thin wall pipe fittings formed from either tubular sections or flat material. All fittings made to this Standard Practice are one of two thicknesses: Class 200, if coppernickel, or Schedule 10**if** made of any other material.

#### 2. <u>REFERENCES</u>

2.1 Standards and specifications adopted by reference in this standard are shown in Annex **A**, for convenience **of** identifying edition number, date and source of supply.

#### 3. SPECIAL CONSIDERATIONS

3.1 Partial Compliance Fittings may be made by agreement between the manufacturer and the purchaser. Special considerations include, but are not limited to, dimensions - such as unlisted reducingtees, sizes - such as **NPS 3** 1/2, shapes - such as a street end tee, tolerances different from those listed in Table 2, or of wrought materials other than those covered by this Standard Practice. When such fittings meet all other stipulations of this Standard Practice, they shall be considered as being in partial compliance herewith, provided they are appropriately marked (see Section 17.4).

3.2 Laterals, wyes, mitered elbows, and tees of notch and point or saddle weld constructions are not covered by this standard.

#### 4. DEFINITIONS

4.1 Belled End Socket Welding Fittings are a family of relatively thin wall wrought fittings, which extend the advantages of socket welded joints through the common sizes of thin walled pipes. In this Standard Practice, "wrought" is used to denote fittings formed from tubular or flat starting materials as opposed to those that are either forged **or** cast to their final shape or machined from forgings or castings.

4.2 CuNi is a notation representing copper nickel alloy.
