DISCLAIMER

The information in this publication was considered technically sound by the consensus of persons engaged in the development and approval of the document at the time it was developed. Consensus does not necessarily mean that there is unanimous agreement among every person participating in the development of this document.

NEMA standards and guideline publications, of which the document contained herein is one, are developed through a voluntary consensus standards development process. This process brings together volunteers and/or seeks out the views of persons who have an interest in the topic covered by this publication. While NEMA administers the process and establishes rules to promote fairness in the development of consensus, it does not write the document and it does not independently test, evaluate, or verify the accuracy or completeness of any information or the soundness of any judgments contained in its standards and guideline publications.

NEMA disclaims liability for any personal injury, property, or other damages of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly resulting from the publication, use of, application, or reliance on this document. NEMA disclaims and makes no guaranty or warranty, express or implied, as to the accuracy or completeness of any information published herein, and disclaims and makes no warranty that the information in this document will fulfill any of your particular purposes or needs. NEMA does not undertake to guarantee the performance of any individual manufacturer or seller's products or services by virtue of this standard or guide.

In publishing and making this document available, NEMA is not undertaking to render professional or other services for or on behalf of any person or entity, nor is NEMA undertaking to perform any duty owed by any person or entity to someone else. Anyone using this document should rely on his or her own independent judgment or, as appropriate, seek the advice of a competent professional in determining the exercise of reasonable care in any given circumstances. Information and other standards on the topic covered by this publication may be available from other sources, which the user may wish to consult for additional views or information not covered by this publication.

NEMA has no power, nor does it undertake to police or enforce compliance with the contents of this document. NEMA does not certify, test, or inspect products, designs, or installations for safety or health purposes. Any certification or other statement of compliance with any health or safety-related information in this document shall not be attributable to NEMA and is solely the responsibility of the certifier or maker of the statement.

AMERICAN NATIONAL STANDARD

Approval of an American National Standard requires verification by ANSI that the requirements for due process, consensus, and other criteria for approval have been met by the standards developer.

Consensus is established when, in the judgment of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that a concerted effort be made toward their resolution.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether he has approved the standards or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standards.

The American National Standards Institute does not develop standards and will in no circumstances give an interpretation of any American National Standard. Moreover, no person shall have the right or authority to issue an interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretations should be addressed to the secretariat or sponsor whose name appears on the title page of this standard.

This American National Standard may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken periodically to reaffirm, revise, or withdraw this standard. Purchasers of American National Standards may receive current information on all standards by calling or writing the American National Standards Institute.

Foreword

In 1979, the ANSI Z53 Committee on Safety Colors was combined with the ANSI Z35 Committee on Safety Signs to form the ANSI Z535 Committee on Safety Signs and Colors. The Z535 Committee has the following scope:

To develop standards for the design, application, and use of signs, colors and symbols intended to identify and warn against specific hazards and for other accident prevention purposes.

While the basic mission and fundamental purpose of the ANSI Z535 Committee is to develop, refine, and promote a single, uniform graphic system used for communicating safety and accident prevention information, the Z535 Committee recognizes that this information can also be effectively communicated using other graphic systems.

The Z535 Committee created subcommittees to update the Z53 and Z35 standards and to write new standards. To date, the following six standards comprise the ANSI Z535 series:

- ANSI Z535.1 *Safety Colors* [ANSI Z53.1-1979 was updated and combined into this standard in 1991]
- ANSI Z535.2 *Environmental and Facility Safety Signs* [ANSI Z35.1-1972 and Z35.4-1972 were updated and combined into this standard in 1991]
- ANSI Z535.3 *Criteria for Safety Symbols* [new in 1991]
- ANSI Z535.4 *Product Safety Signs and Labels* [new in 1991]
- ANSI Z535.5 *Safety Tags and Barricade Tapes (for Temporary Hazards)* [ANSI Z35.2-1974 was updated and combined into this standard in 1991]
- ANSI Z535.6 *Product Safety Information in Product Manuals, Instructions, and Other Collateral Materials* [new in 2006]

Together, these six standards contain information needed to specify formats, colors, and symbols for safety signs used in environmental and facility applications, product and product literature applications, and temporary safety tag and barricade tape applications.

Published separately is the ANSI Z535 Safety Color Chart. This chart gives the user a sample of each of the safety colors: red, orange, yellow, green, blue, purple, brown, grey, white, and black. It also describes each color's ink formulation and closest PANTONE® color.

This ANSI Z535.6 standard was prepared by the Z535.6 Subcommittee on Product Safety Information in Product Manuals, Instructions, and Other Collateral Materials. The foreword and all annexes are considered to be informative; the body is considered normative. In the vocabulary of writing standards, the word "informative" is meant to convey that the content presented is for informational purposes only and is not considered to be mandatory in nature. The word "normative" is meant to convey that the context is considered to be mandatory or prescriptive.

The 1991 standards, which became available in 1992, were revised and a new edition was published in 1998. The 1998 edition of ANSI Z535.4 contained an Annex (Annex A, Guidelines for Increasing Recognition of Safety Label Components), which encouraged manufacturers to describe on-product safety label components (e.g., safety alert symbol, signal words, or safety symbols) in collateral materials (e.g., operation manuals, instructions, safety literature, or service manuals) used with the product. The 1998 standards were subsequently revised to produce the 2002 edition.

In the course of preparing the 2002 edition of the Z535 standards, the ANSI Z535 Accredited Standards Committee considered the merits and practicality of developing a new standard addressing the presentation of safety messages in collateral materials such as owner's manuals, instruction books, and troubleshooting and repair manuals. In 2002, the committee voted to form a new subcommittee, ANSI Z535.6. The purpose of this new subcommittee is to develop a standard to complement the existing Z535 standards by addressing various aspects of the provision of safety information in collateral materials. This

ANSI Z535.6-2011

standard was prepared by Subcommittee Z535.6 on Product Safety Information in Product Manuals, Instructions, and Other Collateral Materials.

The 2011 edition of this standard was revised with minor clarifications and updated to permit the use of the safety alert symbol in the middle of a line of text. In addition, the definitions for “accident,” “harm,” and “incident” were refined across the Z535 series to more clearly delineate a separation between physical injury and other safety-related issues (e.g., property damage).

Due to the differences in color printing technologies and color monitors, the appearance of colors in this document may not be accurate. See the ANSI Z535-2011 Safety Color Chart for the purpose of viewing accurate colors.

Proposals for improvement of this standard are welcome. Information concerning submittal of proposals to the ANSI Z535 Committee for consideration can be found at the back of this standard.

This standard was processed and approved for submittal to ANSI by the Accredited Standards Committee Z535 on Safety Signs and Colors. Committee approval of this standard does not necessarily imply that all committee members voted for its approval. At the time it approved this standard, the Z535 Committee had the following members:

Gary M. Bell, Chair

Richard Olesen, Vice Chair

Greg Winchester, Secretary

AMERICAN NATIONAL STANDARD**ANSI Z535.6-2011**

Product Safety Information in Product Manuals, Instructions, and Other Collateral Materials

1 Introduction

Historically, there has been a lack of widely available or generally applicable graphic systems for presenting safety information in product manuals, instructions, and related collateral materials. The absence of such systems, combined with the increased awareness and use of ANSI Z535.4 Standard for Product Safety Signs and Labels, has led to attempts to apply various aspects of ANSI Z535.4 to the presentation of safety information in collateral materials. Since ANSI Z535.4 was not designed for that purpose, it is not well-suited for broad application beyond the domain of product signs and labels. Its limited applicability stems from differences between product signs and labels and various collateral materials.

- Collateral materials can vary significantly in terms of their purpose, content, format, and/or length. For example, they may come in the form of a bound manual, a single sheet of paper (folded or otherwise), a pamphlet, a booklet, or an electronic document.
- Collateral materials are typically formatted like a book or other published literature. Thus, different formats for safety messages may be required and/or expected compared to on-product information.

In addition, there are differences that may exist between safety information in collateral materials and safety messages on product safety signs and labels. For example:

- Collateral materials typically:
 - contain more information than product safety signs;
 - address multiple hazards and contain multiple safety messages;
 - provide longer and more detailed safety messages;
 - contain multiple pages of information that cannot be viewed simultaneously; and
 - provide information that would be impractical to provide on product safety signs, such as definitions of the safety alert symbol, signal words, and safety symbols.
- Safety information in collateral materials must often be integrated with non-safety information.
- Because collateral materials are not typically attached to the product, issues related to reading conditions, distinctiveness, placement, expected life, and maintenance are different. In addition, the concept of a safe viewing distance is not generally applicable.

To respond to these differences, this standard sets forth a communication system developed specifically for product safety information in collateral materials. It incorporates elements of the graphical approaches used by other ANSI Z535-series standards into a common design direction selected to provide product safety information in an orderly and visually consistent manner.

2 Scope and purpose

2.1 Scope

This standard sets forth requirements for the design and location of product safety messages in collateral materials for a wide variety of products.
