Finite life hydraulic filter pressure/life rating – Method for verifying the fatigue life rating and the burst pressure rating of the pressure containing envelope of a spin-on hydraulic filter

A NATIONAL INDUSTRY STANDARD FOR FLUID POWER

Approved by Committee ASC B93,
accredited by the American National Standards Institute (ANSI)

Descriptors: filter/separator housing, hydraulic fluid power; fluid power; pressure, cyclic test; pressure, rated fatigue; pressure, finite life rated fatigue; pressure, minimum burst; pressure, static test; pressure rating, by similarity; pressure rating, by test; pressure rating, filter/separator housing

Developed and published by

AMERICAN NATIONAL STANDARD

This American National Standard is one of more than 10,000 standards approved as American National Standards by the American National Standards Institute. On 24 August 1966, the ASA was reconstituted as the USA Standard Institute; on October 1969, the USASI changed its name to the American National Standards Institute. Standards formerly designated as ASA or USASI are now designated as ANSI Standards. There is no change in their index identification or technical content.

An American National Standard implies a consensus of those substantially concerned with its scope and provisions. An American National Standard is intended as a guide to aid the manufacturer, the consumer and the general public. The existence of an American National Standard does not in any respect preclude anyone, whether they have approved the standard or not, from manufacturing, marketing, purchasing or using products, processes or procedures not conforming to the standard. An approved ANSI Standard does not constitute or indicate a warranty of any sort, express or implied, including but not limited to a warranty or representation as to quality, merchantability or fitness for a particular use or purpose. American National Standards are subject to periodic review and users are to obtain the latest editions. Producers of goods made in conformity with an American National Standard are encouraged to state on their own responsibility in advertising, promotional material or on tags or labels that the goods are produced in conformity with particular American National Standards.

NOTICE: An approved ANSI standard does not express or imply any judgment, certification or endorsement of or with respect to, the safety, design or performance of any product, component, or its use.

NFPA does not examine, investigate, test, recommend, or certify the design, use of safety of any product or component, even those which may incorporate one or more ANSI standards. Approved ANSI standards therefore have no application to and do not express or imply any recommendation, representation or warranty, with respect to the safety, design, use, performance, or functional interchangeability of components or products which incorporate ANSI standards.

CAUTION NOTICE: This American National Standard may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken to reaffirm, revise, or withdraw this standard no later than five (5) years from the date of publication. Information on this and other FLUID POWER standards may be obtained by calling or writing the National Fluid Power Association, 3333 North Mayfair Road, Milwaukee, WI 53222-3219, (414) 778-3344.

Suggestions for improvement gained in the use of this standard will be welcome. They should be sent to the National Fluid Power Association, 3333 North Mayfair Road, Milwaukee, WI 53222-3219.

Any part of this standard may be quoted. Credit lines should read: Extracted from the national industry standard ***Finite life hydraulic filter pressure/life rating — Method for verifying the fatigue life rating and the burst pressure rating of the pressure containing envelope of a spin-on hydraulic filter, ANSI/(NFPA)T3.10.17-1995 (R2004).***

Foreword

This Foreword is not part of American National Standard *Finite life hydraulic filter pressure/life rating — Method for verifying the fatigue life rating and the burst pressure rating of the pressure containing envelope of a spin-on hydraulic filter*, ANSI/(NFPA) T3.10.17-1995.

At the October 1981 meeting of the Hydraulic Filter and Separators Section (T3.10) it was recommended that a standard be developed which would include methods for verifying the rating of the static and fatigue pressure strength of a finite life hydraulic filter disposal element container (spin-on filter). Kendall McBroom (Nelson Industries) agreed to serve as Project Chairman.

The NFPA Technical Board approved the TSP on 26 May 1982. Numerous drafts were prepared and reviewed by the Project Group.

On 6 March 1991 the Project Group met and it was recommended to submit Draft No. 8 with revisions and annex A for General Review including changing "confidence level" to "verification level". T3.10 concurred with the Project Groups recommendation at their meeting. NFPA's Technical Staff prepared the document for General Review on 10 May 1991.

The General Review closed with several comments which were discussed at the 21 August 1991 Project Group meeting. Changes were made to the document and to the TSP. The title was changed from "Finite life hydraulic filter supplement No. 10 to NFPA Recommended Standard Fluid power systems and products — Method for verifying the fatigue and establishing the static pressure rating of the pressure containing envelope of a metal fluid power component" to "Finite life hydraulic filter pressure rating — Method for verifying the fatigue and establishing the burst pressure rating of the pressure containing envelope of a spin-on hydraulic filter."

The Technical Board approved the change in title on 16 January 1992. The document was prepared by Headquarters and sent out for a Second General Review on 3 February 1992. The Project Group met on 19 August 1992 to discuss the comments received. Several changes were made to the document. The Project Group met on 19 August 1992 and 11 November 1992 to review the document. The Project Group met again on 24 March 1993 and agreed to send the document out for a Third General Review.

The document was sent out for a Third General Review on 31 March 1993. The Third General Review closed with comments from five companies. The Project Group met on 19 August 1993 to discuss these comments.

Project Chairman McBroom updated the document and the Project Group met on 17 November 1993 to review the Proposed Fourth General Review Draft. The Project Group voted to send the document out for Balloting after changes were once again made to the document. Project Chairman McBroom updated the document and submitted Draft No. 9 to Headquarters on 1 December 1993.

Project Chairman McBroom again updated the document due to Technical Board action. Draft No. 10 was discussed at the Project Group meeting held 9 February 1994. The Project Group agreed to send the document out for a Fourth General Review.

The document was sent out for a Fourth General Review on 8 March 1994. The Fourth General Review closed with comments from six companies. The Project Group reviewed these comments at their 25 May 1994 meeting and voted that when the commentators signed off the document should be sent to the Technical Board for approval to Ballot. Project Chairman McBroom wrote to all the commentators on 1 June 1994 and sent an updated document to Headquarters.

The revised document was put on the 18 August 1994 Technical Board agenda for approval to Ballot. The Technical Board approved the document and it was sent out for Ballot on 19 August 1994. Balloting closed with no negative votes and two approval votes with editorial comments. These comments were resolved at the 22 September 1994 T3.10 meeting. At the same meeting it was voted to put this document on the next Technical Board agenda for final approval. Chairman Kendall McBroom added the editorial changes to the document and it was updated at Headquarters.

This document was granted final approval at the 8 December 1994 Technical Board meeting.

Project Group members who developed this standard:

Kendall McBroom
Project Chairman and
Section Chairman
Nelson Industries

Henry Barthe *
Section Chairman
(1978 – 1992)
Schroeder Industries

Kenneth Happach
Section Vice Chairman
Caterpillar Inc.

Albert Cella
Project Secretary
Parker Hannifin Corp.

Douglas Miller
Technical Auditor
Applied Power/Enerpac

Linda E. Gasso
Technical Coordinator
National Fluid Power Association

Shirley Seal
Manager of Standards Development –
Industry/National
National Fluid Power Association

John Berninger
Parker Hannifin Corp.

Bruce Coffey
Dana Corp.

Wayne Conner **
Parker Hannifin Corp.

Marvin Gram
Donaldson Company, Inc.

Udo Holzhausen
Fleetguard, Inc.

L. M. Hough *
Dana Corp./Wix Corp.

Robert Mahon
HYCON Corp.

Richard Smith *
Fleetguard, Inc.

Abbas Vijlee
Schroeder Industries

Steven Wagner
Donaldson Co.

On 15 December 1994, ANSI/(NFPA)T3.10.17 was submitted to ANSI Committee B93 for Ballot. Balloting closed with no negative comments.

ANSI/(NFPA)T3.10.17-1995 was approved by ANSI's Board of Standards Review on 10 May 1995.

The membership roster of Standards Committee B93 at the time of ballot:

Jack C. McPherson
Chairman

Daniel B. Shore
Vice Chairman

Shirley C. Seal
Secretary

American Society of Agricultural Engineers
W. L. Snyder

Compressed Air & Gas Institute
Douglas Morris
John Addington (alternate)

Fluid Controls Institute, Inc.
Jude Pauli
E. C. Rutter (alternate)

Fluid Power Distributors Association, Inc.
Thomas Neff

Fluid Power Society
Probir K. Chatterjea
Art DesMarais III
Greg Gordon
Ray Hanley
Bernard Larson
Jim Morgan (alternate)
Paul Prass
N. Pliny Smith
James J. Staczek

Fluid Sealing Association
Stephen B. Chapman
Robert Ecker (alternate)

Material Handling Institute
Jack C. McPherson

National Fluid Power Association
John Berninger
David Prevallet
Paul Schacht
William Wilkerson

National Machine Tool Builders' Association
Anthony Bratkovich

US Department of Defense
Wayne K. Wilcox

Company Members
Dennis Bonacorsi
John Welker (alternate)
Logan Mathis

Individual Members
John Eleftherakis
William Jones
Z. J. Lansky
A. O. Roberts
Daniel B. Shore
Vince Torrusio
Jack Walrad
Tom Wanke
James C. White
Frank Yeaple

Introduction

In fluid power systems, power is transmitted and controlled through a fluid (liquid or gas) under pressure within an enclosed circuit. A basic requirement of fluid power components is that they should be capable of adequately containing the pressurized fluid.

The pressure that an individual component can normally be subjected to has a relationship with the rated fatigue and minimum burst pressures. This relationship may be estimated and used as a basis of total life expectancy for the component in an individual application. Such an estimate must be applied by the user and factors such as shock, heat, misuse, etc., must be judged by the user in its application. The selection of a specific pressure and life expectancy for a component in such an individual application may be based upon the rated fatigue and burst pressure as prescribed in figure 1. This finite life pressure rating test procedure is different than the basic T2.6.1 R1 infinite life pressure rating document and can be visualized from the figure 1, S-N diagram. The standard T2.6.1 R1 is a rating system along the vertical axis, with its fatigue strength distribution and assurance level in the vertical direction at a defined life. The finite life hydraulic filter is a rating system along the horizontal axis, with its fatigue life distribution and assurance level in the horizontal direction at a defined stress (pressure).

Because the service life of the element container for a finite life hydraulic filter (spin-on) is relatively short, a fatigue life of 100,000 cycles (\emptyset) is judged sufficient for common industrial ratings. Cycle life ratings other than 100,000 cycles are permitted and this standard may be applied for those cases. The method of rating includes both pressure and minimum life – see clause 19 for the proper description.

The pressure rating of the filter head or mounting base would, however, be subjected to the full 10^6 fatigue cycles (RFP) established by NFPA/T2.6.1 R1.

The spin-on can, because of its construction, is tested and evaluated as an elastic body with specific pressure cycle test times and pressure rise rate conditions.

It should be noted that this document deals solely with verification of ratings of a spin-on filter. Separate from this verification procedure, manufacturers have the continuing responsibility to utilize managerial controls necessary to test representative production spin-on filters.

Finite life hydraulic filter pressure/life rating — Method for verifying the fatigue life rating and the burst pressure rating of the pressure containing envelope of a spin-on hydraulic filter

HEADQUARTERS NOTE The Project Group which developed this test standard intended it as a stand-alone document, unrelated to the basic pressure rating document, NFPA/T2.6.1 R1. The Project Group identified unique features of the spin-on filter which dictated that a structural test be conducted on it as a finite life component and as an elastic body. Elastic components are excluded from the basic NFPA/T2.6.1 R1 pressure rating philosophy.

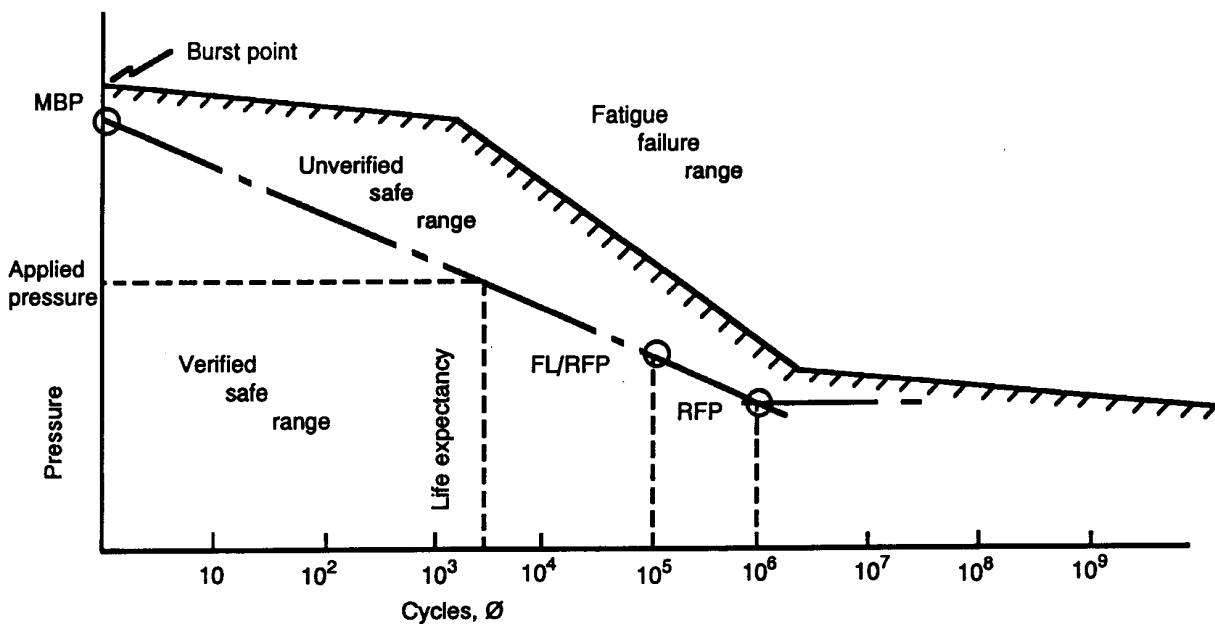

Figure 1 — Possible S-N curve method for estimating finite life rating

1 Scope

1.1 To include methods for verifying the ratings of the burst and fatigue pressure strength of a finite life hydraulic filter, disposable element, container (spin-on filter).

1.2 The purpose is to provide standard methods for verifying the fatigue and static burst pressure ratings of the metal housing of a finite life hydraulic filter with regard to cyclic and steady pressure loads.

1.3 Because the service life of the element container for a finite life hydraulic filter (spin-on) is relatively short, a fatigue life of 100,000 cycles (\emptyset) is judged sufficient for common industrial ratings.
