AMERICAN NATIONAL STANDARD

This standard is an identical adoption of ISO 13655:2009, an International Standard that was developed under ISO Technical Committee 130, Graphic Technology, in collaboration with Technical Committee ISO/TC 42, Photography.

Approval of this American National Standard as a national adoption was done in accordance with the *ANSI Procedures for the National Adoption of ISO and IEC Standards as American National Standards*.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether he has approved the standards or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standards.

The American National Standards Institute does not develop standards and will in no circumstances give an interpretation of any American National Standard. Moreover, no person shall have the right or authority to issue an interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretations should be submitted in writing to the secretariat whose name appears on the title page of this standard, who will forward such requests to the responsible ISO committee.

CAUTION NOTICE: This American National Standard may be revised or withdrawn at any time, following the procedures set forth in the *ANSI Procedures for the National Adoption of ISO and IEC Standards as American National Standards*. Purchasers of American National Standards may receive current information on all standards by calling or writing the American National Standards Institute.

COPYRIGHT NOTICE: These materials are subject to copyright claims of ISO, ANSI and NPES. No part of this publication may be reproduced in any form, including an electronic retrieval system, without the prior written permission of NPES.

All requests pertaining to CGATS.5 should be submitted in writing to NPES.

Foreword

ANSI CGATS.5:2009 is an identical national adoption of ISO 13655:2009. ISO 13655:2009 was prepared by ISO Technical Committee 130, *Graphic technology*, in collaboration with ISO Technical Committee 42, *Photography*, and with the support of the ANSI Committee for Graphic Arts Technologies Standards (CGATS).

Minor edits have been made to this standard to prepare it as an ANSI CGATS standard. No technical changes have been made.

CGATS Subcommittee 3 is the consensus body that approved the national adoption of ISO 13655:2009 for issuance as CGATS.5:2009 in accordance with the *ANSI Procedures for the National Adoption of ISO and IEC Standards as American National Standards* and the CGATS Operating Procedures.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. Neither ISO, ANSI, CGATS nor NPES shall be held responsible for identifying any or all such patent rights.

This standard cancels and replaces CGATS.5:2003.

Introduction

There are many choices allowed when making spectral measurements and performing colorimetric computations. The specific choices made can result in different numerical values for the same property for the same sample. Thus, it might not be possible to make valid comparisons unless the data being compared is all based on the same set of measurement and computational choices. The purpose of this standard is to specify a limited number of such choices for the measurement and computation of the colorimetric characteristics of graphic arts images to allow valid and comparable data to be obtained. While this standard references ISO 3664, the International Standard established for viewing conditions in graphic arts and photography, it is not expected that measured colorimetric data will provide an absolute correlation with visual colour appearance.

When the revision of this standard was started, it was observed that almost all graphic arts specimens exhibited fluorescence. In most cases, this was due to optical brightening agents contained in the paper substrates. In rare cases, the printing inks were fluorescent. According to the recommendations of the 1996 version of this standard, this would have meant that the source used for the measurements (i.e. the spectral power distribution of the sample illumination) was required to closely match CIE illuminant D50. Yet when this revision was started, not a single colour-measuring instrument sold for the graphic arts market provided an illumination system that closely matched CIE illuminant D50. Instead, most instruments used incandescent lamps for light sources. The spectral power distribution of such lamps have varying amounts of UV content. The variation in UV content between instruments could easily amount to a colour difference of $5 \Delta b^*$ when measuring papers with a high level of optical brightening agents. Consequently, the measurement results for unprinted paper substrates and lighter colours differed appreciably between different instrument models. For a thorough study of fluorescence effects, see CIE Publication 163.

It has also been observed that graphic arts viewing booths vary with respect to UV content, even those that comply with the 1996 version of ISO 3664. The practical result is that specimens that have nearly identical measured colorimetric properties, at times will not visually match when viewed in the viewing booth, and vice versa. Only part of such discrepancies can be attributed to fluorescence. There can also be metameric effects due to "non-standard" observers and to instrument wavelength errors, in addition to deviations in the measurement source away from CIE D50. Despite these other potential influences it was deemed important to provide measurement solutions that would minimize the systematic errors introduced by the interaction of paper fluorescence and variations in the spectral power distribution of the sample illumination. Methods for the correction of instrument errors and procedures for reliable visual evaluation of colour images are outside of the scope of this standard.

In this revision, four measurement choices are specified. Measurement condition M0 requires the source illumination to closely match that of illuminant A; this provides consistency with existing instrumentation and ISO 5-3. Measurement condition M1 requires the colorimetry of the specimen illumination to closely match CIE illuminant D50. Measurement condition M2 only requires that the spectral power distribution of the specimen illumination be provided in the wavelength range from 420 nm to at least 700 nm and have no substantial radiation power in the wavelength range below 400 nm (often referred to as "UVCut"). Measurement condition M3 has the same sample illumination requirements as M2 and includes a polarizing filter in the influx and efflux portions of the optical path with their principal axes of polarization in the orthogonal or "crossed" orientation.

The requirements of this standard are focused on colorimetric measurement equipment intended for use in the graphic arts environment. Helpful information on issues such as substrate backing materials, reporting, standardization, standard and improved colour difference metrics, fluorescence and ways to improve the inter-instrument agreement are included. These will be useful to technical advisors of graphic arts associations, specialized graphic arts research institutes, and practitioners with an interest in the basics of measurement and process control.

Graphic technology — Spectral measurement and colorimetric computation for graphic arts images

1 Scope

This standard establishes procedures for the measurements and colorimetric computations appropriate to objects that reflect, transmit, or self-illuminate, including flat-panel displays. It also establishes procedures for computation of colorimetric parameters for graphic arts images. Graphic arts includes, but is not limited to, the preparation of material for, and volume production by, production printing processes that include offset lithography, letterpress, flexography, gravure and screen printing.

This standard does not address spectral measurements appropriate to other specific application needs, such as those used during the production of materials, e.g. printing ink, printing paper and proofing media.
