ANSI/RIA R15.05-1-1990

for Industrial Robots and Robot Systems –
Point-to-Point and Static
Performance Characteristics –
Evaluation
Approval of an American National Standard requires verification by ANSI that the requirements for due process, consensus, and other criteria for approval have been met by the standards developer.

Consensus is established when, in the judgment of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that a concerted effort be made toward their resolution.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether he has approved the standards or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standards.

The American National Standards Institute does not develop standards and will in no circumstances give an interpretation of any American National Standard. Moreover, no person shall have the right or authority to issue an interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretations should be addressed to the secretariat or sponsor whose name appears on the title page of this standard.

CAUTION NOTICE: This American National Standard may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken periodically to reaffirm, revise, or withdraw this standard. Purchasers of American National Standards may receive current information on all standards by calling or writing the American National Standards Institute.

American National Standard
for Industrial Robots and Robot Systems –

Point-to-Point and Static
Performance Characteristics –
Evaluation

Sponsor
Robotic Industries Association

Approved September 13, 1989
American National Standards Institute, Inc
The objective of this standard is to provide meaningful technical information to help robot users select the best robot for their specific applications. It defines the most important static performance criteria and a method for evaluating them. These criteria are accuracy, cycle time, repeatability, overshoot, settling time, and compliance. These six criteria, selected from a list of nearly thirty, are felt to represent the best indication of the overall static performance of industrial robots.

In order to achieve this means of relative comparison of robots, standard test paths and conditions are used. The results do have limitations and should be supplemented with additional engineering information when considering detailed systems specifications and designs.

The concept of performance classes is also introduced. These classes are used to determine robot performance when used at rated capacity, to optimize maximum cyclic rate, to optimize repeatability or optimize other specific criteria important for certain applications.

A list of recommended specifications is also included. These specifications cover much of the information needed by robot users, such as service requirements, environmental effects, and tolerances.

This standard is not a safety standard and therefore does not directly address the safety issues related to robot performance and operation. It is the responsibility of whomever uses this standard to consult and utilize appropriate safety standards and health practices.

Care should be exercised in the interpretation of the results determined by this standard. Many of the parameters measured using the guidelines described in this standard may change during the life of the robot. The manufacturer should be consulted regarding performance warranties covering the life of the robot.

Use of industry standards, including this standard, is voluntary. The Robotic Industries Association makes no determination with respect to whether any robot, manufacturer, or user is in compliance with this standard.

Suggestions for improvement of this standard will be welcome. They should be sent to Subcommittee R15.05 on Performance, Robotic Industries Association, P.O. Box 3724, Ann Arbor, MI 48106.

Consensus for approval of this standard as an American National Standard was achieved by the use of the Canvass Method.

The following organizations recognized as having an interest in an industrial robot point-to-point and static performance test methodology were contacted prior to the approval of the standard:

Inclusion in this list does not necessarily imply that the organization concurred with the submittal of the standard to ANSI:

ABB Robotics
Adept Technology
Advanced Automation
Alliance of American Insurers
Automated Manufacturing Systems
Chrysler Corporation
Cimcorp, Inc
Cincinnati Milacron, Industrial Robot Division
DeVilbiss Company
GMF Robotics
General Motors Corporation
• CPC Division
• Saginaw Division

Hewlett Packard
IBM Corporation
John Deere & Company
Kuka Welding Systems
Lehigh University, Institute for Robotics
Procter & Gamble
Society of Automotive Engineers
United Technology
University of Tennessee
Subcommittee R15.05 had the following members at the time it processed and submitted this standard to ANSI for approval as an American National Standard.

Thomas H. Helzerman, Co-Chairman  
Steve Walsh, Co-Chairman  
D. Scott Ackerson  
Hadi Akeel  
John Bloodgood  
Romeo Bruce  
Walt Cwycyshyn  
Joseph J. Czerak  
Robert Gorman  
John W. Hill  
D. Sung Kim  
William D. Malecki  
Jim Maples  
Joseph Messer  
Tom Mize  
Joseph Ray  
Eugene Rivin  
Thomas A. Saari  
Robert J. Schlesinger  
Mike Sklar  
Albert Sturm  
Jim Wells  
Carl Witham  
Michael Wodzinski

Administrative services were provided by James M. Prange and James A. Payton of the Robotic Industries Association.

American National Standard
for Industrial Robots and Robot Systems –
Point-to-Point and Static
Performance Characteristics –
Evaluation

1. Scope, Purpose, and Exclusions

1.1 Scope. This standard is intended to facilitate understanding between manufacturers and users of industrial robots and industrial robot systems. It defines the most important performance criteria and a method for evaluating these criteria. Included in this method are performance classes, standard test paths, and standard test loads. Means of measuring these performance criteria are not described in this standard.

No attempt has been made to address orientation errors directly. The effects of such errors are indirectly measured through the use of axial and radial offsets. Orientation errors will result in deviations in the position of the measurement point.

This standard is not a safety standard and therefore does not directly address the safety issues related to robot performance and operation. It is the responsibility of whomever uses this standard to consult and utilize appropriate safety standards and health practices.

NOTE: For the purpose of the remaining sections of this standard, the term “robot” will mean industrial robot or industrial robot system.

1.2 Purpose. The purpose of this standard is to provide meaningful technical information that robot users can utilize for the selection of the proper robot for their specific applications.

1.3 Exclusions. This standard applies to robots and robot systems only and is not intended to apply to the following:

1. Automatic guided vehicles and systems
2. Automatic conveyors and shuttle systems
3. Mobile robots
4. Tele-operators
5. Prosthetic and other aids for the handicapped
6. Automated storage and retrieval systems
7. Numerically controlled machine tools
8. Personal robots
9. Undersea and space robots

This list is not intended to be all-inclusive.

2. Related Standards

The following standards contain additional information but are not essential to completing the requirements of this standard.

ANSI Z244.1-1982, Lockout/Tagout of Energy Sources — Safety Requirements
