American National Standard for Ophthalmics –

Nonprescription Sunglass and Fashion Eyewear Requirements

Secretariat

The Vision Council

Approved September 4, 2015

American National Standards Institute, Inc.
Approval of an American National Standard requires review by ANSI that the requirements for due process, consensus, and other criteria for approval have been met by the standards developer.

Consensus is established when, in the judgement of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that a concerted effort be made towards their resolution.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether he has approved the standards or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standards.

The American National Standards Institute does not develop standards and will in no circumstances give an interpretation of any American National Standard. Moreover, no person shall have the right or authority to issue an interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretations should be addressed to the secretariat or sponsor whose name appears on the title page of this standard.

**CAUTION NOTICE:** This American National Standard may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken periodically to reaffirm, revise, or withdraw this standard. Purchasers of American National Standards may receive current information on all standards by calling or writing the American National Standards Institute.

Foreword  (This foreword is not part of American National Standard ANSI Z80.3-2015.)

Summary of Changes to ANSI Z80.3 for 2015

This 2015 revision represents the most current consensus of experts in this field. The changes from the 2010 standard are the result of a thorough study by the ANSI Z80.3 committee of the relevance and applicability of its contents.

This revision incorporates a continued effort to more properly explain and clarify concepts and principles, and to more closely align requirements of this standard with similar relevant provisions in existing US and international standards. In addition to minor typographical corrections, changes include:

- Prism power and imbalance are now defined only for finished products in the as-worn position, since lenses with high base curves and/or significant face-form (wrap) angles must include the proper compensating prism in the lens blanks to ensure minimal prism in the final product.
- Luminous transmittance variations and tolerances are now provided in units of percent rather than density.
- Definitions of reference point, special purpose lenses, and polarization axis tolerance are added.
- Minimum luminous transmittance of gradient tint lenses is modified.
- A figure demonstrating assessment of cosmetic lens quality is added.
- Procedure for assessment of frame flammability is amended.
- Finally, new requirements for frame durability, such as corrosion, material safety, and deformation, which already exist in other standards, are added.

Background and summary of past revisions for ANSI Z80.3

Changes made in 2010 were the addition of subclauses addressing resistance to radiation; revision of the photosensitive lens qualification test; addition of the definition of polarizing efficiency; correction of the equations for the calculation of mean transmittance; addition of country of origin labeling; and addition of an equation to the Notes under Table 5.

The purchasers and users of nonprescription sunglasses and fashion eyewear need to be assured of certain minimum levels of performance and quality in these products. These are either implicit expectations in the product performance, or safety. The purchaser of the product does not ordinarily have the means to properly assess these characteristics.

In order to accomplish these goals, it is necessary to establish commonly accepted definitions, equations, sources, and methodology so that manufacturers can produce products to meet the standard.

This American National Standard specifies impact-resistant characteristics; cosmetic, refractive, and transmittance properties of lenses; and the flammability and durability of frames and lenses.

Cosmetic, refractive, transmittance, and frame properties specified herein are intended as guidelines, and therefore they are subject to revision since there is a need to study further the validity of these property specifications as related to actual normal use requirements.

The Z80.3 Subcommittee was organized in December 1970 and had its first meeting on January 7, 1971. The committee usually meets formally twice per calendar year,
and members review material by email, phone, or fax throughout the year. Working
groups may be formed to investigate specific projects.

This standard contains one annex, which is informative and is not part of this stan-
dard.

Suggestions for improvement of this standard will be welcome. Suggestions should
be sent to The Vision Council, 225 Reinekers Lane, Suite 700, Alexandria, VA
22314.

This standard was processed and approved for submittal to ANSI by the Accredited
Standards Committee Z80 (ASC Z80). Committee approval of this standard does not
necessarily imply that all committee members voted for its approval. At the time it ap-
proved this standard, ASC Z80 had the following members:

Thomas C. White, M.D., Chair
Quido Cappelli, Vice-Chair
William J. Benjamin, O.D., Secretary

American National Standard for Ophthalmics –

Nonprescription Sunglass and Fashion Eyewear Requirements

1 Scope and Purpose

1.1 Scope

This standard applies to all nonprescription sunglasses and fashion eyewear, normally used for casual, dress, and recreational purposes, having lenses of substantially plano power. This standard specifically excludes products covered by ANSI Z87.1, ANSI Z80.1, and those covered within the ASTM F08.57 committee. Sunglass needs for aphakics may not be met by this standard.

1.2 Purpose

The purpose of this standard is to establish standards for noncorrective (essentially plano power) lenses that are intended for attenuation of light and for fashion eyewear, and for the flammability and durability of frames and lenses. These products are commonly called sunglasses, and they are not designed to be industrial safety eyewear as defined in ANSI Z87.1, or to provide corrective prescriptions as defined in ANSI Z80.1, or to provide protection for selected sports as defined within ASTM F08.57 committee standards, or to provide protection when making direct observation of the sun, such as for viewing a partial or annular solar eclipse. Lenses covered by this standard are not intended for use under conditions of reduced illumination; however, variable tint lenses that fade to a luminous transmittance greater than 75% are covered. Lenses with less than 75% luminous transmittance anywhere on the lenses are not suitable for driving under low light conditions, such as but not limited to twilight or night.

2 Normative References

The following standards contain provisions that, through reference in this text, constitute provisions of this American National Standard. All standards are subject to revision, and parties to agreements based on this American National Standard are encouraged to apply the most recent editions of the standards indicated below.

ANSI Z80.1, Ophthalmics – Prescription Ophthalmic Lenses – Recommendations1

ANSI Z80.5, Ophthalmics – Requirements for ophthalmic frames

ANSI Z80.17, Focimeters

ANSI Z87.1, Occupational and educational eye and face protection devices
