IEEE C37.011-2011, Guide for the Application of Transient Recovery Voltage for AC High-Voltage Circuit Breakers
This application guide covers procedures and calculations necessary to apply the standard transient recovery voltage (TRV) ratings for ac high-voltage circuit breakers rated above 1000 V. The breaking capability limits of these circuit breakers are determined to a great degree by the TRV. This application guide is not included in other existing circuit breaker standards. In this document, the TRV ratings are compared with typical system TRV duties. Examples of TRV calculation are given with suggested options if the TRV duty exceeds the TRV ratings of the circuit breaker.

Applies to ac high-voltage circuit breakers rated in accordance with IEEE Std C37.04-1 and listed in ANSI Std C37.06. It is intended to supplement IEEE Std C37.010. Circuit breakers rated and manufactured to meet other standards should be applied in accordance with application procedures adapted to their specific ratings.
IEEE C37.013-1997 (R2008), Standard for AC High-Voltage Generator Circuit Breakers Rated on a Symmetrical Current Basis
This standard provides ratings, performance requirements, and compliance test methods for AC high-voltage generator circuit breakers rated on a symmetrical current basis that are installed between the generator and the transformer terminals. Guidance for applying generator circuit breakers is also given.

IEEE C37.015-2009, Guide for the Application of Shunt Reactor Switching
This application guide applies to ac high-voltage circuit breakers rated for shunt reactor switching. The guide covers the specific cases of switching directly grounded shunt reactors, ungrounded shunt reactors and shunt reactors grounded through a neutral reactor.

IEEE C37.016-2006, Standard for AC High-Voltage Circuit Switchers rated 15.5 kV through 245 kV
Applicable to AC circuit switchers designed for outdoor installation and for rated power frequencies of 50 and 60 Hz and rated maximum voltages of 15.5 kV through 245 kV. Only applicable to three-pole circuit switchers for use in three-phase systems. To be used as an aid to both manufacturers and users in the design and selection process. Establishes the rating basis, preferred ratings, and test procedures.

IEEE C37.017-2010, Standard for Bushings for High Voltage (Over 1000 Volts AC) Circuit Breakers and Gas Insulated Switchgear
This standard is applicable to bushings intended for use in high voltage circuit breakers and gas insulated switchgear. These bushings are intended for indoor and outdoor use, operating on alternating current with a rated voltage greater than 1000 V and a frequency of 50 or 60 Hz. These bushings are usually a part of an apparatus and tested according to the apparatus of which they form part. It defines the special terms used, service conditions, ratings, general requirements, test procedure and acceptance criteria for these bushings.

IEEE C37.04-1999 (R2006), Standard Rating Structure for AC High-Voltage Circuit Breakers
Covers the rating structure for all high-voltage circuit breakers, which include all voltage ratings above 1000 V ac and comprise both indoor and outdoor types having the preferred ratings as listed in ANSI/IEEE C37.06.

IEEE C37.04-1999/Cor 1-2009, Standard Rating Structure for AC High-Voltage Circuit Breakers - Corrigendum 1
This corrigendum corrects technical and other non-editorial errors made during the preparation of C37.04-1999 latest version.

IEEE C37.04b-2009, IEEE Standard for Rating Structure for AC High-Voltage Circuit Breakers Rated on a Symmetrical Current Basis - Amendment to Change the Description of Transient Recovery Voltage for Harmonization with IEC 62271-100
This standard is revised to change the descriptions of the standard transient recovery voltage (TRV) envelope and ratings.

Establishes uniform guidelines for measurement and reporting of sound produced by ac power circuit breakers. Intended for use in measurement of the sound produced by outdoor circuit breakers in a free-field environment. Methods may be used indoors or in restricted field, provided that precautions are observed in measurement and interpretation of results. Three types of tests are described: design tests, conformance tests, and field tests.

This guide provides a basis for synthetic capacitive current switching tests (see IEEE Std C37.04-1999) and for establishing guidelines for testing to demonstrate the capacitive switching rating of circuit breakers on a single phase basis. The guide contains typical circuits for demonstrating capacitive current switching capability.

IEEE C37.09-1999 (R2007), Standard Test Procedure for AC High-Voltage Circuit Breakers Rated on a Symmetrical Current Basis [Also C37.09a-2005 and C37.09-1999/Cor1-2007]
The testing procedures for all high-voltage circuit breakers that include all voltage ratings above 1000 V ac and comprise both indoor and outdoor types, having the preferred ratings as listed in ANSI C37.06 -1997 are covered. The test procedures verify all assigned ratings, including continuous current, dielectric withstand voltages, short-circuit current, transient recovery voltage, and capacitor switching, plus associated capabilities such as mechanical endurance, load current, and out-of-phase switching. Production test procedures are also included.

IEEE C37.09-1999/Cor1-2007, Standard Test Procedure for AC High-Voltage Circuit Breakers Rated on a Symmetrical Current Basis - Corrigendum 1
Corrects technical and other non-editorial errors made during the preparation of IEEE Std C37.09-1999, which covers test procedure for all high-voltage circuit breakers rated over 1000 Vac.

IEEE C37.09b-2010, Standard Test Procedure for AC High-Voltage Circuit Breakers Rated on a Symmetrical Current Basis - Amendment 2: To Change the Description of Transient Recovery Voltage for Harmonization with IEC 62271-100
This test procedure summarizes the various tests that are made on ac high-voltage indoor and outdoor circuit breakers, except for generator circuit breakers, which are covered in IEEE Std C37.013-1997. It describes accepted methods used in making the tests and specifies the tests that will verify assigned ratings under ANSI/IEEE standards. This procedure does not preclude the use of other equivalent or more effective methods of demonstrating ratings.

This standard applies to, and provides the basis for, the definition, specification, performance analysis, and application of SCADA and automation systems in electric substations, including those associated with generating stations and power utilization and conversion facilities.

This guide provides practices and processes to perform, analyze, and report failure investigations of power circuit breakers.

IEEE C37.100.1-2007, Standard of Common Requirements for High Voltage Power Switchgear Rated Above 1000 V
This new standard collects into one document the requirements that are common in many switchgear standards in an effort to reduce minor inconsistencies between switchgear standards and capture the relevant exceptions among them.

IEEE C37.101-2006, Guide for Generator Ground Protection
Intended to assist protection engineers in applying and relaying schemes for protection against stator ground faults on various generator grounding schemes.

Some equations in Annex A.2 (Phasor diagram analysis) are corrected in this document.

IEEE C37.102-2006 (R2012), Guide for AC Generator Protection
This application guide for the relay protection of synchronous generators presents a review of the generally accepted forms of protection for the synchronous generator and its excitation system. It summarizes the use of relays and devices and serves as a guide for the selection of equipment to obtain adequate protection.
This guide covers tests required to help ensure correct connections of differential relays and polarizing circuits of phase and ground relays. Although other preparatory tests are mentioned in this guide, these tests are not discussed in detail.

This guide describes current automatic reclosing practices for ac distribution and transmission lines. Included within this description are application considerations and coordination practices for reclosing.

IEEE C37.105-2010, Standard for Qualifying Class 1E Protective Relays and Auxiliaries for Nuclear Power Generating Stations
This standard covers qualification of Class 1E Protective Relays and Auxiliaries to be used outside the primary containment in the Nuclear Power Generating Stations. Protective relays and auxiliaries located inside the primary containment in a nuclear power generating station present special conditions beyond the scope of this document.

IEEE C37.106-2003 (R2009), Guide for Abnormal Frequency Protection for Power Generating Plants
This guide assists the protection engineer in applying relays for the protection of generating plant equipment from damage caused by operation at abnormal frequencies including overexcitation.

Guidelines for the application of network protectors are established. The use of network transformers and protectors with distributed resources is addressed.

IEEE C37.109-2006, Guide for the Protection of Shunt Reactors
Provides a comprehensive guide to the methods and configurations for the protection of power system shunt reactors. Included are the protection of oil-immersed reactors equipped with auxiliary power windings, improved turn-to-turn protection, and use of digital (microprocessor-based) protection for shunt reactors.

IEEE C37.110-2007, Guide for the Application of Current Transformers Used for Protective Relaying Purpose
This standard guide describes the characteristics and classification of current transformers (cTcTcTs) used for protective relaying. It also describes the conditions which cause the cT output to be distorted and the effects on relaying systems of this distortion. The selection and application of cTcTcTs for the more common protection schemes are also addressed.

IEEE C37.110-2007/Cor 1-2010, IEEE Guide for the Application of Current Transformers Used for Protective Relaying Purposes - Corrigendum 1: Corrections to Equation 18 and Equation 19
This guide describes the characteristics and classification of current transformers (cTcTs) used for protective relaying. It also describes the conditions that cause the CT output to be distorted and the effects on relaying systems of this distortion. The selection and application of CcTs for the more common protection schemes are also addressed.

IEEE C37.111-2013, Measuring relays and protection equipment - Part 24: Common format for transient data exchange (COMTRADE) for power systems
This standard defines a format for files containing transient waveform and event data collected from power systems or power system models. The standard is for files stored on currently used physical media such as portable external hard drives, USB drives, flash drives, CD, and DVD.

IEEE C37.112-1996 (R2007), Standard Inverse-Time Characteristic for Overcurrent Relays
The inverse-time characteristics of overcurrent relays are defined. Reviews various existing analytic techniques used to represent relay operating characteristic curve shapes and proposes analytical formula representation of typical operating characteristic curve shapes to foster some standardization of available inverse-time relay characteristics provided in microprocessor or computer relay applications.

IEEE C37.113-2015, Guide for Protective Relay Applications to Transmission Lines
Concepts of transmission line protection are discussed in this guide. Applications of these concepts to various system configurations and line termination arrangements are presented. Many important issues, such as coordination of settings, operating times, characteristics of relays, impact of mutual coupling of lines on the protection systems, automatic reclosing and use of communication channels are examined.

Application of protective relays on transmission-line series capacitor banks is covered. Purpose is to provide the reader with ample discussion of the protection and control issues related to series capacitor bank installations.

IEEE C37.117-2007, Guide for the Application of Protective Relays Used for Abnormal Frequency Load Shedding and Restoration
Compiles information on the application of underfrequency load shedding and restoration to ac power systems. Describes various system conditions that may require the use of underfrequency load shedding, and the application of protective relays to various methods of performing underfrequency load shedding.

This guide compiles information on the application considerations for breaker failure protection. The reasons for local backup protection are described. Breaker failure schemes are discussed. Issues relating to the settings of current detectors and timers are discussed for various applications.

This document is intended as a guide for use in developing specifications for ac high-voltage circuit breakers. This guide is for specifications that apply to all indoor and outdoor types of ac high-voltage circuit breakers rated above 1000 volts.

This guide identifies and summarizes circuit breaker manufacturer's information that knowledgeable users will find useful for the receipt, installation, commissioning, operation and maintenance, and decommissioning of high-voltage (>1000V) circuit breakers. This guide recommends categories and an arrangement for the presentation of information in circuit breaker instruction manuals.

IEEE C37.121-2012, Guide for Switchgear - Unit Substation - Requirements
This guide covers three-phase unit substations for step-down operation in the range of 112.5 kVA or greater at primary voltages of 601 V through 38 kV.

IEEE C37.122-2010, Standard for High Voltage Gas-Insulated Substations Rated Above 52 kV
This standard establishes ratings and requirements for planning, design, testing, installation, and operation of gas-insulated substations for alternating-current applications for above 52 kV. Typical installations are assemblies of specialized devices such as circuit breakers, switches, bushings, buses, instrument transformers, cable terminations, instrumentation and controls, and the gas-insulating system. It does not include certain items that may be directly connected to gas-insulated substations, such as power transformers and protective relaying. This standard does not apply to gas-insulated transmission lines.

This guide provides information of special relevance to the planning, design, testing, installation, operation, and maintenance of gas-insulated substations (GIS) and equipment.

IEEE C37.122.3-2011, Guide for Sulphur Hexafluoride (SF6) Gas Handling for High Voltage (over 1000 Vac) Equipment
This guide describes significant aspects of handling SF6 gas used in electric power equipment, such as gas recovery, reclamation, and recycling, in order to keep the gas permanently in a closed cycle and to avoid any deliberate release into the environment.
This guide covers the technical requirements for the design, fabrication, testing, and installation of a gasinsulated substation (GIS).

IEEE C37.13-2015, Standard for Low-Voltage AC Power Circuit Breakers Used in Enclosures
This standard covers the following types and preferred ratings for enclosed low-voltage ac power circuit breakers: a) Stationary or drawout type of two-, three-, or four-pole construction with one or more rated maximum voltages of 1058 V, 730 V, 635 V (600 V for units incorporating fuses), 508 V, or 254 V for application on systems having nominal voltages of 1000 V, 690 V, 600 V, 480 V, or 240 V respectively b) Unfused or fused type c) Manually operated or power operated, with or without a trip system d) Fused drawout assemblies consisting of current-limiting fuses in a drawout assembly

Covers definite purpose switching devices for use in metal-enclosed low-voltage power circuit breaker switchgear. The switching devices shall be fused, drawout type, three-pole construction, with one or more rated maximum ac voltages of 600 V, 508 V, and 254 V for application on systems having nominal ac voltages of 600 V, 480 V, and 240 V. Addresses service conditions, ratings, functional components, temperature limitations and classifications of insulating materials, insulation (dielectric) withstand voltage requirements, test procedures, and application.

IEEE C37.13.1a-2010, Standard for Definite Purpose Switching Devices for Use in Metal-Enclosed Low-Voltage Power Circuit Breaker Switchgear - Amendment: Revise Short-Circuit Rating and Test Requirement
This amendment to the standard revises the short-circuit rating and test requirements for definite purpose switching devices for use in metal-enclosed low-voltage power circuit breaker switchgear

IEEE C37.14-2015, Standard for DC (3200 V and below) Power Circuit Breakers Used in Enclosures
This standard covers the following types, preferred ratings, and testing requirements of enclosed dc power circuit breakers: a) Stationary or drawout type of one- or two-pole functional construction, b) Having rated maximum voltages of up to 3200 V, c) Manually operated or power operated, d) With or without overcurrent trip devices

IEEE C37.16-2009, Standard for Preferred Ratings, Related Requirements, and Application Recommendations for Low-Voltage AC (635V and Below) and DC (3200V and Below) Power Circuit Breakers
This standard defines the preferred ratings for low-voltage ac (635V and below) power circuit breakers, general purpose dc (325V and below) power circuit breakers, heavy duty lowvoltage dc (3200V and below) power circuit breakers, and fused (integrated or non-integrated) lowvoltage ac (600V and below) power circuit breakers.

IEEE C37.2-2008, Standard Electrical Power System Device Function Numbers, Acronyms and Contact Designations
This standard applies to the definition and application of function numbers and acronyms for devices and functions used in electrical substations and generating plants and in installations of power utilization and conversion apparatus. It may be submitted to IEC for consideration.

IEEE C37.20.1-2015, Standard for Metal-Enclosed Low-Voltage (1000 Vac and below, 3200 Vdc and below) Power Circuit Breaker Switchgear
This standard covers metal-enclosed low-voltage power circuit breaker switchgear assemblies containing, but not limited to, such devices as lowvoltage power circuit breakers (fused or unfused); other interrupting devices; switches, control, instrumentation, and metering; and protective and regulating equipment. This standard is concerned with enclosed, rather than open, indoor and outdoor switchgear assemblies. It includes types of equipment that are part of secondary unit substations.

IEEE C37.20.1a-2005 (R2008), Standard for Metal-Enclosed Low-Voltage Power Circuit Breaker Switchgear - Amendment 1: Short-Time and Short-Circuit Withstand Current Tests; Minimum Areas for Multiple Cable Connections
Corrects errors in the base document with respect to dummy elements and metrization of Table 10.

IEEE C37.20.1b-2006 (R2008), Standard for Metal-Enclosed Low-Voltage Power Circuit Breaker Switchgear - Amendment 2: Additional Requirements for Control and Auxiliary Power Wiring in DC Traction Power Switchgear
This amendment addresses additional requirements of auxiliary power wiring and control wiring within dc switchgear of traction power substations with rated maximum voltage up to 3200 volts dc. Provides control and power wiring methods for dc traction power switchgear intended to increase reliability of the operation of the equipment, improve protection, reduce maintenance cost and initial cost, and improve overall performance of the dc traction power switchgear.

IEEE C37.20.2-2015, Standard for Metal-Clad Switchgear
This standard covers metal-clad (MC) switchgear containing, but not limited to, devices such as power circuit breakers, other interrupting devices, switches, control, instrumentation and metering, and protective and regulating equipment. It includes, but is not specifically limited to, equipment for the control and protection of apparatus used for power generation, conversion, and transmission and distribution

IEEE C37.20.3-2001 (R2006), Standard for Metal-Enclosed Interrupter Switchgear
Covers metal-enclosed interrupter (MEI) switchgear assemblies containing, but not limited to, such devices as interrupter switches; selector switches; power fuses; control, instrumentation, and metering devices; and protective equipment. It includes, but is not specifically limited to, equipment for the control and protection of apparatus used for distribution of electrical power.

IEEE C37.20.4-2013, Standard for Indoor AC Switches (1 kV to 38 kV) for Use in Metal-Enclosed Switchgear
This standard covers indoor ac switches rated above 1 kV through 38 kV for use in metal-enclosed switchgear as follows: a) Stationary or drawout 17 b) Manual or power operation 18 c) Fused or unfused

IEEE C37.20.6-2015, Standard for 4.76 kV to 38 kV Rated Ground and Test Devices Used in Enclosures
This standard covers drawout-type, indoor, medium-voltage ground and test (G&T) devices for use in drawout metal-clad switchgear rated 4.76 kV through 38 kV as described in IEEE Std C37.20.2™-1 Four G&T device types are generally supplied for temporary circuit maintenance procedures for insertion in place of the circuit breaker as follows: a) Simple manual devices, b) Complex manual devices, c) Simple electrical devices, d) Complex electrical devices

IEEE C37.20.7-2007, Guide for Testing Metal-Enclosed Switchgear Rated Up to 38kV for Internal Arcing Faults
This guide establishes methods by which metal-enclosed switchgear may be tested for resistance to the effects of arcing due to an internal fault. It also discusses service conditions, installation, and application of equipment. This guide applies only to equipment utilizing air as the primary insulating medium and rated up to 38kV ac.
IEEE C37.21-2005 (R2010), IEEE Standard for Control Switchboards
This standard covers ratings, construction, and testing of dead-front control switchboards containing, but not limited to, devices such as switches, control devices, instrumentation, metering, monitoring, alarms, annunciators, protective and auxiliary relays, and regulating devices and accessories. It includes, but is not specifically limited to, switchboards for the control and protection of apparatus used for or associated with power generation, conversion, transmission, and distribution. Types of switchboards may include control, vertical, dead-front, enclosed, dual, or duplex switchboards.

IEEE C37.23-2015, Standard for Metal-Enclosed Bus
This standard covers assemblies of metal-enclosed conductors along with associated interconnections, enclosures, and supporting structures. The types of assemblies covered are nonsegregated-phase bus, segregated-phase bus, isolated-phase bus, and cable bus. When switches and disconnecting links are included, they shall conform to this standard. This standard encompasses the performance characteristics of indoor and outdoor conductor assemblies with rated maximum operating voltages through 38 kV.

IEEE C37.230-2007, Guide for Protective Relay Applications to Distribution Lines
This guide presents a review of generally accepted applications and coordination of protection for radial power system distribution lines. It examines the advantages and disadvantages of schemes presently being used in protecting distribution lines. In addition, it identifies problems with the methods used in distribution line protection and solutions for those problems.

IEEE C37.231-2006, Recommended Practice for Microprocessor-Based Protection Equipment Firmware Control
Deals with the implications surrounding the use and administration of firmware revisions for protection-related equipment. Attempts to provide guidelines for producers, distributors, and users or protection related equipment utilizing firmware with the intent of helping to maximize the security and reliability of the power system.

IEEE C37.232-2011, Standard for Common Format for Naming Time Sequence Data Files (COMNAME)
This standard defines a procedure for naming time sequence data (TSD) files that originate from digital protection and measurement devices, such as transient data records, event sequences, and periodic data logs. The filename includes, among other features, key portions of the information contained in the file, including, but not limited to, the names of the circuit, substation and recording device, and the date and time of event occurrence.

This guide covers suggested test requirements for Power System Protection Scheme Testing. System Application Tests, the scope and level of tests based on the application, and benefits of the overall protective schemes testing. This guide encompasses overall system testing procedures (generators, line, line reactors, transformer, capacitors, Special protection schemes, end-to-end testing, distributed application within substation, etc.), data collection requirements, as well as the test procedure definitions. The Guide describes the methods, extent, and types of system tests for protection applications, at various voltage levels. Control functions which are inherent to the protective systems are included. Importance of line testing, indirect trip applications, and open / closed loop tests (dynamic / non-linear tests) are also covered.

IEEE C37.234-2009, Guide for Protective Relay Applications to Power System Buses
Concepts of power bus protection are discussed in this guide. Consideration is given to availability and location of breakers, current transformers and disconnectors as well as bus switching scenarios, and their impact on the selection and application of bus protection.

IEEE C37.235-2007, Guide for the Application of Rogowski Coils used for Protective Relaying Purposes
This Guide establishes criteria and requirements for application of Rogowski Coils (RC) (air-core current sensor) used for protective relaying in electric power systems. The selection and application of RCs for the more common protection schemes are addressed.

This standard specifies a common profile for use of IEEE 1588-2008 Precision Time Protocol (PTP) in power system protection, control, automation and data communication applications utilizing an Ethernet communications architecture. The profile specifies a well-defined subset of IEEE 1588-2008 mechanisms and settings aimed at enabling device interoperability, robust response to network failures, and deterministic control of delivered time quality. It specifies the preferred physical layer (Ethernet), higher level protocol used for PTP message exchange and the PTP protocol configuration parameters.

IEEE C37.239-2010, Standard for Common Format for Event Data Exchange (COMFEDE) for Power Systems
This standard defines a format for files containing event data such as sequence of events or fault summary reports collected from power systems or power system models. The format is intended to provide an easily interpretable form for use in exchanging data.

This guide provides information to assist in evaluating the effect of solar radiation on outdoor metal-enclosed switchgear, including metal-enclosed bus and control switchboards.

IEEE C37.242-2013, Guide for Synchronization, Calibration, Testing, and Installation of Phasor Measurement Units (PMUs) for Power System Protection and Control
The document provides guidance for synchronization, calibration, testing, and installation of Phasor Measurement Units (PMU) applied in power system protection and control.

This guide presents practical line current differential schemes using digital communications. Operating principles, synchronization methods, channel requirements, current transformer requirements, external time reference requirements, backup considerations, testing considerations and troubleshooting are included. It also provides specific guidelines for various application aspects including multi-terminal lines, series compensated lines, mutually coupled lines, line charging current, in-zone transformers and reactors, single-phase tripping and reclosing, as well as communications channel requirements.

IEEE C37.244-2013, Guide for Phasor Data Concentrator Requirements for Power System Protection, Control, and Monitoring
This guide describes performance, functional and communication needs of phasor data concentrators (PDC) for power system protection, control and monitoring applications. The guide covers synchronophase system needs and testing procedures for PDCs. It includes functional requirements for associated interfaces with phasor measurement units (PMU) to a PDC and PDC systems.

This guide provides methods for determining the value of power factor for inductive lowvoltage (1000 volts ac and below) test circuits. These methods are used in determining power factor during short-circuit current tests in high power laboratories.

This guide applies to unfused low-voltage ac power circuit breakers of the 635 V maximum voltage class with separately-mounted current-limiting fuses for use on ac circuits with available short-circuit currents of 200 000 A (rms symmetrical) or less. Low-voltage ac fused power circuit breakers and combinations of fuses and molded-case circuit breakers are not covered by this guide.

This guide provides evaluation methods and application considerations for high voltage (>1000 V) switches, as covered in IEEE Std C37.30.1TM-2011, under wind loading conditions. This guide includes testing methods to meet both usual and unusual wind conditions.

This guide describes the testing of fault current limiters (FCLs) operating on condition-based impedance increase for AC systems 1000 V and above. This guide does not include constant impedance series reactors and single fuses.

IEEE C37.40-2003 (R2009), Standard Service Conditions and Definitions for High-Voltage Fuses, Distribution Enclosed Single-Pole Air Switches, Fuse Disconnecting Switches, and Accessories

Service conditions and definitions for high-voltage fuses (above 1000 V), distribution enclosed single-pole air switches, fuse disconnecting switches, and accessories for ac distribution systems are covered.

This standard specifies design test requirements for high-voltage (above 1000 V) fuses, distribution enclosed single-pole air switches, disconnecting cutouts, fuse disconnecting switches, and accessories for use on ac power and distribution systems. Devices with rated maximum voltages to 170 kV are covered.

IEEE C37.42-2009, Standard for Specifications for High Voltage (>1000 Volts) Explosion Type Distribution Class Fuses, Fuse and Disconnecting Cutouts, Fuse Disconnecting Switches and Fuse Links and Accessories Used with These Devices

This standard establishes specifications for high voltage (above 1000 volts) explosion type distribution class fuses, cutouts, fuse disconnecting switches, fuse links and associated accessories. All of these devices are intended for use on alternating current distribution systems.

IEEE C37.43-2008, Standard Specifications for High-Voltage Expulsion, Current-Limiting and Combination Type Distribution and Power Class External Fuses, with Rated Voltages from 1 kV through 38 kV, Used for the Protection of Shunt Capacitors

This standard establishes specifications for high voltage (above 1000 volts) distribution and power class expulsion, current-limiting and combination type external capacitor fuses and accessories, with rated voltages from 1 kV through 38 kV, for protecting shunt capacitors complying with ANSI/IEEE 18-2002 and NEMA CP 1.

IEEE C37.45-2007, Standard Specifications for High Voltage Distribution Class Enclosed Single-Pole Air Switches with Rated Voltages from 1 through 8.3 kV

This standard establishes specifications for high voltage (above 1000 V) distribution class enclosed single-pole air switches and associated accessories with rated voltages from 1 through 8.3 kV. All of these devices are intended for use on alternating current distribution systems.

IEEE C37.46-2010, Standard Specifications for High Voltage (>1000 V) Expulsion and Current-Limiting Power Class Fuses and Fuse Disconnecting Switches

This standard establishes specifications for high voltage (above 1000 V) expulsion and current-limiting type power class fuses, and accessories. All of these devices are intended for use on alternating current systems.

IEEE C37.47-2011, Standard Specifications For High Voltage (> 1000 V) Current-Limiting Type Distribution Class Fuses and Fuse Disconnecting Switches

This standard establishes specifications for high voltage (above 1000 volts) distribution class current limiting type fuses and associated accessories. All of these devices are intended for use on alternating current systems.

This guide presents information on the application, operation, and maintenance of high-voltage fuses (above 1000 V), distribution enclosed single-pole air switches, fuse disconnecting switches, and accessories for use on ac distribution systems. Devices with rated maximum voltages to 169 kV are covered.

IEEE C37.48.1-2002 (R2008), Guide for the Operation, Classification, Application, and Coordination of Current-Limiting Fuses with Rated Voltages 1-38 kV

This guide provides additional guidelines for application and coordination of high-voltage power-and-distribution-class current-limiting fuses.

IEEE C37.59-2007, Standard Requirements for Conversion of Power Switchgear Equipment

This standard covers power switchgear equipment that is converted from a qualified design. It provides direction and guidance in those conversions and specifies required design verification in accordance with applicable American National Standards Institute (ANSI), National Electrical Manufacturers Association (NEMA), Underwriters Laboratories Inc. (UL), or IEEE standards. This standard also recognizes that production/field testing does not provide design verification. This can only be accomplished by means of design testing and technical evaluation.

IEEE C37.63-2013, Standard Requirements for Overhead, Pad-Mounted, Dry-Vault, and Submersible Automatic Line Sectionalizers for Alternating Current Systems Up to 38 kV

This standard applies to all overhead, pad-mounted, dry-vault, and submersible single-pole or multi-pole alternating-current automatic line sectionalizers for rated maximum voltages from 1000 V to 38 000 V. Voltages above 38 000 V shall be considered special applications.

IEEE C37.74-2014, Standard Requirements for Subsurface, Vault, and Padmounted Load-Interrupter Switchgear and Fused Load-Interrupter Switchgear for Alternating Current Systems up to 38 kV

This standard applies to enclosed assemblies of single-phase and three-phase, dead-front and live-front, subsurface, vault, and pad-mounted, load-interrupter switches with or without protective devices such as fuses or fault interrupters, up to 38 kV rated maximum voltage.

IEEE C37.81-1989 (R2009), Guide for Seismic Qualification of Class 1E Metal-Enclosed Power Switchgear Assemblies

This guide provides requirements and guidance for the seismic qualification of metal-enclosed power switchgear assemblies including switching, interrupting, control, instrumentation, metering, and protective and regulating devices mounted therein.

IEEE C37.82-1987 (R2009), Standard for the Qualification of Switchgear Assemblies for Class 1E Applications in Nuclear Power Generating Stations

This document describes the methods and requirements for qualifying switchgear assemblies for indoor areas outside of the containment in nuclear power generating stations. These assemblies include 1) Metal-enclosed low-voltage power circuit breaker switchgear assemblies, as defined in ANSI/IEEE C37.20.1-1987, 2) Metal-clad switchgear assemblies, as defined in ANSI/IEEE C37.20.2-1987, 3) Metal-enclosed bus, as defined in ANSI/IEEE C37.23-1987, and 4) Metal-enclosed interrupter switchgear assemblies, as defined in ANSI/IEEE C37.20.3-1987.

IEEE C37.90-2011, Relays and Relay Systems Associated with Electric Power Apparatus

Specifies standard service conditions, standard ratings, performance requirements, and testing requirements for relays and relay systems used to protect and control power apparatus. A relay system may include computer interface equipment and/or communications interface equipment, such as a carrier transmitter/receiver or audio tone equipment.
IEEE C37.90.2-2004 (R2010), Standard for Withstand Capability of Relay Systems to Radiated Electromagnetic Interference from Transceivers

This standard defines a required withstand level and establishes a test method to evaluate the susceptibility of protective relays to single-frequency electromagnetic fields in the radio frequency domain, such as those generated by portable or mobile radio transceivers and wireless communication devices. This publication includes test requirements, signal levels, and setups.

IEEE C37.90.3-2001 (R2006), Standard Electrostatic Discharge Tests for Protective Relays

Describes test procedure, test point selection, test level, and acceptance criteria for repeatable electrostatic discharge immunity evaluations for tabletop and floor-standing protective relay equipment. Simulator characteristics for hand/metal ESD testing are specified for both the air and contact discharge methods.

IEEE C37.91-2008, Guide for Protecting Power Transformers

This guide emphasizes practical applications, and also provides a review of general philosophy and economic considerations involved in power transformer protection. It describes types of faults in transformers. It also discusses technical problems with the protection systems, including the behavior of current transformers (CTs) during system faults, and associated problems, such as fault clearing and re-energization.

IEEE C37.92-2005 (R2011), Analog Inputs to Protective Relays from Electronic Voltage and Current Transducers

Defines the interface between voltage or current transducer systems or sensing systems with analog electronic outputs, and suitably designed protective relays or other substation measuring equipment. These transducer systems reproduce the power system waveforms as scaled values. This standard also defines requirements for optional intermediate summing or ratio-adjusting amplifiers required to add or subtract the outputs of more than one sensing system for measurement by a single relay or measuring device.

IEEE C37.93-2004 (R2010), Guide for Power System Protective Relay Applications of Audio Tones Over Voice Grade Channels

This guide contains information and recommendations for applying audio tones over voice grade channels for power system relaying, including transmitting and receiving equipment, leased voice grade channels, application principles, installation, and testing. Reflected in this guide is the knowledge and experience of equipment manufacturers and telephone companies as well as that of power utility users.

IEEE C37.94-2002 (R2008), N times 64 kilobit per second Optical Fiber Interfaces Between Teleprotection and Multiplexer Equipment

This standard describes the interconnection details for N, where N = 1, 2, 4, 8, 12, 16, or 32. This standard covers the requirements of optical fiber interfaces for use in teleprotection systems, including single- and multi-channel multiplexers. The standard also defines requirements for optional intermediate interconnections.

IEEE C37.95-2002 (R2007), Guide for Protective Relaying of Utility-Consumer Interconnections

This guide covers protective relay applications involving electric service to consumers that requires a transformation between the utility’s supply voltage and the consumer’s utilization voltage. It describes the factors that need to be considered in the design of adequate protection facilities, outlines modern relay practices, and provides several examples of the protection of typical utility-consumer interconnections.

IEEE C37.96-2012, Guide for AC Motor Protection

This application guide presents generally accepted methods of protection for ac motors. It identifies and summarizes the functions necessary for adequate protection of motors based on type, size, and application. The recommendations in this guide are based on typical installations. Information relating to protection requirements, including microprocessor based protection systems, applications, and setting philosophy is provided to enable the reader to determine required protective functions for motor installations.

This guide applies to the protection of shunt power capacitor banks and filter capacitor banks. Included are guidelines for reliable applications of protection methods intended for use in many shunt capacitor applications and design

IEEE C50.12-2005 (R2010), Standard for Salient-Pole 50 Hz and 60 Hz Synchronous Generators and Generator/Motors for Hydraulic Turbine Applications Rated 5 MVA and Above

The requirements in this standard apply to all types of 50 Hz and 60 Hz salient-pole synchronous generators and generator/motors rated 5 MVA and above to be used for hydraulic turbine or hydraulic pump/turbine applications.

IEEE C50.13-2005 (R2010), Standard for Cylindrical-Rotor 50 Hz and 60 Hz Synchronous Generators Rated 10 MVA and Above

The requirements in this standard apply to all 50 Hz and 60 Hz, two-pole and four-pole, cylindrical-rotor synchronous generators driven by steam turbines and/or by combustion gas turbines. The drive may be direct or through a gearbox or other device that permits different speeds for the turbine and the generator. The generators covered by this standard are to have rated outputs of 10 MVA and above. Cylindrical-rotor, two-pole and four-pole generators below this rating are generally covered by NEMA MG 1-2003 [B18].1

IEEE C57.104-2009, Guide for the Interpretation of Gases Generated in Oil-Immersed Transformers

Detailed procedures for analyzing gas from gas spaces or gas-collecting devices as well as gas dissolved in oil are described. The intent is to provide the operator with positive and useful information concerning the serviceability of the equipment.

IEEE C57.105-1992 (R2008), Guide for Application of Transformer Connections in Three-Phase Distribution Systems

This guide applies to transformer connections in 3-phase distribution systems. This guide emphasizes practical applications and design considerations involved in power transformer protection. It describes types of faults in transformers. It also discusses technical problems with the protection systems, including the behavior of current transformers (CTs) during system faults, and associated problems, such as fault clearing and re-energization.

This guide applies to mineral oil used in transformers, load tap changers, voltage regulators, and reactors. The guide discusses the following: a) Analytical tests and their significance for the evaluation of mineral insulating oil. b) The evaluation of new, unused mineral insulating oil before and after filling into equipment. c) The evaluation of in-service mineral insulating oil. d) Health and environmental care procedures for mineral insulating oil. e) Methods of handling and storage of mineral insulating oil.

This guide sets forth recommendations believed essential for the application of overcurrent protective devices applied to limit the exposure time of transformers to short circuit current. Transformer coordination curves are presented for four categories of transformers. There is no intent to imply overload capability.
IEEE C57.110-2008, Recommended Practice for Establishing Liquid-Filled and Dry-Type Power and Distribution Transformer Capability When Supplying Nonsinusoidal Load Currents

This Recommended Practice provides calculation methods to conservatively evaluate the feasibility for an existing dry-type or liquid-filled transformer, to supply nonsinusoidal load currents as a portion of the total load. It also provides necessary application information to assist in properly specifying a new transformer expected to carry a load, a portion of which is composed of nonsinusoidal load currents. It includes examples and reference annexes.

This guide recommends standard tests and evaluation procedures for silicone transformer fluid. Criteria for maintenance and methods of reconditioning of silicone fluid are described.

IEEE C57.113-2010, Recommended Practice for Partial Discharge Measurement in Liquid-Filled Power Transformers and Shunt Reactors

Partial discharge measurements in transformers and shunt reactors should preferably be made on the basis of measurement of the apparent charge. Relevant measuring systems are classified as narrow-band or wide-band systems. Both systems are recognized and widely used. Without giving preference to one or the other, it is the object of this document to describe the wide-band method.

IEEE C57.119-2002 (R2008), Recommended Practice for Performing Temperature Rise Tests on Oil Immersed Power Transformers at Loads Beyond Nameplate Ratings

This recommended practice covers temperature rise test procedures for determining those thermal characteristics of power transformers needed to appraise the transformer’s load carrying capabilities at specific loading conditions other than rated load.

IEEE C57.12.00-2015, Standard for General Requirements for Liquid-Immersed Distribution, Power, and Regulating Transformers

This standard describes electrical and mechanical requirements of liquid-immersed distribution and power transformers, and autotransformers and regulating transformers, single-phase and polyphase, with voltages of 601 V or higher in the highest voltage winding.

IEEE C57.12.01-2015, Standard for General Requirements for Dry-Type Distribution and Power Transformers

This standard describes electrical and mechanical requirements of single and polyphase ventilated, non-ventilated, and sealed dry-type distribution and power transformers or autotransformers, with a voltage of 601 V or higher in the highest voltage winding.

IEEE C57.12.10-2011, Standard Requirements for Liquid-Immersed Power Transformers

This standard sets forth the requirements for power transformer application. This standard is intended for use as a basis for performance, interchangeability, and safety of equipment covered, and to assist in the proper selection of such equipment. This is a product standard which covers certain electrical, dimensional, and mechanical characteristics of 50 and 60 Hz, liquid-immersed power and auto-transformers.

IEEE C57.12.20-2011, Standard for Overhead Type Distribution Transformers, 500 kVA and Smaller: High Voltage, 34 500 Volts and Below; Low Voltage, 7970/13 800Y Volts and Below

This standard covers certain electrical, dimensional, and mechanical characteristics and safety features of single- and three-phase, 60 Hz, mineral-oil-immersed, self-cooled, overhead-type distribution transformers 500 kVA and smaller, high voltages 34 500 V and below and low voltages 7970/13 800Y V and below.

IEEE C57.12.23-2009, Standard for Submersible Single-Phase Transformers: 167 kVA and Smaller; High Voltage 25 000 V and Below; Low Voltage 600 V and Below

This standard covers certain electrical, dimensional, and mechanical characteristics and takes into consideration certain safety features of single-phase, 60 Hz, liquid-immersed, self-cooled, submersible distribution transformers with separable insulated high-voltage connectors. It is intended for use as a basis for determining performance, interchangeability, and safety of the equipment covered, and to assist in the proper selection of such equipment.

IEEE C57.12.24-2009, Standard for Submersible, Three-Phase Transformers, 3750 kVA and Smaller: High Voltage, 34 500 GrdY/19 920 Volts and Below; Low Voltage, 600 Volts and Below

This standard is intended for use as a basis for establishing the performance, electrical and mechanical interchangeability, and safety of the equipment covered, and to assist in the proper selection of such equipment.

IEEE C57.12.30-2010, Standard for Pole-Mounted Equipment - Enclosure Integrity for Coastal Environments

This standard covers conformance tests and requirements for the enclosure integrity of pole-mounted equipment for installations in coastal environments, containing apparatus energized in excess of 600V, typically not accessible to the general public, such as but not limited to the following types of equipment: pole-mounted transformers, pole-mounted switches, pole-mounted regulators, pole-mounted metering equipment, pole-mounted reclosers/sectionalizers, pole-mounted capacitors.

IEEE C57.12.31-2010, Standard for Pole-Mounted Equipment - Enclosure Integrity

This standard covers conformance tests and requirements for the enclosure integrity of pole-mounted equipment containing apparatus energized in excess of 600V, typically not accessible to the general public, such as but not limited to the following types of equipment: pole-mounted distribution transformers, pole-mounted switches, pole-mounted regulators, pole-mounted metering equipment, pole-mounted reclosers/sectionalizers, pole-mounted capacitors.

IEEE C57.12.32-2002 (R2008), Submersible Equipment – Enclosure Integrity

This standard covers conformance tests and requirements for the integrity of carbon steel and copper bearing steel submersible electrical enclosures intended for installation in submerged or partially submerged environments.

IEEE C57.12.34-2015, Standard Requirements for Pad-Mounted, Compartmental-Type, Self-Cooled, Three-Phase Distribution Transformers, 10 MVA and Smaller; High-Voltage, 34.5 kV Nominal System Voltage and Below; Low-Voltage, 15 kV Nominal System Voltage and Below

This standard covers certain electrical, dimensional, and mechanical characteristics and takes into consideration certain safety features of three-phase, 60 Hz., liquid filled, self-cooled, pad-mounted, compartmental-type distribution transformers. These transformers are rated 5 10 MVA and smaller, with the high voltage limit of 34.5 kV system nominal voltage and below, and with low voltage limit of 15 kV system nominal voltage and below. These transformers are generally used for step-down purposes from an underground primary cable supply.

IEEE C57.12.35-2007, Standard Bar Coding for Distribution Transformers

This standard covers bar code label requirements for specific types of distribution transformers and step-voltage regulators. Data content for temporary and permanent bar code labeling is described as well as bar code label print quality and durability requirements.

IEEE C57.12.36-2007, Standard Requirements for Liquid-Immersed Distribution Substation Transformers

This standard sets forth the requirements for indoor/outdoor distribution substation transformer application that is not covered by ANSI/IEEE distribution and power transformer standards. This standard is intended for use as a basis for performance, interchangeability, and to assist in the proper selection of such equipment.

Provides a basis for the electronic reporting of transformer test data on liquid immersed distribution transformers.
IEEE C57.12.38-2009, Standard for Padmounted Type, Self-Cooled, Single Phase Distribution Transformers; High Voltage, 34500 GrdY/19920 Volts and below, Low voltage, 480 Volts and below; 167 KVA and smaller
This standard covers certain electrical, dimensional, mechanical characteristics and safety requirements of single-phase, 60 Hz, liquid filled, self-cooled, padmounted, compartmental-type distribution transformers. These transformers are rated 167 KVA and smaller, with the higher voltage limit of 34.5 kV system nominal voltage and below, and low voltage of 480 volts & below. These transformers are generally used for step-down purposes from an underground primary cable supply. This standard covers the connector, bushing and terminal arrangements for radial or loop feed systems. This standard does not cover the electrical and mechanical requirements of any accessory devices that may be supplied with the transformer.

IEEE C57.12.40-2006, Standard Requirements for Secondary Network Transformers, Subway and Vault Types (Liquid-Immersed)
Covers certain electrical, dimensional, and mechanical characteristics and takes into consideration certain safety features of three-phase, 60 Hz, liquid-immersed, secondary network transformers with a three position grounding switch, subway and vault types, rated 2500 kVA and smaller; primary 34 400 volts and below; secondary 216Y/125 volts and 480Y/277 volts.

IEEE C57.12.51-2008, Standard for Ventilated Dry-Type Power Transformers, 501 kVA and Larger, Three-Phase, with High-Voltage 601 to 34500 Volts; Low-Voltage 208Y/120 to 4160 Volts - General Requirements
This standard is intended to set forth characteristics relating to performance, limited electrical and mechanical interchangeability, and safety of the equipment described, and to assist in the proper selection of such equipment.

IEEE C57.12.58-1991 (R2008), Guide for Conducting a Transient Voltage Analysis of a Dry-Type Transformer Coil
This guide covers general recommendations for measuring voltage transients in dry-type distribution and power transformers are provide. Recurrent surge voltage generator circuitry, instrumentation, test sample, test point location, mounting the test coil, conducting the test, and reporting results are also covered.

IEEE C57.12.59-2015, Guide for Dry-Type Transformer Through-Fault Current Duration
This guide for dry-type transformer through-fault current duration applies to dry-type distribution and power transformers built in accordance with IEEE Std C57.12.01™ Standard General Requirements for Dry-Type Distribution and Power Transformers.

This Test Procedure for the thermal evaluation of insulation systems of dry type power and distribution transformers, including both open-wound technology and solid-cast / encapsulated technology is to be used for determining the temperature classification of the insulation systems.

IEEE C57.12.70-2000 (R2006), Standard Terminal Markings and Connections for Distribution and Power Transformers
Standard terminal markings and connections are described for single-phase and three-phase distribution, power, and regulating transformers.

IEEE C57.12.80-2010, Standard Terminology for Power and Distribution Transformers
This standard is a compilation of terminology and definitions related to electric power and distribution transformers and associated apparatus. It also includes similar terminology relating to power systems and insulation which is commonly involved in transformer technology.

This standard describes methods for performing tests specified in IEEE Std C57.12.00™ and other standards applicable to liquid-immersed distribution, power, and regulating transformers. It is intended for use as a basis for performance and proper testing of such transformers.

IEEE C57.120-1991 (R2006), Loss Evaluation Guide for Power Transformers and Reactors
A method for establishing the dollar value of the electric power needed to supply the losses of a transformer or reactor is provided.

IEEE C57.123-2010, Guide for Transformer Loss Measurement
This guide provides background information and general recommendations of instrumentation, circuitry, calibration and measurement techniques of no-load losses (excluding auxiliary losses), excitation current, and load losses of power and distribution transformers. The test codes, namely, IEEE Std C57.12.90, C57.12.91, and the test code section of IEEE Std C57.15, provide specifications and requirements for conducting these tests. This guide has been written to provide supplemental information for each test.

IEEE C57.125-2015, Guide for Failure Investigation, Documentation, Analysis, and Reporting for Power Transformers and Shunt Reactors
This guide recommends a procedure to be used to perform and document a failure analysis and the reporting and statistical analysis of reliability of power transformers and shunt reactors used on electric power systems.

IEEE C57.127-2007, Guide for the Detection and Location of Acoustic Emissions from Partial Discharges in Oil-Immersed Power Transformers and Reactors
This guide is applicable to the detection and location of acoustic emissions from partial discharges and other sources in oil-immersed power transformers and reactors. Both electrical sources (partial discharge) and mechanical sources (such as loose clamping, bolts, or insulation parts) generate these emissions. There are descriptions of acoustic instrumentation, test procedures, and interpretation of results.

IEEE C57.129-2007, Standard for General Requirements and Test Code for Oil-Immersed HVDC Converter Transformers
The electrical, mechanical, and physical requirements of oil-immersed singlephase and three-phase converter transformers are specified. Tests are described and test code defined. Devices such as arc furnace transformers and rectifier transformers for industrial or locomotive applications are not covered.

IEEE C57.13-2008, Standard Requirements for Instrument Transformers
This standard is intended for use as a basis for performance and interchangeability of equipment covered, and to assist in the proper selection of such equipment. Safety precautions are also addressed. It covers certain electrical, dimensional, and mechanical characteristics, and takes into consideration certain safety features of current and inductively coupled voltage transformers of types generally used in the measurement of electricity and the control of equipment associated with the generation, transmission, and distribution of alternating current.

IEEE C57.13.1-2006, Field Testing of Relaying Current Transformers
Describes field test methods that assure that current transformers are connected properly, are of marked ratio and polarity, and are in a condition to perform as designed both initially and after having been in service for a period of time.

IEEE C57.13.2-2005 (R2010), Standard Conformance Test Procedure for Instrument Transformers
This standard describes the tests and documentary requirements for conducting a conformance test on instrument transformers.

IEEE C57.13.5-2009, Standard of Performance and Test Requirements for Instrument Transformers of a Nominal System Voltage of 115 kV and Above
This standard applies to single-phase instrument transformers of a nominal system voltage of 115 kV and above with capacitive insulation system for line-to-ground connection and for both indoor and outdoor application.
IEEE C57.13.6-2005 (R2010), Standard for High-Accuracy Instrument Transformers
This standard defines one new 0.15 accuracy class for voltage transformers, two new 0.15 accuracy classes for current transformers, two new current transformer burdens, and two new current transformer routine accuracy test methods.

This document provides guidance in the application of dissolved gas analysis (DGA) to transformers and reactors subjected to factory temperature rise tests. This document consists of evaluation procedures and guidelines for acceptable levels of gases generated in conventional mineral-oil-filled transformers and reactors during factory temperature rise tests.

IEEE C57.135-2012, Guide for the Application, Specification and Testing of Phase Shifting Transformers
This guide covers the application, specification, theory of operation, and factory and field testing of single-phase and three-phase oil-immersed phase-shifting transformers (PST). This guide is limited to matters particular to PSTs and does not include shifting transformers (PST). This guide is limited to reactors during factory temperature rise tests.

IEEE C57.139-2015, Guide for Dissolved Gas Analysis in Transformer Load Tap Changers
This guide discusses and recommends methods of testing and evaluating dissolved gases in mineral based transformer oils found in Load Tap Changers (FTCs). General types of LTC mechanisms, breathing configurations, and electrical design will be included for evaluation criteria in determining when mechanical damage or failure has occurred. Dissolved Gas Analysis (DGA) of the oil in the LTC is required.

IEEE C57.140-2010, Guide to Describe the Occurrence and Mitigation of Switching Transients Induced by Transformer, Switching Device, And System Interaction
This Guide addresses the application of transformers in the presence of oscillatory switching transients. These oscillatory transients are typically produced by the interaction of the switching device, transformer, load, and system. This Guide defines operating conditions that may produce switching voltages damaging to the transformer insulation system. It discusses the electrical characteristics of the system source, switching device, transformer, and load and the nature of their transient interaction. It outlines several mitigation methods.

IEEE C57.143-2012, Guide for Application for Monitoring Equipment to Liquid-Immersed Transformers and Components
This guide covers identification of the key parameters that can be monitored for obtaining an indication of the condition of liquid-immersed transformers. It also covers risk/benefit analysis, sensor application, and monitoring systems application. This guide does not cover interpretation of monitoring results.

IEEE C57.144-2004 (R2010), Guide for Metric Conversion of Transformer Standards
A consistent and accurate method of converting dimensions and quantities in transformer standards to SI units is provided in this guide.

IEEE C57.146-2005 (R2011), Guide for the Interpretation of Gases Generated in Silicone-Immersed Transformers
This guide is intended to apply to silicone-immersed transformers in which the silicone fluid was the fluid supplied when the transformer was originally manufactured. This guide also addresses the following: the theory of combustible gas generation in a silicone-filled transformer; recommended procedures for sampling and analysis; recommended actions based on the interpretation of results; a bibliography of related literature.

IEEE C57.148-2011, Standard for Control Cabinets for Power Transformers
This Standard will provide minimum and optional function, layout and construction requirements for standard control cabinet designs. It will also include a coding system for specifying standard control cabinets with the required options. This standard will apply to Class 1 and Class 2 power transformers and will not apply to distribution nor padmount design transformers.

IEEE C57.149-2012, Guide for the Application and Interpretation of Frequency Response Analysis for Oil-Immersed Transformers
This guide is applicable to the measurement of Frequency Response Analysis (FRA) of an oil immersed power transformer. The guide will include the requirements and specifications for instrumentation, procedures for performing the tests, techniques for analyzing the data, and recommendations for long-term storage of the data and results. This guide can be used in both field and factory applications.

IEEE C57.15-2009, Standard Requirements, Terminology, and Test Code for Dry-Type Air-Core Series-Connected Reactors
This standard applies to series-connected dry-type air-core single-phase and three-phase outdoor or indoor reactors of distribution and transmission voltage class that are connected in the power system to control power flow under steady-state conditions and or limit fault current under short-circuit conditions. Dry-type air-core reactors covered by this standard are self-cooled by natural air convection.

IEEE C57.150-2012, Guide for the Transportation of Transformers and Reactors Rated 10 000 KVA or Higher
This guide provides recommendations and considerations for the transportation of transformers and reactors rated 10 000 KVA or larger. It provides information for minimizing the risk of damage and delays in the moving of transformers and reactors regarding their design, shipment preparation, transportation, heavy hauling, and arrival inspections.

IEEE C57.152-2013, Guide for Diagnostic Field Testing of Fluid-Filled Power Transformers, Regulators, and Reactors
This guide describes diagnostic field tests and measurements that are performed on fluid-filled power transformers and regulators. Whenever possible, shunt reactors are treated in a similar manner to transformers.

IEEE C57.153-2015, Guide for Parallelizing Regulating Transformers
This paralleling guide describes and compares control methods of paralleling regulating transformers. The control methods include: master/follower, circulating current, power factor, circulating reactive current and negative reactance methods.

IEEE C57.157-2015, Guide for Conducting Functional Life Tests on Switch Contacts Used in Insulating Liquid-Immersed Transformers
This guide is intended for use in establishing a methodology to evaluate expected long term performance of infrequently operated switch contacts used within insulating liquid filled immersed transformers. These switch contacts are typically found in de-energized tapchangers, dual voltage switches, reversing switches, on-load tapchangers, and step voltage regulators, but the test might possibly be used to evaluate any contact that is used in insulating liquids with similar operating characteristics and within similar environments.

IEEE C57.16-2011, Standard Requirements, Terminology, and Test Code for Dry-Type Air-Core Series-Connected Reactors
This standard applies to series-connected dry-type air-core single-phase and three-phase outdoor or indoor reactors of distribution and transmission voltage class that are connected in the power system to control power flow under steady-state conditions and or limit fault current under short-circuit conditions. Dry-type air-core reactors covered by this standard are self-cooled by natural air convection.

IEEE C57.163-2015, Guide for Establishing Power Transformer Capability while under Geomagnetic Disturbances
This guide describes the effects of Geomagnetic Disturbances (GMD) on power transformers when there is the presence of Geomagnetically Induced Current (GIC) in a power transformer. It establishes specification parameters and performance characteristics for power transformers to help minimize the risk and impact when GIC is present in the power system.

IEEE C57.17-2012, Standard Requirements for Arc Furnace Transformers
This standard covers electrical characteristics and mechanical features of liquid-immersed transformers 69 kV or less (but not limited to 69 kV), used for supplying electric power to direct arc-melting furnaces.
IEEE C57.19-2004 (R2010), IEEE Standard General Requirements and Test Procedures for Power Apparatus Bushings
This standard applies to power apparatus bushings that have basic impulse insulation levels of 110 kV and above for use as components of oil-filled transformers and oil-filled reactors.

IEEE C57.19.100-2012, Guide for Application of Power Apparatus Bushings
Guidance on the use of outdoor power apparatus bushings is provided in this document. The bushings are limited to those built in accordance with IEEE Std C57.19.00-1991 (not the latest revision). The latest revision of C57.19.00 does not address the use of condenser bushings in oil circuit breakers and several voltage classes were dropped that are still in use.

IEEE C57.21-2008, Standard Requirements, Terminology, and Test Code for Shunt Reactors Rated Over 500 kVA
This standard covers all oil-immersed or dry-type, single-phase or three-phase, outdoor or indoor shunt reactors rated over 500 kVA. It states terminology and general requirements and sets forth the basis for rating shunt reactors. Routine, design, and other tests are described. It also covers losses and impedance, temperature rise, dielectric tests, and insulation levels, as well as construction requirements for oil-immersed reactors and construction and installation requirements for dry-type reactors. This standard also covers thyristor controlled shunt reactors used in a static VAR compensator (SVC).

This standard applies to devices used for the purpose of controlling the ground current or the potentials to ground of an alternating current system. These devices are: grounding transformers, ground-fault neutralizers, resistors, reactors, or combinations of these devices.

The scope of this guide covers mineral insulating oil commonly defined as transformer oil; definition and description of reclaiming procedures; the test methods used to evaluate the progress and end point of the reclamation process, and what criteria recommended for the use of reclaimed oils are considered suitable. This guide does not cover the use of oil in new apparatus under warranty.

IEEE C57.93-2007, Guide for Installation and Maintenance of Liquid-Immersed Power Transformers
This guide provides guidance and recommended practices on the installation and maintenance of liquid-immersed power transformers rated 501 kVA and above with secondary voltages of 1000 V and above. It covers the entire range of power transformers, including extra high voltage (EHV) transformers. This guide does not cover special transformers such as furnace transformers, rectifier transformers etc. Distinctions are made as required for various MVA ratings, voltage ratings, and types of liquid insulation.

IEEE C57.94-2015, Recommended Practice for Installation, Application, Operation, and Maintenance of Dry-Type Distribution and Power Transformers
This recommended practice covers general recommendations for the application, installation, operation, and maintenance of all single and polyphase ventilated, non-vented, and sealed dry-type distribution and power transformers or autotransformers, including those with solid-cast and/or resin encapsulated windings.

IEEE C62.11a-2008, Standard for Metal-Oxide Surge Arresters for AC Power Circuits (> 1 kV) - Amendment: Short-Circuit Tests for Station, Intermediate and Distribution Arresters
New procedures for short-circuit testing of station, intermediate and distribution arresters would replace existing pressure-relief and short-circuit test procedures for these classes of arrester.

IEEE C62.21-2003 (R2009), Guide for the Application of Surge Voltage Protective Equipment on AC Rotating Machinery 1000 V and Greater (including IEEE C62.21/Cor1-2008)
This guide covers the application of surge voltage protective equipment to ac rotating machines rated 1000 V and greater. This standard, the first part of which may be assembled from any combination of series and/or parallel diode chips.

This standard applies to two or three terminal, four or five layer, thyristor surge protection devices (SPDs) for application on systems with voltages equal to or less than 1000 V rms or 1200 V dc. These protective devices are designed to limit voltage surges on communication circuits and on power circuits operating from direct current (dc) to 420 Hz. The thyristor SPD can be manufactured with unidirectional or bidirectional, symmetrical, or asymmetrical V-I characteristics.

This application guide applies to Thyristor Surge Protective Components (SPCs) used in systems with voltages up to 1000 Vrms or 1200 Vdc. These components are designed to limit overvoltage and divert surge currents by limiting the voltage and switching to a low impedance state.

This standard sets terms, test methods, test circuits, measurement procedures and preferred result values for series connected, self-restoring current limiter components used in low-voltage telecommunication circuit surge protection. It is only applicable for components in telecommunications circuits with sinusoidal ringing voltages up to 150 V rms at 15 Hz to 70 Hz and dc powering voltages up to 400 V.

This guide describes the surge voltage, surge current, and temporary overvoltages (TOV) environment in low-voltage [up to 1000 V root mean square (rms)] dc power circuits. This scope does not include other power disturbances, such as notches, sags, and noise.

IEEE C62.43-2005 (R2010), IEEE Guide for the Application of Surge Protectors Used in Low-Voltage (Equal to or Less than 1000 V, rms, or 1200 V, DC) Data, Communications, and Signaling Circuits

This guide provides assistance in selecting the most appropriate type of surge protector for a particular data, communication, and/or signaling circuit application. The purpose of this guide is to enable an understanding and an evaluation of the functions of the various types of multiple-component data, communications, and signaling circuit protectors in terms of particular applications.

IEEE C62.45-2002 (R2008), Recommended Practice on Surge Testing for Equipment Connected to Low-Voltage (1000 V and Less) AC Power Circuits

The scope of this recommended practice is the performance of surge testing on electrical and electronic equipment connected to low-voltage ac power circuits, specifically using the recommended test waveforms defined in IEEE Std C62.41.2 & #153; 1998. The recommendations are applicable to any surge testing, regardless of the specific surges that may be applied.

IEEE C62.62-2010, Standard Test Specifications for Surge-Protective Devices (SPDs) for Use on the Load Side of the Service Equipment in Low Voltage (1000 V and Less) AC Power Circuits

This standard applies to surge-protective Devices (SPDs) intended to be installed on the load side of the service equipment connected to 50 Hz or 60 Hz AC power circuits rated at 1000 V (rms) or less. Performance characteristics and standard methods for testing and rating are established for these devices, which may be composed of any combination of components. The tests in this standard are aimed at providing comparisons among the variety of surge-protective devices available.

IEEE C62.64-2009, Standard Specifications for Surge Protectors Used in Low-Voltage Data, Communications, and Signaling

This standard applies to surge protectors for application on multi-conductor and coaxial, balanced or unbalanced, data, communications, and signaling circuits with voltages less than or equal to 1000 V rms, or 1200 V dc. These surge protectors are intended to limit voltage surges, current surges, or both.

IEEE C62.72-2007, Guide for the Application of Surge Protective Devices for Low Voltage (1000 Volts or Less) AC Power Circuits

Information is provided to specifiers and users of surge protective devices (SPDs) about the application considerations associated with power distribution systems within North America. Applies to SPDs to be connected to the load side of the service entrance main over current protective device of 50 Hz or 60 Hz ac power circuits rated at 100-1000 Vrms.

The scope of this project is to summarize the general considerations in grounding of generating station auxiliary power systems, the factors to be considered in selecting between the appropriate grounding classes and specifying equipment ratings. This guide applies to both medium-voltage (1kV - 15kV) and low-voltage (less than 1kV) auxiliary power systems.

This document provides information on the basic factors and general considerations in selecting the class and means of neutral grounding for a particular ac transmission or sub-transmission system, and the suggested method and apparatus to be used to achieve the desired grounding.

IEEE C93.4-2012, Standard for Power-Line Carrier Line-Tuning Equipment (30 kHz to 500 kHz) Associated with Power Transmission Lines

This standard applies to power-line carrier line-tuning equipment connected between the coupling capacitors and power-line carrier transmitter/receiver terminals operating in the frequency range of 30 to 500 kHz over power transmission lines and cables or to similar line-tuning equipment in a carrier bypass. Power-line carrier line-tuning equipment includes assemblies and components: tuning inductor, impedance matching transformer, balancing transformer, tuning capacitor, inductance-capacitance (LC) tuning unit, hybrid, filter, protective unit, interconnecting cables and enclosure.

IEEE C95.1-2006, Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz

Provides recommendations to protect against harmful effects in human beings exposed to electromagnetic fields in the frequency range from 3 kHz to 300 GHz. Intended to apply in controlled environments and for general population exposure.

IEEE C95.3-2002 (R2008), Recommended Practice for Measurements and Computations of Radio Frequency Electromagnetic Fields With Respect to Human Exposure to Such Fields, 100 kHz-300 GHz

The scope of this recommended practice is to revise and develop specifications for preferred methods for measuring and computing external radio frequency electromagnetic fields to which persons may be exposed.

IEEE C95.3.1-2010, Recommended Practice for Measurements and Computations of Electric, Magnetic, and Electromagnetic Fields with Respect to Human Exposure to Such Fields, 0 - 100 kHz

This recommended practice describes 1) methods for measuring external electric and magnetic fields and contact currents to which persons may be exposed, 2) instrument characteristics and the methods for calibrating such instruments, and 3) methods for computation and the measurement of the resulting fields and currents that are induced in bodies of humans exposed to these fields. This recommended practice is applicable over the frequency range of 0 to 100 kHz.

IEEE C95.4-2002 (R2008), Recommended Practice for Determining Safe Distances from Radio Frequency Transmitting Antennas When Using Electric Blasting Caps During Explosive Operations

This document provides recommended practices for the prediction and practical determination of safe distances from radio and radar transmitting antennas when using electric blasting caps to remotely detonate an explosive charge.

IEEE C95.6-2007, Standard for Safety Levels with Respect to Human Exposure to Electromagnetic Fields, 0-3 kHz

This standard makes recommendations to prevent harmful effects in human beings exposed to electromagnetic fields in the frequency range of 0–3 kHz. The recommendations are intended to apply to exposures of the general public, as well as to individuals in controlled environments. They are not intended to apply to the purposeful exposure of patients by or under the direction of practitioners of the healing arts and may not be protective with respect to the use of medical devices or implants. A rationale that describes how the recommendations were arrived at, and the factors taken into account in formulating them, is included.

IES (Illuminating Engineering Society)

Today's digital technology, in both control systems and light sources, offers new potential to better control the lighting system and provide the right amount of lighting when required.
Errata for ANSI/IES LM-80-15 changes to Section 6.1 DUT Photometric and Electrical Measurements.

ANSI/IES RP-1-2013, IES Recommended Practice for Office Lighting
ANSI/IES RP-1-12 Recommended Practice for Office Lighting covers the current design standards for commercial office spaces, and is updated with new illumination levels corresponding with the IES Lighting Handbook, 10th Edition, 2011, as well as many updates for energy codes.

ANSI/IES RP-22-2011, Practice for Tunnel Lighting
New material on lamp data added since first public review

ANSI/IES RP-27.3-2017, Photobiological Safety for Lamps - Risk Group Classification and Labeling
The purpose of this standard (BSR/IES RP-27.3-xx) is to provide the criteria for proper categorization, classification, and informational requirements of lamps so that such sources may be properly applied in the design of lamp systems.

An update of ANSI/IES RP-28-07 includes major additions centered on the aging population and those with low vision. Seniors represent the fastest growing segment of the population with over 40 million Americans over 65.

ANSI/IES RP-29-2016, Lighting for Healthcare Facilities
This practice provides guidelines for good lighting, inspires the designers of lighting systems so that the sick and infirm will have a more comfortable and enjoyable recovery environment.

ANSI/IES RP-8-2014, IES Recommended Practice for Roadway Lighting
ANSI/IES RP-8-xx Recommended Practice for Roadway Lighting covers the current design standards for roadway lighting, and is updated with new illumination levels, as well as many updates for new technologies.

ANSI/IESNA DG-3-2000 (R2015), Application of Luminaire Symbols on Lighting Design Drawing
This Design Guide provides a consistent guideline for creating a symbology for luminaires represented on drawings.

ANSI/IESNA LM-63-2002 (R2008), File Format for the Electronic Transfer of Photometric Data and Related Information
This standard addresses photometric data file formats for lighting data transfer and for data storage and retrieval.

A standard procedure by which entertainment lighting luminaires, specifically designed for use in theater, AV environment, film studios or on-location shoots can be measured.

ANSI/IESNA RP-16-2005, Addendum c-2009, Nomenclature and Definitions for Illuminating Engineering
Modified language to maintain harmony as much as possible with international standards and popular usage.

ANSI/IESNA RP-16-2005, Addendum c-2016, Nomenclature and Definitions for Illuminating Engineering - Addendum C
Advances in lighting technology (e.g. LEDs) have created new lighting terminology. Better measurement techniques have led to more international agreement in fundamental units and constants used in basic laws of physics. There is greater use of SI units today in illuminating engineering. This Standard reflects these changes with several new terms and definitions, and revisions in existing definitions.

ANSI/IESNA RP-16-2005, Nomenclature and Definitions for Illuminating Engineering
The standard reflects advances in lighting technology and new lighting terminology and updates terms and definitions for illuminating engineering.

ANSI/IESNA RP-16a-2008, Nomenclature and Definitions for Illuminating Engineering
With the increased use of solid state lighting devices, it has become necessary to establish definitions for LEDs, their components, and performance characteristics to insure a common understanding of the terminology.

ANSI/IESNA RP-16b-2009, Nomenclature and Definitions for Illuminating Engineering, Addenda
Update to a previous addendum (A) in constantly changing terminology for solid state lighting (LED sources).

ANSI/IESNA RP-27.1-2015, Recommended Practice for Photobiological Safety of Lamps and Lamp Systems-General Requirements
This recommended practice covers the evaluation and control of optical radiation hazards from all electrically powered sources of optical radiation that emit in the wavelength form 200 nm to 3,000 nm except for light emitting diodes (LEDs) used in optical fiber communications systems and for lasers which are covered in a separate series of ANSI standards (series 2136).

This standard applies to electrically powered light sources of optical radiation that emit in the wavelength range from 200 nm to 3,000 nm. It offers guidance regarding problems related to photobiological hazard measurements.

ANSI/IESNA RP-3-2013, Recommended Practice on Lighting for Educational Facilities
Lighting is a critical element in the school environment. Lighting can influence behavior, satisfaction, psychological responses to a space and task performance, communication and interest, visual comfort and safety and security, while defining space and architecture.

ANSI/IESNA RP-30-2016, Recommended Practice for Museum Lighting
BSR/IES RP-30 Museum Lighting includes current lighting techniques and new lighting technology since 1996 and intended for lighting designers, museum administrators, curators, and exhibit designers.

ANSI/IESNA RP-7-2012, Recommended Practice for Lighting Industrial Facilities
A comprehensive treatment of lighting in the industrial environment. It provides guidance to achieve efficient, reliable and easily maintained lighting systems.

IEST (Institute of Environmental Sciences and Technology)

ANSI/IEST/ISO 14644-1-2015, Cleanrooms and associated controlled environments - Part 1: Classification of air cleanliness by particle concentration
This Final Draft of ISO 14644 establishes the classification of air cleanliness in terms of concentration of airborne particles in cleanrooms and clean zones; and separative devices as defined in ISO 14644-7:2004. Only particle populations having cumulative distributions based on threshold (lower limit) particle sizes ranging from 0.1 μm to 5 μm are considered for classification purposes. The use of light scattering (discrete) airborne particle counters (LSAPC) is the basis for determination of the concentration of airborne particles, equal to and greater than the specified sizes, at designated sampling locations. This part of ISO 14644 does not...
ANSI/IEST/ISO 14644-2-2015, Cleanrooms and associated controlled environments - Part 2: Monitoring to provide evidence of cleanroom performance related to air cleanliness by particle concentration

This Final Draft of ISO 14644 specifies minimum requirements for a monitoring plan for cleanroom or clean zone performance related to air cleanliness by particle concentration, based upon parameters that measure or affect airborne particle concentration. This part of ISO 14644 does not address condition monitoring of aspects such as vibration or general maintenance of the engineering systems. It does not provide for monitoring of particle populations that are outside the specified lower threshold particle-size range, 0.1 μm to 5 μm. Concentrations of ultrafine particles (particles smaller than 0.1 μm) are addressed in ISO 14644:2 - 1).

This part of ISO 14644 specifies test methods for designated classification of airborne particulate cleanliness and for characterizing the performance of cleanrooms and clean zones. Performance tests are specified for two types of cleanrooms and clean zones: those with unidirectional flow and those with non-unidirectional flow, in three possible occupancy states: as-built, at-rest and operational. The test methods recommend test apparatus and test procedures for determining performance parameters.

This part of ISO 14644 specifies requirements for the design and construction of cleanroom installations but does not prescribe specific technological or contractual means to meet these requirements. It is intended for use by purchasers, suppliers and designers of cleanroom installations and provides a checklist of important parameters of performance. Construction guidance is provided, including requirements for start-up and qualification. Basic elements of design and construction needed to ensure continued satisfactory operation are identified through the consideration of relevant aspects of operation and maintenance. Note: Further guidance in respect of the above requirements is given in annexes A to H. Other parts of ISO 14644 may provide complementary information. Application of this part of ISO 14644 is restricted in the following: user requirements are represented by purchaser or specifier; specific processes to be accommodated in the cleanroom installation are not specified; fire and safety regulations are not considered specifically—the appropriate national and local requirements should be respected; process media and utility services are only considered with respect to their routing between and in the different zones of cleanliness; regarding initial operation and maintenance, only cleanroom construction-specific requirements are considered.

This part of ISO 14644 specifies basic requirements for cleanroom operations. It is intended for those planning to use and operate a cleanroom. Aspects of safety that have no direct bearing on contamination control are not considered in this part of ISO 14644 and national and local safety regulations must be observed. This document considers all classes of cleanrooms used to produce all types of products. Therefore, it is broad in application and does not address specific requirements for individual industries. Methods and programmes for routine monitoring within cleanrooms are not covered in detail in this part of ISO 14644 but reference is made to ISO 14644-2 and ISO 14644-3 for monitoring particles and ISO 14698-1 and ISO 14698-2 for monitoring micro-organisms.

ANSI/IEST/ISO 14644-7-2004, Cleanrooms and associated controlled environments-Part 7: Separative devices (clean air hoods, gloveboxes, isolators and minienvironments

This part of ISO 14644 specifies the minimum requirements for the design, construction, installation, test and approval of separative devices, in those respects where they differ from cleanrooms as described in ISO 14644-4 and 14644-5. The application of this part of ISO 14644 takes into account the following limitations: user requirements are as agreed by customer and supplier; application-specific requirements are not addressed; specific processes to be accommodated in the separative-device installation are not specified; fire, safety and other regulatory matters are not considered specifically; where appropriate, national and local regulations apply. This part of ISO 14644 is not applicable to full-suits.

ANSI/IEST/ISO 14644-8-2006, Cleanrooms and associated controlled environments - Part 8: Classification of airborne molecular contamination

This part of ISO 14644 covers the classification of airborne molecular contamination (AMC) in cleanrooms and associated controlled environments, in terms of airborne concentrations of specific chemical substances (individual, group or category) and provides a protocol to include test methods, analysis and time weighted factors within the specification for classification. (Full scope as presented in Standard includes additional limitations.

IIAR (International Institute of Ammonia Refrigeration)

ANSI/IIAR 1-2017, Definitions and Terminology Used in IIAR Standards

This Standard provides a unified set of definitions for use in the IIAR Standards. A set of common definitions is provided to prevent confusion for those that use IIAR Standards. This Standard is a companion to ANSI/IIAR Standards.

The standard is being revised and shall provide the minimum safe requirements for application and design of ammonia refrigeration systems.

ANSI/IIAR 3-2017, Ammonia Refrigeration Valves

The purpose of this standard is to specify performance criteria for valves and strainers used in closed-circuit ammonia refrigeration systems.

ANSI/IIAR 4-2015, Installation of Closed-Circuit Ammonia Refrigeration Systems

Standard shall provide the minimum requirements for the safe installation of closed-circuit ammonia refrigeration systems.

ANSI/IIAR 5-2013, Start-up and Commissioning of Closed-Circuit Ammonia Mechanical Refrigerating Systems

This standard specifies minimum requirements for the start-up and commissioning of ammonia mechanical refrigerating systems.

ANSI/IIAR 7-2013, Developing Operating Procedures for Closed-Circuit Ammonia Mechanical Refrigerating Systems

This standard includes the minimum criteria for operating procedures for closed-circuit ammonia mechanical refrigerating systems.

ANSI/IIAR 8-2015, Decommissioning of Closed-Circuit Ammonia Refrigeration Systems

This Standard specifies minimum criteria for removing the ammonia charge and decommissioning of closed-circuit ammonia refrigeration systems.

IICRC (the Institute of Inspection, Cleaning and Restoration Certification)

ANSI/IICRC S100-2015, Standard for Professional Cleaning of Textile Floor Coverings

This standard describes the procedures, methods, and systems to be followed when performing professional commercial and residential textile floor coverings (e.g., carpet and rugs) maintenance and cleaning.

This Standard provides a specific set of practical standards for water damage restoration. It does not attempt to teach comprehensive water damage restoration procedures; rather, it provides the foundation for basic principles of proper restoration practices. It does not attempt to include exhaustive performance characteristics or standards for the manufacture or installation of structural components, materials and contents (personal property).

The S600 Standard and Reference Guide will cover both Residential and Commercial Carpet Installations. This industry consensus document will give specific guidance for the proper, recommended procedures for installing various carpet products in different types of installations. Note: All comments must be submitted on the comment form provided by IICRC. Contact Mili at mili@iicrc.org for comment form.

ANSI/IICRC S800-2013, Standard and Reference Guide for Professional Inspection of Textile Floor Coverings

The scope of the S800 includes inspection of textile floor covering including carpet and rugs. The S800 establishes a procedural standard and reference guide for professionally inspecting textile floor coverings.

IKECA (International Kitchen Exhaust Cleaning Association)

ANSI/IKECA C10-2016, Standard for the Methodology for Cleaning Commercial Kitchen Exhaust Systems

This standard is intended to determine the methodology for frequency and necessity for commercial kitchen exhaust system cleaning through inspection procedures, to define acceptable methods for cleaning exhaust systems and components, and to set standards for acceptable post-cleaning cleanliness.

ANSI/IKECA-I10-2015, Standard for the Methodology for Inspection of Commercial Kitchen Exhaust Systems

This standard shall provide minimum requirements for inspecting commercial kitchen exhaust systems and system components for mechanical conditions, structural integrity, fire safety, and cleanliness levels.

ILTVA (International Light Transportation Vehicle Association, Inc.)

ANSI/ILTVA Z130.1-2012, Standard for Golf Cars - Safety and Performance Specifications

This standard provides safety and performance specifications relating to golf cars, driven by electric motors or internal combustion engines specifically intended for and used on golf courses for transporting golfers and their equipment. This standard does not apply to Personal Transport Vehicles, (PTVs), which are covered by ANSI Z135.

This standard provides safety and performance specifications relating to personal transport vehicles, (PTVs), driven by electric motors or internal combustion engines to be operated on designated roadways, or within a closed community where permitted by law or by regulatory authority rules. This standard does not apply to golf cars, which are covered by ANSI Z130.1.

InfoComm (InfoComm International)

ANSI/INFOCOMM 10-2013, Audiovisual Systems Performance Verification

Provides a framework and supporting processes for determining elements of an audiovisual system that need to be verified; the timing of that verification within the project delivery cycle; a process for determining verification metrics, and reporting procedures. Consultants, integrators, manufacturers, technology support staff, owners, third-party commissioning agents, and architects who have verification processes in place can integrate those existing processes into the framework this Standard provides, adding customized items to those already defined in the Standard.

ANSI/INFOCOMM 2M-2010, Audiovisual Systems Design and Coordination Components

A successful professional audiovisual system installation depends on the clear definition and coordination of processes, resources, and responsibilities of the design and installation project teams. A properly documented audiovisual system provides the information necessary to understand and implement the system goals and project requirements in a logical and efficient manner. The documentation should complement and coordinate related architectural, engineering, and construction documentation. This standard outlines a consistent set of the standard tasks, responsibilities, and deliverables required for professional audiovisual systems design and construction.

ANSI/INFOCOMM 3M-2011, Projected Image System Contrast Ratio

Defines projected image system contrast ratio and its measurement. It applies to both permanently installed systems and live events. It applies to front and rear projection. This Standard defines four contrast ratios based on content viewing requirements. System contrast ratio refers to the image as it is presented to viewers in a space with ambient light. Practical metrics to measure and validate the defined contrast ratios are provided. This Standard includes an optional HTML test pattern (appendix), which can be downloaded as a zip file from: http://docdev.infocomm.org/apps/group_public/documents.php?view=openforcomment

Addresses power consumption management of audiovisual systems. Although the requirements and procedures can be applied to many types of audiovisual systems, this Standard pertains to audiovisual systems that have been permanently installed. This Standard addresses requirements of the audiovisual system as a whole, while allowing the user flexibility in design and selection of individual components. No power consumption or efficiency requirements for components are made as part of this Standard. An ROI spreadsheet and an energy management plan spreadsheet form are available for download at www.infocomm.org/standardsforms.

ANSI/INFOCOMM A102.01-2017, Audio Coverage Uniformity in Listener Areas

This Standard defines parameters for characterizing an audio system’s coverage of defined listening areas. It provides performance classifications and measurement procedures to assess the uniformity of coverage of an audio system’s early arriving sound, with the goal of achieving consistent sound pressure levels throughout the defined listening areas.

ANSI/INFOCOMM V202.01:2016 , Display Image Size for 2D Content in Audiovisual Systems

This Standard determines required display image size and relative viewing positions according to two defined viewing needs: Basic Decision Making and Analytical Decision Making. The Standard can be used to design a new space or to assess/modify an existing space, from either drawings or the space itself. It applies to both permanently installed systems and temporary systems. The Standard applies to the overall system and not the performance or efficiency of any component.
INMM (ASC N14) (Institute of Nuclear Materials Management)

ANSI N14.1-2012, Uranium Hexafluoride - Packagings for Transport
This standard provides criteria for packagings used for transport of uranium hexafluoride (UF6). It includes specific information on design and fabrication requirements for the procurement of new UF6 packagings for transportation of 0.2205 lb (0.1 kg) or more of UF6. This standard also defines the requirements for in-service inspections, cleanliness, and maintenance for packagings in service. Packagings currently in service and not specifically defined in this standard are acceptable for use, provided that they are used within their original design limitations and are inspected, tested, and maintained so as to comply with the intent of this standard.

ANSI N14.5-2014, Leakage Tests on Packagings for Shipment
This Standard specifies methods for demonstrating that Type B packages designed for transport of normal form radioactive material comply with the containment requirements of Title 10 of the Code of Federal Regulations Part 71 (10 CFR Part 71). This Standard describes package release limits, methods for relating package release limits to allowable and reference leakage rates and minimum requirements for leakage rate test procedures.

ANSI N14.7-2013, Guidance for Packaging Type A Quantities of Radioactive Materials
This standard was prepared to provide guidance to individuals responsible for developing the design of packagings for transport of radioactive material limited to Type A quantities including fissile material that does not exceed the limits authorized under the general license sections of the US NRC regulation for packaging and transportation of radioactive material. This standard is also intended to assist those who test, evaluate, fabricate, fill, ship, or otherwise perform functions related to Type A packages in accordance with applicable regulatory requirements.

ANSI/N14.36-2013, Measurement of Radiation Level and Surface Contamination for Packages and Conveyances
This standard sets forth methods for radiation and contamination measurement for packaging and transportation of radioactive material by all transportation modes and during all phases of transportation activities. The objective of this standard is to provide users with an approach to conformance with regulations that control residual surface contamination and external radiation of shipping packages and conveyances.

ANSI N15.36-2010, American National Standard for Methods of Nuclear Material Control -- Measurement Control Program -- Nondestructive Assay Measurement Control and Assurance
This standard is directed to the scientist or engineer, with appropriate technical training, who is responsible for establishing, maintaining, or supervising a measurement control program for nondestructive assay of nuclear materials. The measurement control program provides administration, evaluation, and control of the measurement process and ensures that the measurement process provides results of sufficient quality for facility operations.

ANSI N15.51-2007, Methods of Nuclear Material Control Measurement Control Program - Nuclear Materials Analytical Chemistry Laboratory
This standard provides the principal elements of a measurement control program for an analytical chemistry laboratory supporting nuclear fuel cycle activities. The ability to safely manage and to maintain accounts of these materials requires measurement of the materials as they are produced, used, shipped, stored, and inventoried. A comprehensive measurement control program demonstrates the reliability of the measurement data, quantifies the performance of the measurement system, assures that the measurements are suitable for the intended use, and provides for detection and correction of adverse changes.

This standard defines administrative practices for generating and reporting of nondestructive assay (NDA) data regarding holdup deposits. It provides guidance on procedures, definition of terms, definition of quality objectives, vocabulary, recordkeeping, application of techniques, calculation, reporting of values, and uncertainties so that some consistency of use can be achieved by as large a community of stakeholders as practicable.

ANSI N15.8-2009 (R2015), Standard for Methods of Nuclear Material Control - Material Control Systems - Special Nuclear Material Control and Accounting Systems for Nuclear Power Plants
This standard provides the principle elements of a system for the controlling and accounting for special nuclear material (SNM) at a nuclear power plant. It sets forth the fundamentals of an SNM control and accounting system, including criteria for the receipt, internal control, physical inventory, and shipment of SNM.

INMM (ASC N15) (Institute of Nuclear Materials Management)

ANSI IT4.185-2018, American National Standard for Test Method for ascertaining the Purity of Ferric Ammonium Ethylenediaminetetraacetic Acid (EDTA) [Ethylenedinitrolyl(tetraacetic Acid), and Its Salts
This standard establishes criteria for the purity of photographic-grade ferric ammonium ethylenediaminetetraacetic acid (EDTA) and its salts, and describes the tests to be used to determine the purity.

ANSI IT4.189-1984 (R2007), Photography (Chemicals) – Sodium Thiocyanate
This standard establishes criteria for the purity of photographic-grade sodium thiocyanate crystals and sodium thiocyanate solution (50%), and describes the tests to be used to determine the purity.

INMM (Materials Management)

ANSI N15.7-2012, Uranium Hexafluoride - Packagings for Transport
This standard provides criteria for packagings used for transport of uranium hexafluoride (UF6). It includes specific information on design and fabrication requirements for the procurement of new UF6 packagings for transportation of 0.2205 lb (0.1 kg) or more of UF6. This standard also defines the requirements for in-service inspections, cleanliness, and maintenance for packagings in service. Packagings currently in service and not specifically defined in this standard are acceptable for use, provided that they are used within their original design limitations and are inspected, tested, and maintained so as to comply with the intent of this standard.

ANSI N14.5-2014, Leakage Tests on Packagings for Shipment
This Standard specifies methods for demonstrating that Type B packages designed for transport of normal form radioactive material comply with the containment requirements of Title 10 of the Code of Federal Regulations Part 71 (10 CFR Part 71). This Standard describes package release limits, methods for relating package release limits to allowable and reference leakage rates and minimum requirements for leakage rate test procedures.

ANSI N14.7-2013, Guidance for Packaging Type A Quantities of Radioactive Materials
This standard was prepared to provide guidance to individuals responsible for developing the design of packagings for transport of radioactive material limited to Type A quantities including fissile material that does not exceed the limits authorized under the general license sections of the US NRC regulation for packaging and transportation of radioactive material. This standard is also intended to assist those who test, evaluate, fabricate, fill, ship, or otherwise perform functions related to Type A packages in accordance with applicable regulatory requirements.

ANSI/N14.36-2013, Measurement of Radiation Level and Surface Contamination for Packages and Conveyances
This standard sets forth methods for radiation and contamination measurement for packaging and transportation of radioactive material by all transportation modes and during all phases of transportation activities. The objective of this standard is to provide users with an approach to conformance with regulations that control residual surface contamination and external radiation of shipping packages and conveyances.

ANSI N15.36-2010, American National Standard for Methods of Nuclear Material Control -- Measurement Control Program -- Nondestructive Assay Measurement Control and Assurance
This standard is directed to the scientist or engineer, with appropriate technical training, who is responsible for establishing, maintaining, or supervising a measurement control program for nondestructive assay of nuclear materials. The measurement control program provides administration, evaluation, and control of the measurement process and ensures that the measurement process provides results of sufficient quality for facility operations.

ANSI N15.51-2007, Methods of Nuclear Material Control Measurement Control Program - Nuclear Materials Analytical Chemistry Laboratory
This standard provides the principal elements of a measurement control program for an analytical chemistry laboratory supporting nuclear fuel cycle activities. The ability to safely manage and to maintain accounts of these materials requires measurement of the materials as they are produced, used, shipped, stored, and inventoried. A comprehensive measurement control program demonstrates the reliability of the measurement data, quantifies the performance of the measurement system, assures that the measurements are suitable for the intended use, and provides for detection and correction of adverse changes.

This standard defines administrative practices for generating and reporting of nondestructive assay (NDA) data regarding holdup deposits. It provides guidance on procedures, definition of terms, definition of quality objectives, vocabulary, recordkeeping, application of techniques, calculation, reporting of values, and uncertainties so that some consistency of use can be achieved by as large a community of stakeholders as practicable.

ANSI N15.8-2009 (R2015), Standard for Methods of Nuclear Material Control - Material Control Systems - Special Nuclear Material Control and Accounting Systems for Nuclear Power Plants
This standard provides the principle elements of a system for the controlling and accounting for special nuclear material (SNM) at a nuclear power plant. It sets forth the fundamentals of an SNM control and accounting system, including criteria for the receipt, internal control, physical inventory, and shipment of SNM.

ANSI/IREC 14732-2014, General Requirements for the Accreditation of Clean Energy Certificate Programs
This standard forms the foundation for the accreditation of certificate-awarding entities that develop and administer credit or non-credit clean energy-related programs offered in formal educational institutions and other legal entities. For the purposes of this standard, clean energy technologies and practices include renewable energy, energy efficiency, distributed renewable energy generation, and other sustainability practices.

IS&T (The Society for Imaging Science & Technology)

ANSI IT4.206-1984 (R2007), Photography (Chemicals) – 5-Nitrobenzimidazole Nitrate
This standard establishes criteria for the purity of photographic-grade 5-nitrobenzimidazole nitrate and describes the tests to be used to determine the purity.

ANSI IT4.207-1982 (R2007), Photography (Chemicals) – Sodium Bromide
This specification establishes criteria for the purity of photographic grade sodium bromide and describes the test to be used to determine the purity.

ANSI IT4.234-1986 (R2007), Photography (Chemicals) – Trisodium Phosphate, Dodecahydrate
This standard establishes criteria for purity of photographic-grade trisodium phosphate, dodecahydrate and describes the tests to be used to determine the purity.

ANSI/II 13A IT4.177-1983 (R2007), Photography (Chemicals) – Sodium Thiocyanate
This standard establishes criteria for the purity of photographic grade sodium thiocyanate crystals and sodium thiocyanate solution (50%), and describes the tests to be used to determine the purity.

ANSI/II 13A IT4.185-1987 (R2007), Photography (Chemicals) – Ethylenediaminetetraacetic Acid (EDTA) [(Ethylenedinitrolyl(tetraacetic Acid), and Its Salts
This standard establishes the criteria for the purity of photographic-grade ethylenediaminetetraacetic acid (EDTA) and its salts, and describes the tests to be used to determine the purity.

ANSI/II 13A IT4.189-1984 (R2007), Photography (Chemicals) – Ferric Ammonium Ethylenediaminetetraacetate Solution and Sodium Ferric Ethylenediaminetetraacetate Trihydrate
This standard establishes criteria for the purity of photographic-grade ferric ammonium ethylenediamine - tetraacetate solution and sodium ferric ethylenediaminetetraacetate trihydrate and indicates the test methods to be used to determine their purity.
ISA (Organization) (International Society of Automation)

ANSI/ISA 100.11a-2011, Wireless Systems for Industrial Automation: Process Control and Related Applications

This standard will present a wireless industrial process automation network to address control, alerting, and monitoring applications plant-wide. The focus will be on field devices with the ability to scale to large installations. It will address wireless infrastructure, interfaces to legacy host applications plus security, and network management requirements in a functionally scalable manner.

ANSI/ISA 101.01-2015, Human Machine Interfaces for Process Automation Systems

Scope encompasses human machine interfaces (HMI) for equipment and automated processes, in applications including continuous, batch, discrete processes, and any process using an HMI for interfacing to a controlled system. There may be differences in implementation to meet the specific needs based on process type.

ANSI/ISA 107.01-2013, Industry Standard File Format for Revolution-Based Tip Timing Data

This standard presents the file format to be utilized for data acquired by a revolution-based tip timing data system. It standardizes the following: - All header information needed to describe the contents of the data file - The format of the header - The definition and type of all variable names - The format of the sensor(s) data blocks

ANSI/ISA 12.10.02 (IEC 61241-0:2006) (R2015), Electrical Apparatus for Use in Zone 20, Zone 21, and Zone 22 Hazardous (Classified) Locations - General Requirements

This standard specifies general requirements for the design, construction, testing and marking which is applicable to electrical apparatus protected by any recognized protection technique for use in areas where combustible dust may be present in quantities that could lead to a fire or explosion hazard.

ANSI/ISA 12.12.01-2015 / CAN/CSA C22.2 No. 213, Nonincendive Electrical Equipment for Use in Class I and II, Division 2 and Class III, Divisions 1 and 2 Hazardous (Classified) Locations, same as CAN/CSA C22.2 No. 213

The purpose of this standard is to provide minimum requirements for the design, construction, and marking of electrical equipment or parts of such equipment for use in Class I and Class II, Division 2 and Class III, Divisions 1 and 2 hazardous (classified) locations.

ANSI/ISA 18.2-2016, Management of alarm systems for the process industries

Addresses the development, design, installation, and management of alarm systems in the process industries. Alarm management includes multiple work processes throughout the alarm system lifecycle. This standard defines the terminology and models to develop an alarm system, and it defines the work processes recommended to effectively maintain the alarm system throughout the lifecycle.

ISI/ISA 5.06.01-2007, Functional Requirements Documentation for Control Software Applications

This standard establishes control software documentation requirements for that class of industrial automation equipment and systems consisting of distributed control systems, programmable controllers, and industrial personal computers. It provides techniques for documenting control system software, and establishes a basis for validation of run-time application software after it is developed and tested to ensure that the initial requirement specification has been met.

IAN/ISA 5.1-2009, Instrumentation Symbols and Identification

Establishes a uniform means of designating instruments and instrumentation systems used for industrial process measurement and control. To this end, a designation system is presented that includes symbols and an identification code.

IAN/ISA 50.00.01-1975 (R2012), Compatibility of Analog Signals for Electronic Industrial Process Instruments

This document applies to analog dc signals used in process control and monitoring systems to transmit information between subsystems or separated elements of systems. Its purpose is to provide for compatibility between the several subsystems or separated elements of given systems.

IAN/ISA 61241-1 (12.10.03)-2007 (R2015), Electrical Apparatus for Use in Zone 21 and Zone 22 Hazardous (Classified) Locations - Protection by Enclosures "tD"

This standard is applicable to electrical apparatus protected by enclosures and surface temperature limitation for use in explosive dust atmospheres classified as zone 21 or zone 22 hazardous locations in accordance with Article 506 of the NEC®. It specifies requirements for design, construction and testing of electrical apparatus.

IAN/ISA 61241-11 (12.10.04)-2007 (R2015), Electrical Apparatus for Use in Zone 20, Zone 21 and Zone 22 Hazardous (Classified) Locations - Protection by Intrinsic Safety "iD"

This standard specifies requirements for the construction and testing of intrinsically safe apparatus intended for use in an explosive dust atmosphere and for associated apparatus that is intended for connection to intrinsically safe circuits which enter such atmospheres.

IAN/ISA 61241-18 (12.10.07)-2007 (R2015), Electrical Apparatus for Use in Zone 20, Zone 21 and Zone 22 Hazardous (Classified) Locations - Protection by Intrinsic Safety "mD"

This standard is applicable to electrical apparatus protected by encapsulation type of protection "mD" and surface temperature limitation for use in areas where combustible dust may be present in quantities which could lead to a fire or explosion hazard. It specifies requirements for design, construction and testing of electrical apparatus, parts of electrical apparatus and Ex components where the rated voltage does not exceed 10 kV.

ISA (ASC Z213) (International Society of Arboriculture)

ANSI Z133-2012, Standard for Arboricultural Operations - Safety Requirements

This standard contains the arboriculture safety requirements for pruning, repairing, maintaining, and removing trees, and for using equipment in such operations.

ANSI/ISA IT4.201-1981 (R2007), Photography (Chemicals) - Potassium Iodide

This specification establishes criteria for the purity of photographic grade potassium iodide and describes the tests to be used to determine the purity.

ANSI/ISA IT4.23-2001 (R2006), Photography (Processing) - Roll and Dental Films - Film Clips and Hangers - Bite Dimensions

This standard specifies requirements for film clips and hangers used to hold photographic films and dental radiographic films during processing.

ANSI/ISA IT4.231-1982 (R2006), Photography (Chemicals) - Sodium Metaborate Octahydrate

This specification establishes criteria for the purity of photographic grade sodium metaborate octahydrate and describes the tests to be used to determine the purity.

This document specifies a profile of JPEG 2000 suitable for use in digital still cameras (DSC profile). The profile specifies the following items: Decoder/Reader conformance requirements for software and hardware devices (including the camera itself) that desire to read images captured on JPEG 2000 based digital still cameras (DSC). This includes both codestream and file format requirements. Encoder/Writer conformance requirements for the files created by digital still cameras. This includes both codestream and file format requirements. Note: this is a reaffirmation of ANSI/ISA IT10.2000-2004 as an IS&T standard.

ANSI/IS&T IT10.7000-2015, Photography - Digital still cameras - Guidelines for reporting pixel-related specifications

This standard specifies guidelines for reporting pixel-related specifications (e.g., the number of camera pixels) of a digital still camera, for the purposes of camera labeling, camera packaging, advertising, and the like. It is applicable to monochrome and color digital still cameras using one or more image sensors. Note: this is a reaffirmation of ANSI/ISA IT10.7000-2004 as an IS&T standard.

ANSIB/ISA IT4.232-2006, Photography - Processing chemicals - Specifications for photographic grade ammonium hydroxide, NH 4 OH (aqueous ammonia)

This standard states the purity requirements and test methods for photographic grade ammonium hydroxide.

ISA (ASC Z213) (International Society of Arboriculture)

ANSI Z133-2012, Standard for Arboricultural Operations - Safety Requirements

This standard contains the arboriculture safety requirements for pruning, repairing, maintaining, and removing trees, and for using equipment in such operations.
**ANSI/ISA 61241-2 (12.10.06)-2007 (R2015),**

Electrical Apparatus for Use in Zone 21 and Zone 22 Hazardous (Classified) Locations - Protection by Pressurization "pD"

This standard gives requirements on the design, construction, testing and marking of electrical apparatus for use in combustible dust atmospheres in which a protective gas (air or inert gas), maintained at a pressure above that of the external atmosphere, is used to prevent the entry of dust which might otherwise lead to the formation of a combustible mixture within enclosures which do not contain a source of combustible dust.

**ANSI/ISA 61804-3-2016, Functions Blocks (FB) for process control and Electric Device Description Language (EDDL) - Part 3: EDDL Syntax and semantics**

This standard specifies the Electronic Device Description Language (EDDL) technology, which enables the integration of real product details using the tools of the engineering life cycle. This standard specifies EDDL as a generic language for describing the properties of automation system components. EDDL is used to create Electronic Device Description (EDD), for example, concrete devices, common usable profiles or libraries. This EDD is used with appropriate tools to generate an interpretable code to support parameter handling, operation, and monitoring of automation system components such as remote I/Os, controllers, sensors, and programmable controllers.

**ANSI/ISA 61804-4-2016, Functions Blocks (FB) for process control and Electric Device Description Language (EDDL) - Part 4: EDD interpretation**

This standard specifies EDD interpretation for EDD applications and EDDs to support EDD interoperability. This document is intended to ensure that field device developers use the EDDL constructs consistently and that the EDD applications have the same interpretations of the EDD. It supplements the EDDL specification to promote EDDL application interoperability and improve EDD portability between EDDL applications.

**ANSI/ISA 61804-5-2016, Functions Blocks (FB) for process control and Electric Device Description Language (EDDL) - Part 5: EDDL Built-in library**

This standard specifies the EDDL Built-in library and provides the profiles of the various fieldbus.

**ANSI/ISA 62381-2012, Automation Systems in the Process Industry - Factory Acceptance Test (FAT), Site Acceptance Test (SAT), and Site Integration Test (SIT)**

Defines procedures and specifications for the Factory Acceptance Test (FAT), the Site Acceptance Test (SAT), and the Site Integration Test (SIT). These tests are carried out to prove that the automation system is in accordance with the specification.

**ANSI/ISA 62382-2012, Control Systems in the Process Industry - Electrical and Instrumentation Loop Check**

Describes the steps recommended to complete a loop check, which comprises the activities between the completion of the loop construction (including installation and point-to-point checks) and the startup of cold commissioning. This standard is applicable for the construction of new plants and for expansion/retrofits (i.e. revamping) of E&I installations in existing plants (including PLC, BAS, DCS, panel-mounted and field instrumentation). It does not include a detailed checkout of power distribution systems, except as they relate to the loops being checked (i.e. a motor starter or a power supply to a four-wire transmitter).

The first of a multipart series, this standard addresses the electronic or cyber security of industrial automation and control systems. The term security is considered here to mean the prevention of illegal or unwanted penetration or of intentional or unintentional interference with the proper and intended operation of industrial automation and control systems. Electronic security, the focus of this standard, includes computers, networks, or other programmable components of the system.

Describes the elements contained in a cyber security management system for use in the industrial automation and control systems environment and provides guidance on how to meet the requirements described for those elements.

**ANSI/ISA 62443-3-(99.03.03)-2013, Security for industrial automation and control systems - Part 3-3: System security requirements and security levels**

This part of the ISA 62443 series provides detailed technical control system requirements associated with the seven foundational requirements described in ISA 62443 &##829; 1 &##829; 1 and 99.01.01 including defining the requirements for control system capability security levels.

**ANSI/ISA 62453-1 (103.00.01)-2011, Field device tool (FDT) interface specification - Part 1: Overview and guidance**

This part presents an overview and guidance for this series. It explains the structure and content of the series; provides explanations of some aspects of the ISA 62453 series that are common to many of the parts of the series; describes the relationship to some other standards.
61784 series specifies communication and other parameters concerning allowed values and FDT data types. For restrictions of protocol specific only specifies the mapping of Modbus parameters to FDI standard (ISA-62453-2). This part of the ISA 62453 series provides information for integrating Modbus TCP and Modbus Serial Line protocol support into FDT based systems. NOTE &h#195;This part of ISA 62453 series only specifies the mapping of Modbus parameters to FDT data types. For restrictions of protocol specific parameters concerning allowed values and concerning limitations of arrays used in the definition of FDT data types, refer to IEC 61158-5-15 and the MODBUS Application Protocol Specification.

ANSI/ISA 62453-3-2011, Field device tool (FDT) interface specification - Part 315: Communication profile integration - IEC 61784 CPF 15

This standard defines the FDI Information Model. One of the main tasks of the Information Model is to reflect the topology of the automation system. Therefore it represents the devices of the automation system as well as the connecting communication networks including their properties, relationships, and the operations that can be performed on them. The types in the AddressSpace of the FDI Server constitute some kind of catalog, which is built from FDI Packages.

ANSI/ISA 62769-1:2016, Field Device Integration (FDI) - Part 1: Overview

This standard describes the concepts and overview of the Field Device Integration (FDI) specifications. The detailed motivation for the creation of this technology is also described.

ANSI/ISA 62769-101-1:2016, Field Device Integration (FDI) - Part 101-1: Profiles - Foundation Fieldbus H1

This standard specifies an FDI profile of ISA-62769 for IEC 61784-1_CP 1/1 (FOUNDATION™ Fieldbus H1).

This standard specifies the ISA-62769 profile for IEC 61784-1, CP 1/2 (FOUNDATION™ Fieldbus HSE).

ANSI/ISA 62769-103-1:2016, Field Device Integration (FDI) - Part 103-1: Profiles - PROFIBUS

This standard specifies an FDI profile of ISA-62769 for IEC 61784_1_CP 3/1 (PROFIBUS DP) and IEC 61784_1_CP3/2 (PROFIBUS PA).

ANSI/ISA 62769-103-4:2016, Field Device Integration (FDI) - Part 103-4: Profiles - PROFINET

This standard specifies an FDI profile of ISA-62769 for IEC 61784-2_CP 3/4, IEC 61784-2_CP3/5 and IEC 61784-2_CP3/6 (PROFINET).

This standard specifies an FDI profile of ISA-62769 for IEC 61784_1_CP 9/1 (HART*) and IEC 61784_1_CP 9/2 (WirelessHART*).

ANSI/ISA 62769-2-2016, Field Device Integration (FDI) - Part 2: FDI Client

This standard specifies the FDI Client and specific architectural components within the overall FDI architecture.

ANSI/ISA 62769-3:2016, Field Device Integration (FDI) - Part 3: FDI Server

This standard specifies the FDI Server and specific architectural components within the overall FDI architecture.

ANSI/ISA 62769-4:2016, Field Device Integration (FDI) - Part 4: FDI Packages

This standard specifies the FDI Packages and specific architectural components within the overall architecture.

ANSI/ISA 62769-5:2016, Field Device Integration (FDI) - Part 5: FDI Information Model

This standard defines the FDI Information Model. One of the main tasks of the Information Model is to reflect the topology of the automation system. Therefore it represents the devices of the automation system as well as the connecting communication networks including their properties, relationships, and the operations that can be performed on them. The types in the AddressSpace of the FDI Server constitute some kind of catalog, which is built from FDI Packages.

ANSI/ISA 62769-6:2016, Field Device Integration (FDI) - Part 6: FDI Technology Mapping

This standard specifies the technology mapping for the concepts described in the Field Device Integration (FDI) standard. The technology mapping focuses on implementation regarding the components FDI Client and User Interface Plug-in (UIP) that are specific only to the workstation platform as defined in ISA-62769-4.2015, Annex E.

ANSI/ISA 62769-7:2016, Field Device Integration (FDI) - Part 7: FDI Communication Devices

This standard specifies the elements implementing communication capabilities called Communication Devices (ISA-62769-5).

ANSI/ISA 67.02.01-2016, Field Device Integration (FDI) - Part 1: Profiles - Related to Nuclear Safety, Related to Related to Nuclear Safety

This standard specifies an FDI profile for IEC 61784-1, CP 1/1 (FOUNDATION™ Fieldbus H1).

ANSI/ISA 67.04.01-2006 (R2011), Setpoints for Nuclear Safety-Related Instrumentation

This standard defines the requirements for assessing, establishing, and maintaining nuclear safety-related and other important instrument setpoints associated with nuclear power plants or nuclear reactor facilities. The scope includes instrumentation-based setpoints that assure compliance to one or more design limits.
ANSI/ISA 75.08.04-2007 (R2013), Face-to-Face Dimensions for Butt weld-End Globe-Style Control Valves (Class 4500)
This standard applies to butt weld-end globe-style control valves, sizes 1/2 inch (15 mm) through 8 inches (200 mm), having top and cage guiding.

ANSI/ISA 75.08.05-2016, Face-to-Face Dimensions for Butt weld-End Globe-Style Control Valves (Classes 150, 300, 600, 900, 1500, and 2500)
This standard applies to butt weld-end globe-style control valves, sizes 15 mm (1/2 inch) through 450 mm (18 inches) for Classes 150 through 2500, having top, top and bottom, port, or cage guiding.

ANSI/ISA 75.08.06-2002 (R2013), Face-to-Face Dimensions for Flanged Globe-Style Control Valve Bodies (Classes 900, 1500, and 2500)
This standard applies to flanged globe-style control valves, sizes 15 mm (1/2 inch) through 450 mm (18 inches), having top, top and bottom, port, or cage guiding.

ANSI/ISA 75.08.07-2001 (R2013), Face-to-Face Dimensions for Separable Flanged Globe-Style Control Valves (Classes 150, 300, and 600)
This standard applies to separable flanged globe-style control valves, sizes 1 inch through 4 inches.

ANSI/ISA 75.08.08-2015, Face-to-Centerline Dimensions for Flanged Globe-Style Angle Control Valve Bodies (Classes 150, 300, and 600)
This standard aids users in their piping design by providing Classes 150, 300, and 600 raised-face flanged globe-style angle control valve face-to-centerline dimensions without giving special considerations to the equipment manufacturer to be used.

ANSI/ISA 75.08.09-2016, Face-to-Face Dimensions for Sliding Stem Flangeless Control Valves (Classes 150, 300, and 600)
This standard applies to sliding stem flangeless control valves, sizes 20 mm (3/4 inch) through 600 mm (24 inches) for Classes 150, 300, and 600.

ANSI/ISA 75.10.01-2013, General Requirements for Clamp or Pinch Valves
This document applies to valves, sizes 1 inch through 26 inches, of the clamp or pinch valve design, incorporating clamp or pinch elements.

ANSI/ISA 75.10.02-2014, Installed Face-to-Face Dimensions for Dual Pinch Flanged Clamp or Pinch Valves (Classes 125 and 150)
This document applies to valves, sizes NPS 3/8" (DN 15) through NPS 26 (DN 650), of the clamp or pinch valve design incorporating clamp or pinch elements.

ANSI/ISA 75.10.03-2015, Installed Face-to-Face Dimensions for Shell and Tube Flanged Pinch Valves
This document applies to directly pneumatically operated pinch valves, sizes 1/2 inch through 24 inches, of the shell and tube design which have flanges that mate with ASME B16.1 Class 125 (PN20) and/or ASME B16.5 Class 150 (PN20) flanges. This document excludes solenoid-actuated valves, electric motor operated valves, cylinder operated valves, diaphragm operated valves, pressure-reducing valves, and manually (hand wheel) operated valves. This document applies only to pinch valves of the shell and tube design.

ANSI/ISA 75.11.01-2013, Inherent Flow Characteristic and Rangeability of Control Valves
The scope of this standard is to define the statement of typical control valve inherent flow characteristics and inherent rangeabilities, and to establish criteria for adherence to manufacturer-specified flow characteristics.

ANSI/ISA 75.13.01-2013, Method of Evaluating the Performance of Positioners with Analog Input Signals and Pneumatic Output
This standard specifies tests designed to determine the performance of positioners with analog input signals and pneumatic output. The method of evaluation described in this standard specifies the use of an actuator of the user's or manufacturer's choice. The positioner may be single-acting or double-acting.

ANSI/ISA 75.19.01-2013, Hydrostatic Testing of Control Valves
This standard establishes requirements and definitions for standard hydrostatic shell testing of control valves by the valve manufacturer to prove the structural integrity and leak tightness of the valves' pressure retaining parts, including any closure parts such as the valve body to bonnet joint, but excluding packings, bellows or other moving seals, and packing leakoff/purge/vent port connections.

ANSI/ISA 75.25.01-2001 (R2010), Test Procedure for Control Valve Response
This standard defines the testing and reporting of step response of control valves that are used in throttling closed loop control applications. A control valve consists of the complete, ready-to-use assembly of the control valve body, actuator, and any required accessories. The most probable accessory is a valve positioner.

ANSI/ISA 75.34.01-2019 (R2011), Fossil Fuel Power Plant Feedwater Control System - Drum Type
Assist in the development of design specifications covering the measurement and control of feedwater systems in boilers with steam capacities of 200,000 lbs/hr (25 kg/s) or greater.

ANSI/ISA 75.37.01-2014, Fossil Fuel Power Plant Unit/Plant Demand Development
The scope of this standard is to address the unit/plant demand development subsystem for boilers with steam capacities of 200,000 lbs/hr (25 kg/s) or greater. This subsystem includes generation demand, boiler demand development, turbine demand development, throttle/annular pressure control, and unit megawatt steam flow control as applicable.

ANSI/ISA 77.14.01-2010, Fossil Fuel Power Plant Steam Turbine Controls
This standard addresses steam turbine governor controls and overspeed protection of steam turbine generators in fossil power plants. Specifically excluded from consideration are single valve and controlled extraction turbines, mechanical drive turbines, automated startup/shutdown systems, turbine supervisory instrumentation, steam bypass systems, and turbine water induction prevention (TWIP) systems.

ANSI/ISA 77.20.01-2012, Fossil Fuel Power Plant Simulators: Functional Requirements
The scope of this standard is to address the simulation of fossil fuel power plants typically consisting of: Boiler, turbine, and balance of plant with steam capacities of 200,000 lbs/hr (25 kg/s) or greater and boiler turbine or combined cycle combustion turbine capacity of greater than 100MWs and/or 226; Associated or interactive processes This standard will address high-fidelity process and control logic models, highly replicated user interfaces, highly functional instructor tools, high-realism physical fidelity trainee environments, simulator platform considerations, and minimum levels of documentation.
ANSI/ISA 77.44.01-2010, Steam Temperature Controls

This standard provides general requirements for the specification of pneumatic rack and pinion actuators. This document applies to actuators with a maximum allowable operating pressure (MAOP) up to 150 psig with a compressed gas (i.e., instrument air).

ANSI/ISA 95.00.04-2012, Enterprise-Control System Integration - Part 4: Object Models

This standard defines business-to-object models and attributes of the object models that define some of the information exchanged between functions defined in ANSI/ISA-95.00.03. The object models and attributes may be used in the design and implementation of interface standards and for interoperability in manufacturing operations management.

ANSI/ISA 95.00.05-2013, Enterprise-control system integration - Part 5: Business-to-manufacturing transactions

This standard defines business-to-manufacturing transactions that may be used on the objects defined in the object models of the Part 1 and Part 2 standards in the ANSI/ISA-95 series. The transactions of required and actual manufacturing activities bind and organize the manufacturing objects and activities defined in those earlier standards.

ANSI/ISA 95.00.06-2014, Enterprise-Control System Integration - Part 6: Messaging Service Model

Defines a set of services that may be used to exchange information messages in a publish/subscribe mode and a request/response mode. Defines a minimal interface subset to message exchange systems.

ANSI/ISA 96.02.01-2016, Guidelines for the Specification of Electric Valve Actuators

This standard covers the development of specifications, minimum design requirements and sizing criteria for electric actuators.

ANSI/ISA 96.03.01-2012, Guidelines for the Specification of Pneumatic Scotch Yoke Valve Actuators

This standard provides general requirements for the development of specifications for pneumatic scotch yoke actuators. This document applies to actuators with a maximum allowable operating pressure (MAOP) up to 250 psig with a compressed gas (i.e., instrument air).

ISANTA (International Staple, Nail and Tool Association)

ANSI SNT-101-2015, Safety Requirements for Portable, Compressed-Air-Actuated Fastener Driving Tools

The requirements of this standard apply to portable hand-held compressed-air-powered tools for driving fasteners, such as nails and staples, into or through concrete, fabric, fiberboard, metal, plastic, wood, wood products, cartons, and other materials.
ISEA (ASC Z87) (International Safety Equipment Association)

ANSI ISEA 287.1-2015, Occupational and Educational Personal Eye and Face Protection Devices

This standard sets forth criteria related to the general requirements, testing, permanent marking, selection, care, and use of protectors to minimize the occurrence and severity or prevention of injuries from such hazards as impact, non-ionizing radiation and liquid splash exposures. Certain hazardous exposures, such as those caused by recreational activities or biological agents are not covered in this standard.

ISEA (International Safety Equipment Association)

ANSI/ISEA 101-2014, Limited-Use and Disposable Coveralls - Size and Labeling Requirements

This standard provides requirements for finished dimensions, labeling and packaging for limited-use and disposable coveralls. It also provides guidance on selecting the appropriate garment size for the wearer.

ANSI/ISEA 102-1990 (R2015), Gas Detector Tube Units - Short Term Type for Toxic Gases and Vapors in Working Environments

This standard sets forth the minimum performance requirements for gas detector tube units and components, which are used to determine the concentration of toxic gases and vapors in working environments.

ANSI/ISEA 104-2009 (R2015), Air Sampling Devices - Diffusive Type for Gases and Vapors in Working Environments

This standard sets forth the test methods, performance parameters, and reporting requirements for diffusion type sampling devices used to determine the concentrations of gases and vapors in working environments. The information provided by manufacturers in compliance with this standard is necessary for the proper selection and use of these devices for measuring workplace exposures, including determining compliance with Occupational Exposure Limit Value (ELV), e.g., Threshold Limit Value (TLV), Permissible Exposure Limit (PEL), Short Term Exposure Limit (STEL).

ANSI/ISEA 105-2016, Hand Protection Classification

This standard addresses the classification and testing of hand protection for specific performance properties related to chemical and industrial applications. Hand protection includes gloves, mittens, partial gloves, or other items covering the hand or a portion of the hand that are intended to provide protection against or resistance to a specific hazard.

ANSI/ISEA 107-2015, High-Visibility Safety Apparel and Accessories

This standard specifies performance requirements for high visibility safety apparel and accessory PPE. Performance requirements are included for color, retroreflection, and minimum areas of background, retroreflective and combined-performance materials used in the construction of high-visibility garment configurations.

ANSI/ISEA 113-2013, Fixed and Portable Decontamination Shower Units

This standard addresses testing and performance criteria for fixed and portable decontamination shower units designed for facilities used by first responders and receiving medical facilities for initially treating victims of hazardous materials exposure.

ANSI/ISEA 125-2014, Conformity Assessment of Safety and Personal Protective Equipment

This standard establishes criteria for conformity assessment of safety and personal protective equipment which is sold with claims of compliance with product-performance standards. Specific provisions are described for qualification performance testing data collection and maintenance; periodic verification; substantiation of processes to maintain manufacturing quality; roles and responsibilities of suppliers, testing organizations; and certification organizations who participate in the process.

ANSI/ISEA 201-2012, Classification of Insulating Apparel Used in Cold Work Environments

Establishes classification requirements for occupational apparel items worn in cold environments. Specific criteria are included for thermal insulation (in units of clo), thermal transport properties, and resistance to the deterioration of these properties due to laundering.

ANSI/ISEA Z308.1-2014, Minimum Requirements for Workplace First Aid Kits and Supplies

Revision addresses technical issue regarding criteria for splints (Section 6.17) and requirements for first aid kit labeling.

ANSI/ISEA Z358.1-2014, Emergency Eyewash and Shower Equipment

This standard establishes minimum performance requirements for emergency flushing fixtures for the immediate treatment of eyes and the body of a person who has been exposed to injurious or corrosive materials. Specific equipment includes: emergency showers, eyewash equipment, eye/face wash equipment, combination units and supplemental equipment such as personal wash units and drench hoses.

ANSI/ISEA Z89.1-2014, Industrial Head Protection

This standard establishes minimum performance requirements for protective helmets that reduce the forces of impact and penetration that may provide protection from electrical shock. It also includes product assessment for optional features. Type and class designations and product markings are also included.

ITI (INCITS) (InterNational Committee for Information Technology Standards)

ANSI INCITS 373-2003 [S2013], Information technology - Fibre Channel Framing and Signaling Interface (FC-FS)

This standard describes the framing and signaling interface of a high-performance serial link for support of FC-4s associated with upper level protocols (e.g., SCSI, IP, SB/COS, VI). FC-FS (along with FC-PH) is the combination of the FC-PH [1], its amendments 1 [2] and 2 [3], FC-PH-2 [4] and FC-PH-3 [5] standards. This standard also deletes or obsoletes outdated functions and features from those standards.

ISO/IEC 18092, ISO/IEC 14443 and ISO/IEC 15693 specify the radio frequency signal interface, initialization, anti-collision and protocols for wireless interconnection of closely coupled devices and access to contactless integrated circuit cards operating at 13.56 MHz. This Standard specifies the communication mode selection mechanism, designed not to disturb any ongoing communication at 13.56 MHz, for devices implementing ISO/IEC 18092, ISO/IEC 14443 or ISO/IEC 15693. This Standard requires implementations to enter the selected communication mode as specified in the respective Standard. The communication mode specifications, however, are outside the scope of this Standard.

INCITS 100-1989 [S2010], Interface Between DTE & DCE for Packet Mode Operation with Packet Switch Data Communications Networks (CCITT X.25)

Conforms to the requirements of CCITT Recommendation X.25, ISO 7776:1986, and ISO 8208:1987, and covers both the DTE/DCE and DTE/DTE interfaces.

INCITS 100a-1991 [S2010], Information Systems - Interface between Data Terminal Equipment (DTE) and Data Circuit-Terminating Equipment (DCE) for Operation with Packet-Switched Data Communications Networks (PSDN), or between Two DTEs, by Dedicated Circuit Addendum

Specifies extensions that were considered important to have available in the U.S., prior to publication of the next full revision of the national standard. It addresses extensions related to the Network User Identification (NUI) Selection facility. Implementations conforming to this supplement must conform to X3.100:1989 and the 1988 version of CCITT Recommendation X.25. Supplement to ANSI X3.100-1989
INCITS 103-1983 [S2011], Unrecorded Magnetic Tape Minicassette For Information Interchange, Coplanar 3.81 mm (0.150 Inch)
Represents the minimum requirements for mechanical and magnetic interchangeability of the minicassette between information processing systems, communication systems, and associated equipment using ANSI X3.4-1977, American Standard Code for Information Interchange (ASCII).

INCITS 11-1990 [S2007], General Purpose Paper Cards for Information Processing
This standard specifies the quality of paper, dimensions and quality of general purpose cards, and test methods for general purpose cards of 7 3/8 inch length.

INCITS 111-1986 [S2007], Information Systems - Optical Character Recognition (OCR) - Matrix Character Sets for OCR-M
Describes the matrix of dot placement and size limits for OCR-M alphanumeric characters and symbols for optical character recognition (OCR) systems.

INCITS 112-1984 [S2007], 14-inch (356-mm) Diameter and Low Surface Friction Magnetic Storage Disk
Provides the mechanical, physical and magnetic properties of a magnetic disk with a 14-inch (356-mm) diameter and low surface friction intended for mounting in data storage devices operating at 160 oo flux transitions per track and at typical track density of 480 tracks per inch (tpi).

INCITS 113-1987 [S2008], Information Systems - Programming Language – Full BASIC
Promotes the interchangeability of BASIC programs among a variety of automatic data processing systems.

INCITS 113a-1989 [S2008], Information Systems - Programming Languages – Modules and Individual Character Input for Full BASIC
Establishes the syntax of BASIC programs written using individual character input, or modules, or both; the semantic rules for interpreting the meaning of a BASIC program that uses individual character input, or modules, or both; the errors and exceptional circumstances that shall be detected; and also the manner in which such errors and exceptional circumstances shall be handled.

INCITS 115-1984 [S2007], Unformatted 80 Megabyte Trident Pack for Use at 370 TPI and 6000 BPI – Physical, Mechanical and Magnetic Characteristics
Specifies the general, physical and magnetic requirements for interchangeability of the five disk pack, as required to achieve unrecorded pack interchange between disk storages and associated information processing systems.

INCITS 116-1986 [S2007], Recorded Magnetic Tape Cartridge for Information Interchange 4-Track, Serial 0.250 in (6.30 mm) 6400 BPI (252 BPM) Inverted Modified Frequency Modulation Encoded
This American National Standard is intended to provide a format and recording standard for a 0.250-inch (6.30-mm) wide, 4-track magnetic tape in a cartridge to be used for information interchange between information processing systems, communications systems, and associated equipment utilizing a standard code for information interchange, as agreed upon by the interchange parties.

INCITS 117-1984 [S2007], Printable/Image Areas for Text and Facsimile Communication Equipment
This standard defines the sizes and location of the printable/image areas common to both the ISO A4 and North American paper sizes for international communication on text and facsimile equipment.

INCITS 118-1998 [S2008], Personal Identification Number – PIN Pad
This standard identifies the fixed arrangement of the alphanumeric characters and keys of a PIN pad. The PIN pad is used by a customer to enter a Personal Identification Number (PIN) when requested as part of a transaction. As this standard is being submitted for stabilization maintenance, INCITS will consider requests for change and information on the submittal of such requests.

INCITS 119-1984 [S2007], Contact Start/Stop Storage Disk, 158361 Flux Transitions per Track, 8.268 Inch (210 mm) Outer Diameter and 3.937 Inch (100 mm) Inner Diameter
Provides the mechanical, physical and magnetic properties of a magnetic disk with an 8.268 inch (210 mm) diameter and low surface friction intended for mounting in data storage devices. A typical recording density is 480 tpi with 8464 flux transitions per inch (ftpi) at a radius of 2.978 in (78.64 mm).

INCITS 120-1984 [S2007], Contact Start/Stop Storage Disk, 95840 Flux Transitions per Track, 7.874 Inch (200 mm) Outer Diameter and 2.500 Inch (63.5 mm) Inner Diameter
Provides the mechanical, physical and magnetic properties of a magnetic disk with an 7.874-in (200-mm) diameter and low surface friction intended for mounting in data storage devices. A typical recording density is 480 tpi with 6858 flux transitions per inch (ftpi) at a radius of 2.224 in (56.49 mm).

INCITS 121-1984 [S2011], Two-Sided Unformatted 8-Inch (200 MM) Double Density Flexible Disk Cartridge (For 13262 FTPR Two-headed Application) (Combined with Project 287)
Specifies the general, physical, and magnetic requirements for interchangeability of the two-sided, 8-in (200-mm) (nominal), 48-tracks-per-inch (tpi) flexible disk cartridge (for 13 262 flux transitions per radian (ftpr) for use) as required to achieve unformatted disk cartridge interchange among disk drives using 77 tracks per side and associated information processing systems.

INCITS 124-1985 [S2012], Information processing systems - Computer graphics - Graphical Kernel System (GKS) Functional Description
Specifies a set of functions for computer graphics programming (GKS). GKS is a basic graphics system for applications that produce computer generated two-dimensional pictures on line graphics or raster graphics output devices. It supports operator input and interaction by supplying basic functions for graphical input and picture segmentation and allows storage and dynamic modification of pictures.

INCITS 124.1-1985 [S2011], FORTRAN Binding of Graphical Kernel System (GKS)
Specifies a language independent nucleus of graphics system. For integration into a programming language, GKS is embedded in a language dependent layer obeying the particular conventions of that language. This document specifies such a language dependent layer for the FORTRAN language.

Specifies a language-independent nucleus of a graphics system. For integration into a programming language, GKS is embedded in a language-dependent layer obeying the particular conventions of that language. This part of ANSI X3.124 specifies such a language-dependent layer for the Pascal language.

INCITS 124.3-1989 [S2010], Information technology - Computer Graphics - Graphical Kernel System (GKS), Ada Binding
The Graphical Kernel System (GKS), as described in ANSI X3.124-1985, specifies a language-independent nucleus of a graphics system. For integration into a programming language, GKS is embedded in a language-independent layer obeying the particular conventions of that language. This document specifies such a language-dependent layer for the Ada language.

INCITS 125-1985 [S2011], Two-Sided, Double-Density, Unformatted 5.25 Inch (130 mm) 48-tpi (1.9 tpm) Flexible Disk Cartridge for 7958 BPR Use
Specifies the general, physical, and magnetic requirements for the interchangeability of the two-sided, 5.25 inch (130 mm) (nominal), 48-tracks-per-inch (tpi) 1.9-tracks-per-millimeter (tpmm) flexible disk cartridge (for 7958 bits-per-radian (bpr) use) as required to achieve unformatted disk cartridge interchange among disk drives using 40 tracks per side and associated information processing systems.
INCITS 126-1986 [S2007], One- and Two-Sided Double Density Unformatted 5.25 Inch (130 mm) 96 Tracks per Inch (3.8 Tracks per mm) Flexible Disk Cartridge – General, Physical, and Magnetic Requirements for 7958 BPR Use

This standard specifies the general, physical, and magnetic requirements for interchangeability of the one- or two-sided, 5.25-Inch (130-mm) (nominal), 96-tracks-per-inch (tpi) (3.8-tracks-per-millimeter (tpmm)) flexible disk cartridge (for 7958-bits-per-radian (bpr) use) as required to achieve unformatted disk cartridge interchange among disk drives using 80 tracks per side and associated information processing systems.

INCITS 127-1987 [S2007], Information Systems – Unrecorded Magnetic Tape Cartridge for Information Interchange, 0.250 Inch (6.30 mm), 6400–10 000 ftpi (252–394 ftppm)

Presents the minimum requirements for an unrecorded cartridge containing 0.250-inch (6.30-mm) wide magnetic tape regarding the mechanical and magnetic interchangeability of the cartridge between information processing systems, using physical recording densities in the range of 6400 to 10 000 flux transitions per inch (ftpi) (252 to 394 flux transitions per millimeter (ftppm)).

INCITS 131-1994 [S2013], Information technology - Small Computer System Interface - 2 (SCSI-2)

This standard defines an input/output bus for interconnecting computers and peripheral devices. It defines extensions to the Small Computer System Interface (ISO 9316: 1989), referred to herein as SCSI-1. It also provides more complete standardization of the previously defined command sets.

INCITS 136-1986 [S2007], Serial Recorded Magnetic Tape Cartridge for Information Interchange, Four and Nine Track, 0.250 Inch (6.30 mm), 8000 bpi (315 bpmms), Streaming Mode, Group Code Recording

Provides a format and recording standard for an 8000-bpi (315-bpmms) streaming 0.250-inch (6.3-mm) wide, 4- and 9-track, magnetic tape in a cartridge to be used for information interchange between information processing systems, communication systems, and associated equipment utilizing a standard code for information interchange, as agreed upon by the interchange parties.

INCITS 137-1988 [S2008], Information Systems - One- and Two-sided, Unformatted, 90-mm (3.5-in), 5.3-tpmm (135-tpi) Flexible Disk Cartridge for 7958 BPR Use - General, Physical, and Magnetic Requirements

The standard specifies the general, physical and magnetic requirements for interchangeability of the one-and two-sided 90mm (3.5 in) (nominal) flexible disk cartridge (for 7958 bits-per-radian (bpr) use) as required to achieve unformatted disk cartridge interchange among disk drives using 80 tracks per side and associated information processing systems.

INCITS 137-1988/AM1-1999 [S2012], Information Systems - One- and Two-sided, Unformatted, 90-mm (3.5-in), 5.3-tpmm (135-tpi) Flexible Disk Cartridge for 7958 BPR Use - General, Physical, and Magnetic Requirements

The revision contains substantive and editorial changes to INCITS 137-1988. The standard specifies the general, physical and magnetic requirements for interchangeability of the one-and two-sided 90mm (3.5 in) (nominal) flexible disk cartridge (for 7958 bits-per-radian (bpr) use) as required to achieve unformatted disk cartridge interchange among disk drives using 80 tracks per side and associated information processing systems.

INCITS 139-1987 [S2007], Information Systems – Fiber Distributed Data Interface (FDDI) – Token Ring Media Access Control (MAC)

Provides specifications for format and recording for a 1/2 inch, 9-track magnetic tape to be used for information interchange among information processing systems, communication systems, and associated equipment utilizing ANSI X3.4:1977, American National Code for Information Interchange (ASCII). This standard deals solely with recording on magnetic tape and supports and complements ANSI X3.40-1983, Unrecorded Magnetic Tape for Information Interchange, (9-Track 800 CPI, NRZI, 1600 CPI, PE and 6250 CPI, GCR).

INCITS 148-1988 [S2008], Fiber Distributed Data Interface (FDDI) Physical Layer (PHY)

Provides a format and recording standard for an 8000-bpi (315-bpmms) streaming 0.250-inch (6.3-mm) wide, 4- and 9-track, magnetic tape in a cartridge to be used for information interchange between information processing systems, communication systems, and associated equipment utilizing a standard code for information interchange, as agreed upon by the interchange parties.

INCITS 149-1986 [R2012], Financial Transaction Card Formsets - Location of Imprinted Information

Provides the location of the imprinted account number, area for source ID, amount of transaction, and date of transaction as they appear on 51-column and 80-column card size financial transaction card formsets.

INCITS 150-1987 [S2007], Business Machines, Data Processing Equipment and Business Forms – Character and Line Spacing

This standard specifies the most commonly used character line spacings for office machines and data processing equipment.

INCITS 151-1987 [S2007], Bond Papers and Index Bristols – Common Sheet Sizes

This standard (1) lists the preferred and common sheet sizes of bond papers and index bristols and their applicable tolerances; (2) cross references to metric sizes, and (3) references a standard test method.

This standard provides the following specifications for adding machine paper rolls: terminology; roll widths; roll length; paper substance and quality, thickness, finish, color, brightness, opacity, tearing and bursting strength; diameter of rolls; winding and cutting, core materials; diameter of core and spindle hole; roll end sealing; and quantity packaging and cartoning.

INCITS 154-1988 [S2009], Information technology - Office Machines and Supplies Alphanumeric Machine -- Keyboard Arrangement

Describes the arrangement of the 48 basic keys on the keyboard and the uppercase and lowercase characters that appear on the keys. The character assignments are divided into five application areas, in recognition of the different graphic character requirements of each application.

This American National Standard provides specifications for format and recording for a 1/2-inch (12.7-mm), 9-track magnetic tape to be used for interchange among information processing systems, communication systems, and associated equipment utilizing a standard code for interchange as agreed upon by the interchange parties.

INCITS 158-1987 [S2008], Information Systems – Recorded Magnetic Tape Cassette for Information Interchange – 4 Track, 0.150 Inch (3.81 mm) 8000 bpi (315 bpmms), Group Code Recording

This American National Standard is intended to provide a format and recording standard for an 8000-bpi (315-bpmms) streaming 0.150-inch (3.81-mm)-wide, 4-track magnetic tape cassette to be used for information interchange among information processing systems, communication systems, and associated equipment utilizing a standard code for interchange, as agreed upon by the interchange parties.

INCITS 162-1988 [S2009], Information Systems - Two-Sided, High-Density, Unformatted, 5.25-inch (130-mm), 96-tpi (3.8 tpmm) Flexible Disk Cartridge for 13 262 ftps Use - General, Physical, and Magnetic Requirements

This standard specifies the general, physical, and magnetic requirements for interchangeability for the two-sided, 5.25-in (130-mm), 96-tracks-per-inch (tpi) (3.8-tracks-per-millimeter (tpmm)) flexible disk cartridge for 13 262 flux-transitions-per-radian (ftpr) use as required to achieve unformatted disk cartridge interchange among disk drives using 77 or 80 tracks per side and associated information processing systems.

Specifies the general, physical, and magnetic requirements for interchangeability for two-sided, 5.25-in (130-mm), 96-tracks-per-inch (tpi) (3,8-track-per-millimeter (tpmm)) flexible disk cartridge (for 13 262 flux-transitions-per-radian (ftpr) use) as required to achieve unformatted disk cartridge interchange among disk drives using 77 or 80 per side and associated information processing systems.

INCICTS 163-1988 [S2007], Information Systems – Contact Start/Stop Metallic Film Storage Disk – 83,333 Flux Transitions Per Track, 130-mm (5.118 in) Outer Diameter and 40-mm (1.575 in) Inner Diameter

Specifies the general, physical, and magnetic requirements for interchangeability for the two-sided, 5.25-in (130-mm) flexible disk cartridge (for 13262 flux transitions per radian use) as required to achieve unformatted disk cartridge interchange among disk drives using 77 or 80 tracks per side and associated information processing systems.

INCICTS 164-1990 [S2011], Unrecorded Magnetic Tape Cassette for Information Interchange 3.81 mm (0.150 In), 252 to 394 ftppm (6400 to 10000 ftpp)

Presents the minimum requirements for the mechanical and magnetic interchangeability of the cassette between information processing systems, using the physical recording density of 394 ftppm (10 000 ftpp).

This standard is designed to promote the interchangeability of DIBOL programs among a variety of computers. Programs conforming to this standard will be said to be written in DIBOL.

INCICTS 166-1989 [S2010], Fiber Distributed Data Interface (FDDI) Physical Layer, Medium Dependent (PMD)

Specifies Physical Layer, Medium Dependent (PMD) requirements for the Fibre Distributed Data Interface (FDDI). The FDDI provides a high-bandwidth (100 Mbit/s) general-purpose interconnection among computers and peripheral equipment using fibre optics as the transmission medium. The FDDI may be configured to support a sustained transfer rate of approximately 80 Mbit/s (10 Mbyte/s). It may not meet the response time requirements of all unbuffered high-speed devices. The FDDI establishes the connection among many FDDI nodes (stations) distributed over distances of several kilometers in extent.

INCICTS 17-1981 [S2007], Character Set for Optical Character Recognition (OCR-A)

Prescribes shapes and sizes of OCR-A alphanumeric characters and symbols for optical character recognition (OCR) systems.

INCICTS 171-1989 [S2010], One and Two-Sided, High Density, Unformatted, 90-mm (3.5 in), 5,3 tspmm (135-tpi), Flexible Disk Cartridge for 15 916 bpr Use - General, Physical and Magnetic Requirements

This standard specifies the general, physical, and magnetic requirements for interchangeability of the one- and two-sided, high-density, 90-mm (3.5-in) (nominal) flexible disk cartridge for 15 916 bits-per-radian (bpr) use as required to achieve unformatted disk cartridge interchange among disk drives using 80 tracks per side and associated information processing systems. The one- and two-sided flexible disk enclosed in a protective case and having one or two recording surfaces is of the type intended specifically for use with digital recording and reproducing equipment employing access mechanisms capable of positioning to these data tracks.

INCICTS 172-2002 [S2012], Information Technology - Standard Dictionary of Information Technology (ANSDIT)

[NOTE - ANSI INCITS 172-2002 is published in HTML format. The file you will download is a .ZIP file containing all the necessary files. To view the standard, please unzipped all of the files and place them into the same folder, then open the HTML file ANSDIT.HTM’. This file provides links to the other sections of the standard.] ANSI INCITS 172-2002 contains concepts used in information technology. In general, concepts or terms found in an everyday non-technical dictionary are not included.

INCICTS 175:1999 [S2013], 19-mm Type ID-1 Recorded Instrumentation - Digital Cassette Tape Form

Establishes the format of information on 19-mm type ID-1 instrumentation digital cassettes. It specifies the dimensions and locations of the helical data, control, time code, and annotation tracks. Also, it defines the format and recording requirements of the data blocks forming the helical data record containing digital instrumentation and other associated data and specifies the content, format, and recording method for the control record. This standard also specifies the recording requirements for the longitudinal records contained in the annotation and the time code tracks.

INCICTS 178-1990 [S2010], Packet-Switched Signalling System Between Public Networks Providing Data Transmission Services

CCITT Recommendation X.75, Packet-Switched Signalling System Between Public Networks Providing Data Transmission Services, defines the interface between public networks providing data transmission services in the packet-switched mode. The 1988 (Blue book) version of the Recommendation is the current official version of the X.75 interface definition. Subsequent references to X.75 in this document will be to the 1988 version unless otherwise stated. This standard adapts the international X.75 standard, with modifications and extensions to apply to interfaces between public networks within the United States.

INCICTS 178a-1991 [S2010], Packet-Switched Signalling System Between Public Networks Providing Data Transmission Services - Addendum

This supplement addresses extensions related to the Network User Identification (NUI) utility. In particular, it provides procedures for passing verified NUI utility values between networks and additional constraints on the parameter field format.

INCICTS 179-1990 [S2007], 95-mm Diameter Rigid Digital Recording Disk

Provides the mechanical, physical and magnetic properties of a low-friction disk with a diameter of 95 mm (3.740 inches) and with a typical recording density of 31.5 tracks per millimeter (tpmm) (800 tracks per inch (tpi)) with 567 flux transitions per millimeter (ftppm) (14 400 flux transitions per inch (ftpi)) at a radius of 23 mm (0.900 inch).

INCICTS 18-1974 [S2010], Punched paper tape - Dimensions and location of feed holes and code holes

Covers the physical dimensions of the paper tape and its perforations and is for perforated paper tape with fully punched round holes.

INCICTS 180-1990 [S2011], Magnetic Tape and Cartridge for Information Interchange, 18-Track, Parallel, 12.65mm (1/2 in.) 1491 cpmm (37 871 cpi) Group-Coded, Requirements for Recording

Provides the requirements for a tape cartridge to be used for information interchange among information-processing systems, communication systems, and associated equipment utilizing a standard code for information interchange as agreed upon by the interchange parties.

INCICTS 18093:1990 [S2010], Information technology - Data Interchange on 130 mm Optical Disk Cartridges of Type WORM (Write Once Read Many) using Irreversible Effects - Capacity: 5,2 Gbytes per Cartridge

Specifies the characteristics of a 130-mm optical disk cartridge (ODC) of Type WORM (Write Once Read Many) with a capacity of 5,2 Gbytes. Type WORM ODCs use writing effects that are inherently irreversible. Written marks cannot be erased and attempted modification of the written marks are detectable.

INCICTS 181-1990 [S2011], Recorded Magnetic Tape Cartridge for Information Interchange 0.500 in, 22 and 48 Tracks Serial Serpentine, 6 667 and 10 000 bpi

Provides the requirements for a tape cartridge to be used for information interchange among information-processing systems, communications systems, and associated equipment utilizing a standard code for information interchange as agreed upon by the interchange parties. This standard deals solely with the requirements for recording on magnetic tape.
INCITS 182-1990 [S2007], Guideline for Bar Code Print Quality
Covers the optical characteristics of a printed bar code symbol. This document shall be used with the appropriate application specifications, or symbology specifications, or both. The appropriate application specifications, or symbology specifications, or both, shall take precedence over this guideline.

Provides the mechanical, electrical and signalling protocol specifications for an efficient simplex high-performance point-to-point interface between pieces of data-processing equipment. The interface described in this document can be operated at peak data rates of 800 or 1600 Mbit/s, over distances of up to 25m by means of copper cabling. A distance-independent signalling protocol allows the average data rates to approach the peak data rates, even over distances longer than specified for the HIPPI-PH.

INCITS 184-1993 [S2013], Fiber Distributed Data Interface (FDDI) Single Mode Physical Layer Medium Dependent (SMF-PMD)
This standard specifies a media-level, point-to-point, 12-channel, full-duplex, electrical/optical interface, with each channel operating at 500 Mbit/s or 1 Gbit/s. Multimode (MM) fiber cables, and single-mode (SM) fiber cables, are used for distances up to 1 km when carrying the HIPPI-6400-PH protocol. Differential signals are used on the electrical side.

INCITS 186-1992 [S2007], Information Systems – Fiber-Distributed Data Interface (FDDI) – Hybrid Ring Control (HRC)
Specifies a Hybrid Ring Control (HRC) protocol that provides a mode of operation in which both packet switched and isochronous data are transmitted within the same special frame structure, called a cycle.

INCITS 187-1990 [S2011], Recorded Magnetic Tape for Longitudinal Recording of Instrumentation Data-Interchange
Presents the minimum requirements for the mechanical and magnetic interchangeability of the cassette between information processing systems, using the physical recording density of 394 ft/pm (10 000 fpi).

INCITS 189-1991 [S2007], Information Systems – Interface between Data Terminal Equipment (DTE) and Data Circuit-Terminating Equipment (DCE) for Terminals Operating in the Packet Mode and Accessing a Packet-Switched Public Data Network Through Switched Access
Adopts the international CCITT X.32 standard, modifications and extensions to apply to DTE/DCE interfaces.

INCITS 19-1974 [S2010], Eleven-Sixteenths Inch Perforated Paper Tape for Information Interchange
Covers the physical dimensions of the paper tape and its perforations and is for perforated paper tape with fully punched round holes.

INCITS 197-1991 [S2007], Information Systems – Unrecorded Magnetic Tape and Cartridge for Information Interchange 1/2 in (12.65 mm), Serial Serpentine, 22-Track, 6667 ftpi (262 ftpmm) and 48-Track, 10,000 ftpi (394 ftppm)
Provides the requirements for a tape cartridge to be used for information interchange among information-processing systems, and associated equipment. This standard provides the general requirements, definitions, physical and magnetic tape characteristics, and the tape cartridge requirements.

INCITS 199-1991 [S2012], Information Systems - 356-mm Optical Disk Cartridge (Write-Once) - Test Methods for Media Characteristics
 Specifies test methods for media characteristics of 356-mm nominal diameter optical disk cartridges used for information processing systems and for information storage.

INCITS 20-1967 [S2010], Take-up Reels for One Inch Perforated Tape for Information Interchange
Covers the physical dimensions of take-up (or storage) reels, with either fixed or separable flanges, so that reels of perforated tape may be interchanged among machines of various manufacturers, and is intended to serve as a guide in the coordination of equipment design.

INCITS 203-1992 [S2007], Information Systems – Helical-Scan Digital Computer Tape Cartridge for Information Interchange (3.81 mm (0.150 in)) Digital Data Storage (DDS) Recorded Format
Provides the requirements for the helical-scan recording method and the Digital Data Storage (DDS) recorded format of a 3.81-mm (0.150-in) magnetic tape cartridge to be used for information interchange between information processing systems. Information interchange between information processing systems requires the use of this standard in conjunction with the unrecorded tape and cartridge requirements provided by the American National Standard for Information Systems - Unrecorded Helical-Scan Digital Computer Tape Cartridge for Information Interchange, 3.81-mm (0.150-in), ANSI X3.206-1993.

INCITS 204-1992 [S2007], Information Systems – Recorded Magnetic Tape for Information Interchange, 15 and 18 Track, 0.250-inch (6.35-mm) 10 000-bpi (394-bppm) Streaming Mode, Group Code Recording
This standard provides the requirements for a standard for a streaming 0.250 inch (6.30 mm), wide, 15 & 18 Track, magnetic tape in a cartridge to be used for information interchange between information processing systems, communications systems, and associated equipment utilizing a standard code for information interchange, as agreed upon by the interchange parties. This standard refers solely to recording on magnetic tape.

INCITS 205-1992 [S2007], Information Systems – Helical-Scan Digital Computer Tape Cartridge for Information Interchange (3.81-mm (0.150 in)) Data/DAT Recorded Format
This standard provides the requirements for the Helical-Scan recording method and the DATA/DAT recorded format of a 3.81 mm (0.150 in) magnetic tape cartridge to be used for information interchange between information processing systems.

INCITS 207-1991 [S2012], Office Machines and Supplies - Alphanumeric Machines - Alternate Keyboard Arrangement
Provides a performance-oriented keyboard arrangement to the keyboard presented in American National Standard for Office Machines and Supplies-Keyboard Arrangement for Alphanumeric Machines, ANSI X3.154. This standard describes the arrangement of the 48 basic printing keys on the keyboard and the characters, uppercase and lowercase, that appear on the keys.

Describes the matrix of dot placement and size limits for OCR-MB alphanumeric characters and symbols for optical character recognition (OCR) systems.

INCITS 21-1967 [S2007], Rectangular Holes in Twelve-Row Punched Cards
Specifies the size and location of rectangular holes in twelve-row 3-1/4 inch wide punched cards.

INCITS 210-2008 [S2013], Information technology - High-Performance Parallel Interface - Framing Protocol (HIPPI-FP)
This American National Standard provides data framing for a high-performance point-to-point interface between data-processing equipment. This standard does not protect against certain errors that might be introduced by intermediate devices interconnecting multiple HIPPI-PHs.

INCITS 212-1992 [S2012], Information Systems - 130-mm Rewritable Optical Disk Cartridge for Information Interchange
The standard specifies the characteristics of 130-mm optical disk cartridges (ODC) of the type providing for information to be written, read, and erased many times using the magneto-optical effect.
INCITS 213-1994 [S2009], Information Technology - 90-mm (3.54-in) Optical Disk Cartridge Rewritable and Read Only Using Direct Block Format (DBF) Method for Digital Information Interchange

Specifies the characteristics of a 90-mm (3.54-in) optical disk cartridge (ODC) of the type providing for information to be written, read, and erased many times, using thermomagnetic and magneto-optical effect. A part or all of the optical disk may be prerecorded (read only) and be reproduced by embossing information in the recording layer. This information is read without recourse to the magneto-optical effect. The optical disk cartridge consists of two parts, a protective case and an optical disk held inside the case. The optical disk shall be single-sided with one substrate and one recording layer.

INCITS 214-1992 [S2012], Information Systems - 130-mm Write-Once Optical Disk Cartridge Using Servoed Servo and 4/15 Encoding

This standard specifies the characteristics of 130-mm optical disk cartridges (ODC) of the type providing for information to be written once and read many times.

INCITS 215:1994 [R2011], Information Systems - Programming Languages - Forth

This Standard specifies an interface between a Forth System and a Forth Program by defining the words provided by a Standard System.

This Standard specifies a common method for encapsulating ISO/IEC 8802-2 (IEEE Std 802.2) Logical Link Control Protocol Data Units that conform to ISO/IEC 8802-2 (IEEE Std 802.2) Logical Link Control; – Provision for 48-bit source and destination addresses conforming to IEEE 802.1a; – Provision for eight forwarding classes to distinguish, for example, among ordinary data PDUs, PDUs for services that require bandwidth guarantees such as packet video, etc.

INCITS 22-1983 [S2011], Recorded Magnetic Tape for Information Interchange (800 CPI, NRZI)

Provides for format and recording for 1/2 inch, 9-track magnetic tape to be used for information interchange among information processing systems, communication systems, and associated equipment utilizing ANSI X3.4.1977. This standard deals solely with recording on magnetic tape and supports and complements ANSI X3.40.1983, Unrecorded Magnetic Tape for Information Interchange, (9-Track 800 CPI, NRZI, 1600 CPI, PE and 6250 CPI, GCR).

INCITS 220-1992 [S2012], Information Systems - Digital Information Interchange 130-mm Optical Disk Cartridges of the Write-Once, Read Multiple (WORM) Type, Using the Magnetic-Optical Effect

This standard specifies the characteristics of 130-mm optical disk cartridges (ODC) of the Write Once Multiple (WORM) type, which provides for the disk to be initialized once, and the information to be written once only and read many times using the magnet.

INCITS 222-1997 [S2012], Information Technology - High-Performance Parallel Interface - Switch Control (HIPPI-SC)

This American National Standard provides switch control for physical layer switches using the High-Performance Parallel Interface (HIPPI). a high-performance point-to-point interface between data-processing equipment. This standard does not protect against errors introduced by intermediate devices interconnecting multiple HIPPI-PHs.

INCITS 223-1995 [S2011], Data Compression Algorithm – Adaptive Coding with Embedded Dictionary (DCLZ Algorithm) for Information Interchange

Specifies a lossless compression algorithm to reduce the number of bits required to represent information coded by means of 8-bit bytes. This algorithm is known as DCLZ, which stands for Data Compression according to Lempel and Ziv. (See annex C for reference).

INCITS 224-1994 [S2008], Extended Tape Format for Information Interchange, (18-Track, Parallel, 12.65 mm (0.50 in), 1491 cpmn (37 871 cpi), Group-Coded Recording)

Provides the requirements for a tape format to be used for information interchange of processed or unprocessed data between information processing systems, communication systems, and associated equipment using standard code as agreed upon by the interchange parties. This standard deals solely with the requirements for recording, with provision made for using a processing algorithm, on magnetic tape. From: NCITS Storefront: http://www.csisinfo.com/cgi-bin/detail?product_id=56212.

INCITS 225-1994 [S2008], Compaction Algorithm, Binary Arithmetic Coding

Provides the information necessary to ensure interchangeability of compacted data between information processing systems, communications systems, and associated equipment using standard codes as agreed upon by the interchange parties. This standard deals solely with the requirements for using the compaction algorithm.

INCITS 226-1994 [S2008], Programming Language Common Lisp

The specification set forth in this document is designed to promote the portability of Common Lisp programs among a variety of data processing systems. It is a language specification aimed at an audience of implementors and knowledgeable programmers. It is neither a tutorial nor an implementation guide.

INCITS 227-1996 [S2011], Recorded Magnetic Tape Mini-Cartridge for Information Interchange - Serial, 0.250 in (6.30 mm) 20 Tracks, 10,000 bpi (394 bpm) and 28-Track, 14 700 bpi (579 bpcm), MFM Encoded

Provides the requirements for a tape cartridge to be used for information interchange among information processing systems, communication systems and associated equipment utilizing a standard code for information interchange as agreed upon by the interchange parties.

INCITS 228-1993 [S2008], Information Systems – X.25 Data Transfer Phase (DTP) Procedures for Operation with Frame Relay

Describes X.25 Data Transfer Phase (DTP), which facilitates: (a) interworking with X.25/X.31 subnetworks; and (b) provision of the data-transfer aspects of the OSI CONS in the frame relay end points (terminals).

INCITS 229-1994 [S2008], Fiber Distributed Data Interface (FDDI) Station Management (SMT)

Provides the PICS proforma for the Fibre Distributed Data Interface (FDDI) specified in the base standards as denoted in Section 5, General Description, of this PICS.

The described Physical Layer Protocol Standard is intended for use in a high-performance multimedia network. This protocol is designed to be effective at 100 megabits per second using a token ring architecture and fiber optics or other transmission media over distances of several kilometers in extent.

Defines the CAM (Common Access Method) for SCSI (Small Computer Systems Interface). The purpose of this standard is to define a method whereby multiple environments may adopt a common procedure for the support of SCSI devices.

INCITS 234-1993 [S2008], Information Systems – Test Methods for Media Characteristics – 130-mm Rewritable Optical Disk Data Storage Cartridges with Continuous Composite Servo (CCS)

Specifies test methods for media characteristics of optical disks used for information processing systems and for information storage.

INCITS 235-1995 [S2010], Unrecorded Magnetic Tape Cartridge for Information Interchange - 0.25 (6.30 mm), 10000 -12500 ftpi, (394 - 492 ftppm) Coercivity 550 oersteds (44000 amperes/meter) (Types 6150, 6250, 6037)

Provides the information necessary to ensure mechanical and magnetic interchangeability for a tape cartridge between information processing systems, communication systems, and associated equipment. This standard provides the general requirements, definitions, physical and magnetic tape characteristics, and the cartridge requirements.
INCITS 237-1995 [S2011], Fiber Distributed Data Interface (FDDI) Low-Cost Fiber Physical Layer - Medium Dependent (LCF-PMD)

Specifies requirements for the Fibre Distributed Data Interface (FDDI) Part: Token ring low-cost fibre physical layer medium dependent (LCF-PMD). FDDI provides a high-bandwidth (100 Mbit/s), general-purpose interconnection among computers and peripheral equipment.

INCITS 238-1994 [S2008], Information Technology - Programming Language - PL/B

Specifies the form and establishes the interpretation of programs written in the PL/B programming language. The standard is designed to promote portability of PL/B programs among a variety of data processing systems. It is intended for use by implementors.

INCITS 239-1994 [S2008], FDDI - Media Access Control-2 (MAC-2)

Specifies the Media Access Control (MAC), the middle sublayer of the Data Link Layer (DLL), for Fibre Distributed Data Interface (FDDI).

INCITS 241-1994 [S2008], Data Compression Method, Adaptive Coding with Sliding Window for Information Interchange

Specifies an encoding method for the lossless compression of binary data.

INCITS 242-1994 [S2008], Magnetic Tape Cartridge for Information Interchange, .50 in (12.65 mm) Serial Serpentine, 48-Track, 42-500 bpi (1 673 bppm), DLT1 Format

Provides the requirements for a tape cartridge to be used for information interchange among information-processing systems, communications systems, and associated equipment utilizing a standard code for information interchange as agreed upon by the interchange parties. This standard deals with the requirements for the unrecorded cartridge and for recording on the enclosed magnetic tape.

INCITS 243-1996 [S2011], Serial Magnetic Tape Cartridge for Information Interchange, 26 Tracks, 0.250 in (6.35 mm), 16 000 bpi (630 bppm), Streaming Mode, Group Code Recording

Provides the requirements for a streaming 0.250 inch (6.35 mm) wide, 26-Track, magnetic tape in a cartridge to be used for information interchange between information processing systems, communication systems, and associated equipment utilizing a standard code for information interchange, as agreed upon by the interchange parties.

INCITS 244-1995 [S2010], Information Technology - Test Methods for Media Characteristics - 90 mm Read Only and Rewritable M.O. Optical Disk Data Storage Cartridges with Continuous Composite Servo (CCS)

Specifies test methods of 90mm Read Only and Rewritable M.O. Optical Disk Cartridges with CCS used for information processing systems and for information storage.

INCITS 245-1995 [S2011], Abstract Test Suite for FDDI Media Access Control Conformance Testing (FDDI MAC ATS)

Contains the abstract test suite for the Fiber Distributed Data Interface (FDDI) token ring Media Access Control (MAC) layer protocol. This test suite was developed based on the principles defined in OSI Conformance Testing Methodology and Framework (ISO INCITS 246-1994 [S2009], Information Processing Systems - Test Methods for Media Characteristics of 90mm Read Only and Rewritable M.O. Optical Disk Data Storage Cartridge with Discrete Block Format (DBF)

Specifies methods for media characteristics of optical disks used for information processing systems and for information storage (90-mm rewritable optical disk cartridges, using discrete block format (DBF).

Defines a conformance test of the PHY functions in a path through an FDDI node. Figure 1 is a functional block diagram of an FDDI path. The path contains the necessary functions to repeat (that is, decode and retransmit) frames through an FDDI path. The PHY Repeat Filter is optional when there is a MAC in the repeat path, then the function is implemented in PHY.

INCITS 249-1995 [S2010], Unrecorded Magnetic Tape Cartridge for Information Interchange, 0.25 in (6.35 mm), 10 000 - 14 700 ftpi (394 579 ftppm), Coercivity 550 oersteds (44 000 amperes/meter), (Types 2000, 2060, 2080, 2120)

Provides the information necessary to ensure mechanical and magnetic interchangeability for a tape cartridge between information processing systems, communication systems, and associated equipment. This standard provides the general requirements, definitions, physical and magnetic tape characteristics, and the cartridge requirements.

INCITS 250-1996 [S2011], Recorded Magnetic Tape Mini-Cartridge for Information Interchange, 0.250 in (630 mm)12 and 24 Track,10000 bpi (394 bppm) GCR

Provides the requirements for a tape mini cartridge to be used for information interchange among information processing systems, communication systems, and associated equipment utilizing a standard code as agreed upon by the interchange parties.

INCITS 251-1995 [S2010], Unrecorded Magnetic Tape Cartridge for Information Interchange, 0.25 in (6.35 mm), 20 000 ftpi (787 ftppm), Coercivity 550 oersteds (44 000 amperes/meter), (Types 6320, 6525, 6080, 6081)

Provides the information necessary to ensure mechanical and magnetic interchangeability for a tape cartridge between information processing systems, communication systems, and associated equipment. This standard provides the general requirements, definitions, physical and magnetic tape characteristics, and the cartridge requirements.

INCITS 255-1996 [S2011], Abstract Test Suite for FDDI Physical Medium Dependent Conformance Testing (FDDI PMD ATS)

International Standard ISO 9314-3:1990, Fibre Distributed Data Interface (FDDI) - Physical Layer Medium Dependent (PMD), specifies the requirements for theoretical input/output port of FDDI stations as well as for cable plants. The intention of ISO 9314-

INCITS 256:2007 [R2012], Radio Frequency Identification (RFID)

Establishes a technical standard for a family of compatible RFID devices, specifically, RFID devices operating in freely available international frequency bands at license-free power levels. Its purposes are as follow: Promote interoperability and compatibility between RFID devices by defining a common API and limited physical and data link layer options. Support item management applications and provide flexibility in the physical layer definitions to allow additional features for uses that value such enhancements.

INCITS 257-1997 [S2012], Information Technology - FDDI Station Management-2 Common Services (SMT-2-CS)

This standard specifies the common services portion of station management-2 (SMT-2-CS) for the Fibre Distributed Data Interface (FDDI). FDDI provides a high bandwidth (100 Mbit/s) general purpose interconnection among computers and peripheral equipment using optical fibre or copper twisted pair as the transmission medium in a ring configuration. FDDI can be configured to support a sustained transfer rate of approximately 80 Mbit/s (10 Mbyte/s). The use of dual attachment stations with dual MACs allows these rates to be doubled under the circumstance of a fault-free FDDI ring.

INCITS 258-1997 [S2012], Fibre Distributed Data Interface (FDDI) - Station Management-2 - Isochronous Services (SMT-2-IS)

This standard specifies the isochronous Services portion of Station Management-2 (SMT-2-IS) for the Fibre Distributed Data Interface (FDDI). FDDI provides a high bandwidth (100 megabits per second) general purpose interconnection among computers and peripheral equipment using optical fibre or copper twisted pair as the transmission medium in a ring configuration. FDDI can be configured to support a sustained transfer rate of approximately 80 megabits (10 megabytes) per second. The use of dual attachment stations with dual MACs allows these rates to be doubled under the circumstance of a fault-free FDDI ring.
connectivity for many nodes distributed over may not meet the response time requirements of all transfer rate of at least 80 Mbit/s (10 Mbyte/s). It FDDI can be configured to support a sustained data computers and peripheral equipment using fibre twisted pair as the transmission medium in a ring configuration. FDDI can be configured to support a sustained transfer rate of approximately 80 megabits width held inside the case on a reel. The tape shall be transported on the reel for digital recording at a physical density of 1944 ftpmm (49 378 fppi).

INCITS 261-1996 [S2011], Extended Magnetic Tape Format for Information Interchange 36-track, Parallel Serpentine, 12.65 mm (0.50 in), 1491 cpm (37 871 cpi) Group-Coded Recording Provides the requirements for a 36-track tape format to be used for information interchange of data between information processing systems, communication systems, and associated equipment using standard code as agreed upon by the interchange parties. This standard deals solely with the requirements for recording, with provision made for using a processing algorithm, on magnetic tape.

INCITS 262-1995 [S2010], Protocol Implementation Conformance Statement Proforma for FDDI (FDDI CT-PCS) Provides the PICS proforma for the Fibre Distributed Data Interface (FDDI) specified in the base standards as denoted in Section 5, General Description, of this PICS.

INCITS 263-1995 [S2010], Fiber Distributed Data interface (FDDI) Twisted Pair - Physical Medium Dependent (TP-PMD) Requirements for the Fibre Distributed Data Interface. FDDI provides a high-bandwidth (100 Mbit/s) general-purpose interconnection among computers and peripheral equipment using fibre optics and twisted pair as the transmission medium. FDDI can be configured to support a sustained data transfer rate of at least 80 Mbit/s (10 Mbyte/s). It may not meet the response time requirements of all unbuffered high-speed devices. FDDI provides connectivity for many nodes distributed over distances of several kilometers in extent. Default values for FDDI were calculated on the basis of 1 000 physical links and a total fibre path length of 200 km.

INCITS 264-1996 [S2011], Unrecorded Helical-Scan Digital Computer Tape Cartridge for Information Interchange, 19 mm (0.748 in) Type D-1 Provides the unrecorded requirements for a computer tape cartridge to be used for information interchange between information processing systems. Such a cartridge is comprised of two parts: - a case to provide protection from contaminants and human

INCITS 265-1995 [S2011], Unrecorded Magnetic Tape Cartridge for Information Interchange, 36-Track, Parallel Serpentine, Extended Length, 12.57 mm (0.495 in), 1944 ftpmm (49 378 fppi), Group-Coded Recording Provides the requirements for an unrecorded tape cartridge to be used for information interchange among information-processing systems. Such a cartridge comprises two parts: (a) a case to provide protection of the media from contaminants and human handling, and to facilitate loading and unloading of the cartridge by the drive and (b) a magnetic tape of 12.573 mm (0.495 in) width held inside the case on a reel. The tape shall be transported on the reel for digital recording at a physical density of 1944 ftpmm (49 378 fppi).

INCITS 266-1996 [S2011], Magnetic Tape Cartridge for Information Interchange, 50 in (12.65 mm), Serial Serpentine, 112-Track, 42 500 bpi (1673 bpsm) (DLT2 Format) Provides the requirements for a tape cartridge to be used for information interchange among information-processing systems, communication systems, and associated equipment utilizing a standard code for information interchange as agreed upon by the interchange parties.

INCITS 267-1996 [S2011], Helical-Scan Digital Computer Tape Cartridge, 12.65 mm (0.498 in) for Information Interchange Specifies the requirements for a helical data storage (HDS) tape cartridge to be used for information interchange among information-processing systems, communication systems and associated equipment utilizing a standard code for information interchange a.

INCITS 269-1996 [S2011], SCSI-3 Fibre Channel Protocol (FCP) This standard defines the SCSI-3 Fibre Channel Protocol (FCP). The FCP is a mapping protocol (FC-4) for applying the SCSI command set to the Fibre Channel. The FCP defines the Fibre Channel information units in accordance with the SCSI Architecture Model (ANSI X3.270-1996). The FCP additionally defines how the Fibre Channel services are used to perform the services defined by the SCSI Architecture Model.

INCITS 27-1987 [S2008], Magnetic Tape Labels and File Structure for Information Interchange This standard specifies the file structure and the labeling of magnetic tapes for the interchange of information between users of information processing systems.

INCITS 273-1997 [S2012], Information Technology - CASE Tool Integration Messages This standard includes an abstract interface to services used by CASE tools. This interface will insulate a tool that uses a service from the provider of the service. The standard focuses on: - Defining specific messages with their abstract parameters; - Message semantics; - Message sequencing (constraints on message ordering); - Messages for Computer Aided Software Engineering domain.

INCITS 274-1996 [S2008], Information Technology - Programming Language REXX Specifies the semantics and syntax of the programming language REXX by specifying requirements for a conforming language processor. The scope of this standard includes: - the syntax and constraints of the REXX language; - the semantic rules for interpreting REXX programs; - the restrictions and limitations that a conforming language processor may impose; - the semantics of configuration interfaces.

INCITS 274-1996/AM1-2000 [S2008], Information Technology - Programming Language REXX Amendment 1 Specifies the semantics and syntax of the programming language REXX by specifying requirements for a conforming language processor. The scope of this standard includes: - the syntax and constraints of the REXX language; - the semantic rules for interpreting REXX programs; - the restrictions and limitations that a conforming language processor may impose; - the semantics of configuration interfaces.

INCITS 278-1997 [S2012], Information Technology - Fibre distributed data interface (FDDI) - Physical Layer Repeater Protocol (PHY-REP) This FDDI standard specifies the Physical Layer Repeater Protocol (PHY-REP) for the upper sublayer of the FDDI Physical Layer. FDDI provides a high-bandwidth (100 Mbit/s), general-purpose interconnection among information processing systems, subsystems, and peripheral equipment, using fibre optics or other transmission media. FDDI can be configured to support a sustained data transfer rate of at least 80 Mbit/s (10 Mbyte/s). FDDI provides connectivity for many nodes distributed over distances of several kilometers in extent.

INCITS 280-1996 [S2011], Data Compression Algorithm Adaptive Lossless Data Compression (ALDC), Algorithm for Information Interchange Provides the requirements for a lossless compression algorithm to reduce the number of bytes required to represent data. The algorithm is known as the ALDC (Adaptive Lossless Data Compression) algorithm. The ALDC has been assigned ISO algorithm identifier numbers as follows: History Buffer Size 512-Byte 1024-Byte 2048-Byte Algorithm id number 3 4 5

INCITS 282-1996 [S2011], Magnetic Tape Cartridge for Information Interchange, 0.50 in (12.65 mm) Serial Serpentine, 128-Track, 62 500 bpi (2460 bpsm), DLT3 Format Provides the requirements for a tape cartridge to be used for information interchange among information-processing systems, communication systems, and associated equipment utilizing a standard code for information interchange as agreed upon by the interchange parties.
INCITS 284-2011 [R2016], Information Technology - Identification Cards - Health Care Identification Cards
This Standard describes the parameters for identification cards for health care applications in the United States.

INCITS 286-1997 [S2012], Information Technology - Abstract Test Suite for FDDI Station Management Conformance Testing (FDDI SMT ATS)
This American National Standard contains the Abstract Test Suites for the Fiber Distributed Data Interface (FDDI) token ring Station Management (SMT) layer protocol. The SMT Protocol is extensive and very complex. In the development process, the protocol was broken into six separate areas. Those areas dealt with Physical Connection Management (PCM), Entity Coordination Management (ECM) Ring Management (RMT), Configuration Management (CMT), Frame Based Management (FBM) and Management Information Base (MIB).

INCITS 29-1971 [S2010], Specifications for Properties of Unpunched Oiled Paper Perforator Tape
Defines the physical characteristics of unpunched oiled paper tape to be used in perforated tape equipment.

INCITS 293-1996 [S2011], Serial Storage Architecture - Physical Layer 1 (SSA-PH1)
Defines the physical layer of the Serial Storage Architecture (SSA). SSA defines a serial interface hierarchy to be used for purposes within its distance and performance characteristics, including, but not limited to, storage subsystems. This standard is intended to be used with an upper layer protocol (e.g., SCSI-2 Protocol (SSA-S2P)) and a transport layer (e.g., SSA Transport Layer 1 (SSA-TL1)). A major goal of the SSA-PH1 standard is to define a physical layer acceptable to device vendors, looking for an evolution from parallel SCSI, and systems designers looking for opportunities to more fully exploit the capabilities inherent to a serial bus.

Describes an upper-level protocol of Serial I/O Subsystem. SSA-S2P is a mapping of the existing SCSI-2 protocol, described in American National Standard for Information Systems - Small Computer Systems Interface-2 (SCSI-2), ANSI X3.131-1994 (R1999), with extensions to map SCSI-2 to the SSA serial link.

INCITS 295-1996 [S2011], Serial Storage Architecture - Transport Layer-1 (SSA-TL1)
Defines the transport layer of the Serial Storage Architecture (SSA). SSA defines a serial interface hierarchy to be used for purposes within its distance and performance characteristics, including, but not limited to, storage subsystems. This standard is intended to be used with an upper layer protocol (e.g., SCSI-2 Protocol (SSA-S2P)) and a physical layer (e.g., SSA Physical Layer 1 (SSA-PH1)). A major goal of the SSA-TL1 standard is to define a transport layer acceptable to vendors, looking for an evolution from parallel SCSI, and systems designers looking for opportunities to more fully exploit the capabilities inherent to a serial bus.

INCITS 296-1997 [S2012], Information technology - Single Byte Command Code Sets CONNection (SBCON)
SBCON describes an input/output (I/O) and interconnection architecture. SBCON specifies fiber optic links, switched point-to-point topology, and I/O protocols for high bandwidth, high performance and long distance information exchange.

INCITS 30:1997 [R2013], Representation of Calendar Date and Ordinal Date for Information Interchange
The scope is limited to the representation of calendar date for interchange among data systems; it does not describe how the date is determined.

INCITS 300-1997 [S2012], Information technology - High-Performance Parallel Interface - Serial Specification (HIPPI-Serial)
This American National Standard specifies a physical-level interface for transmitting digital data at 800 Mbit/s or 1600 Mbit/s serially over fiber-optic cables across distances of up to 10 km. The signalling sequences and protocol used are compatible with HIPPI-PH, ANSI X3.183-1991, which is limited to 25 m distances. HIPPI-Serial may be integrated as a host's native interface, or used as an external extender for HIPPI-PH ports.

INCITS 302-1998 [S2013], Information technology - SCSI-3 Parallel Interface - 2 (SPI-2)
This standard defines the mechanical, electrical, timing, and protocol requirements of the SCSI parallel interface to allow conforming devices to interoperate. The SCSI parallel interface is a local I/O bus that may be operated over a wide range of transfer rates.

INCITS 303-1998 [S2013], Fibre Channel Physical and Signaling Interface-3 (FC-PH-3)
FC-PH-3 describes the enhancement to ANSI X3.230, FC-PH and to the ANSI X3.297, FCPH-2 and is an addendum to the FC-PH and FC-PH-2 documents.

INCITS 305:1998 [R2013], Information technology - SCSI Enclosure Services (SES)
The SCSI Enclosure Services (SES) command set documents the commands and parameters necessary to manage and sense the state of the power supplies, cooling devices, displays, indicators, individual drives, and other non-SCSI elements installed in an enclosure. The command set uses the SCSI SEND DIAGNOSTIC and RECEIVE DIAGNOSTIC RESULTS commands to obtain configuration information for the enclosure and to set and sense standard bits for each type of element that may be installed in the enclosure.

INCITS 305:1998/AM1:2000 [R2013], Information technology - SCSI - Enclosure Services (SES) - Am 1
This is the amendment to INCITS 305-1998[R2008]

INCITS 306:1998 [R2013], Information technology - SCSI-3 Block Commands (SBC)
This standard defines the command set extensions to facilitate operation of SCSI block devices. The clause (s) of this standard pertaining to the SCSI block device class, implemented in conjunction with the applicable clauses of the ANSI NCITS 301-1999 SCSI-3 Primary Commands (SPC), fully specify the standard command set for SCSI block devices.

INCITS 307-1997 [S2012], Information Technology - Serial Storage Architecture - Physical Layer 2 (SSA-PH2)
The SSA-PH2 standard (ANSI NCITS 307-1997) defines a physical layer that supports the SSA transport layer 2 (ANSI NCITS 308-1997), and any protocols supported by SSA-TL2 (ANSI NCITS 308-1997). The goals of SSA-PH2 (ANSI NCITS 307-1997) are: a) extending the cable distance; b) copper cable operation at 40 Mbit/s; c) full duplex operation to achieve an aggregate 80 Mbit/s between two ports; and d) other capabilities that fit within the scope of SSA-PH2 (ANSI NCITS 307-1997) that may be proposed during the development phase by the participants in the project.

INCITS 308:1997 [S2012], Information Technology - Serial Storage Architecture - Transport Layer 2 (SSA-TL2)
This document defines a transport layer of the Serial Storage Architecture (SSA) that runs SSA-S2P and SSA-S3P while running on SSA-PH2. The goals of SSA-TL2 are: a) provide an Extended Distance Option; b) provide support for higher data rates in the physical layer 2 (SSA-PH2); c) enhance packet formats and addressing methods; d) define a transport layer acceptable to vendors looking for an evolution from parallel SCSI and systems designers looking for opportunities to more fully exploit the capabilities inherent to a serial bus; etc.
This document defines a protocol layer of the Serial Storage Architecture (SSA) that runs on SSA-TL2 while running on SSA-PH2. The goals of SSA-53P are: a) map the SAM services and terminology to SSA; b) define the data field format of the SSA-53P SMs; c) support for dual port and alternate pathing; d) provide support for auto-sense; e) provide support for third-party operations; f) other capabilities that fit within the scope of SSA-53P that may be proposed during the development phase by the participants in the project.

INCITS 31-2009 [R2014], Information technology - Codes for the Identification of Counties and Equivalent Areas of the United States, Puerto Rico, and the Insular Areas
This standard establishes a structure for the assignment of identifying codes to counties and county equivalents of the United States and its insular and associated areas, for the purpose of information interchange among data processing systems.

INCITS 310:1998 [R2013], Information Technology - Representation of Time for Information Interchange
Presents representation of time for interchange among data systems; it does not describe how time is determined.

INCITS 311:1998 [S2013], Magnetic Tape Format for Information Interchange, 128-Track, Parallel Serpentine, 12.65 mm (1/2 in), 3400 bpm (86 360 bpi) Run Length Limited Recording
Provides the requirements for a 128-track tape format to be used for information interchange of data between information processing systems, communication systems, and associated equipment using standard code as agreed upon by the interchange parties. Deals solely with the requirements for recording, with provision made for using a processing algorithm, on magnetic tape.

INCITS 312:1998 [S2013], Magnetic Tape Cartridge 0.50 in (12.65 mm), Serial Serpentine, 112-Track, 81 600 bpi (3213 bppm), DLT4 Format
Provides the requirements for a tape cartridge to be used for information interchange among information-processing systems, communication systems, and associated equipment utilizing a standard code for information interchange as agreed upon by the interchange parties. Deals with the requirements for the unrecorded cartridge and for recording on the enclosed magnetic tape.

INCITS 314-1998 [S2013], Information technology - SCSI-3 Medium Changer Commands (SMC)
This standard defines the command set extensions for operation of SCSI medium changer devices, and command set extensions that allow medium changer functions in other types of SCSI devices.

INCITS 315:1998 [S2013], Unrecorded magnetic tape cartridge for information interchange, 12.65 mm (0.498 in), 128-track, parallel serpentine, 2550 fpm (64 770 fpi)
Provides the requirements for an unrecorded tape cartridge to be used for information interchange among information-processing systems. Such a cartridge comprises two parts: a) to provide protection of the media and contaminants and human handling, and to facilitate loading and unloading of the cartridge by the drive; b) a magnetic tape of 12.65 mm (0.498 in) width held inside the case on a reel.

INCITS 318-1998 [S2013], Information technology - SCSI Controller Commands - 2 (SCC-2)
This standard defines the command set extensions to facilitate operation of SCSI storage array devices. Clauses of this standard pertaining to the SCSI storage array device class, implemented in conjunction with the applicable clauses within any of the SCSI command standards, shall specify the standard command set available for SCSI storage arrays.

INCITS 319-1998 [S2012], Information Technology - Programming Languages - Smalltalk
This is a standard for the Smalltalk language such that: 1. working only from the standard, a conforming implementation can be produced, 2. Smalltalk programs which conform to the standard will have the same execution semantics on any conforming implementation, and 3. the standard shall be sufficiently complete to allow useful Smalltalk programs to be constructed.

INCITS 320:1998 [R2013], Information technology - Spatial Data Transfer
The standard will provide a common mechanism for transferring digital spatial data among different systems, for sharing and integrating data from many diverse sources.

INCITS 322-2015, Information technology - Card Durability Test Methods
This American National Standard describes Test Methods for the evaluation of identification (ID) card durability. An ID card is defined as a card identifying its holder and issuer which may carry data required as input for the intended use of the card.

This American National Standard specifies a physical-level, point-to-point, full-duplex, link interface for reliable, flow-controlled, transmission of user data at 6400 Mbit/s, per direction, across distances of up to 1 km. A parallel copper cable interface for distances of up to 40 m is specified. Connections to a separate longer-distance optical interface are provided. Small fixed-size micropackets provide an efficient, low-latency, structure for small transfers, and a component for large transfers.

INCITS 323-1998/AM 1-2001 [S2016], Information Technology - High-Performance Parallel Interface - 6400 Mbit/s Physical Layer (HIPPI -6400-PH) - Amendment 1
S2016
Provides the requirements for a tape cartridge to be used for information interchange among information processing systems.

INCITS 325-1998 [S2013], Information technology - SCSI-3 Serial Bus Protocol 2 (SBP-2)
This standard defines a protocol for the transport of commands and data over High Performance Serial Bus, as specified by ANSI/IEEE 1394. The transport protocol, Serial Bus Protocol 2 or SBP-2, requires implementations to conform to the requirements of the aforementioned standard as well as to ISO/IEC 13213:1994, Control and Status Register (CSR) Architecture for Microcomputer Buses, and permits the exchange of commands, data and status between initiators and targets connected to Serial Bus.

INCITS 328-2000 [S2015], Information Technology - 19 mm DD-2 Helical Scan Digital Computer Tape Cassette for Information Interchange
Presents the requirements for DD-2 digital data storage cassettes to be used for information interchange between information processing systems.

INCITS 329-2000 [S2015], Magnetic Tape Cartridge for Information Interchange, 0.50 in (12.65 mm), Serial Serpentine, 208-Track, 85 940 bpi (3383 bppm), DLT5 Format
Provides the requirements for a tape cartridge to be used for information interchange among information-processing systems, communication systems, and associated equipment utilizing a standard code for information interchange as agreed upon by the interchange.

INCITS 330-2000 [S2015], Information technology - Reduced Block Commands (RBC)
This standard defines a Reduced Block Command set for logical block devices. The Reduced Block Commands along with the required SPC-2 commands and their restrictions described in this standard, fully specify the complete command set for RBC logical block devices.

INCITS 330:2000/AM1:2003 [R2013], Information technology - SCSI - Reduced Block Command Set (RBC) - Am 1
This is the amendment to INCITS 330:2000
INCITS 332-1999 [S2014], Information technology - Fibre Channel Arbitrated Loop (FC-AL-2)
This American National Standard for FC-AL specifies signaling interface enhancements for ANSI X3, FC-PH-x to allow L_Ports to operate with an Arbitrated Loop topology. This standard defines L_Ports that retain the functionality of Ports as specified in ANSI X3, FC-PH-x. The Arbitrated Loop topology attaches multiple communicating points in a Loop without requiring switches.

INCITS 332-1999/AM 2-2006 [S2016], Information technology - Fibre Channel Arbitrated Loop 2nd Generation (FC-AL-2) - Amendment 2
Amendment 2 to INCITS 332-1999

INCITS 332-1999/AM1:2003 [S2013], Information technology - Fibre Channel Arbitrated Loop (FC-AL) - Amendment 1
This is the amendment to INCITS 332:1999

INCITS 333-2000 [S2015], Information technology - SCSI Multi-Media Commands - 2 (MMC-2)
This standard defines a multimedia command set extensions for Device Type 5 devices. The commands specified within this standard define standard access and control to those Features of the device that are used in multimedia applications. The SPC command set and these extensions are transport independent and may be implemented across a wide variety of environments for that a SCSI command mapping and delivery vehicle has been defined. To date these include Fibre Channel, SCSI Parallel Interface, High Performance Serial Bus, Serial Storage Architecture, and ATA/ATAPI. The objective of this command set is to provide for the following: 1) A definition of the command formats and functions independent of delivery, protocol/signaling or transport mechanism. Architectural constraints regarding command functions, over the various transports, are addressed in the document specific to the physical transport. 2) Standardized access to common Features of SCSI devices employed in multimedia applications. 3) System software/firmware independence across device classes. Thus, different tape drives, optical media drives, and other devices can be added to the system without requiring modifications to generic system hardware and software. Provision is made for the addition of special Features and functions through the use of vendor-specific options. Reserved Opcodes are provided for future standardization. 4) To provide compatibility such that properly conforming SCSI-2 devices may inter-operate with subsequent devices given that the system engineering is correctly done. SCSI protocol extensions are designed to be permissive of rejections by conforming SCSI-2 devices and thus allow the SCSI-2 device to remain backward-compatible.

INCITS 334-2000 [S2015], Information Technology - Magnetic Tape Cartridge for Information Interchange - 0.50 in (12.65 mm), Serial Serpentine 128-Track, 62 500 BPI (2 460 BPPM) DLT 3-XT Format
Specifies the physical and magnetic characteristics of a 0.5-in (12.65-mm)-wide 128-track magnetic tape cartridge, to enable physical interchange of such cartridges. It also specifies the quality of the recorded signals, a format - called Digital Linear Tape 3 Extended (DLT 3-XT) - and a recording method, thereby allowing data interchange between drives. The use of a labeling standard such as American National Standard for Information Technology - File Structure and Labelling of Magnetic Tapes for Information Interchange, ANSI X3.27-1987 (R1998), will support data interchange between data processing systems.

INCITS 335-2000 [R2015], Information technology - Small Computer System Interface (SCSI-3) Stream Commands (SSC)
This standard defines the command set extensions to facilitate operation of SCSI stream devices. The classes of this standard, implemented in conjunction with the applicable classes of the SCSI Primary Commands – 2 standard, fully specify the standard command set for the SCSI stream device class. The objectives of the SCSI-3 Stream Commands standard (SSC) is to provide the following: a) Permit an application client to communicate over a SCSI service delivery subsystem, with a logical unit that declares itself to be a sequential access device or printer device in the device type field of the INQUIRY command response data; b) define commands unique to each type of SCSI stream device; c) define commands to manage the operation of SCSI stream devices; and d) define the differences between the types of SCSI stream devices.

INCITS 337-2000 [S2015], Information technology - Scheduled Transfer Protocol (ST)
Specifies a connection-oriented data transfer protocol supporting flow-controlled Read and Write sequences and non-flow-controlled, persistent-memory Put, Get and FetchOp sequences. For all sequences, small control messages are used to preallocate buffers at the data destination before the data movement begins, thus allowing the data to be moved immediately from the physical network into the end device’s memory. The control and data messages may use different physical media or may share a single physical medium. Procedures are provided for moving data over HIPPI, Ethernet, and other media.

INCITS 338:2003 [S2013], IT - High-Performance Parallel Interface - 6400 Mbit/s Optical Specifications (HIPPI-6400-OPT)
This American National Standard specifies a media-level, point-to-point, 12-channel, full-duplex, electrical/optical interface, with each channel operating at 500 Mbit/s or 1 Gbit/s. Multimode (MM) fiber cables, and single-mode (SM) fiber cables, are used for distances up to 1 km when carrying the HIPPI-6400-PH protocol. Differential signals are used on the electrical side.

INCITS 34-1972 [S2010], Interchange Rolls of Perforated Tape for Information Interchange
Describes conventions for rolled-up, perforated tapes which are used for the interchange of information. This standard defines and applies to interchange rolls of tape not contained on reels, it does not preclude the interchange of tapes wound on take-up reels.

INCITS 340-2000 [R2015], Information technology - AT Attachment with Packet Interface - 5
This standard specifies the AT Attachment Interface between host systems and storage devices. It provides a common attachment interface for systems manufacturers, system integrators, software suppliers, and suppliers of intelligent storage devices. The application environment for the AT Attachment Interface is any host system that has storage devices contained within the processor enclosure. This standard defines the connectors and cables for physical interconnection between host and storage device, as well as the electrical and logical characteristics of the interconnecting signals. It also defines the operational registers within the storage device, and the commands and protocols for the operation of the storage device. This standard maintains a high degree of compatibility with the AT Attachment with Packet Interface Extensions standard (ATA/ATAPI-4), INCITS 317, and while providing additional functions, is not intended to require changes to presently installed devices or existing software.

INCITS 341:2000 [S2015], Information technology - 25.4 mm (1 in) Type DCRsi Recorded Instrumentation - Digital Cartridge Tape Format
This standard establishes the format of information on 25.4 mm (1 in) type DCRsi instrumentation digital cartridges. It specifies the dimensions and locations of the transverse scan data and pilot tone track, the control track and the longitudinal data track. It defines the formatting, randomizing, ECC, and other recording requirements of the data blocks forming the transverse data record, containing user data and other associated data and specifies the content, format, and recording method for the control track to ensure that a compliant recorder will be able to reproduce the recorded tape. This standard also specifies the recording requirements for the longitudinal records contained in the longitudinal data tracks. Additionally this standard specifies the prerecorded and post-recording zones of the transverse scan tracks and the longitudinal data track. The physical requirements, magnetic requirements and test methods for the magnetic tape and tape cartridge are also specified in this standard. All dimensions given are metric with their corresponding U.S. customary engineering units (similar to British Imperial units) shown in parentheses.
INCITS 344-2001 [S2011], Information Technology - 12.65 mm wide Magnetic Tape Format for Information Interchange - Helical Scan Recording - Recorded Instrumentation Format

Represents the minimum requirements for 12.65 mm (0.50 in) digital data storage cassettes for instrumentation systems and associated data analysis equipment. The physical requirements, magnetic requirements, and test methods for the magnetic tape and tape cassette are specified in ISO/IEC CD 15204. This proposed standard is for a recording format supported by the referenced standard.

INCITS 345-2001 [S2011], Magnetic Tape Cartridge for Information Interchange, 0.5 in (12.65 mm) Serial Serpentine, 208-Track, 98 250 BPI (3868 BPM), DLT 6 Format

Represents the minimal environmental, mechanical and magnetic requirements for a 40 Gigabytes user data 0.5 in cartridge for data interchange between systems. It also describes the format, DLT 6 used in the recorded portion of the media.

This standard defines a second version of the SCSI Fibre Channel Protocol (FCP). This standard is a mapping protocol for applying the SCSI command set to Fibre Channel. This standard defines how the Fibre Channel services and the defined Information Units (IUs) are used to perform the services defined by the SCSI-3 Architecture Model - 2 (SAM-2). This second version includes additions and clarifications to the first version, removes information that is now contained in other standards, and describes additional error recovery capabilities for the Fibre Channel protocol.

INCITS 356-2002 [S2012], Information technology - Fibre Channel Audio-Video (FC-AV)

This American National Standard specifies the transport of digital Audio and Video formats over Fibre Channel.

INCITS 357-2002 [S2012], Information technology - Fibre Channel Virtual Interface Architecture Mapping Protocol (FC-VI)

This standard defines the Fibre Channel mapping protocol for the Virtual Interface (VI) Architecture (FC-VI). FC-VI defines the Fibre Channel Information Units in accordance with the VI Architecture model. FC-VI additionally defines how Fibre Channel services are used to perform the services required by the VI Architecture model of its network transport.

INCITS 358:2002 [R2012], Information technology - BioAPI Specification

Defines the Application Programming Interface and Service Provider Interface for a standard biometric technology interface. It is beyond the scope of this specification to define security requirements for biometric applications and service providers, although some related information is included by way of explanation of how the API is intended to support good security practices.

This Amendment to INCITS 358 adds support for biometric fusion to the standard and extends the API and the SPI of BioAPI by specifying new functions and new values for existing data types.

INCITS 359-2012, Information Technology - Role Based Access Control

The RBAC Reference Model defines sets of basic RBAC elements (i.e., users, roles, permissions, operations and objects) and relations as types and functions that are included in this standard.

INCITS 360:2002 [R2012], Information Technology - SCSI Multimedia Commands - 3 (MMC-3)

This standard defines multimedia command set extensions for Device Type 5 devices. The commands specified within this standard define standard access and control to those Features of the device that are used in multimedia applications. The SPC and these extensions are transport independent and may be implemented across a wide variety of environments for which a SCSI transport protocol has been defined. To date these include Fibre Channel, SCSI Parallel Interface, High Performance Serial Bus (IEEE 1394), Serial Storage Architecture, and ATA/ATAPI.

INCITS 361:2002 [R2012], Information technology - AT Attachment with Packet Interface-6 (ATA/ATAPI-6)

This standard specifies the AT Attachment Interface between host systems and storage devices. It provides a common attachment interface for systems manufacturers, system integrators, software suppliers, and suppliers of intelligent storage devices.

This standard specifies the AT Attachment Interface betweenhost systems and storage devices. It provides a common attachment interface for systems manufacturers, system integrators, software suppliers, and suppliers of intelligent storage devices. In this erratum, pages 65-66A and 341-343 are reprinted with corrections.

INCITS 364:2003 [S2014], Information technology - Fibre Channel - 10 Gigabit (10GFC)

10GFC describes signaling and physical requirements that may be utilized by the FC-2 level to transport data at a rate in excess of 10 gigabits per second. The Fibre Channel signaling and physical requirements described in this document are: - Link Architecture including retiming - clause 5; - Physical Layer specifications - clause 6; - Connector performance specifications - clause 7; - Link and cable plant management specifications - clause 8; - FC-1 data path interface - clause 9; - Optional interconnect interfaces clauses 10, 11, and 14; - Transmission Coding - clauses 12 and 13; - Management interface and register set - clause 15

INCITS 364:2003/AM1:2007 [R2012], Information technology - Fibre Channel - 10 Gigabit - Amendment 1 (10GFC/AM1)

This amendment to ANSI INCITS 364-2002, Information Technology - Fibre Channel - 10 Gigabit, corrects the definition of the clock synchronization primitives to comply with ANSI INCITS 424-2007, Information Technology - Fibre Channel - Framing and Signaling - 2.

INCITS 365:2002 [R2012], Information Technology - SCSI RDMA Protocol (SRP)

This standard defines the rules for exchanging information between SCSI devices using an RDMA communication service. Other SCSI transport protocol standards define the rules for exchanging information between SCSI devices using other interconnects.

INCITS 366:2003 [R2013], Information technology - SCSI Architecture Model-2 (SAM-2)

The set of SCSI (Small Computer System Interface) standards consists of this standard and the SCSI implementation standards described in 1.3. This standard defines a reference model that specifies common behaviors for SCSI devices, and an abstract structure that is generic to all SCSI I/O system implementations.

INCITS 367:2003 [R2013], SCSI Parallel Interface - 5 (SPI-5)

This standard defines the mechanical, electrical, timing, and protocol requirements of the SCSI parallel interface to allow conforming SCSI devices to interoperate. The SCSI parallel interface is a local I/O bus that may be operated over a wide range of transfer rates.

INCITS 368:2003 [R2013], Information technology - SCSI Passive Interconnect Performance (PIP)

In the past only the performance requirements for uniform bulk cable (called “media” in earlier standards) have been specified in SCSI standards. Since bulk cable provides only part of the electrical path in a SCSI bus segment, the performance requirements of the interconnect comprising the path is incomplete if only bulk cable is considered. This document expands the coverage to the complete assembled interconnect including connectors, uniform bulk cable, and non-uniform bulk cable. A syntax and framework is described for all types of passive interconnect.

INCITS 369:2003 [R2013], Information technology - SCSI Signal Modeling (SSM-2)

This Standard establishes a common methodology for SCSI system signal modeling. Using this methodology, SCSI systems may be modeled accurately and consistently. This Standard establishes the requirements for the exchange of signal performance information between component suppliers, system integrators, and those carrying-out simulations. This Standard defines the acceptable methods for extracting the electrical and signal performance attributes of the constituent parts of a SCSI bus segment. This Standard establishes the acceptable methods for modeling these parts.
INCITS 37:1999 [S2014], Information Technology - Programming Language APT: Processor Input Language and System-Neutral CLFILE

This standard establishes the form for and the interpretation of programs expressed in the Automatically Programmed Tools (APT) language and of the System-Neutral CLFILE (SCL), which can be generated by processors, such as APT, or by graphical systems. The purpose is to promote portability of these input language programs to a wide variety of computers.

INCITS 370-2004 [R2014], Information technology - ATA/ATAPI Host Adapters Standard (ATA - Adapter)

This standard specifies the AT Attachment Interface between host systems using Automatic Direct Memory Access (ADMA) and storage devices. It provides a common link layer interface for systems manufacturers, system integrators, and software suppliers.

INCITS 377-2009 [R2014], Information technology - Finger Pattern Data Interchange Format

This is the revised version of Finger Pattern Data Interchange Format, ANSI INCITS 377-2004. This standard specifies an interchange format for the exchange of fingerprint recognition data. It describes the conversion of a raw fingerprint image to a cropped and down-sampled finger pattern followed by the cellular representation of the fingerprint pattern image to create the finger-pattern interchange data.

INCITS 382-2004 [R2013], Information technology - SCSI Media Changer Command Set (SMC-2)

This standard defines the command set extensions for operation of SCSI media changer devices, and command set extensions that allow media changer functions in other types of SCSI devices.

INCITS 383-2008 [R2013], Information Technology - Biometric Profile - Interoperability and Data Interchange - Biometrics Based Verification and Identification of Transportation Workers

 Specifies the application profile in support of identification and verification of transportation workers, through the use of Biometric data collected during enrollment, at local access points (i.e., doors or other controlled entrances) and across local boundaries within the defined area of control.

INCITS 385-2004 [R2014], Information technology - Face Recognition Format for Data Interchange

This standard specifies definitions of photographic (environment, subject pose, focus, etc.) properties, digital image attributes and a face interchange format for relevant applications, including human examination and computer automated face recognition.

INCITS 374:2003/AM1:2007 [R2012], Information technology - Single-Byte Command Set - 3 (FC-SB-3) - Amendment 1 (FC-SB-3/AM1)

This amendment to ANSI INCITS 374:2003, Information Technology - Fibre Channel - Single-Byte Command Set-3 (FC-SB-3), describes persistent IU pacing, a method for allowing an FC-SB-3 channel to retain a pacing count that can be used at the start of execution of a channel program. This may improve performance of long I/O programs at higher link speeds and long distances by allowing the Channel to send more IUs to the control unit and eliminating the delay of waiting for the first Command Response.

INCITS 375:2004 [R2013], Information technology - Serial Bus Protocol 3 (SBP-3)

INCITS 380-2009 [R2014], Information technology - Finger Image Based Data Interchange Format

This standard specifies a data record interchange format for storing, recording, and transmitting the information from one or more fingerprint or palm image areas. An amendment to this standard is currently in process.

INCITS 381-2009/AM 1:2011 [R2016], Information technology - Finger Image Based Data Interchange Format - Amendment 1

Amendment 1 to INCITS 381:2009.

This National Standard defines an API specification that serves as a boundary across which application software uses facilities of programming languages to invoke the services of the RTLS Air Interface Protocol standard as defined by INCITS T20.

INCITS 374:2003 [S2013], Information technology - Fibre Channel Single - Byte Command Set-3 (FC-SB-3)

This document describes a communication interface between a channel and I/O control units that utilize the Single-Byte Command Code Sets (SBCCS) as implemented in a wide range of data processing systems. It employs information formats and signaling protocols that provide a uniform means for communicating with various types of I/O control units, facilitating a high bandwidth, high performance, and long distance information exchange environment.

INCITS 374:2003/AM1:2007 [R2012], Information technology - Single-Byte Command Set - 3 (FC-SB-3) - Amendment 1 (FC-SB-3/AM1)

This amendment to ANSI INCITS 374:2003, Information Technology - Fibre Channel - Single-Byte Command Set-3 (FC-SB-3), describes persistent IU pacing, a method for allowing an FC-SB-3 channel to retain a pacing count that can be used at the start of execution of a channel program. This may improve performance of long I/O programs at higher link speeds and long distances by allowing the Channel to send more IUs to the control unit and eliminating the delay of waiting for the first Command Response.

INCITS 375:2004 [R2013], Information technology - Serial Bus Protocol 3 (SBP-3)

INCITS 377-2009 [R2014], Information technology - Finger Pattern Data Interchange Format

This is the revised version of Finger Pattern Data Interchange Format, ANSI INCITS 377-2004. This standard specifies an interchange format for the exchange of pattern-based fingerprint recognition data. It describes the conversion of a raw fingerprint image to a cropped and down-sampled finger pattern followed by the cellular representation of the fingerprint pattern image to create the finger-pattern interchange data.

INCITS 378-2009 [R2014], Information Technology - Finger Minutiae Format for Data Interchange

This Standard specifies a concept and data format for representation of fingerprints using the fundamental notion of minutiae. The data format is generic, in that it may be applied and used in a wide range of application areas where automated fingerprint recognition is involved. No application-specific requirements or features are addressed in this standard. The Standard contains definitions of relevant terms, a description of where minutiae shall be defined, a data format for containing the data, and conformance information. An amendment to this standard is currently in process.

INCITS 378:2009/AM 1:2010 [R2015], Information Technology - Finger Minutiae Format for Data Interchange - Amendment 1

Amendment 1 to INCITS 378:2009

INCITS 380:2003 [R2013], Information technology - SCSI Stream Commands - 2 (SSC-2)

This standard defines the command set extensions to facilitate operation of the sequential-access device type member of the SCSI stream device class. The clauses of this standard, implemented in conjunction with the applicable clauses of the SCSI Primary Commands - 3 standard, fully specify the standard command set for the sequential-access device type member of the SCSI stream device class.

INCITS 381-2009 [R2014], Information technology - Finger Image Based Data Interchange Format

This standard specifies a data record interchange format for storing, recording, and transmitting the information from one or more fingerprint or palm image areas. An amendment to this standard is currently in process.

INCITS 381-2009/AM 1:2011 [R2016], Information technology - Finger Image Based Data Interchange Format - Amendment 1

Amendment 1 to INCITS 381:2009.

INCITS 382-2004 [R2013], Information technology - SCSI Media Changer Command Set (SMC-2)

This standard defines the command set extensions for operation of SCSI media changer devices, and command set extensions that allow media changer functions in other types of SCSI devices.

INCITS 383-2008 [R2013], Information Technology - Biometric Profile - Interoperability and Data Interchange - Biometrics Based Verification and Identification of Transportation Workers

Specifies the application profile in support of identification and verification of transportation workers, through the use of Biometric data collected during enrollment, at local access points (i.e., doors or other controlled entrances) and across local boundaries within the defined area of control.

INCITS 385-2004 [R2014], Information technology - Face Recognition Format for Data Interchange

This standard specifies definitions of photographic (environment, subject pose, focus, etc.) properties, digital image attributes and a face interchange format for relevant applications, including human examination and computer automated face recognition.

INCITS 374:2003/AM1:2007 [R2012], Information technology - Single-Byte Command Set - 3 (FC-SB-3) - Amendment 1 (FC-SB-3/AM1)

This amendment to ANSI INCITS 374:2003, Information Technology - Fibre Channel - Single-Byte Command Set-3 (FC-SB-3), describes persistent IU pacing, a method for allowing an FC-SB-3 channel to retain a pacing count that can be used at the start of execution of a channel program. This may improve performance of long I/O programs at higher link speeds and long distances by allowing the Channel to send more IUs to the control unit and eliminating the delay of waiting for the first Command Response.
A standard application programming interface (API) defines a scope within which, and a grammar by which, it is possible to write application software without attention to vendor-specific infrastructure behavior. The Fibre Channel HBA API standard specifies a standard API, the scope of which is management of Fibre Channel host bus adapters (HBAs) and use of certain Fibre Channel facilities for discovery and management of the components of a Fibre Channel Storage Area Network (SAN).

INCITS 39-1986 [S2007], Recorded Magnetic Tape for Information Interchange (1600 CPI, PE)
This standard provides specifications for format and recording for a 1/2 inch (12.7-mm), 9-track magnetic tape to be used for information interchange among information processing systems, communication systems, and associated equipment utilizing a code for information interchange that was agreed upon by the interchange parties.

INCITS 397-2005 (R2015), Information technology - AT Attachment with Packet Interface-7 (ATA/ATAPI-7)
This standard specifies the AT Attachment Interface between host systems and storage devices. It provides a common attachment interface for systems manufacturers, system integrators, software suppliers, and suppliers of intelligent storage devices.

INCITS 397:2005/AM1:2007 [R2012], Information technology - AT Attachment with Packet Interface-7 Amendment 1 (ATA/ATAPI-7/AM1)
This is the first Amendment to INCITS 397-2005 that specifies the AT Attachment Interface between host systems and storage devices. It provides a common attachment interface for systems manufacturers, system integrators, software suppliers, and suppliers of intelligent storage devices.

INCITS 398:2008 [R2013], Information technology - Common Biometric Exchange Formats Framework (CBEFF)
This standard (revision of ANSI INCITS 398-2005) specifies a common set of data elements necessary to support multiple biometric technologies and to promote interoperability of biometric-based application programs and systems by allowing for biometric data exchange. These common data elements can be placed in a single file, re-coded, or data object used to exchange biometric information between different system components and applications. This standard specifies the biometric data elements.

INCITS 399-2004 [S2014], Information technology - Fibre Channel Switch Application Programming Interface (FC-SWAPI)
A standard application programming interface (API) defines a scope within which, and a grammar by which, it is possible to write application software without attention to vendor-specific infrastructure behavior. This standard specifies a standard API, the scope of which is management of Fibre Channel Switches and exercise of certain Fibre Channel facilities for discovery and management of the components of a Fibre Channel Storage Area Network (SAN).

INCITS 4:1986 [R2012], Information Systems - Coded Character Sets - 7-Bit Standard Code for Information Interchange (7-Bit ASCII)
Details information interchange among information processing systems, communication systems, and associated equipment. Specifies a set of 128 characters (control characters and graphics characters such as letters, digits, and symbols) with their coded representation.

INCITS 40-1993 [S2008], Information Systems – Unrecorded Magnetic Tape for Information Interchange (9-track 800 CPI, NRZI; 1600 CPI, PE; and 6250 CPI, GCR)
This standard provides the information necessary to enable mechanical and magnetic interchangeability for reels of 1/2-inch-wide unrecorded magnetic tape between information processing systems, communication systems, and associated equipment utilizing American National Standard for Information systems - Coded character sets - 7-bit American national standard code for information interchange (7-bit ASCII), ANSI X3.4-1986, and amendments thereto. This standard deals solely with magnetic tape for digital recording and supports and complements American National Standards on recorded magnetic tape for information interchange.

INCITS 401-2005 [S2015], Information technology - SCSI Multimedia Commands - 4 (MMC-4)
This standard defines a set of SCSI command descriptor blocks that are useful in accessing and controlling devices with a peripheral device type set to 5. This command set is transport independent and may be implemented across a wide variety of environments for which a SCSI transport protocol has been defined. To date, these include Parallel SCSI, ATA/ATAPI, Serial ATA, Universal Serial Bus (USB versions 1.1 and 2.0), and High Performance Serial Bus (IEEE 1394, 1394A, and 1394B). The command set described has been selected for correct operation when the physical interface is ATA with the ATAPI command protocol. Although some commands are also described in the SPC-3, the descriptions are also in this standard for the purpose of profiling mandatory and optional command features as applied to multimedia devices. The objective of this command set is to provide for the following: A definition of the command formats and functions independent of delivery, protocol/signaling or transport mechanism. Architectural constraints regarding command functions, over the various transports, are addressed in the document specific to the physical transport. -Standardized access to common features of devices employed in multimedia applications. -System software/firmware independence across device classes and physical interfaces. Provision is made for the addition of special features and functions through the use of vendor specific options. -Compatibility such that properly conforming devices may interoperate with subsequent devices.

INCITS 403-2005 [R2015], Information technology - Automation/Drive Interface - Commands (ADC)
This standard defines the model and command set extensions to facilitate operation of automation/drive interface devices. The clauses of this standard, implemented in conjunction with the applicable clauses of SPC-2 and SPC-3, fully specify the standard command set for automation/drive interface devices. The objective of this standard is to provide the following: a) Permit an application client to communicate over a SCSI service delivery subsystem, with a logical unit that declares itself to be an automation/drive interface device in the device type field of the INQUIRY command response data (see SPC-3); b) define commands unique to the automation/drive interface device type; and c) define commands and parameters to manage the operation of the automation/drive interface device type.

INCITS 404-2006 [S2016], Information technology - Fibre Channel Physical Interfaces - 2 (FC-PH-2)
This standard describes the point-to-point physical interface portions of Fibre Channel high performance electrical and optical link variants that support the higher level Fiber Channel protocols including FC-FS, HIPP, IPI, SCSI and others. This standard is recommended for new implementations but does not obsolete the existing Fibre Channel standards.
This standard defines the command set extensions to facilitate operation of SCSI direct-access block devices. The clauses of this standard, implemented in conjunction with the applicable clauses of SPC-3, fully specify the standard command set for SCSI direct-access block devices. The objective of this standard is to: a) permit an application client to communicate over a SCSI service delivery subsystem with a logical unit that declares itself to be a direct-access block device in the PERIPHERAL DEVICE TYPE field of the standard INQUIRY data (see SPC-3); and b) define commands unique to the direct-access block device type.

INCITS 406-2005 [R2015], Information technology - Automation/Drive Interface - Transport Protocol (ADT)

This standard specifies the transport requirements for the SCSI Automation/Drive interface device. This standard permits the SCSI Automation/Drive interface devices to attach to application clients and provides the definitions for their use.

INCITS 407-2005 [R2015], Information technology - BIOS Enhanced Disk Drive Services - 3 (EDD-3)

This standard assumes that the reader is familiar with the conventional INT 13h interface, the usage of the BIOS Device Parameter Table, and the basic operation of mass storage devices. This standard describes in detail BIOS functions and data structures that are used as an abstraction layer to allow higher-level applications to access mass storage devices in an interface and command-set independent manner. To comply with this standard, higher-level software shall call the INT functions using the data structures described herein, and system firmware shall provide the INT functions and data structures described herein. The storage industry has increased the capacity and functionality of many types of mass storage devices. This increase in capacity and functionality has required the development of a BIOS interface. This standard documents the BIOS interface that is supplied by many BIOS vendors. This standard defines solutions to the following INT 13h BIOS-specific issues: • The INT 13h interface has a limit of 528 megabytes (MB); • The INT 13h interface allows more than two devices to be attached to a system but has no consistent method for storing the additional configuration parameters; • The INT 13h interface does not define CHS-independent methods for addressing devices. The methods defined by the INT 13h interface are not device-geometry independent. A different method of address representation and operation is needed; • Methods of data transfer continue to be added to ATA devices. Capabilities such as, DMA modes, multisector data transfers and PIO modes are not reported to the operating system via the INT 13h interface; • Systems require more than two storage devices, and with this requirement comes the need to assign the order in which.

INCITS 407:2005/Erratum 1-2009 [R2014], Information technology - BIOS Enhanced Disk Drive Services - 3 (EDD-3) Erratum

Erratum to INCITS 407-2005

INCITS 409.4-2006 [R2016], Information technology - Biometric Performance Testing and Reporting - Part 4: Operational Testing Methodologies

This standard is Part 4 (Operational Testing Methodologies) of American National Standard for Information Technology Biometric Performance Testing and Reporting, INCITS 409. The objective of this standard is to establish requirements for operational performance-based biometric testing and reporting.

INCITS 409.5-2011 [R2016], Information Technology - Biometric Performance Testing and Reporting - Part 5: Framework for Testing and Evaluation of Biometric System(s) for Access Control

This standard is concerned solely with the scientific 'technical performance testing' of biometric system(s) and subsystem(s) to be used for access control.

INCITS 410-2015, Information Technology - Identification Cards - Limited Use (LU), Proximity Integrated Circuit Card (PICC)

This standard provides a physical specification with similar electronic characteristics to Proximity Integrated Circuit Cards (PICCs), such as those specified within ISO/IEC 14443-2 and -3. The physical card thickness (finished card body) formats, are defined within this specification and may also have references to both ISO/IEC 7810:2012 (ID1-identification cards), INCITS 440 (Card Life Cycle), and ISO/IEC 15457 for thin flexible cards and other thickness dimensions as called out in this standard. Construction attributes, pertaining to the materials, functionality, and environmental requirements and the targeted use of these cards are also specified.

INCITS 411:2007 [R2012], Information technology - iSCSI Management API, Version 1.1.6

This API provides interfaces to discover and manage iSCSI resources on a system. The intended audience is vendors that deliver drivers that provide these resources to a system.

INCITS 412-2006 [S2016], Information technology - SNIA Multipath Management API Specification, Version 1.0.1

This API provides management interfaces to standard capabilities defined in ANSI INCITS 408-2005 (SPC-3) and common vendor-specific extensions to the standard capabilities. The intended audience is vendors that deliver drivers that provide these capabilities. This standard relates to SCSI multipathing features and excludes multipathing between interconnect devices (such as Fibre Channel switches) and transport specific multipathing (such as iSCSI multiple connections per session).

INCITS 413:2007 [R2012], Information technology - RapidIO(TM) Interconnect Specification (version 1.3)

The Rapid architecture was developed to address the need for a high-performance low pin count packet-switched system level interconnect to be used in a variety of applications as an open standard. The architecture is targeted toward networking, telecom, and high performance embedded applications. It is intended primarily as an intra-system interconnect, allowing chip-to-chip and board-to-board communications at Gigabyte per second performance levels.

INCITS 414-2006 [S2016], Information technology - Fibre Channel Backbone - Generation 3 (FC-BB-3)

This standard defines the functions and mappings necessary to tunnel Fibre Channel links, or bridge Fibre Channel networks, across Wide Area Networks.

The primary purpose of this standard, Homeland Security Mapping Standard - Point Symbolology for Emergency Management, is to establish a common set of symbols for use by mapmakers in support of emergency managers and first responders. It will allow users to rapidly interpret map data and to be able to disseminate consistent, usable information. This American National Standard is applicable to all organizations that create maps or otherwise display features for the Emergency Management or First Responder communities. It is limited at this time to support portrayal of point features that relate to the emergency management and hazard mapping disciplines.

INCITS 417-2006 [S2016], Information technology - Serial Attached SCSI-2 (SAS-1.1)

This standard specifies the functional requirements for the Serial Attached SCSI (SAS) physical interconnect, which is compatible with the Serial ATA physical interconnect. It also specifies three transport protocols, one to transport SCSI commands, another to transport Serial ATA commands to multiple SATA devices, and a third to support interface management. This standard is intended to be used in conjunction with SCSI and ATA command set standards.

INCITS 418-2006 [R2016], Information technology - Switch Fabric - Generation 4 (FC-SW-4)

This standard describes the requirements for an interconnecting Fabric consisting of multiple Fabric Switch elements to support the INCITS Fibre Channel - Framing and Signaling (FC-FS) and INCITS Fibre Channel - Physical Interface (FC-PI) standards.
This standard consists of distinct Fibre Channel mappings resulting in the following models: - FC-BB_IP (FC over TCP/IP backbone network); - FC-BB_GFPT (FC over SONET/SDH/OTN/PDH backbone network using GFPT adaptation); - FC-BB_PW (FC over MPLS network using PW adaptation).

This part of the multi-part standard specifies the concepts, test types and conformance testing methodologies to test biometric data interchange records or computer algorithms that create biometric data interchange records. The biometric data interchange records are specified in the INCITS biometric data interchange format standards. It defines two types (A and B) and three levels (1, 2 and 3) of conformance testing, with a general description and methodology for each one.

This part of INCITS 423 specifies the tests required to assure a vendor’s application(s) or service(s) conform to the ANSI INCITS 378-2004 standard. For the purposes of this part of INCITS 423, of the two types (A and B) and three levels (1,2 and 3) of conformance testing as defined in INCITS 423.1, only Type A and Levels 1 and 2 are within the scope of this part of INCITS 423.

This standard is concerned with conformance testing of implementations claiming conformance to the Finger Pattern Data Interchange Format specification defined in ANSI INCITS 377-2004. More specifically, it is concerned with testing only of the Biometric Data Interchange Records (BDIR) requirements as defined in ANSI INCITS 423.1-2008.

INCITS 423.4-2009 [R2014], Information technology - Conformance Testing Methodology Standard for Biometric Data Interchange Format Standards - Part 4: Conformance Testing Methodology for INCITS 381: Finger Image Data Interchange Format

This part of ANSI INCITS 423 is concerned with conformance testing of implementations claiming conformance to the Finger Image-Based Data Interchange Format specification as per ANSI INCITS 381-2004. Further, this part of ANSI INCITS 423 is concerned with testing only of the Biometric Data Interchange Records (BDIR) requirements as defined in ANSI INCITS 381-2004. For the purposes of this part of ANSI INCITS 423, and as also described in Part 1: Generalized Conformance Testing Methodology of ANSI INCITS 423, conformance testing of the CBFEF requirements as set forth in ANSI INCITS 381-2004 is not within the scope of this part of ANSI INCITS 423.

INCITS 424:2007 [R2012], Information technology - Fibre Channel Framing and Signaling - 2 (FC-FS-2)

This standard describes the framing and signaling interface of a high performance serial link for support of FC-4s associated with upper level protocols (e.g., SCSI, IP, SBCCS, VI). This standard is based on FC-FS with subsequent modifications approved by the T11 committee. Extended Link Services (ELSs) are not specified in this standard. FC-LS should be consulted for the functional description of all ELSs referenced in this specification.

This amendment to FC-FS-2 describes the incremental framing and signaling requirements for scrambling frames on Fibre Channel links. The requirements for use of Frame Scrambling on specific link technologies are described in FC-FH-4. Future standards may also require Frame Scrambling.

INCITS 426:2007 [R2012], Information technology - Fibre Channel Security Protocols (FC-SP)

This standard is one of the Fibre Channel family of standards. This standard describes the protocols used to implement security in a Fibre Channel fabric. This standard includes the definition of protocols to authenticate Fibre Channel entities, protocols to set up session keys, protocols to negotiate the parameters required to ensure frame-by-frame integrity and confidentiality, and protocols to establish and distribute policies across a Fibre Channel fabric.

INCITS 427:2007 [R2012], Information technology - Fibre Channel Generic Services-5 (FC-GS-5)

This standard describes in detail the services accessed by well-known addresses defined in FC-FS-2. Generic Services described in this document are: a) Directory Service; b) Management Service; c) Event Service; and d) Alias Service.

INCITS 428:2007 [R2012], Information technology - Storage Management - Host Bus Adapter Application Programming Interface (SM-HBA)

This standard defines requirements and guidelines for specifying conformance test suites and related test methods for measuring conformance of Biometric Service Provider components to the BioAPI specification, and defines procedures to be followed before, during, and after conformance testing.

INCITS 430:2007 [R2012], Information technology - Multi-Media Commands - 5 (MMC-5)

This standard defines a set of SCSI command descriptor blocks that are useful in accessing and controlling devices with a peripheral device type set to 5. This command set is transport independent and may be implemented across a wide variety of environments for which a SCSI transport protocol has been defined. To date, these include Parallel SCSI, ATA/ATAPI, Serial ATA, Universal Serial Bus (USB versions 1.1 and 2.0), and High Performance Serial Bus (IEEE 1394, 1394A, and 1394B). The command set described has been selected for correct operation when the physical interface is ATA with the ATAPI command protocol.

INCITS 431:2007 [R2012], Information technology - SCSI/ATA Translation (SAT)

The set of SCSI standards specifies the interfaces, functions, and operations necessary to ensure interoperability between conforming SCSI implementations. This standard is a functional description. Conforming implementations may employ any design technique that does not violate interoperability. This standard defines the protocol requirements of the SCSI / ATA Translation Layer (SATL) to allow conforming SCSI/ATA translating elements to interoperate with ATA devices and SCSI application layers. The SATL covers the range of implementations that use ATA devices to emulate the behavior of SCSI devices as viewed by the SCSI application layer.
INCITS 432:2007 [R2012], Information technology - Fabric Application Interface Standard (FAIS)
This standard describes a set of functions and data structures in the C language abstracting the details of the FAIS_Platform from the implementation of a storage management application. This standard defines an API only in the C language. Functionally equivalent APIs may be implemented in other languages but these are beyond the scope of this standard. All functions provided to operate with function specifications defined in this standard shall use C-style calling conventions. This constraint does not limit the internal implementation of components of a FAIS_Provider.

INCITS 433:2007 [R2012], Information technology - Fibre Channel - Link Services (FC-LS)
FC-LS describes in detail the Fibre Channel Extended Link Services.

INCITS 434:2007 [R2012], Information technology - Tenprint capture using BioAPI
This standard specifies requirements for the use of ISO/IEC 19784-1, BioAPI Specification (also known as BioAPI 2.0), a software interface standard, for the purpose of performing a tenprint capture operation. This includes one or more of the following: 1. Identification of BioAPI functions to be utilized and the order (if any) in which they are to be called 2. Specification of values for function parameters 3. Definition of GUI (graphical user interface) events (for use with an application controlled GUI) 4. User interface specifications for use with a BSP (biometric service provider) controlled GUI 5. Sample calling sequences and example inputs/outputs.

INCITS 435:2007 [R2012], Information technology - Fibre Channel BaseT (FC-BaseT)
This standard describes extensions to the Fibre Channel signaling and physical layer requirements defined in ANSI INCITS 404-2005, Information Technology - Fibre Channel - Physical Interfaces 2, to transport Fibre Channel over the commonly available 4-pair balanced copper cabling specified in ISO/IEC 11801:2002 and TIA/EIA 568-B.2-2001. This standard is one of the Fibre Channel family of standards.

INCITS 437:2008 [R2013], Information technology - Fibre Channel SATA Tunneling Protocol (FC-SATA)
This standard specifies a Fibre Channel mapping layer (i.e., an FC-4) to enable the use of Fibre Channel topologies to attach Serial ATA devices to ATA host systems. The Serial ATA interface is defined in the ATA/ATAPI-7 set of standards (ANSI INCITS 397-2005).

This document lays the general framework for the Server Management Command Line Protocol (SM CLP). This specification is intended to guide developers of implementations of the SM CLP and optionally be used as a reference by system administrators and other users of SM CLP implementations.

INCITS 440-2015, Information technology - Card Durability / Service Life
This American National Standard defines a method to determine a card application class for the intended card use. Once the service life application is determined, the standard defines test methods and requirements for the card application.

INCITS 441:2008 [R2013], Information technology - Automation/Drive Interface - Commands-2 (ADC-2)
This standard defines the model and command set extensions to facilitate operation of automation/drive interface devices. The clauses of this standard, implemented in conjunction with the applicable clauses of SPC-3, fully specify the standard command set for automation/drive interface devices.

INCITS 442:2010 [R2015], Information Technology - Biometric Identity Assurance Services (BIAS)
BIAS defines biometric services used for identity assurance that are invoked over a services-based framework. It is intended to provide a generic set of biometric and identity-related functions and associated data definitions to allow remote access to biometric services. To allow BIAS to be flexible to the amount and types of biographic and biometric information available to and used by a system, the terms “biographic data” and “biometric data” as used in this standard are very general. The binding of these services to specific frameworks is not included in this project, but will be the subject of separate standards. The first such standard (for a Web services framework) is planned to be developed by OASIS by the BIAS Integration Technical Committee. Although focused on biometrics, this standard will necessarily include support for other related identity assurance mechanisms such as biographic and token capabilities. BIAS is intended to be compatible with and used in conjunction with other biometric standards as described in clause 3. Specification of single-platform biometric functionality (e.g., client-side capture, etc.) is not within the scope of this standard. Integration of biometric services as part of an authentication service or protocol is not within the scope of this standard; however, it is possible that some of the basic biometric services defined herein may be used by such an implementation in the future.

INCITS 443:2008 [R2013], Information technology - Fibre Channel Storage Network PING (SNPing)
This standard defines a Command Line Interface (CLI) for a storage networking management utility program that is equivalent to the IP Networking Ping function. The CLI may be directly useful to storage management personnel or it may be accessed via other applications (e.g., an SMI-S Client).

INCITS 444:2015, Information technology - Identifying Attributes for Named Physical and Cultural Geographic Features (Except Roads and Highways) of the United States, Its Territories, Outlying Areas, and Freely Associated Areas, and the Waters of the Same to the Limit
This standard applies to selected named physical and cultural geographic features, geographic areas, and locational entities, except roads and highways, that are generally recognizable and locatable by name (i.e., have achieved some landmark status) and are of interest to any level of government and to the public for any purpose that would lead to the representation of the feature in printed or electronic maps and/or geographic information systems.

INCITS 447:2008 [R2013], Information technology - SCSI Architecture Model - 4 (SAM-4)
The set of SCSI (Small Computer System Interface) standards consists of this standard and the SCSI implementation standards described in 1.3. This standard defines a reference model that specifies common behaviors for SCSI devices, and an abstract structure that is generic to all SCSI I/O system implementations. The set of SCSI standards specifies the interfaces, functions, and operations necessary to ensure interoperability between conforming SCSI implementations. This standard is a functional description. Conforming implementations may employ any design technique that does not violate interoperability.

INCITS 449:2008 [R2013], Information technology - Fabric Application Interface Standard - 2 (FAIS-2)
This standard describes a set of functions and data structures in the C language abstracting the details of the FAIS_Platform from the implementation of a storage management application. This standard defines an API only in the C language. Functionally equivalent APIs may be implemented in other languages but these are beyond the scope of this standard. All functions provided to operate with function specifications defined in this standard shall use C-style calling conventions. This constraint does not limit the internal implementation of components of a FAIS_Provider.

INCITS 45-1982 [S2007], Information Systems - Character Set for Handprinting
Prescribes shapes and sizes of handprinted characters to be used in Optical Character Recognition (OCR) systems and shapes of handprinted characters for man-to-man communication. The standard encompasses international requirements.

INCITS 450-2009 [R2014], Information technology - Fibre Channel - Physical Interfaces - 4 (FC-Pi-4)
This international standard describes the physical interface portions of high performance electrical and optical link variants that support the higher level Fibre Channel protocols including FC-FS-2 and the higher Upper Level Protocols (ULPs) associated with HIPPI, SCSI, IP and others.
INCITS 451:2008 [R2013], Information technology - AT Attachments-8 ATA/ATAPI Architecture Model (ATA8-AAM)
The set of AT Attachment standards consists of this standard and the ATA implementation standards described in 1.3. This standard defines a reference model that defines common behaviors for ATA hosts and devices and an abstract structure that is generic to all ATA I/O system implementations.

INCITS 452-2009 [R2014], Information technology - AT Attachment-8 ATA/ATAPI Command Set (ATA8-ACS)
The set of AT Attachment standards consists of this standard and the ATA implementation standards described in AT Attachment - 8 ATA/ATAPI Architecture Model (ATA8-AAM). The AT Attachment ATA Command Set (ATA8-ACS) specifies the command set host systems use to access storage devices. It provides a common command set for systems manufacturers, system integrators, software suppliers, and suppliers of intelligent storage devices. Figure 1 shows the relationship of this standard to the other standards and related projects in the ATA and SCSI families of standards and specifications.

INCITS 452-2009/AM 1:2010 [R2015], Information technology - AT Attachment-8 ATA/ATAPI Command Set (ATA8-ACS) - Amendment 1
The project corrects defects in INCITS 452.

The North American Profile of ISO 19115:2003, Geographic information - Metadata, is intended to identify geospatial metadata that are needed for North American organizations to describe their geospatial data, including dataset and dataset series, and related Web services. It is based on ISO 19115:2003, Geographic information - Metadata, and ISO 19106:2004, Geographic information - Profiles.

INCITS 454-2009 [R2014], Information technology - Codes for the Identification of Metropolitan and Micropolitan Statistical Areas and Related Statistical Areas of the United States and Puerto Rico
This standard establishes a structure for the assignment of data codes by which to uniquely identify metropolitan and micropolitan statistical areas generically referred to as &##44;core based statistical areas&##44; and related statistical areas i e metropolitan divisions combined statistical areas New England city and town areas NECTAs NECTA divisions and combined NECTAs of the United States and Puerto Rico for the purpose of information interchange among data processing systems.

INCITS 455-2009 [R2014], Information technology - Codes for the Identification of Congressional Districts and Equivalent Areas of the United States, Puerto Rico, and the Insular Areas
This standard establishes a structure for the assignment of identifying data codes to congressional districts of the United States and its insular and associated areas, for the purpose of information interchange among data processing systems.

INCITS 457-2010 [R2015], Information technology - Serial Attached SCSI - 2 (SAS-2)
The SCSI family of standards provides for many different transport protocols that define the rules for exchanging information between different SCSI devices. This standard defines the rules for exchanging information between SCSI devices using a serial interconnect. Other SCSI transport protocol standards define the rules for exchanging information between SCSI devices using other interconnects.

INCITS 458-2011 [R2016], Information technology - SCSI Object-Based Storage Device Commands-2 (OSD-2)
Defines the command set extensions to control operation of Object-Based Storage devices. The clause(s) of this standard pertaining to the SCSI Object-Based Storage Device class, implemented in conjunction with the applicable clauses of the ISO/IEC 14776-43 SCSI Primary Commands - 4 (SPC-4), specify the standard command set for SCSI Object-Based Storage devices.

INCITS 459-2011 [R2016], Information Technology - Requirements for the Implementation and Interoperability of Role Based Access Control
Specifies the implementation of RBAC systems. It describes the packaging of features through the selection of functional components and feature options within a component, beginning with a core set of RBAC features that shall be included in all packages.

INCITS 460-1974 [S2007], Unrecorded Magnetic Six-Disk Pack (General, Physical, and Magnetic Characteristics)
Specifies the general, physical and magnetic requirements for interchangeability of the magnetic six-disk pack, as required to achieve unrecorded pack interchange between disk storages and associated information processing systems.

INCITS 460-2011 [R2016], Information technology - Fibre Channel - Physical Interface - 3 (FC-Pi-3)
Describes the physical interface portions of a high performance serial link based on the work of the XFP MSA. FC-Pi-3 applies only to the variant described in FC-Pi-3 and does not affect or supersede any requirements in any other FC standard or technical report. defines the electrical interfaces called XFI+ based on INF-8077(XFI) the XFP MSA for high-speed serial operation from 9.95-11.1 Gigabaud.

INCITS 461-2010 [R2015], Information technology - Fibre Channel - Switch Fabric - 5 (FC-SW-5)
This standard describes the operation and interaction of Fibre Channel Switches. This standard includes: a) E_Port Operation and Fabric Configuration; b) Path selection (FSPF); c) Bridge Port (B_Port) Operation; d) Distributed server interaction and communication; e) Exchange of information between Switches to support zoning; f) Distribution of Event Notifications between Switches; g) Virtual Fabrics Switch Support; h) Enhanced Commit Service; i) Virtual Channels.

INCITS 462-2010 [R2015], Information technology - Fibre Channel - Backbone - 5 (FC-BB-5)
This standard consists of distinct Fibre Channel mappings resulting in the following models: –FC-BB_IP (FC over TCP/IP backbone network) – Transparent FC-BB consisting of: –FC-BB_GFPT (FC over SONET/SDH/OTN/PDH backbone network using GFPT adaptation) –FC-BB_PW (FC over MPLS network using PW adaptation) –FC-BB_FB (FC over Ethernet)

INCITS 462-2010/AM1:2012, Information technology - Fibre Channel - Backbone - 5 AMENDMENT 1 (FC-BB-5/AM 1)
This is Amendment 1 to INCITS 462-2011 which has been issued in response to questions that have been raised regarding certain specifications contained in the content of: INCITS 462-2010, Information technology - Fibre Channel Backbone - 5 (FC-BB-5)

INCITS 463-2010 [R2015], Information technology - Fibre Channel - Generic Services - 6 (FC-GS-6)
This standard describes in detail the services accessed by well-known addresses defined in FC-FS-3. Generic Services described in this document are: a) Directory Service; b) Management Service; and c) Event Service. In addition, to the aforementioned Generic Services, the Common Transport (CT) protocol is described. The Common Transport service provides a common FC-4 for use by Generic Services. The following commands, parameter data, and features defined in previous versions of this standard are made obsolete by this standard: a) RDF_ID (Register FC-4 Descriptor); b) GFD_ID (Get FC-4 Descriptors); c) RPN_ID (Register Port Name); d) RPT_ID (Register Port Type) e) Third-Party registrations; f) Unsolicited transaction modes; g) Asynchronous transaction mode; h) Alias Server; i) Multicast Server; j) Class 1 and associated functionality, and k) Class 6 and associated functionality.
This part of the XAM™ standard is a normative specification of the general architecture and semantics of the XAM API. It applies to programmers who are generating XAM applications in any programming language. It also applies to storage system vendors who are creating vendor interface modules (VIMs). This document uses an object model to describe syntax in examples; these examples are informative only. It is not a normative specification of the syntax of the XAM interfaces in any language binding. The normative specification of the syntax of the Java language binding is defined in the XAM Java API Specification [XAM-JAVA-API].

The set of SCSI standards specifies the interfaces, functions, and operations necessary to ensure interoperability between conforming SCSI implementations. This standard is a functional description. Conforming implementations may employ any design technique that does not violate interoperability. This standard defines the protocol requirements of the SCSI / ATA Translating Layer (SATL) to allow conforming SCSI / ATA translating components to interoperate with ATA devices and SCSI application layers.

This document describes a communication interface between a channel and I/O control units that utilize the Single-Byte Command Code Sets (SBCCS) as implemented in a wide range of data processing systems.

Defines the command set extensions to facilitate operation of the sequential-access device type. This standard, implemented in conjunction with the requirements of the SCSI Architecture Model - 4 standard and the applicable clauses of the SCSI Primary Commands - 4 standard, fully specify the standard command set for the sequential-access device type.

This standard defines a set of SCSI command descriptor blocks that are useful in accessing and controlling devices with a peripheral device type set to 5.

This standard specifies the concepts test types and a conformance testing methodology to test conformance of CBEEF Biometric Information Records BIR claiming to be conformant to patron formats A the BioAPI BIR or the NIST 1TL Type 99 data record specified in INCITS 398 2008 annexes as well as the LDS patron format for applications other than MRTD and other ICAO applications.

This standard defines a set of SCSI command descriptor blocks that are useful in accessing and controlling devices with a peripheral device type set to 5.
This amendment updates ANSI INCITS 479-2011, FC-PI-5, to allow for forward error correction on 16GFC EL variants.

INCITS 48-1986/TC 1:1995 [S2016], Information Systems - Magnetic Tape Cassette for Information Interchange (3.81 mm, 0.150 inch) Tape at 32 bpm (800 BPI), Phase Enclosed - Technical Corrigendum 1

This American National Standard for unrecorded and recorded cassettes containing 3.81-mm (0.150-in) - wide magnetic tape presents the minimum requirements for mechanical and magnetic interchangeability of the cassette and for data interchange between information processing systems, which are capable of utilizing a standard code for information interchange as agreed upon by the interchange parties, using a data density of 32 bpi (800 bpi).

INCITS 480-2011 [R2016], Information technology - BIOS Enhanced Disk Drive Services - 4 (EDD-4)

This document contains all the requirements specified in FC-Pi, FC-PI-2 and SM-LL-V that are recommended for new designs, plus requirements for 800 MB/s.

INCITS 480-2011/AM1-2015, Information technology - BIOS Enhanced Disk Drive Specification - 4 (EDD-4) - Amendment 1

This project would be an amendment to ANSI INCITS 480-2011 Information Technology - BIOS Enhanced Disk Drive Services - 4 (EDD-4). The project would: 1. Add device interface and device path information for new interfaces to ANSI INCITS 480-2011 Information technology - BIOS Enhanced Disk Drive Services - 4 (EDD-4).

INCITS 481-2011 [R2016], Information technology - Fibre Channel Protocol for SCSI - 4 (FCP-4)

FCP-4 defines the fourth generation Fibre Channel Protocol to be used to transport SCSI commands over the T11 Fibre Channel interface.

INCITS 482-2012, Information technology - ATA/ATAPI Command Set - 2 (ACS-2)

The set of AT Attachment standards consists of this standard and the ATA implementation standards described in AT Attachment - 8 ATA/ATAPI Architecture Model (ATA8-AAM). The ATA/ATAPI Command Set - 2 (ACS-2) standard specifies the command set host systems use to access storage devices. It provides a common command set for systems manufacturers, system integrators, software suppliers, and suppliers of intelligent storage devices.

INCITS 483-2012, Information technology - Virtualization Management Specification

The Virtualization Management Specification describes an open, secure, portable, efficient and extensible infrastructure for management of virtualized systems.

INCITS 484-2012, Information technology - SCSI Media Changer Command Set - 3 (SMC-3)

Defines the command set extensions to facilitate operation of SCSI media changer devices. The clauses of this standard, implemented in conjunction with the requirements of the SCSI Architecture Model - 4 standard and SPC-4, fully specify the standard command set for SCSI media changer devices.

This project proposal recommends the development of a set of technical additions and clarifications to INCITS 466-2011, Fibre Channel - Single-Byte Command Code Sets - 4 Mapping Protocol (FC-SB-4) to define enhancements to the link-control and transport-mode protocols to expand the capabilities and increase the efficiency of transport-mode operations.

INCITS 488-2016, Information technology - Fibre Channel Framing and Signaling 4 (FC-FS-4)

This standard describes the framing and signaling interface of a high performance serial link for support of FC-As associated with upper level protocols (e.g., SCSI, IP, SBCS, VI). This standard is based on FC-FS-3 (INCITS 470-2011) with subsequent modifications approved by the member body that originally authored and approved FC-FS-3.

INCITS 489-2014, Information technology - SCSI over PCI(RTM) architecture (SOP)

The SCSI family of standards provides for many different transport protocols that define the rules for exchanging information between different SCSI devices. This standard defines the rules for exchanging information between SCSI devices using a PCI Express queuing layer. Other SCSI transport protocol standards define the rules for exchanging information between SCSI devices using other interconnects.

INCITS 49-1975 [S2007], Character Set for Optical Character Recognition (OCR-B)

Describes nominal shapes, sizes, and printing positions of OCR-B alphanumeric characters and symbols for optical character recognition (OCR-B) systems.

INCITS 490-2014, Information technology - PCIe (RTM) architecture Queuing Interface (PQI)

The SCSI family of standards provides for different transport protocols that define the methods for exchanging information between SCSI devices. This standard defines the transport methods for exchanging information between SCSI devices using a PCI Express interconnect. This standard defines a queuing layer, used by SOP. Other SCSI transport protocol standards define the methods for exchanging information between SCSI devices using other interconnects. Figure 1 shows the relationship of this standard to the other standards and related projects in the SCSI family of standards.

INCITS 492-2015, Information technology - SAS Protocol Layer - 3 (SPL-3)

SAS Protocol Layer - 3 is the next generation of the protocol portion of current Serial Attached SCSI. It follows SPL-2, SPL, and the protocol portions of SAS-2, SAS-1.1, and SAS. The following items should be considered for inclusion in Serial Attached Protocol - 3: a) enhancements to the protocol; b) corrections and clarifications; and c) other capabilities that may fit within the scope of this project.

INCITS 493-2012, Information technology - AT Attachment 8 - ATA/ATAPI Serial Transport (ATA8-AST)

The set of AT Attachment standards consists of this standard and the ATA implementation standards described in AT Attachment - 8 ATA/ATAPI Architecture Model (ATA8-AAM). This standard defines the ATA Serial ATA transport by: (a) referencing the Serial ATA specifications published by the SATA-IO organization; and (b) documenting the transport-dependent components found in ATA8 family of standards.

INCITS 494-2012, Information technology - Role Based Access Control - Policy Enhanced

This RBAC Policy-Enhanced standard (to be referenced as RPE) provides a framework and functional specifications to handle the relationship between roles and dynamic constraints. Some of the administrative and user permission review advantages of RBAC are retained while allowing the access control system to work in a rapidly changing environment.

INCITS 495-2012, Information technology - Platform Management

The Platform Management specification defines platform-independent, interoperable, industry standard management information models and profiles for managing the physical aspects of platforms. Examples of physical platforms include, but are not limited to, the following: desktop platform mobile platforms, blade PCs, servers spanning the spectrum of: stand-alone, blades and partitionable systems, enterprise and Telco, low cost to mission critical, etc. .

INCITS 496-2012, Information Technology - Fibre Channel - Security Protocols (FC-SP-2)

This standard is one of the Fibre Channel family of standards. This standard describes the protocols used to implement security in a Fibre Channel fabric. This standard includes the definition of protocols to authenticate Fibre Channel entities, protocols to set up session keys, protocols to negotiate the parameters required to ensure frame-by-frame integrity and confidentiality, and protocols to establish and distribute policies across a Fibre Channel fabric.

INCITS 496-2012/AM1-2015, Information technology - Fibre Channel - Security Protocols - 2 Amendment 1 (FC-SP-2/AM1)

This amendment updates ANSI INCITS 496-2012, FC-SP-2, to support additional cryptographic algorithms.
This standard defines the model and command set extensions to facilitate operation of automation/drive interface devices. The clauses of this standard, implemented in conjunction with the applicable clauses of SPC-4, fully specify the standard command set for automation/drive interface devices.

**INCITS 498-2012, Information technology - CIM Representations for Management**

This proposed standard defines a standard for the representation of CIM elements and messages in XML. The Extensible Markup Language (XML) is a simplified subset of SGML that offers powerful and extensible data modeling capabilities. An XML document is a collection of data represented in XML. An XML schema is a grammar that describes the format of an XML document. An XML document is described as valid if it has an associated XML schema to which it conforms. The Common Information Model (CIM) is an object-oriented information model defined by the DMTF that provides a conceptual framework for describing management data.

**INCITS 499-2013, Information technology - Next Generation Access Control - Functional Architecture (NGAC-FA)**

Next Generation Access Control (NGAC) is a fundamental reworking of traditional access control into a form that suits the needs of the modern distributed interconnected enterprise. Access control is both an administrative and an automated process of defining and restricting which users and their processes can perform which operations on which system resources. The information that provides the basis by which access requests are granted or denied is known as a policy, and a wide variety of types of policies have been created to address different situations.

**INCITS 500-2012, Information technology - Database Language SQL - Row Pattern Recognition (SQL/RPR)**

This proposed standard specifies the syntax and semantics of database language facilities that support row pattern matching using regular expressions. The database language facilities that support row pattern recognition include: - A subset of regular expression syntax; - Row pattern variables that span subsequences of rows, defined using conditions on individual rows and on aggregates of rows; and - A major new syntax element, the MATCH_RECOGNIZE clause, that can be applied to table expressions and can be used in definitions of windows.

**INCITS 501-2016, Information technology - Security Features for SCSI Commands (SFSC)**

The set of SCSI standards specifies the interfaces, functions, and operations necessary to ensure interoperability between conforming SCSI implementations. This standard is a functional description. Conforming implementations may employ any design technique that does not violate interoperability. This standard defines security features for use by all SCSI devices. This standard defines the security model that is basic to every device model and the parameter data that may apply to any device model.

**INCITS 504-4-2013, Information Technology - Generic Identity Command Set Part 4: Card Application Profile Template**

The Card Application profile template is to define the template to use to describe the data model of the GICS card application.

The SCSI family of standards provides for many different transport protocols that define the rules for exchanging information between different SCSI devices. This standard defines the rules for exchanging information between SCSI devices using a serial interconnect. Other SCSI transport protocol standards define the rules for exchanging information between SCSI devices using other interconnects.

**INCITS 507-2016, Information technology - PCIe® architecture Queuing Interface - 2 (PQI-2)**

The SCSI family of standards provides for different transport protocols that define the methods for exchanging information between SCSI devices. This standard defines the transport methods for exchanging information between SCSI devices using a PCI Express interconnect. This standard defines a queuing layer, used by SOP. Other SCSI transport protocol standards define the methods for exchanging information between SCSI devices using other interconnects.

**INCITS 508-2014, Information technology - Storage Management - HBA - 2nd Generation (SM-HBA-2)**

A standard application programming interface (API) defines a scope within which, and a grammar by which it is possible to write application software without attention to vendor-specific infrastructure behavior. This standard specifies a standard API the scope of which is management of Fibre Channel (FC) and Serial Access SCSI (SAS) HBAs, and the use of FC and SAS capabilities for discovery and management of the components of the respective fabric or domain.
INCITS 509-2014, Information technology - Fibre Channel - Backbone - 6
This standard consists of distinct Fibre Channel mappings resulting in the following models: - FC-BB_IP (FC over TCP/IP backbone network) - Transparent FC-BB consisting of: - FC-BB_GFPT (FC over SONET/SDH/OTN/POH backbone network using GFPT adaptation) - FC-BB_PW (FC over MPLS network using PW adaptation) - FC-BB_E (FC over Ethernet)

INCITS 511-2016, Information Technology - Fibre Channel - Switch Fabric - 6 (Fc-Sw-6)
FC-SW-6 describes the requirements for an interconnecting Fabric consisting of multiple Fabric Switch elements to support the ANSI/INCITS Fibre Channel - Framing and Signaling (FC-FS-2) and INCITS Fibre Channel - Physical Interface (FC-PI-4) standards.

INCITS 512-2015, Information technology - Fibre Channel - Switch Fabric - 6 (FC-SW-6)
FC-SW-6 describes the requirements for an interconnecting Fabric consisting of multiple Fabric Switch elements to support the ANSI/INCITS Fibre Channel - Framing and Signaling (FC-FS-2) and ANSI/INCITS Fibre Channel - Physical Interface (FC-PI-4) standards.

INCITS 513-2015, Information technology - SCSI Primary Commands-4
The SCSI Primary Commands - 4 standard will be based on the SCSI Primary Commands - 3 standard that defines a SCSI commands that apply to all SCSI device types. Technological advances require continuing improvements in the set of SCSI commands employed by all SCSI device types. After the publication of SPC-3, SPC-3 will provide the vehicle for standardizing the needed improvements. SPC-4 will maintain a high degree of compatibility with the present SPC-3 standard, which is nearing completion of its development cycle.

INCITS 514-2014, Information technology - SCSI Block Commands - 3 (SBC-3)
This standard defines the command set extensions to facilitate operation of SCSI direct access block devices. The clauses in this standard, implemented in conjunction with the applicable clauses of SPC-4, specify the standard command set for SCSI direct access block devices.

INCITS 515-2016, Information technology - SCSI Architecture Model - 5 (SAM-5)
The set of Small Computer System Interface (SCI) standards consists of this standard and the SCI implementation standards described in 4.2. This standard defines a reference model that specifies common behaviors for SCI devices, and an abstract structure that is generic to all SCI I/O system implementations. The set of SCI standards specifies the interfaces, functions, and operations necessary to ensure interoperability between conforming SCI implementations. This standard is a functional description. Conforming implementations may employ any design technique that does not violate interoperability. The following concepts from previous versions of this standard are made obsolete by this standard: a) support for the SCI-5 SCI transport protocol; b) Contingent Allegiance; c) the TARGET RESET task management function; d) basic task management model; e) untagged tasks; and f) linked command function.

INCITS 516-2013, Information Technology - SCI Stream Commands (SSC-4)
The SCI Stream Commands - 4 standard will be based on the SCI Stream Commands - 3 standard that provides the model and command sets for the sequential-access device type. The model and command sets may be implemented on multiple transport protocols. The following items should be considered for inclusion into SSC-4: 1) continuation and enhancement of the sequential-access device type model; 2) continuation and enhancement of the explicit address command set; 3) enhancement of the implicit address command set; 4) continuation of TapeAlert standardization, etc.

INCITS 517-2015, Information Technology - SCI /ATA Translation - 3 (SAT-3)
The set of SCI standards specifies the interfaces, functions, and operations necessary to ensure interoperability between conforming SCI implementations. This standard is a functional description. Conforming implementations may employ any design technique that does not violate interoperability. This standard defines the protocol requirements of the SCI /ATA Translation Layer (SATL) to allow conforming SCI /ATA translating components to interoperate with ATA devices,SCI transports, and SCI application layers.

INCITS 519-2014, Information technology - Serial Attached SCSI-3 (SAS-3)
The SCI family of standards provides for many different transport protocols that define the rules for exchanging information between different SCI devices. This standard specifies the functional requirements for the Serial Attached SCSI (SAS) physical interconnect, which is compatible with the Serial ATA physical interconnect. The SAS Protocol Layer - 3 (SPL-3) standard documents the SAS protocol layer corresponding to the Serial Attached SCSI - 3 (SAS-3), defining the rules for exchanging information between SCI devices using a serial interconnect.

INCITS 520-1976 [S2007], Unrecorded Single Disk Cartridge (Front Loading, 22000 BPI), General, Physical, and Magnetic Requirements
Specifies the general, physical, and magnetic requirements for interchangeability of the single-disk cartridge (front loading) as required to achieve unrecorded cartridge interchange between disk storage drive and associated information processing systems.

INCITS 522-2014, Information technology - ATA/ATAPI Command Set - 3 (ACS-3)
The set of AT Attachment standards consists of this standard and the ATA implementation standards described in AT Attachment - 8 ATA/ATAPI Architecture Model (ATA8-AAM). The ATA/ATAPI Command Set - 2 (ACS-2) standard specifies the command set host systems use to access storage devices. It provides a common command set for systems manufacturers, system integrators, software suppliers, and suppliers of intelligent storage devices. Figure 1 shows the relationship of this standard to the other standards and related projects in the ATA and SCSI families of standards and specifications.

INCITS 524-2016, Information Technology - AT Attachment 8 - ATA/ATAPI Parallel Transport (ATA8-AP)
This standard specifies the mandatory and optional operating features of a parallel bus transport for ATA commands described in the AT Attachment 8 - Command Set (ATA8-ACS) standard. It provides a common attachment interface for systems manufacturers, system integrators, software suppliers, and suppliers of intelligent storage devices. This document specifies the connectors, cables, electrical, and logic parameters for the interconnect between a device and the host, and the transport protocols for transporting commands, data, status, and other relevant communications across a parallel bus interface. This document also describes the mapping of command parameters from ATAB-ACS to registers and interface actions on the parallel transport.

INCITS 526-2016, Information technology - Next Generation Access Control - Generic Operations and Data Structures (NGAC-GOADS)
This standard provides a detailed refinement of the definitions and concepts in the access control architecture and framework defined by the NGAC-FA standard. To provide a precise specification of the abstractions involved, the refinements are based on the mathematics of set theory and predicate calculus in consonance with the Z notation. By capturing the essential properties of NGAC mathematically, free from constraints on how these properties are achieved, NGAC-GOADS serves as a formal, conceptual model for the composition and working of NGAC.

INCITS 528-2013, Information technology - Common Building Blocks Specification
The Common Building Blocks Specification describes an open, secure, portable, efficient and extensible infrastructure for management of desktop, mobile, server, virtualized and storage systems.
INCITS 53-1976 [S2008], Programming Language PL/I

Specifications both the form and interpretation of computer programs written in PL/I. It is intended to provide a high degree of machine independence and thereby facilitate program exchange among a variety of computing systems. The standard serves as an authoritative reference rather than as a tutorial exposition.

INCITS 530-2013, Information technology - Architecture for Managed Computing Systems

The architecture for Managed Computing Systems defines and documents the architecture and language infrastructure that is the foundation for DMTF management profiles, registries, protocols and schemas. The key properties of Architecture for Managed Computing Systems are as follows:

- Specification of the CIM Infrastructure, (meta-model and qualifiers, and the MOF language)
- Specification of Standard Message infrastructure...etc.

INCITS 531-2013, Information technology - Systems Management Discovery for Managed Computer Systems

The Systems Management Discovery for Managed Computer Systems describes an open, secure, portable, efficient and extensible infrastructure for management of computer systems. The key properties of Systems Management Discovery for Managed Computer Systems are as follows:

- provide a mechanism that allows WBEM Clients to discover WBEM Servers - use existing standards and protocols for rapid development and deployment - provide a mechanism that scales from small environments to enterprise environments...etc.

INCITS 532-2014, Information technology - Vocabulary description and management

This standard addresses the description and management of open vocabularies. The main purposes of this is to support data interchange and data interoperability across organizations, systems, subject, time, and geography. This standard specifies three main ideas: 

- a model for the contents of a vocabulary (clause 4) 
- a model for a registry of vocabularies (clause 5) 
- a set of procedures for managing a vocabulary registration process (clause 6)

INCITS 533-2016, Information technology – Fibre Channel – Physical Interfaces – 6P 128GFC Four Lane Parallel (FC-P1-6P)

This standard will define the requirements for new physical layer variants that operate at FC-P1-6 line rate on a four lane physical variant. It is desirable that new variants operate at similar distances as those of the corresponding variants specified in FC-P1-6. This standard will consider all aspects of transmit, receive and cable-plant performance requirements for optical and electrical links. The standard will enable interoperability of transmitter devices, receiver devices, interconnects, and components among different manufacturers.

INCITS 536-2016, Information technology – Zoned Block Commands (ZBC)

This standard defines the model and command set extensions to facilitate operation of zoned block devices. The clauses in this standard, implemented in conjunction with the applicable clauses of SPC-5 and SBC-4, specify the standard command set for zoned block devices.

INCITS 537-2016, Information technology – Zoned-device ATA Commands (ZAC)

The set of AT Attachment standards consists of this standard and the ATA implementation standards described in AT Attachment - 8 ATA/ATAPI Architecture Model (ATA8-DMM). This standard specifies the command set that host systems use to access storage devices that implement the Host Aware Zones feature set (see 4.3) or the Host Managed Zones feature set (see 4.4). This standard provides a common command set for systems manufacturers, system integrators, software suppliers, and suppliers of storage devices that provide one of the zones feature sets.

INCITS 539-2016, Information technology – Management of Security Credentials Specification

The Management of Security Credentials Specification describes an open, secure, portable, efficient and extensible infrastructure for management of systems. The key properties of Management of Security Credentials Specification are as follows:

- It provides a CIM based top-level object model needed for the representation of security management interfaces.  
- It specifies services for the security management, including operations for local user account modification, role and privilege assignment, certificate importation and exportation, and certificate signing request creation.  
- It provides an object model for the security principal, local and third party user accounts, privileges, roles, security keys, keystores, certificates and CRLs

INCITS 54-1986 [S2007], Recorded Magnetic Tape for Information Interchange (6250 CPI, Group Coded Recording)

Provides specifications for a 1/2-inch (12.7 mm), 9-track magnetic tape to be used for information interchange among information processing systems, communication systems, and associated equipment utilizing a standard code as agreed upon by the interchange parties. This standard deals solely with recording on magnetic tape and support and complements American National Standard for Unrecorded Magnetic Tape for Information Interchange (9-Track 800 CPI, NRZI; 1600 CPI, PE; and 6250 CPI, GCR), ANSI X3.40:1983.

INCITS 55-1992 [S2007], Information Systems – Unrecorded Magnetic Tape Cartridge for Information Interchange – 0.250 Inch (6.30 mm), 1600 bpi (63 bppm), Phase Encoded

This standard for an unrecorded cartridge containing 0.250-inch (6.30 mm) magnetic tape presents the minimum requirements for the mechanical and magnetic interchangeability of the cartridge between information processing systems, communications systems, and associated equipment using the American National Standard Code for Information Interchange, ANSI X3.4:1977 (ASCII).

INCITS 56-1986 [S2007], Recorded Magnetic Tape Cartridge for Information Interchange (4-Track, 0.250 Inch, 1600 BPI, Phase Encoded)

Provides a format and recording standard for a 0.250-in (6.30-mm) wide 4-track, magnetic tape in a cartridge to be used for information interchange between information processing systems, communication systems, and associated equipment utilizing a standard code, as agreed upon by the interchange parties.

Specifies the general, physical and magnetic requirements for the physical interchange of magnetic eleven-disk packs for use in electronic data processing systems.

Incorporates new wording for subclause 3.5.2 to better reflect the present state and practical use of OCR papers and equipment, as well as incorporate procedures from existing recognized standards.

INCITS 62-1987/AM1-1999 [S2007], Information Systems - Optical Character Recognition (OCR) - Paper Used in OCR Systems Amendment 1

Contains basic definitions, measurement requirements, specifications, and recommendations for papers used with optical character recognition readers.

INCITS 72-1981 [S2008], Recorded Magnetic Tape Cartridge for Information Interchange, 4 Track, 0.250 Inch (6.30 mm), 1600 BPI (63 BPPM), Phase Encoded, Parallel

This American National Standard is intended to provide a format and recording standard for a 0.250-inch (6.30-mm) wide, 4-track magnetic tape in a cartridge to be used for information interchange between information processing systems, communication systems and associated equipment utilizing the American National Standard Code for Information Interchange, ANSI X3.4-1977 (ASCII).
INCITS 73-1980 [S2007], Cartridge, Single-Sided Unformatted Flexible Disk (for 6631 BPR Use)

This standard specifies the general, physical, and magnetic requirements for interchangeability of the single-sided flexible disk cartridge - for use at 6631 bits per radian (BPR) - as required to achieve unformatted disk cartridge interchange among disk drives and associated information processing systems.

INCITS 74-1987 [S2008], Information Systems - Programming Language - PL/I General-Purpose Subset

Defines the computer programming language PL/I General Purpose Subset. Is intended to serve as an authoritative reference rather than as a tutorial introduction.

INCITS 76-1981 [S2007], Unformatted Single Disk Cartridge (Top Loading, 200 TPI, 4400 BPI) – General, Physical, and Magnetic Requirements

 Specifies the general, physical, and magnetic requirements for interchangeability of the single-disk cartridge (top loading) as required to achieve unrecorded cartridge interchange between disk storages and associated information processing systems.

INCITS 82-1980 [S2011], One-Sided Single-Density Unformatted 5.25 Inch Flexible Disk Cartridge

Specifies the general, physical, and magnetic requirements for interchangeability of the one-sided 5.25 inch (nominal) flexible disk cartridge - for use at 3979 bits per radian (BPR) - as required to achieve unformatted disk cartridge interchange among disk drives using 35 tracks (can be negotiated between concerned parties for use in drives using up to 40 tracks) and associated information processing systems.

INCITS 83:1995 [R2015], Information Systems - ISO Registration According to ISO 2375 - ANSI Sponsorship Procedures

Specifies the procedure to be followed in submitting proposals for character sets for ANSI sponsorship for submission to the ISO Registration Authority for processing in accordance with the ISO procedure for registration.

INCITS 85-1981 [S2008], One Half Inch Magnetic Tape Interchange Using a Self-Loading Cartridge

This standard provides the information necessary to allow physical interchange of a self-loading cartridge to be used with 1/2-inch-wide magnetic tape, as described in American National Standard for Unrecorded Magnetic Tape for Information Interchange (9-Track 200 and 800 CPI, NRZ), 1600 CPI, PE), ANSI x3.40-1976, and modified herein, when contained in a self-loading cartridge.

INCITS 86-1980 [S2007], Inks, Optical Character Recognition (OCR)

Specifies optical character recognition (OCR) inks by their spectral characteristics for different users with the OCR community. It includes definitions, test methods, and information needed to apply this standard.

INCITS 89-1981 [S2007], Unrecorded Single-Disk Double-Density Cartridge (Front Loading, 2200 BPI, 200 TPI), General, Physical, and Magnetic Requirements for

 Specifies the general, physical, and magnetic requirements for interchangeability of the single-disk cartridge (front loading) as required to achieve unrecorded cartridge interchange between disk storages and associated information processing systems.

INCITS 93M-1981 [S2007], Optical Character Recognition Positioning

Specifies the location of OCR-A and OCR-B characters in relationship to other characters on a document or page and to reference points of the document or page.

INCITS 94-1985 [S2007], Programming Aid to Numerically Controlled Manufacturing (PANCM)

Standardizes the language features of the SPLIT, ACTION, and COMPACT II languages, to ensure compatibility of language enhancements and to promote portability of part programs between implementations.

 Specifies sizes for single-part continuous business forms for use in handwritten or machine applications, or both. Such forms are continuous lengths of forms that have sprocket feed holes in both the left and right margins.

INCITS 99-1983 [S2007], Optical Character Recognition (OCR) Print Quality, Guideline for

Describes the print quality parameters and measuring techniques for determining the quality of machine-printed characters to maximize the likelihood that they can be read by electro-optical means.

INCITS X4.6-1979 [S2008], 10-Key Keyboard for Adding and Calculating Machines

Prescribes the arrangement of the 10 numeric keys, one through zero, for adding and calculating machines of the 10-key type.

INCITS/ISO 1860:1986 [S2015], Information processing - Precision reels for magnetic tape used in interchange instrumentation applications

This Standard defines the recorder/reproducer interface or envelope requirements for precision reels with 76 mm (3 in) centre hole, designed for use in magnetic tape interchange instrumentation applications.

Defines the reference model for standardization in the field of geographic information. This reference model describes the notion of interoperability and sets forth the fundamentals by which this standardization takes place. Although structured in the context of information technology and information technology standards, ISO 19101-1:2014 is independent of any application development method or technology implementation approach.

INCITS/ISO 19101-2002 [R2012], Geographic information - Reference Model

This International Standard defines the framework for standardization in the field of geographic information and sets forth the basic principles by which this standardization takes place. This framework identifies the scope of the standardization activity being undertaken and the context in which it takes place. The framework provides the method by which what is to be standardized can be determined and describes how the contents of the standards are related.

INCITS/ISO 19103:2015 [2017], Geographic information - Conceptual schema language

Provides rules and guidelines for the use of a conceptual schema language within the context of geographic information. The chosen conceptual schema language is the Unified Modeling Language (UML). Provides a profile of the Unified Modelling Language (UML). The standardization target type of this standard is UML schemas describing geographic information.

INCITS/ISO 19105:2000 [R2016], Geographic information - Conformance and testing

Specifies the framework, concepts and methodology for testing and criteria to be achieved to claim conformance to the family of ISO geographic information standards. It provides a framework for specifying abstract test suites (ATS) and for defining the procedures to be followed during conformance testing. Conformance may be claimed for data or software products or services or by specifications including any profile or functional standard.

INCITS/ISO 19106:2004 [R2015], Geographic information - Profiles

This standard is intended to define the concept of a profile of the ISO geographic information standards developed by ISO/TC 211 and to provide guidance for the creation of such profiles. Only those components of specifications that meet the definition of a profile contained herein can be established and managed through the mechanisms described in this International Standard. These profiles can be standardized internationally using the ISO standardization process. This document also provides guidance for establishing, managing, and standardizing at the national level (or in some other forum).
INCITS/ISO 19107-2003 [R2013], Geographic Information - Spatial schema

ISO 19107-2003 specifies conceptual schemas for describing the spatial characteristics of geographic features, and a set of spatial operations consistent with these schemas. It treats vector geometry and topology up to three dimensions. It defines standard spatial operations for in access, query, management, processing, and data exchange of geographic information for spatial (geometric and topological) objects of up to three topological dimensions embedded in coordinate spaces of up to three axes.

INCITS/ISO 19108-2002 [R2013], Geographic information - Temporal schema

ISO 19108:2002 defines concepts for describing temporal characteristics of geographic information. It depends upon existing information technology standards for the interchange of temporal information. It provides a basis for defining temporal feature attributes, feature operations, and feature associations, and for defining the temporal aspects of metadata about geographic information. Since this International Standard is concerned with the temporal characteristics of geographic information as they are abstracted from the real world, it emphasizes valid time rather than transaction time.

INCITS/ISO 19108:2002/COR 1:2006 [R2015], Geographic information - Temporal schema Technical Corrigendum 1

INCITS/ISO 19110:2005 [R2015], Geographic information - Methodology for feature cataloguing

This standard defines the methodology for cataloguing feature types and specifies how the classification of feature types is organized into a feature catalogue and presented to the users of a set of geographic data. ISO 19110:2005 is applicable to creating catalogues of feature types in previously uncatalogued domains and to revising existing feature catalogues to comply with standard practice. ISO 19110:2005 applies to the cataloguing of feature types that are represented in digital form. Its principles can be extended to the cataloguing of other forms of geographic data. This standard is applicable to the definition of geographic features at the type level. ISO 19110:2005 is not applicable to the representation of individual instances of each type and excludes spatial, temporal, and portrayal schemas as specified in ISO 19107, ISO 19108, and the future ISO 19117, respectively. It also excludes collection criteria for feature instances. This standard may be used as a basis for defining the universe of discourse being modelled in a particular application, or to standardize general aspects of real world features being modelled in more than one application.

INCITS/ISO 19111-2:2009 [R2015], Geographic information - Spatial referencing by coordinates - Part 2: Extension for parametric values

This standard specifies the conceptual schema for the description of spatial referencing using parametric values or functions. It applies the schema of ISO 19111 to combine a position referenced by coordinates with a parametric value to form a spatial&\#8209;parametric coordinate reference system (CRS). The spatial&\#8209;parametric CRS can optionally be extended to include time. The intended users of ISO 19111-2:2009 are producers and users of environmental information. Parameters which are attributes of spatial locations or features, but which are not involved in their spatial referencing, are not addressed by ISO 19111-2:2009.

INCITS/ISO 19111:2007 [R2012], Geographic information - Spatial referencing by coordinates

Defines the conceptual schema for the description of spatial referencing by coordinates, optionally extended to spatio-temporal referencing. It describes the minimum data required to define one-, two- and three-dimensional spatial coordinate reference systems with an extension to merged spatial-temporal reference systems. It allows additional descriptive information to be provided. It also describes the information required to change coordinates from one coordinate reference system to another.

INCITS/ISO 19112:2003 [R2014], Geographic information - Spatial referencing by geographic identifiers

ISO 19912:2003 defines the conceptual schema for spatial references based on geographic identifiers. It establishes a general model for spatial referencing using geographic identifiers, defines the components of a spatial reference system and defines the essential components of a gazetteer. Spatial referencing by coordinates is not addressed in this document; however, a mechanism for recording complementary coordinate references is included.

ISO 19115-1:2014 defines the schema required for describing geographic information and services by means of metadata. It provides information about the identification, the extent, the quality, the spatial and temporal aspects, the content, the spatial reference, the portrayal, distribution, and other properties of digital geographic data and services. ISO 19115-1:2014 is applicable to: - the cataloguing of all types of resources, clearinghouse activities, and the full description of datasets and services; - geographic services, geographic datasets, dataset series, and individual geographic features and feature properties.

INCITS/ISO 19115-2:2009 [R2014], Geographic information - Metadata - Part 2: Extensions for imagery and gridded data

ISO 19115-2:2009 extends the existing geographic metadata standard by defining the schema required for describing imagery and gridded data. It provides information about the properties of the measuring equipment used to acquire the data, the geometry of the measuring process employed by the equipment, and the production process used to digitize the raw data. This extension deals with metadata needed to describe the derivation of geographic information from raw data, including the properties of the measuring system, and the numerical methods and computational procedures used in the derivation.

INCITS/ISO 19116:2004 [R2015], Geographic information - Positioning services

This standard specifies the data structure and content of an interface that permits communication between position-providing device(s) and position-using device(s) so that the position-using device(s) can obtain and unambiguously interpret position information and determine whether the results meet the requirements of the use. A standardized interface of geographic information with position allows the integration of positional information from a variety of positioning technologies into a variety of geographic information applications, such as surveying, navigation and intelligent transportation systems. ISO 19116:2004 will benefit a wide range of applications for which positional information is important.

INCITS/ISO 19117:2012 [2013], Geographic information -- Portrayal

ISO 19117:2012 specifies a conceptual schema for describing symbols, portrayal functions that map geospatial features to symbols, and the collection of symbols and portrayal functions into portrayal catalogues. This conceptual schema can be used in the design of portrayal systems. It allows feature data to be separate from portrayal data, permitting data to be portrayed in a dataset independent manner.

INCITS/ISO 19119-2005, AM 1-2008 [R2013], Geographic information - Services - Amendment 1: Extensions of the service metadata model

This is the first amendment to ISO 19119-2005 that identifies and defines the architecture patterns for service interfaces used for geographic information, defines its relationship to the Open Systems Environment model, presents a geographic services taxonomy and a list of example geographic services placed in the services taxonomy. It also prescribes how to create a platform-neutral service specification, how to derive conformance platform-specific service specifications, and provides guidelines for the selection and specification of geographic services from both platform-neutral and platform-specific perspectives.
INCITS/ISO 19119:2005 [R2015], Geographic information - Services
This standard identifies and defines the architecture patterns for service interfaces used for geographic information, defines its relationship to the Open Systems Environment model, presents a geographic services taxonomy and a list of example geographic services placed in the services taxonomy. It also prescribes how to create a platform-neutral service specification, how to derive conformant platform-specific service specifications, and provides guidelines for the selection and specification of geographic services from both platform-neutral and platform-specific perspectives.

INCITS/ISO 19123:2005 [R2016], Geographic information - Schema for coverage geometry and functions
Defines a conceptual schema for the spatial characteristics of coverages. Coverages support mapping from a spatial, temporal or spatiotemporal domain to feature attribute values where feature attribute types are common to all geographic positions within the domain. A coverage domain consists of a collection of direct positions in a coordinate space that may be defined in terms of up to three spatial dimensions as well as a temporal dimension.

INCITS/ISO 19125-1:2004 [R2015], Geographic information - Simple feature access - Part 1: Common architecture
This standard establishes a common architecture for geographic information and defines terms to use within the architecture. It also standardizes names and geometric definitions for Types for Geometry. This standard does not place any requirements on how to define the Geometry Types in the internal schema nor does it place any requirements on when or how or who defines the Geometry Types. ISO 19125-1:2004 does not attempt to standardize and does not depend upon any part of the mechanism by which Types are added and maintained.

INCITS/ISO 19125-2:2004 [R2015], Geographic information - Simple feature access - Part 2: SQL option
This standard specifies an SQL schema that supports storage, retrieval, query and update of simple geospatial feature collections via the SQL Call Level Interface (SQL/CLI) and establishes an architecture for the implementation of feature tables. It defines terms to use within the architecture. of geographic information and defines a simple feature profile of ISO 19107. In addition, this part of ISO 19125:2004 describes a set of SQL Geometry Types together with SQL functions on those types. The Geometry Types and Functions described represent a profile of ISO 13249-3. It standardizes the names and geometric definitions of the SQL Types for Geometry and the names, signatures and geometric definitions of the SQL Functions for Geometry.

INCITS/ISO 19128:2005 [R2015], Geographic information - Web map server interface
This standard specifies the behaviour of a service that produces spatially referenced maps dynamically from geographic information. It specifies operations to retrieve a description of the maps offered by a server, to retrieve a map, and to query a server about features displayed on a map. ISO 19128:2005 is applicable to pictorial renderings of maps in a graphical format; it is not applicable to retrieval of actual feature data or coverage data values.

INCITS/ISO 19131:2007 [2017], Geographic information - Data product specifications
Specifies requirements for the specification of geographic data products, based upon the concepts of other ISO 19100 International Standards. It also provides help in the creation of data product specifications, so that they are easily understood and fit for their intended purpose.

This is the first Amendment to ISO 19131:2007 that specifies requirements for the specification of geographic data products, based upon the concepts of other ISO 19100 International Standards. It also provides help in the creation of data product specifications, so that they are easily understood and fit for their intended purpose.

INCITS/ISO 19132:2007 [R2013], Geographic information - Location Based Services - Reference model
ISO 19132:2007 defines a reference model and a conceptual framework for location-based services (LBS), and describes the basic principles by which LBS applications may interoperate. This framework contains an ontology, a taxonomy, a set of design patterns and a core set of LBS service abstract specifications in UML. ISO 19132:2007 further specifies the framework’s relationship to other frameworks, applications and services for geographic information and to client applications.

INCITS/ISO 19133:2005 [R2016], Geographic information - Location Based Services - Tracking and navigation
Describes the data types, and operations associated with those types, for the implementation of tracking and navigation services. It is designed to specify web services that can be made available to wireless devices through web-resident proxy applications, but is not restricted to that environment.

INCITS/ISO 19134:2007 [R2012], Geographic information - Location Based Services - Multimodal routing and navigation
ISO 19134:2006 specifies the data types and their associated operations for the implementation of multimodal location-based services for routing and navigation. It is designed to specify web services that may be made available to wireless devices through web-resident proxy applications, but is not limited to that environment.

INCITS/ISO 19135:2005 [R2016], Geographic information - Procedures for registration of geographical information items
Specifies procedures to be followed in establishing, maintaining and publishing registers of unique, unambiguous and permanent identifiers, and meanings that are assigned to items of geographic information. In order to accomplish this purpose, this standard specifies elements of information that are necessary to provide identification and meaning to the registered items and to manage the registration of these items.

INCITS/ISO 19136-2:2015[2017], Geographic information - Geography Markup Language (GML) - Part 2: Extended schemas and encoding rules
This standard is an XML encoding in compliance with ISO 19118 for the transport and storage of geographic information modelled in accordance with the conceptual modelling framework used in the ISO 19100 series of International Standards and including both the spatial and non-spatial properties of geographic features. This standard defines the XML Schema syntax, mechanisms and conventions that provide an open, vendor-neutral framework for the description of geospatial application schemas for the transport and storage of geographic information in XML; allow profiles that support proper subsets of GML framework descriptive capabilities; support the description of geospatial application schemas for specialized domains and information communities; enable the creation and maintenance of linked geographic application schemas and datasets; support the transport and storage of application schemas and datasets; increase the ability of organizations to share geographic application schemas and the information they describe. Implementers may decide to store geographic application schemas and information in GML, or they may decide to convert from some other storage format on demand and use GML only for schema and data transport.

INCITS/ISO 19137-2007 [R2012], Geographic information - Core profile of the spatial schema
This International Standard defines a core profile of the spatial schema specified in ISO 19107 that specifies, in accordance with ISO 19106, a minimal set of geometric elements necessary for the efficient creation of application schemata. This International Standard supports many of the spatial data formats and description languages already developed and in broad use within several nations or liaison organizations. NOTE Data modelled with this International Standard are consistent with spatial models already developed and used by a number of organizations; see Annex A.
INCITS/ISO 19141-2008 [R2013], Geographic information - Schema for moving features
ISO 19141:2008 defines a method to describe the geometry of a feature that moves as a rigid body. Such movement has the following characteristics. The feature moves within any domain composed of spatial objects as specified in ISO 19107. The feature may move along a planned route, but it may deviate from the planned route. Motion may be influenced by physical forces, such as orbital, gravitational, or inertial forces.

INCITS/ISO 19142:2010 [R2016], Geographic information -- Web Feature Service
Specifies the behaviour of a web feature service that provides transactions on and access to geographic features in a manner independent of the underlying data store. It specifies discovery operations, query operations, locking operations, transaction operations and operations to manage stored parameterized query expressions.

INCITS/ISO 19143:2010 [R2016], Geographic information - Filter encoding
Describes an XML and KVP encoding of a system neutral syntax for expressing projections, selection and sorting clauses collectively called a query expression. These components are modular and intended to be used together or individually by other International Standards which reference ISO 19143:2010. ISO 19143:2010 defines an abstract component, named AbstractQueryExpression, from which other specifications can subclass concrete query elements to implement query operations.

INCITS/ISO 19144-1-2010/Cor 1-2013, Geographic information -- Classification systems -- Part 1: Classification system structure, Technical Corrigendum 1
This Technical Corrigendum affect Part 1 of ISO 19144-1 which establishes the structure of a geographic information classification system, together with the mechanism for defining and registering the classifiers for such a system. It specifies the use of discrete coverages to represent the result of applying the classification system to a particular area and defines the technical structure of a register of classifiers in accordance with ISO 19135.

INCITS/ISO 19144-1:2009 [R2015], Geographic information - Classification systems - Part 1: Classification system structure
This standard establishes the structure of a geographic information classification system, together with the mechanism for defining and registering the classifiers for such a system. It specifies the use of discrete coverages to represent the result of applying the classification system to a particular area and defines the technical structure of a register of classifiers in accordance with ISO 19135.

INCITS/ISO 19144-2:2012 [2013], Geographic information - Classification systems -- Part 2: Land Cover Meta Language (LCML)
This part of ISO 19144 specifies a Land Cover Meta Language (LCML) expressed as a UML metamodel that allows different land cover classification systems to be described based on the physiognomic aspects. This part of ISO 19144 also specifies the detailed structure of a register for the extension of LCML but does not specify the maintenance of the register. This part of ISO 19144 recognizes that there exist a number of land cover classification systems. It provides a common reference structure for the comparison and integration of data for any generic land cover classification system, but does not intend to replace those classification systems.

INCITS/ISO 19146-2010 [R2016], Geographic information -- Cross-domain vocabularies
Defines a methodology for cross-mapping technical vocabularies that have been adopted by industry-specific geospatial communities. It also specifies an implementation of ISO 19135 for the registration of geographic information concepts for the purpose of integrating multiple domain-based vocabularies.

INCITS/ISO 19148:2012 [2012], Geographic information - Linear referencing
ISO 19148:2012 specifies a conceptual schema for locations relative to a one-dimensional object as measurement along (and optionally offset from) that object. It defines a description of the data and operations required to use and support linear referencing. ISO 19148:2012 is applicable to transportation, utilities, location-based services and other applications which define locations relative to linear objects.

INCITS/ISO 19149:2011 [2012], Geographic information -- Rights expression language for geographic information -- GeoREL
ISO 19149:2011 defines an XML-based vocabulary or language to express rights for geographic information in order that digital licenses can be created for such information and related services. This language, GeoREL, is an extension of the rights expression language in ISO/IEC 21000-5 and is to be used to compose digital licenses. Each digital license will unambiguously express those particular rights that the owners (or their agent) of a digital geographic resource extend to the holders of that license. The digital rights management system in which these licenses are used can then offer ex ante (before the fact) protection for all such resources.

INCITS/ISO 19150-2:2015 [2017], Geographic information - Ontology - Part 2: Rules for developing ontologies in the Web Ontology Language (OWL)
Defines rules and guidelines for the development of ontologies to support better the interoperability of geographic information over the Semantic Web. The Web Ontology Language (OWL) is the language adopted for ontologies. It defines the conversion of the UML static view modeling elements used in the ISO geographic information standards into OWL. It further defines conversion rules for describing application schemas based on the General Feature Model defined in ISO 19109 into OWL. It does not define semantics operators, rules for service ontologies, and does not develop any ontology.

ISO 19153:2014 is a reference model for digital rights management (DRM) functionality for geospatial resources (GeoDRM). As such, it is connected to the general DRM market in that geospatial resources shall be treated as nearly as possible like other resources, such as music, text, or services. It is not the intention to reinvent a market nor the technology that already exists and is thriving, but to make sure that a larger market has access to geospatial resources through a mechanism that it understands and that is similar to and consistent with the ones already in use.

INCITS/ISO 19156:2011 [2012], Geographic information -- Observations and measurements
ISO 19156:2011 defines a conceptual schema for observations, and for features involved in sampling when making observations. These provide models for the exchange of information describing observation acts and their results, both within and between different scientific and technical communities.

INCITS/ISO 19157:2013[2014], Geographic information -- Data quality
ISO 19157:2013 establishes the principles for describing the quality of geographic data. It defines components for describing data quality; specifies components and content structure of a register for data quality measures; describes general procedures for evaluating the quality of geographic data; establishes principles for reporting data quality.

Defines a conceptual model for address information (address model), together with the terms and definitions that describe the concepts in the model. Lifecycle, metadata, and address aliases are included in the conceptual model. The model is presented in the Unified Modeling Language (UML). The model provides a common representation of address information, independent of actual addressing implementations. It is not intended to replace conceptual models proposed in other specifications, but provides a means to cross-map between different conceptual models for address information and enables the conversion of address information between specifications.

INCITS/ISO 19162:2015 [2017], Geographic information - Well-known text representation of coordinate reference systems

This standard defines the structure and content of a text string implementation of the abstract model for coordinate reference systems described in ISO 19111:2007 and ISO 19111-2:2009. The string defines frequently needed types of coordinate reference systems and coordinate operations in a self-contained form that is easily readable by machines and by humans. The essence is its simplicity; as a consequence there are some constraints upon the open content allowed in ISO 19111:2007. To retain simplicity in the well-known text (WKT) description of coordinate reference systems and coordinate operations, the scope of this Standard excludes parameter grouping and pass-through coordinate operations. The text string provides a means for humans and machines to correctly and unambiguously interpret and utilise a coordinate reference system definition with look-ups or cross references only to define coordinate operation mathematics. Because it omits metadata about the source of the data and may omit metadata about the applicability of the information, the WKT string is not suitable for the storage of definitions of coordinate reference systems or coordinate operations.

INCITS/ISO 2033-1983 [R2013], Information processing - Coding of machine readable characters for OCR & MICR

 Defines the coded representation of printed characters recognized by reading equipment. Includes the fonts £ 13 B; CMC 7; OCR-A; OCR-B. Assigns bit-patterns to characters recognized by reading equipment. This information is then given to the recipient by different media and can be used by printing devices. Single-font reader and multiple-font reader are considered as applications. References: ISO 646; 1004; 1073; 2022.

INCITS/ISO 2382-21-1985 [S2011], Information technology -- Vocabulary - Part 21: Interfaces between process computer systems and technical processes

Enables the international communication in information processing. Provides selected English and French terms and their definitions in the field of the links between the technical processes and the process computer systems, especially the process interface system the process control equipment and its interaction.

This International Standard is intended to facilitate international communication in information processing. It presents, in two languages, terms and definitions of selected concepts relevant to the field of information processing and identifies relationships between the entries. In order to facilitate their translation into other languages, the definitions are drafted so as to avoid, as far as possible, any peculiarity attached to a language. This part of ISO 2382 (which will comprise some twenty-five parts) deals with calculators. It concerns the main operating processes and types of machines used, their functions and technical parts.

INCITS/ISO 3275-1974 [R2013], Implementation of the 7-bit coded character set and its 7-bit and 8-bit extensions on 3.81 mm magnetic cassette for data interchange

Defines the implementation of the 7-bit coded character set and of its 7-bit and 8-bit extensions for the interchange of data on 3.81 mm magnetic tape cassette. References: ISO 646; 2022; 3407.

INCITS/ISO 3562-1976 [R2015], Information processing - Interchangeable magnetic single-disk cartridge (top loaded) - Physical and magnetic characteristics

Includes the general, physical and magnetic characteristics for the interchange of magnetic single disk cartridges (top loaded) in order to facilitate the interchange of data between electronic data processing systems.

This International Standard specifies the basic layout of numerals and symbols on keyboards intended to be used in applications where the data are generally numeric.

Specifies file structures for data interchange on magnetic tape cassettes. To provide for the range of sophistication in equipment and applications, the basic, compact, and extended systems are specified. This standard is not limited to the 3, 81 mm magnetic tape cassette described in ISO 3407 but could also be applied to higher capacity cassettes or cartridges.

INCITS/ISO 5138-1-1978 [S2009], Information technology - Office Machines - Office Machines - Vocabulary - Part 01: Dictation Equipment

Includes bilingual vocabulary serves for facilitating international communication in the field of office machines. Establishes reference between entries. Covers vocabulary of dictation machines.

INCITS/ISO 5138-2-1980 [S2009], Information technology - Office Machines - Vocabulary - Part 02: Duplicators

Includes bilingual vocabulary is intended to facilitate international communication in the field of office machines. Establishes references between entries. Covers vocabulary of duplicators.

INCITS/ISO 5138-3-1981 [S2009], Information technology - Office Machines - Vocabulary - Part 03: Addressing Machines

Includes bilingual vocabulary is intended to facilitate international communication in the field of office machines. Establishes references between entries. Covers vocabulary of addressors.

INCITS/ISO 5138-4-1981 [S2009], Office Machines - Vocabulary - Part 04: Letter Opening Machines

Includes bilingual vocabulary serves for facilitating international communication in the field of office machines. Establishes references between entries. Covers vocabulary of letter opening machines.

INCITS/ISO 5138-5-1981 [S2009], Information technology - Office equipment - Part 05: Letter Folding Machines

Outlines terms used for letter folding machines, their main functions and types, in order to facilitate international exchange. Contains bilingual (English, French) collection of words and definitions and indicates references between them.

INCITS/ISO 5138-9-1984 [S2009], Information technology - Office machines - Part 9: Typewriters

Is aimed at simplifying international communication in the field of office machines. Provides English and French terms and definitions of selected concepts and establishes connections between entries. Deals with their operating processes, types, functions and parts.

INCITS/ISO 5654-1-1984 [R2015], Information processing - Data interchange on 200 mm (8 in) flexible disk cartridges using two-frequency recording at 13 262 fprad, 1,9 tppm (48 tpi), on one side - Part 1: Dimensional, physical and magnetic characteristics

This Standard Defines dimensional, physical and magnetic characteristics of the 200 mm (8 in) flexible disk cartridges using two-frequency recording at 13 262 fprad on one side so as to provide physical interchangeability between data processing systems.

INCITS/ISO 6586-1980 [R2013], Data processing Implementation of the ISO 7-Bit and 8-Bit Coded Character Sets on Punched Cards

Defines implementation of ISO 7-bit and 8-bit coded character sets on punched cards as well as the representation of 7-bit and 8-bit combinations on 12-row punched cards. This representation is derived from, and compatible with, the Hollotith Code. Ensures widely compatibility with existing punched card files. Intended for general interchange of information among data processing systems.
INCITS/ISO 6596-1:1985 [R2015], Information processing - Data interchange on 130 mm (5.25 in) flexible disk cartridges using two-frequency recording at 7 958 ftpm, 1.9 tpmm (48 tpi), on one side - Part 1: Dimensional, physical and magnetic characteristics
This Standard shows dimensional, physical and magnetic characteristics of 130 mm (5.25 in) flexible disk cartridges recorded at 7 958 ftpm on one side using two frequency so as to provide physical interchangeability between data processing systems. Applicable in conformance with ISO 646, 2022, 4873, 7665

INCITS/ISO 6709-2008 [R2013], Standard representation of geographic point locations by coordinates
ISO 6709:2008 is applicable to the interchange of coordinates describing geographic point location. It specifies the representation of coordinates, including latitude and longitude, to be used in data interchange. It additionally specifies representation of horizontal point location using coordinate types other than latitude and longitude. It also specifies the representation of height and depth that can be associated with horizontal coordinates. Representation includes units of measure and coordinate order.

INCITS/ISO 6709-2008/COR 1:2009 [R2015], Standard representation of geographic point location by coordinates - Technical Corrigendum 1
Technical Corrigendum 1

INCITS/ISO 6936:1988 [R2014], Information processing - Conversion between the two coded characters sets of ISO 646 and ISO 6937-2 and the CCITT international telegraph alphabet No. 2 (ITA 2)
Lays down rules for converting between 58 characteristics of CCITT International Telegraph Alphabet No. 2 (Recommendation F.1) and the characters according to the ISO 646 and 6937-2 coded sets. Serves for interaction between international telex service and terminals in data networks if telex character repertoire is sufficient.

INCITS/ISO 7064:2003 [S2013], Information technology - Security techniques - Check character systems
This International Standard specifies a set of check character systems capable of protecting strings against errors which occur when people copy or type data. The strings may be of fixed or variable length and may have character sets which are a) numeric (10 digits: 0 to 9); b) alphabetic (26 letters: A to Z); and c) alphanumeric (letters and digits).

INCITS/ISO 7487-2-1985 [S2012], Information Processing - Data interchange on 130 mm (5.25 in) Flexible Disk Cartridges Using Modified Frequency Modulation Recording at 7 958 ftpm, 1.9 tpmm (48 tpi), on Both Sides - Part 2: Track Format A
This part of ISO 7487 specifies the quality of recorded signals, the track layout, and a track format to be used on such a flexible disk cartridge, which is intended for data interchange between data processing systems.

INCITS/ISO 8378-3-1986 [S2008], Information Processing - Data interchange on 130 mm (5.25 in) Flexible Disk Cartridges Using Modified Frequency Modulation Recording at 7 958 ftpm, 3.8 tpmm (96 tpi), on Both Sides - Part 3: Track Format B
Specifies the quality of recorded signals, the track layout, and a track format to be used on 130 mm (5.25 in) flexible disk cartridges intended for data interchange between data processing systems.

INCITS/ISO 8485-1989 [S2011], Programming languages - APL
This Standard defines the programming language APL and the environment in which APL programs are executed. Its purpose is to facilitate interchange and promote portability of APL programs and programming skills.

INCITS/ISO 8630-1:1987 [R2015], Information processing - Data interchange on 130 mm (5.25 in) flexible disk cartridges using modified frequency modulation recording at 13 262 ftpm, on 80 tracks on each side - Part 1: Dimensional, physical and magnetic characteristics
This standard defines the dimensional, physical and magnetic characteristics of the cartridge so as to provide physical interchangeability between data processing systems. Provides for full data interchange between data processing systems and provides an alternative method of full data interchange between data processing systems. To be used in conformance with ISO 646; ISO 2022; ISO 4873; ISO 7665; ISO 9293.

This International Standard specifies an abstract syntax known as the Standard Generalized Markup Language (SGML). The language expresses the description of a document's structure and other attributes, as well as other information that makes the markup interpretable.

This International Standard: Specifies an abstract syntax known as the Standard Generalized Markup Language (SGML). The language expresses the description of a document's structure and other attributes, as well as other information that makes the markup interpretable. Specifies a reference concrete syntax that binds the abstract syntax to specific characters and numeric values, and criteria for defining variant concrete syntaxes. Defines conforming documents in terms of their use of components of the language.

INCITS/ISO 9036-1987 [R2013], Information processing - Arabic 7-bit coded character set for information interchange
A set of mandatory 120 characters is described with the coded representation. This set is intended for interchange of information using Arabic language and includes control characters for code extensions. Procedures for using these control characters are specified in ISO 2022. References: ISO 646; ISO 2022; Arab Standard ASMO 449.

This Standard specifies a data structure known as the SGML Document Interchange Format (SDIF). SDIF enables a document conforming to ISO 8879, which might be stored in several entities, to be packed into a data stream for interchange in a manner that will permit the recipient to reconstitute the separate entities. SDIF also allows related documents to be included in the data stream, such as covering letters, transmittal forms, catalog cards, formatting procedures, or the "document profile" required by a document architecture.

This International Standard specifies a data structure known as the SGML Document Interchange Format (SDIF). SDIF enables a document conforming to ISO 8879, which might be stored in several entities, to be packed into a data stream for interchange in a manner that will permit the recipient to reconstitute the separate entities. SDIF also allows related documents to be included in the data stream, such as covering letters, transmittal forms, catalog cards, formatting procedures, or the "document profile" required by a document architecture.

ISO/IEC 9075-14:2011 defines ways in which SQL can be used in conjunction with XML. It defines ways of importing and storing XML data in an SQL database, manipulating it within the database and publishing both XML and conventional SQL data in XML form.
INCITS/ISO 9529-2:1989 [S2012], Information Processing Systems - Data Interchange on 90 mm (3.5 in) Flexible Disk Cartridges Using Modified Frequency Modulation Recording at 15 916 Itrads on 80 tracks on Each Side - Part 2: Track Format

This part of ISO/IEC 9529 specifies the track layout, the track format and the characteristics of the recorded signals.

Specifies a) procedures for transmission of multicast announcement, multicast address mapping and group composition information between Network entities residing in End Systems and Network entities residing in Intermediate Systems; b) the encoding of the protocol data units used for multicast announcement, multicast address mapping and group composition information.

INCITS/ISO 962-1974 [R2013], Implementation of the 7-bit coded character set and its 7-bit and 8-bit extensions on 9-track 12.7 mm (0.5 in) magnetic tape

Provides the PICS proforma for the Distributed Transaction Processing: Protocol Implementation Conformance Statement (PICS) proforma

This part of ISO/IEC 10026 provides the PICS proforma for the Distributed Transaction Processing Protocol as specified in ITU-T Rec. X.862 ISO/IEC 10026-3 in compliance with the relevant requirements, and in accordance with the relevant guidance, given in CCITT Rec. X.291 ISO/IEC 9646-2.
INCITS/ISO 10089:1991 [S2009],
Information Technology - 130 mm Rewritable Optical Disk Cartridge for Information Interchange

This International Standard specifies definitions of the essential concepts; the environment in which the characteristics are to be tested; the environments in which the cartridge are to be operated and stored; the mechanical, physical and dimensional characteristics of the case and of the optical disk; the magneto-optical characteristics and the recording characteristics for recording the information, for reading the information and for erasing it many times, so as to provide physical interchangeability between data processing systems; two formats for the physical disposition of the tracks and sectors, the error correction codes.

INCITS/ISO/IEC 10090:1992 [S2009],
Information Technology - 90 mm Optical Disk Cartridges, Rewritable and Read Only, for Data Interchange

Specifies the conditions for conformance testing and the Reference Drive, the mechanical and physical characteristics of the cartridge, so as to provide mechanical interchangeability between data processing systems; the format of the information on the disk, both embossed and user-written; the characteristics of the embossed information on the disk; the magneto-optical characteristics of the disk, enabling data processing systems to write data onto the disk; the minimum quality of user-written data on the disk, enabling data processing systems to read data from the disk.

INCITS/ISO/IEC 10116-2008 [R2013],
Information technology - Security techniques - Modes of operation for an n-bit block cipher

This International Standard establishes five modes of operation for applications of an n-bit block cipher (e.g. protection of data transmission, data storage). The defined modes only provide protection of data confidentiality. Protection of data integrity and requirements for padding the data are not within the scope of this International Standard. Also most modes do not protect the confidentiality of message length information.

INCITS/ISO/IEC 10116:2006/COR1:2008 [R2014], Information technology - Security Techniques - Modes of operation for an n-bit block cipher - Corrigendum 1

This is the first Corrigendum to ISO/IEC 10116:2006

INCITS/ISO/IEC 10118-1:2000 [R2014],
Information technology - Security techniques - Hash-functions - Part 1: General

ISO/IEC 10118 specifies hash-functions and is therefore applicable to the provision of authentication, integrity and non-repudiation services. Hash-functions map arbitrary strings of bits to a fixed-length strings of bits, using a specified algorithm. They can be used for reducing a message to a short imprint for input to a digital signature mechanism, and committing the user to a given string of bits without revealing this string.

INCITS/ISO/IEC 10118-2:2010 [R2016],
Information technology -- Security techniques -- Hash-functions -- Part 2: Hash-functions using an n-bit block cipher

Specifies hash-functions which make use of an n-bit block cipher algorithm. They are therefore suitable for an environment in which such an algorithm is already implemented.

INCITS/ISO/IEC 10118-3:2004 [R2014],
Information technology - Security techniques - Hash-functions - Part 3: Dedicated hash-functions

This part of ISO/IEC 10118 specifies dedicated hash-functions, i.e., specially designed hash-functions. The hash-functions in this part of ISO/IEC 10118 are based on the iterative use of a round-function. Seven distinct round-functions are specified, giving rise to distinct dedicated hash-functions. The first and third dedicated hash-functions in clauses 7 and 9 respectively provide hash-codes of lengths up to 160 bits; the second in clause 8 provides hash-codes of lengths up to 128 bits; the fourth in clause 10 provides hash-codes of lengths up to 256 bits; the sixth in clause 12 provides hash-codes of a fixed length, 384 bits.

This is the first Amendment to INCITS/ISO/IEC 10118-3:2004

INCITS/ISO/IEC 10118-4:1998 [S2013],
Information Technology - Security techniques - Hash-functions: Part 4: Hash functions using modular arithmetic

This part of ISO/IEC 10118 specifies two hash-functions which make use of modular arithmetic. These hash-functions, which are believed to be collision-resistant, compress messages of arbitrary but limited length to a hash-code whose length is determined by the length of the prime number used in the reduction-function defined in 7.3. Thus, the hash-code is easily scaled to the input length of any mechanism (e.g., signature algorithm, identification scheme).

INCITS/ISO/IEC 10149:1995 [R2014],
Information technology - Data interchange on read-only 120 mm optical data disks (CD-ROM)

Specifies the characteristics of 120 mm optical disks (CD-ROM) for information interchange between information processing systems and for information storage.

INCITS/ISO/IEC 10175-1:1996 [R2013],
Information Technology - Text and Office Systems - Document Printing Application (DPA) - Part 1: Abstract Service Definition and Procedures

Specifies a client-server model of printing in accordance with the Distributed-office-applications Model (ISO/IEC 10031-1). Together, the capabilities provided can enable users to create and produce high-quality office documents in a consistent and unambiguous manner within a distributed open system environment.

INCITS/ISO/IEC 10175-2:1996 [R2013],
Information technology -- Text and office systems -- Document Printing Application (DPA) -- Part 2: Protocol specification

Specifies the abstract syntax of the Document Printing Application (DPA) access protocol, how this protocol supports the DPA abstract service, the mapping of the DPA onto the services used and the requirements for conformance with the DPA access protocol.

INCITS/ISO/IEC 10179:1996 [S2014],
Information technology - Text Composition: Document Style Semantics and Specification Language (DSSSL)

Specifies the processing of valid Standard Generalized Markup Language (SGML) documents. Document Style Semantics and Specification Language (DSSSL) defines the semantics, syntax, and processing model of languages for the specification of documentation processing. Provides means for externalization of style characteristics and other techniques for associating style information with an SGML document.

Amendment 2 to ISO/IEC 10179:1996

Technical Corrigendum 1
INCITS/ISO/IEC 10180:1995 [S2014],
Information technology - Text Composition - Standard Page Description Language (SPDL)
Defines a language for the specification of electronic documents, comprised of black and white, gray scale, or full color text, images, and geometric graphics, in a form suitable for presentation (printing or displaying on other suitable media).

INCITS/ISO/IEC 10206:1991 [S2008],
Information Technology - Programming Languages - Extended Pascal
Specifies the syntax and semantics of the programming language by specifying requirements for a processor and for a conforming program. Includes an alphabetical index. Annexes A to G are for information only.

INCITS/ISO/IEC 10279:1991 [S2010],
Information technology - Programming languages - Full BASIC
Specifies the programming language which is derived from the ANSI X3.113-1987. For details of the syntax and semantics see ANSI X3.113-1987. Annexes A and B are for information only.

INCITS/ISO/IEC 10367-1991 [R2013],
Information technology - Standardized coded graphic character sets for use in 8-bit codes
Specifies a unique coded character set for use as G0 set and a series of coded character sets of up to 96 characters for use as G1, G2 and G3 sets in versions of ISO/IEC 4873.

INCITS/ISO/IEC 10373-1:2006 [R2016],
Identification cards - Test methods - Part 1: General characteristics tests
Defines test methods for characteristics of identification cards according to the definition given in ISO/IEC 7810. Each test method is cross-referenced to one or more base standards, which may be ISO/IEC 7810 or one or more of the supplementary standards that define the information storage technologies employed in identification card applications. This part of ISO/IEC 10373 defines test methods which are common to one or more ICC technologies and other parts deal with other technology-specific tests.

INCITS/ISO/IEC 10373-2:2015 [2016],
Identification cards - Test methods - Part 2: Magnetic strip technologies
Defines test methods for characteristics of identification cards according to the definition given in ISO/IEC 7810. Each test method is cross-referenced to one or more base standards, which may be ISO/IEC 7810 or one or more of the supplementary standards that define the information storage technologies employed in identification card applications. Defines test methods which are specific to magnetic stripe technology.

INCITS/ISO/IEC 10373-3:2010 [R2016],
Identification cards -- Test methods -- Part 3: Integrated circuit cards with contacts and related interface devices
Defines test methods for characteristics of integrated circuit cards with contacts and related interface devices according to the definition given in ISO/IEC 7816.

INCITS/ISO/IEC 10373-5:2006 [R2012],
Identification cards - Test methods - Part 5: Optical memory cards
ISO/IEC 10373 defines test methods for characteristics of identification cards as defined in ISO/IEC 7810. Each test method is cross-referenced to one or more base standards, which may be ISO/IEC 7810 or one or more of the supplementary standards that define the information storage technologies employed in identification cards applications.

INCITS/ISO/IEC 10373-6:2016 [2016],
Identification cards -- Test methods -- Part 6: Proximity cards
Defines test methods for characteristics of identification cards according to the definition given in ISO/IEC 7810. Each test method is cross-referenced to one or more base standards, which may be ISO/IEC 7810 or one or more of the supplementary standards that define the information storage technologies employed in identification card applications. This part of ISO/IEC 10373 deals with test methods, which are specific to contactless integrated circuit card (proximity card) technology. ISO/IEC 10373-1 deals with test methods which are common to one or more ICC technologies and other parts deal with other technology-specific tests.

INCITS/ISO/IEC 10373-7:2008 [R2016],
Identification cards -- Test methods -- Part 7: Vicinity cards
Defines test methods for characteristics of identification cards according to the definition given in ISO/IEC 7810. Each test method is cross-referenced to one or more base standards, which may be ISO/IEC 7810 or one or more of the supplementary standards that define the information storage technologies employed in identification card applications. This part of ISO/IEC 10373 deals with test methods, which are specific to contactless integrated circuit card (vicinity card) technology. ISO/IEC 10373-1 deals with test methods which are common to one or more ICC technologies and other parts deal with other technology-specific tests.

INCITS/ISO/IEC 10356-1:2000 [R2013],
Identification cards - Contactless integrated circuit(s) cards - Close-coupled cards - Part 1: Physical characteristics
This part of ISO/IEC 10356 specifies the physical characteristics of close-coupled cards (CICCs). It applies to identification cards of the card type ID-1 operating either in a slot or on the surface of a coupling device.

Identification Cards - Contactless Integrated Circuit(s) Cards - Part 2: Dimensions and Location of Coupling Areas
Specifies the dimensions, location, nature and assignment of each of the coupling areas to be provided for interfacing slot or surface card coupling devices (CCDs) with contactless integrated circuit(s) cards (CICCs) of the ID-1 card type.

INCITS/ISO/IEC 10536-3:1996 [R2013],
Identification cards - Contactless integrated circuit(s) cards - Part 3: Electronic signals and reset procedures
This part of ISO/IEC 10536 specifies the nature and characteristics of the fields to be provided for power and bi-directional communications between card coupling devices (CCDs) and contactless integrated circuit(s) cards (CICCs) of the ID-1 card type in slot or surface operation.

INCITS/ISO/IEC 10538-1991 [R2013],
Information technology - control functions for text communication
Defines the control functions and their coded representations. Applies only to text made up of characters. Does not define any control functions required for controlling the process of communication. Annexes A, B and C are for information only.

INCITS/ISO/IEC 10561-1999 [S2016],
Information technology - Office Equipment - Printing Devices Method for measuring printer throughput - Class 1 and Class 2 printers
Specifies a method for measuring the throughput of class 1 and class 2 printers, as defined in ISO/IEC 11160-1. Specifies three different test patterns: (1) a standard business letter; (2) a spreadsheet; or (3) a graphic pattern.

INCITS/ISO/IEC 10589-2002 [R2012],
Information technology - Telecommunications and information exchange between systems - Intermediate System to Intermediate System intra-domain routeing information exchange protocol for use in conjunction with the protocol for providing the connectionless-mode network service (ISO 8473)
This International Standard specifies a protocol which is used by Network Layer entities operating the protocol specified in ISO 8473 in Intermediate Systems to maintain routeing information for the purpose of routeing within a single routeing domain. The protocol specified in this International Standard relies upon the provision of a connectionless-mode underlying service.

Specifies a general framework for testing conformance to a computer graphics standard. The general framework described in this standard addresses the following six components: (a) conformance in the standard itself; (b) test requirements document, defining what shall be tested for a computer graphics standard; (c) test specifications document, addressing the test technique and the content of each test; (d) test method, defining the implementation of the test specification document, including the test software; (e) test procedures, defining the application of the test software, which consists of the procedures to be used in conformance testing; and (f) the establishment of test services.

INCITS/ISO/IEC 10646:2012 [2012], Information technology - Universal Coded Character Set (UCS)

There are extensive electronic attachments to this standard which are only available on DVD. Please contact ANSI's Customer Service Department at 1-212-624-4980 or ansonline@ansi.org for more information. ISO/IEC 10646:2012 specifies the Universal Character Set (UCS). It is applicable to the representation, transmission, interchange, processing, storage, input and presentation of the written form of the languages of the world as well as additional symbols. It covers 110 181 characters from the world's scripts.

This International Standard specifies an Amendment 1 to ISO/IEC 10646:2012/Amd 1:2013, Information technology -- Universal Coded Character Set (UCS) -- Amendment 1: Linear A, Palmyrene, Manichaean, Khojki, Khudawadi, Bassa Vah, Duployan, and other characters

Describes the forms of printed images and the sizes of alphanumeric characters as well as the signs and graphical symbols (OCR-A) intended for optical character reading according to ISO 646-1973.

Indicates the forms of printed images and the sizes of alphanumeric characters as well as the signs and graphical symbols (OCR-B-character set) intended for optical character reading according to ISO 646-1973.

INCITS/ISO/IEC 10744:1997 [R2015], Information technology - Hypermedia/Time-based Structuring Language (HyTime)

This Standard defines a language and underlying model for the representation of "hyperdocuments" that link and synchronize static and dynamic (time-based) information contained in multiple conventional and multimedia documents and information objects. The language is known as the "Hypermedia/Time-based Structuring Language", or "HyTime". HyTime can represent time in both the abstract, or "musical" sense, and in user-defined real-time units. It also provides a way of relating the two so that elements of time-dependent documents can be synchronized. NOTE 7 This facility extends to the representation of multimedia information the power, once limited to conventional documents, to distinguish intrinsic information content from style considerations. HyTime’s techniques for representing its time model are equally applicable to spatial and other domains; all are treated as systems for measuring along different axes of a coordinate space. Arbitrary cross-refrences and access paths based on external interactions ("hypermedia links") are also supported. HyTime’s time representation contains sufficient information to derive the durations of both control ("gestural") data (e.g., control information for audio or video hardware) and visual data (e.g., a music score, presentation storyboard, or television script). The media formats and data notations of objects in a HyTime hyperdocument can include formatted and unformatted documents, audio and video segments, still images, and object-oriented graphics, among others. Users can specify the positions and sizes of occurrences of objects in space and time, using a variety of measurement units and granularities. Temporal requirements of applications...

This Recommendation / International Standard: - gives an introduction and motivation for ODP; - provides an overview of the Reference Model of Open Distributed Processing (RM-ODP) and an explanation of its key concepts; - gives guidance on the application of the RM-ODP.

ISO/IEC 10746 provides a coordinating framework for the standardization of open distributed processing (ODP). This supports distribution, interworking, portability, and platform and technology independence. It establishes an enterprise architecture framework for the specification of ODP systems. ISO/IEC 10746 defines the essential concepts necessary to specify open distributed processing systems from five prescribed viewpoints. It provides a well-developed framework for the structuring of specifications for large-scale, distributed systems.

ISO/IEC 10746 provides a coordinating framework for the standardization of open distributed processing (ODP). This supports distribution, interworking, portability, and platform and technology independence. It establishes an enterprise architecture framework for the specification of ODP systems. ISO/IEC 10746 defines the essential concepts necessary to specify open distributed processing systems from five prescribed viewpoints. It provides a well-developed framework for the structuring of specifications for large-scale, distributed systems.

The purpose of this standard is provide an architectural semantics for ODP.

INCITS/ISO/IEC 10747:1994 [R2015], Information technology - Telecommunications and information exchange between systems - Protocol for exchange of inter-domain routing information among intermediate systems to support forwarding of ISO 8473 PDUs

Technical Corrigendum 1

Amendment 1

Technical Corrigendum 1
INCITS/ISO/IEC 10779:2008 [R2014], Information technology - Office equipment - Office equipment accessibility for elderly persons and persons with disabilities

ISO/IEC 10779:2008 specifies accessibility guidelines to be considered when planning, developing and designing electrophotographic copying machines, page printers and multi-function devices. These guidelines are intended to improve accessibility required when primarily older persons, persons with disabilities and persons with temporary disabilities use office equipment.

INCITS/ISO/IEC 10885:1993 [R2015], Information technology - 356 mm optical disk cartridge for information interchange - Write once

This standard specifies definitions of essential concepts, the environment in which the characteristics shall be tested, the environments in which the cartridge shall be operated and stored, the mechanical, physical and dimensional characteristics of the case and of the optical disk, the optical characteristics and the recording characteristics for recording the information once and for reading it many times, so as to provide physical interchangeability between data processing systems, the format for the physical disposition of the tracks and sectors, the error correction codes, the modulation methods used for recording and the quality of the recorded signals.

Specifies processes for converting source image data to compressed image data, processes for converting compressed image data to reconstructed image data, coded representations for compressed image data, and gives guidance on how to implement these processes in practice. Is applicable to continuous-tone - grayscale or colour - digital still image data and to a wide range of applications which require use of compressed images. Is not applicable to bi-level image data.

Specifies normative compliance tests for the ITU-T Rec. T.81 (ISO/IEC 10981-1) encoding and decoding processes. These compliance tests are applicable to "stand-alone" generic implementations of one or more of the encoding and decoding processes specified in ITU-T Rec. T.81 (ISO/IEC 10981-1). The purposes of these tests include that generic encoder (and decoder) implementations compute the discrete cosine transform (DCT) and quantization functions with sufficient accuracy.

This Recommendation 1 International Standard is applicable to continuous-tone - grayscale or colour - digital still image data. It is applicable to a wide range of applications which require use of compressed images.

INCITS/ISO/IEC 10918-4:1999 [R2014], Information technology -- Digital compression and coding of continuous-tone still images: Registration of JPEG profiles, SPIFF profiles, SPIFF tags, SPIFF colour spaces, APPn markers, SPIFF compression types and Registration Authorities (REGAUT)

This Recommendation | International Standard provides for the unique registration of JPEG and SPIFF Profiles, SPIFF Tags, SPIFF Colour Spaces, application specific Markers, SPIFF Compression types and images Registration authorities as defined in the CCITT Rec. T.81 | ISO/IEC 10918-1 and ITU-T Rec. T.84 | ISO/IEC 10918-3. Unless otherwise specified, (P) rofiles, (T)ags, colour (S)paces, (M)arkers, (C) ompression types and image (R)egistration authorities will be referred to as PTSMCR items.

INCITS/ISO/IEC 10994:1992 [S2012], Information Technology - Data Interchange on 90mm Flexible Disk Cartridges Using Modified Frequency Modulation Recording at 31 831 ftpcad on 80 Tracks on Each Side - ISO Type 303

This standard specifies the characteristics of 90-mm flexible disk cartridges recorded at 31 831 ftpc on 80 tracks on each side. Such flexible disk cartridges are identified as ISO Type 303.

INCITS/ISO/IEC 10995:2011 [2013], Information technology - Digitally recorded media for information interchange and storage - Test method for the estimation of the archival lifetime of optical media

ISO/IEC 10995:2011 specifies an accelerated aging test method for estimating the life expectancy for the retrievability of information stored on recordable or rewritable optical disks.

ISO/IEC 11002:2008(E) is an Application Programming Interface (API) which provides management interfaces as defined in ISO/IEC 14776 -453 (Information technology - Small computer system interface (SCSI) - Part 453: Primary commands -3 (SCC-3)) and common vendor-specific extensions to the standard capabilities. ISO/IEC 11002 relates to SCSI multipathing features and excludes multipathing between interconnect devices (such as Fibre Channel switches) and transport specific multipathing (such as isCSI multiple connections per session).

Defines a set of concepts and their inter-relationships which should be applicable to the complete range of future computer graphics standard. May be applied to verify and refine requirements for computer graphics; to identify needs for computer graphics standards and external interfaces; to develop models based on requirements for computer graphics; to define the architecture of new computer graphics standards; compare computer graphics standards.

INCITS/ISO/IEC 11160-1:1996 [S2014], Information technology - Office Equipment - Minimum information to be included in specification sheets - Printers - Part 1: Class 1 and Class 2 printers

Specifies the minimum information that shall be included in the specification sheets of printers enabling users to compare the characteristics of different machines and select a suitable printer. Applies to Class 3 and Class 4 printers according annex B for an office environment.

INCITS/ISO/IEC 11160-2:2013[2014], Information technology -- Office equipment -- Minimum information to be included in specification sheets -- Printers -- Part 2: Class 3 and Class 4 printers

ISO/IEC 11160 is intended to facilitate users in selecting a printer which meets their requirements. ISO/IEC 11160 specifies the minimum information to be included in the specification sheets of printers in order for users to compare the characteristics of different machines. The term "Specification Sheets" applies to documents which describe the performance characteristics of the printers to be included in instruction manuals, product brochures on websites. ISO/IEC 11160 applies to printers that could be operated in an office environment. Printers requiring specially equipped rooms or specially instructed operators are not considered in ISO/IEC 11160.

INCITS/ISO/IEC 11172-1-1993 [R2013], Information Technology - Coding of Moving Pictures and Associated Audio for Digital Storage Media at up to about 1,5 Mbit/s - Part 1: Systems

This part of ISO/IEC 11172 specifies the system layer of the coding. It was developed principally to support the combination of the video and audio coding methods defined in ISO/IEC 11172-2 and ISO/IEC 11172-3.
INCITS/ISO 11172-2:1993 [R2013], Information Technology - Coding of Moving Pictures and Associated Audio for Digital Storage Media at up to about 1.5 Mbit/s - Part 2: Video

ISO/IEC 11172-2:2005 [R2014], Information technology - Metadata Registries (MDR) - Part 2: Classification for administered items

ISO/IEC 11179-2:2005 restates and elaborates on the procedures and techniques of ISO/IEC 11179-3:2003 for registering classification schemes and classifying administered items in a metadata registry (MDR). All types of administered items can be classified, including object classes, properties, representations, value domains, and data element concepts, as well as data elements themselves.

INCITS/ISO 11179-3:2014, Information technology - Metadata registries (MDR) - Part 3: Registry metamodel and basic attributes

ISO/IEC 11179-3:2013 specifies the structure of a metadata registry in the form of a conceptual data model.

INCITS/ISO 11179-4:2004 [R2014], Information technology - Management and Interchange - Metadata Registries (MDR) - Part 4: Formulation of data definitions

ISO/IEC 11179-4:2004 specifies requirements and recommendations for constructing definitions for data and metadata. Only semantic aspects of definitions are addressed; specifications for formatting the definitions are deemed unnecessary for the purposes of this standard. While especially applicable to the content of metadata registries as specified in ISO/IEC 11179-3, ISO/IEC 11179-4:2004 is useful broadly for developing definitions for data and metadata.

INCITS/ISO 11179-5:2015 [2016], Information technology - Metadata registries (MDR) - Part 5: Naming principles

Provides instruction for naming of the following items, as defined in ISO/IEC 11179-3: concept, data element concept, conceptual domain, data element, and value domain. Describes naming in a metadata registry (MDR); includes principles and rules by which naming conventions can be developed; and provides examples of naming conventions.

INCITS/ISO 11179-6:2005 [R2015], Information technology - Metadata registries (MDR) - Part 6: Registration

This standard specifies the procedure by which Administered items required in various application areas could be registered and assigned an internationally unique identifier. For each Administered item to be registered, this standard defines the type of information that is specified, the conditions that are met, and the procedure that is followed. The requirements and procedure contained herein apply to all Administered items specified in ISO/IEC 11179-3. In addition, administration records that document the common administration and identification, naming and definition details as required by, and associated with, any administered item-specific details are also governed by this standard. This standard only addresses the metadata that is used to specify all types of Administered Items. Others may want to use This standard to register and manage locally defined Administered item types that are not defined in ISO/IEC 11179-3. This standard does not address the metadata that is used to specify particular types of Administered Items such as data elements and value domains. This standard does not specify the registry’s system design, file organization techniques, storage media, programming languages, etc. to be used in its implementation.

INCITS/ISO 11319-1993 [S2016], Information Technology - 8mm Wide Magnetic Tape Cartridges for Information Interchange - Helical Scan Recording

Specifies the physical and magnetic characteristics of an 8 mm wide magnetic tape cartridge to enable interchangeability of such cartridges. It also provides a format and recording method, thus allowing, together with ISO 1001 for Magnetic Tape Labelling, full data interchange by means of such magnetic tape cartridges.

INCITS/ISO 11404-2007 [R2014], Information technology - General-Purpose Datatypes (GPD)

ISO/IEC 11404-2007 specifies the nomenclature and shared semantics for a collection of datatypes commonly occurring in programming languages and software interfaces, referred to as the General-Purpose Datatypes (GPD).

INCITS/ISO 11544-1993 [R2013], Information technology - Coded representation of picture and audio information - Progressive bi-level image compression

Defines a bit-preserving (lossless) compression method for coding image bit-planes and is particularly suitable for bi-level (two-tone, including black-white) images. Specifies requirements and test methods and gives datastream examples.
INCITS/ISO/IEC 11557:1992 [S2008],
Information Technology - 3.81 mm Wide Magnetic Tape Cartridge for Information Interchange - Helical Scan Recording - DDS-DC Format Using 60 m and 90 m Length Tapes

Specifications the physical and magnetic characteristics of a 3.81 mm-wide magnetic tape cartridge to enable interchangeability of such cartridges. It also specifies the quality of the recorded signal, the recording method and the recorded format, thereby allowing data interchange between drives by means of such magnetic tape cartridges.

INCITS/ISO/IEC 11560:1992 [R2015],
Information technology - Information interchange on 130 mm optical disk cartridges using the magneto-optical effect, for write once, read multiple functionality

This standard specifies definitions of the essential concepts, the environment in which the characteristics are to be tested, the environments in which the cartridge is to be operated and stored, the mechanical, physical and dimensional characteristics of the case and of the optical disk, the magneto-optical characteristics and the recording characteristics, so as to provide physical interchangeability between data processing systems, the format for the physical disposition of the tracks and sectors, the error correction codes, the modulation method used for recording and the quality of the recorded signals.

INCITS/ISO/IEC 11571:1998 [S2016],
Information technology - Telecommunications and Information Exchange Between Systems - Private Integrated Services Networks - Addressing

Defines the requirements for the handling of network addresses for the identification of entities which use or provide telecommunication services offered by Private Integrated Services Networks (PISNs). Covers numbering, including the requirements for the support of a Private Numbering Plan, the addressing of network service access points for open systems interconnection (OSI NSAP addressing), and the support of sub-addressing.

INCITS/ISO/IEC 11572:2000 [S2012],
Information technology - Telecommunications and information exchange between systems - Private Integrated Services Network - Circuit mode bearer services - Inter-exchange signalling procedures and protocol

This International Standard defines the signalling procedures and protocol for the purpose of circuit-switched Call Control at the Q-reference point between Private Integrated Network Exchanges (PINXs) connected together within a Private Integrated Services Network (PISN). The Q reference point is defined in ISO/IEC 11579-1. This International Standard is based upon that described in ITU-T Recommendation Q.931, including the provisions for symmetrical operation described in annex D of that recommendation.

INCITS/ISO/IEC 11574:2000 [R2014],
Information technology - Telecommunications and information exchange between systems - Private Integrated Services Network - Circuit-mode 64 kbit/s bearer services - Service description, functional capabilities and information flows

This International Standard specifies the service description and control aspects, including functional capabilities and information flows, of standardised circuit-mode bearer services which may be supported by a Private Integrated Services Network (PISN). This International Standard includes the following basic services: Circuit-mode 64 kbit/s unrestricted 8 kHz structured bearer service category; Circuit-mode 64 kbit/s 8 kHz structured bearer service category usable for speech information transfer; Circuit-mode 64 kbit/s 8 kHz structured bearer service category usable for 3.1 kHz audio information transfer.

INCITS/ISO/IEC 11576:1994 [S2008],
Information Technology - Procedure for the Registration of Algorithms for the Lossless Compression of Data

 Specifies the procedures to be followed by a Registration Authority in preparing, maintaining and publishing an International Register of numeric identifiers allocated to algorithms for the lossless compression of data, excluding cryptographic algorithms.

INCITS/ISO/IEC 11579-1:1994 [S2015],
Information technology - Telecommunications and information exchange between systems - Private integrated services network - Part 1: Reference configuration for PISN Exchanges (PINX)

This standard specifies a reference configuration (RC) for private integrated services network exchanges (PINX) for their interconnection to form private integrated services networks (PISN). The configuration is not intended to require any specific implementation of a PINX, but only to provide guidance for the specification of PINX capabilities. This RC is sufficient to support ISDN-like applications. It can be extended to also support non-ISDN-like applications. This RC describes a conceptual PINX. By combining multiple PINXs to a private integrated services network the RC becomes applicable to a PISN.

Technical Corrigendum 1 to ISO/IEC 11579-1:1994

INCITS/ISO/IEC 11581-6:1999 [S2016],
Information technology - User system interfaces and symbols - Icon symbols and functions - Part 6: Action Icons

Applies to icons that are shown on a screen, that users can manipulate and interact with, and that represent data or computer system functions. Addresses only action icons. Action icons represent actions by association with objects that prompt the user to recall the intended actions. Describes user interaction with and appearance of action icons on the screen. Other types of icons are covered in other parts of the standard, listed in the Foreword.

INCITS/ISO/IEC 11693-1:2012[2014],
Identification cards - Optical memory cards - Part 1: General characteristics

The intent of ISO/IEC 11693-1:2012 is to provide necessary information for card manufacturers, card issuers, and card users interested in interchanging information encoded on optical memory cards. ISO/IEC 11693-1:2012 serves as a guide to companies who plan to develop equipment and systems using optical memory cards. The data content and use of the cards depend upon the applications developed by each industry group.

INCITS/ISO/IEC 11694-1:2012 [2014],
Identification cards - Optical memory cards - Linear recording method - Part 1: Physical characteristics

ISO/IEC 11694-1:2012 defines the physical characteristics of optical memory cards using the linear recording method.

INCITS/ISO/IEC 11694-2:2012 [2014],
Identification cards - Optical memory cards - Linear recording method - Part 2: Dimensions and location of the accessible optical area

ISO/IEC 11694-2:2012 defines the dimensions and location of the accessible optical area of optical memory cards with ID-1 dimensions using the linear recording method.

INCITS/ISO/IEC 11694-3:2015 [2016],
Identification cards - Optical memory cards - Linear recording method - Part 3: Optical properties and characteristics

Specifies the optical properties and characteristics of optical memory cards using the linear recording method.

INCITS/ISO/IEC 11694-4:2008 [R2016],
Identification cards -- Optical memory cards -- Linear recording method -- Part 4: Logical data structures

Defines the logical data structures for optical memory cards necessary to allow compatibility and interchange between systems using the linear recording method.
INCITS/ISO/IEC 11694-5:2014 [2016],
Identification cards - Optical memory cards - Linear recording method - Part 5: Data format for information interchange for applications using ISO/IEC 11694-4

Defines the data format for optical memory cards necessary to allow compatibility and interchange between systems using the linear recording method.

INCITS/ISO/IEC 11694-6:2014 [2016],
Identification cards - Optical memory cards - Linear recording method - Part 6: Use of biometrics on an optical memory card

Describes the use of biometric data on optical memory cards using the logical data structure described in ISO/IEC 11694-5.

INCITS/ISO/IEC 11695-1:2015 [2016],
Identification cards -- Optical memory cards -- Holographic recording method -- Part 1: Physical characteristics

Defines the physical characteristics of optical memory cards using the holographic recording method.

INCITS/ISO/IEC 11695-2:2015 [2016],
Identification cards - Optical memory cards - Holographic recording method - Part 2: Dimensions and location of accessible optical area

Defines the dimensions and location of the accessible optical area of optical memory cards using the holographic recording method.

INCITS/ISO/IEC 11695-3:2008 [R2016],
Identification cards -- Optical memory cards -- Holographic recording method -- Part 3: Optical properties and characteristics

Specifies the optical properties and characteristics of optical memory cards using the holographic recording method.

INCITS/ISO/IEC 11770-1:1996 [2010],
Information technology -- Security techniques - Key management - Part 1: Framework

Defines a general model of key management that is independent of the use of any particular cryptographic algorithm. Identifies the objective of key management, basic concepts and key management services.

INCITS/ISO/IEC 11770-1:2010 [2013],
Information technology - Security techniques - Key management - Part 1:Framework

ISO/IEC 11770-1:2010 defines a general model of key management that is independent of the use of any particular cryptographic algorithm. However, certain key distribution mechanisms can depend on particular algorithm properties, for example, properties of asymmetric algorithms. ISO/IEC 11770 -1:2010 contains the material required for a basic understanding of subsequent parts. Examples of the use of key management mechanisms are included in ISO 11568. If non-repudiation is required for key management, ISO/IEC 13888 is applicable.

INCITS/ISO/IEC 11770-2:2008 [R2014],
Information technology - Security techniques - Key Management - Part 2: Mechanisms using symmetric techniques

ISO/IEC 11770 is concerned with the management of cryptographic keys. ISO/IEC 11770-2.2008 specifies a series of 13 mechanisms for establishing shared secret keys using symmetric cryptography. These mechanisms address three different environments for the establishment of shared secret keys: point-to-point key establishment schemes, mechanisms using a Key Distribution Centre (KDC), and techniques that use a Key Translation Centre (KTC). ISO/IEC 11770 -2.2008 describes the content of messages which carry keying material or are necessary to set up the conditions under which the keying material can be established.

INCITS/ISO/IEC 11770-3:2008 [R2014],
Information technology - Security techniques - Key management - Part 3: Mechanisms using asymmetric techniques

INCITS/ISO/IEC 11770-4:2008 [R2013],
Information technology - Security techniques - Key management - Part 4: Key establishment mechanisms based on weak secrets

This part of ISO/IEC 11770 defines key establishment mechanisms based on weak secrets, i.e., secrets that can be readily memorized by a human, and hence secrets that will be chosen from a relatively small set of possibilities. It specifies cryptographic techniques specifically designed to establish one or more secret keys based on a weak secret derived from a memorized password, while preventing off-line brute-force attacks associated with the weak secret.

INCITS/ISO/IEC 11770-5:2011 [2012],
Information technology -- Security techniques -- Key management -- Part 5: Group key management

ISO/IEC 11770-5:2011 specifies key establishment mechanisms for multiple entities to provide procedures for handling cryptographic keying material used in symmetric or asymmetric cryptographic algorithms according to the security policy in force.

INCITS/ISO/IEC 11889-1:2009 [R2014],
Information technology - Trusteed Platform Module - Part 1: Overview

ISO/IEC 11889 defines the Trusted Platform Module (TPM), a device that enables trust in computing platforms in general. ISO/IEC 11889-2:2009 defines the principles of TPM operation. These include base operating modes, cryptographic algorithms and key sizes for the algorithms, basic interoperability requirements, basic protocols and the use of the protocols, and use of TPM resources.

INCITS/ISO/IEC 11889-3:2009 [R2014],
Information technology - Trusteed Platform Module - Part 3: Structures

ISO/IEC 11889 defines the Trusted Platform Module (TPM), a device that enables trust in computing platforms in general. ISO/IEC 11889-3:2009 defines the structures and constants that enable the interoperability between TPM implementations.

INCITS/ISO/IEC 11889-4:2009 [R2014],
Information technology - Trusteed Platform Module - Part 4: Commands

ISO/IEC 11889 defines the Trusted Platform Module (TPM), a device that enables trust in computing platforms in general. ISO/IEC 11889-4:2009 defines the commands, actions of the commands, and the parameters to the commands that provide the TPM functionality.

INCITS/ISO/IEC 11976-2008 [R2014],
Information technology - Data interchange on 130 mm rewritable and write-once-read-many ultra density optical (UDO) disk cartridges - Capacity: 60 Gbytes per cartridge - Second generation

This International Standard specifies the mechanical, physical, and optical characteristics of a 130 mm optical disk cartridge (ODC) that employs thermo-optical Phase Change effects to enable data interchange between such disks.

INCITS/ISO/IEC 11989-2010 [2013], Information technology - iSCSI Management API

ISO/IEC 11989-2010(E) specifies an ApplicationProgramming Interface (API) that provides interfaces to discover and manage iSCSI resources on a system. This International Standard is applicable to vendors who deliver drivers that provide iSCSI resources to a system.

INCITS/ISO/IEC 12087-1:1995 [S2010],

ISO/IEC 12087 is concerned with the manipulation, processing and interchange of all types of digital images. The main purpose of this part is to define a generic, unifying imaging architecture to which other parts of ISO/IEC 12087 conform. This part of ISO/IEC 12087 also defines those “specializations” or “delineations” of the generic imaging architecture that are required to support IPI-PIKS and IPI-HIF.
INCITS/ISO/IEC 12087-2:1994 [R2014],
Information technology - Computer graphics and image processing - Image Processing and Interchange (IPI) - Functional specification - Part 2: Programmer’s imaging kernel system application programme interface

Establishes the specification of the application program interface (API), called the Programmer’s Imaging Kernel System (PIKS). PIKS is intended to provide a rich set of both low-level and high-level services on image and image-derived data objects. These services can be used as building blocks for a broad range of common imaging applications. Lists are included containing a summary of technological capabilities provided by PIKS and not provided by PIKS. It should be noted that PIKS functionality may be used as a pre-processor or co-processor for many of the technologies in the “Not provided by PIKS” list.

Technical Corrigendum 1

Facilitates the interchange of digital images. For this purpose, conceptual, architectural, and functional definitions of the Image Interchange Facility (IIF) are established. ISO/IEC 12087-3 consists of two major parts: (a) the IIF data format (IIF-DF) definition (by means of a formal syntax, described according to the Abstract Syntax Notation One (ASN.1)) - refer to clause 5), and (b) the IIF Gateway definition (by means of a manual page description of the functionality of an Application Program Interface (API) – refer to clause 7).

This is Amendment 1 to ISO/IEC 12087-3:1995 that facilitates the interchange of digital images. For this purpose, conceptual, architectural, and functional definitions of the Image Interchange Facility (IIF) are established. ISO/IEC 12087-3 consists of two major parts: (a) the IIF data format (IIF-DF) definition (by means of a formal syntax, described according to the Abstract Syntax Notation One (ASN.1)) - refer to clause 5), and (b) the IIF Gateway definition (by means of a manual page description of the functionality of an Application Program Interface (API) – refer to clause 7).

This part of ISO/IEC 12087 establishes the specification of the Basic Image Interchange Format (BIIF) part of the standard. BIIF is a standard developed to provide a foundation for interoperability in the interchange of imagery and imagery-related data among applications.

Technical Corrigendum 1

Technical Corrigendum 2

INCITS/ISO/IEC 12088-4:1995 [S2011], Information technology - Computer graphics and image processing - Image processing and interchange - Application program interface language bindings

Consists of the three parts that define the functional aspects of this part of ISO/IEC 12088. The Common Architecture of Imaging (IPI-CAI) defines the overall architecture. The Programmer’s Imaging Kernel System (PIKS) and the Image Interchange Facility (IPI-IF) each specify a language-independent image-processing Application Program Interface (API) within the Image Processing and Interchange Standard.

INCITS/ISO/IEC 12089:1997 [R2014], Information technology - Computer graphics and image processing - Encoding for the Image Interchange Facility (IIF)

This International Standard defines the encoding rules which shall apply to the representation of IPI-IF image data. The IPI-IF data format is defined in ISO/IEC 12087-3, called ‘Image Interchange Facility (IIF)’. It is Part 3 of the Image Processing and Interchange International Standard, defined in ISO/IEC 12087. The IPI-IF facilitates the interchange of digital images. It consists of two major parts: the IPI-IF data format (IIF-DF) definition, whose syntax is described using ASN.1; the IPI-IF gateway definition, whose functionality is described by an application programmers interface.

INCITS/ISO/IEC 12246:1993 [S2013], 8 mm wide magnetic tape cartridge dual azimuth format for information interchange - Helical Scan Recording

Specifies the physical and magnetic characteristics. Also specifies the quality of the recorded signals, the recorded format and the recording method, thereby allowing full data interchange by means of such magnetic tape cartridges. Is based on ISO/IEC 11319 with extensions and modifications which specify the additional features of the dual azimuth format, but is not intended to replace ISO/IEC 11319.

INCITS/ISO/IEC 12248:1993 [S2013], 3.81 mm wide magnetic tape cartridge for information interchange - Helical scan recording - DATA/DAT-DC format using 60m and 90 m length tapes

Specifies the physical and magnetic characteristics. Also specifies the quality of the recorded signals, the recorded format and the recording method, thereby allowing data interchange between drives by means of such magnetic tape cartridges. Specifies two types of cartridges referred to as type A (magnetic tape of nominal thickness of 13 micrometer and a nominal length of up to 60.5 m) and type B (magnetic tape of a nominal thickness of 9 micrometer and a nominal length of up to 92.0 m).

INCITS/ISO/IEC 12862-2011 [2014], Information technology - 120 mm (8,54 Gbytes per side) and 80 mm (2,66 Gbytes per side) DVD recordable disk for dual layer (DVD-R for DL)

ISO/IEC 12862:2011 specifies the mechanical, physical and optical characteristics of a 120 mm and an 80 mm dual layer DVD recordable disk to enable the interchange of such disks. It specifies the quality of the pre-recorded, unrecorded and recorded signals, the format of the data, the format of the information zone, the format of the unrecorded zone, and the recording method, thereby allowing for information interchange by means of such disks. This disk is identified as a DVD recordable disk for dual layer (DVD-R for DL).

INCITS/ISO/IEC 13187-2011 [2013], Information technology - Server management command line protocol (SM CLP) specification

This International Standard lays out the general framework for the Server Management Command Line Protocol (SM CLP). This standard is intended to guide developers of implementations of the SM CLP and may also be used as a reference by system administrators and other users of SM CLP implementations.

INCITS/ISO/IEC 13211-1-1995 [R2012], Information Technology - Prolog Language Part 1: General Core

ISO/IEC 13211 is designed to promote the applicability and portability of Prolog text and data among a variety of data processing systems.
Designed to promote the applicability and portability of Prolog modules that contain Prolog text complying with the requirements of the Programming Language Prolog as specified in this part of ISO/IEC 13211.

The scope of this standard is: an enterprise spec. for the trading function; an information spec. for the trading function; a computational spec. for traders; conformance requirements in terms of conformance points.

This part of the standard describes how the ODP trading Function can be realised using information entries and support mechanisms of the OSI Directory.

This International Standard, known as the Interchange Standard for Multimedia Interactive Documents or ISMID, facilitates the interchange of Multimedia Interactive Documents (MIDs) among heterogeneous interactive document development and delivery systems by providing the architecture from which common interchange languages can be created. ISMID is a client architecture of International Standard ISO/IEC 10744:1997, Information technology – Hypermedia/Time-based Structuring Language (HyTime) and is an SGML application conforming to International Standard ISO 8879 -- Standard Generalized Markup Language.

This International Standard, known as the Interchange Standard for Multimedia Interactive Documents or ISMID, facilitates the interchange of Multimedia Interactive Documents (MIDs) among heterogeneous interactive document development and delivery systems by providing the architecture from which common interchange languages can be created. ISMID is a client architecture of International Standard ISO/IEC 10744:1997, Information technology – Hypermedia/Time-based Structuring Language (HyTime) and is an SGML application conforming to International Standard ISO 8879 -- Standard Generalized Markup Language.

ISO/IEC 13249 defines a number of packages of generic data types common to various kinds of data used in multimedia and application areas, to enable that data to be stored and manipulated in an SQL database. The package in each subject area is defined as a part of ISO/IEC 13249. ISO/IEC 13249-1:2007 defines those concepts, notations and conventions that are common to two or more other parts of ISO/IEC 13249. In particular, it describes the way ISO/IEC 9075 is used in other parts of ISO/IEC 13249 to define the user-defined types and their behaviour appropriate to each subject area.

Introduces the Full-Text part of ISO/IEC 13249 (all parts); gives the references necessary for this part of ISO/IEC 13249; defines notations and conventions specific to this part of ISO/IEC 13249; defines concepts specific to this part of ISO/IEC 13249; and defines the full-text user-defined types and their associated routines.

ISO/IEC 13249-3:2011 defines spatial user-defined types, routines and schemas for generic spatial data handling. It addresses the need to store, manage and retrieve information based on aspects of spatial data such as geometry, location and topology.

INCITS/ISO/IEC 13249-5:2003 [S2016], Information technology -- Database languages -- SQL multimedia and application packages -- Part 5: Still image
Introduces the still image part of ISO/IEC 13249 (all parts); gives the references necessary for this part of ISO/IEC 13249; defines notations and conventions specific to this part of ISO/IEC 13249; defines concepts specific to this part of ISO/IEC 13249; and defines the still image user-defined types and their associated routines.

INCITS/ISO/IEC 13249-6:2006 [R2012], Information technology - Database languages - SQL - Multimedia and Application Packages - Part 6: Data Mining (2nd ed.)
ISO/IEC 13249 defines a number of packages of generic data types common to various kinds of data used in multimedia and application areas, to enable that data to be stored and manipulated in an SQL database. ISO/IEC 13249-6:2006 introduces the data-mining package, gives the necessary references, defines notations and conventions specific to ISO/IEC 13249-6:2006, defines concepts specific to ISO/IEC 13249-6:2006, and defines data mining user-defined types and their associated routines.

INCITS/ISO/IEC 13250-2:2006 [R2014], Information Technology - Topic Maps - Data Model
ISO/IEC 13250-2:2006 specifies the Topic Maps data model. It defines the abstract structure and interpretation of topic maps, the rules for merging topic maps and a set of fundamental subject identifiers. The purpose of the data model is to define the interpretation of the Topic Maps interchange syntax, and to serve as a foundation for the definition of supporting standards for canonicalization, querying, constraints, etc.

ISO/IEC 13250:2003 (2nd edition) specifies two syntaxes for the interchange of Topic Maps. One of these syntaxes is based on the ISO/IEC 10744:1997 (HyTime) meta-DTD (Meta Document Type Definition), and it is itself specified as a meta-DTD. The other, called XTM (XML Topic Maps), is specified as an Extensible Markup Language (XML) DTD.

ISO/IEC 13250:3-2013 defines an XML-based interchange syntax for Topic Maps, which can be used to interchange instances of the data model defined in ISO/IEC 13250-2. It also defines a mapping from the interchange syntax to the data model. The syntax is defined with a RELAX-NG schema, and more precision is provided through the mapping to the data model, which effectively also defines the interpretation of the syntax.

ISO/IEC 13250-4:2009 defines a format known as Canonical XTM, or CXTM for short. The format is an XML format, and has the property that it guarantees that two equivalent Topic Maps Data Model instances (ISO/IEC 13250-2) will always produce byte-by-byte identical serializations, and that non-equivalent instances will always produce different serializations. CXTM thus enables direct comparison of two topic maps to determine equality by comparison of their canonical serializations.

ISO/IEC 13250-6:2010 defines a text-based notation for representing instances of the data model defined in ISO/IEC 13250-2. It also defines a mapping from this notation to the data model. The syntax is defined through an Extended Backus-Naur Form (EBNF) grammar.
INCITS/ISO/IEC 13403:1995 [S2009],
Information Technology - Information Interchange on 300 mm Optical Disk Cartridges of the Write Once, Read Multiple (WORM) Type Using the CCS Method

Specifies the characteristics of 300 mm optical disk cartridges (ODC) of the WORM type providing for embossed information and for data to be written once and read multiple times.

INCITS/ISO/IEC 13422:1994 [S2008],
Information Technology - Data Interchange on 90 mm Flexible Disk Cartridges on 10 Mbyte Capacity Using Sector Servo Tracking - ISO Type 304

Specifies the characteristics of 90 mm Flexible Disk Cartridges of 10 Mbyte formatted capacity, recorded at 33 157 fprad using modified frequency modulation recording and sector servo tracking on 255 data tracks on each side.

INCITS/ISO/IEC 13481:1993 [S2009],
Information Technology - Data Interchange on 130 mm Optical Disk Cartridges - Capacity: 1 Gigabyte Per Cartridge

Specifies two implementations: Type R/W (data to be written, read and erased many times) and type WO (having write once, read multiple functionality). Specifies the conditions for conformance testing and the reference drive; the environments in which the cartridges are to be operated and stored; the mechanical, physical and dimensional characteristics of the case and of the cartridge; the format of the information on the disk; the characteristics of the embossed information on the disk; the magneto-optical characteristics of the disk; the minimum quality of user-written data on the disk.

INCITS/ISO/IEC 13549:1993 [S2009],
Information Technology - Data Interchange on 130 mm Optical Disk Cartridges - Capacity: 1,3 Gigabytes Per Cartridge

This International Standard specifies the conditions for conformance testing; the environments in which the cartridges are to be operated and stored; the mechanical, physical and dimensional characteristics of the case and of the cartridges, so as to provide mechanical interchangeability between the data processing systems; the format of the information on the disk, both embossed and user-written, including the physical disposition of the tracks and sectors, the error correction codes, and the modulation method used.

INCITS/ISO/IEC 13568-2002 [R2012],
Information technology - Z formal specification notation - Syntax, type system and semantics

The following are within the scope of this International Standard: the syntax of the Z notation; the type system of the Z notation; the semantics of the Z notation; a toolkit of widely used mathematical operators; L A T E X [10] and e-mail mark-up of the Z notation.

INCITS/ISO/IEC 13614:1995 [S2009],
Information technology - Interchange on 300 mm optical disk cartridges of the write once, read multiple (WORM) type using the SSF method

This International Standard specifies the characteristics of 300 mm optical disk cartridges (ODC) of the WORM type providing for embossed information and for data to be written once and read multiple times. Together with the standard for Volume and File Structure, this International Standard provides for full data interchange between data processing systems. Interchange involves the ability to write and read data without introducing any error.

INCITS/ISO/IEC 13660-2001 [R2012],
Information technology - Office equipment - Measurement of image quality attributes for hardcopy output - Binary monochrome text and graphic images

This International Standard specifies device-independent image quality attributes, measurement methods, and analytical procedures to describe the quality of output images from hardcopy devices. This International Standard is applicable to human-readable documents composed of binary monochrome images produced from impact printers, non-impact printers, and copiers.

INCITS/ISO/IEC 13673:2000 [R2015],
Information technology - Document processing and related communication - Conformance testing for Standard Generalized Markup Language (SGML) systems

This standard addresses the construction and use of test suites for verifying conformance of SGML systems. Its provisions assist those who build test suites, those who build SGML systems to be evaluated by such suites, and those who examine an SGML system's performance on a test suite as part of the process of selecting an SGML tool. This standard includes criteria for the organization of test suites, including naming conventions, documentation conventions, and specification of applicable concrete syntaxes and features. This standard applies to the testing only of aspects of SGML implementation and usage for which objective conformance criteria are defined in ISO 8879.

INCITS/ISO/IEC 13714:1995 [S2011],
Information Technology - User Interface to Telephone-based Services: Voice Messaging Applications

Provides users of voice messaging systems with a consistent mode of interaction in a way that is independent of the underlying system implementations. The interface is based on a set of design guidelines that are annexed to this standard.

INCITS/ISO/IEC 13817-1:1996 [S2012],
Information technology - Programming languages, their environments and system software interfaces - Vienna Development Method - Specification Language - Part 1: Base language

This part of ISO/IEC 13817 specifies the model based specification language VDM-SL (Vienna Development Method - Specification Language).

INCITS/ISO/IEC 13818-1:2013 [2014], Information technology - Generic coding of moving pictures and associated audio information: Systems ISO/IEC 13818-1:2013 specifies the system layer of the coding. It was developed principally to support the combination of the video and audio coding methods defined in ISO/IEC 13818-2 and ISO/IEC 13818-3. The system layer supports six basic functions: the synchronization of multiple compressed streams on decoding; the interleaving of multiple compressed streams into a single stream; the initialization of buffering for decoding start up; continuous buffer management; time identification; multiplexing and signalling of various components in a system stream.

This part of ISO/IEC 138 18 defines compliance to Data Storage Media Command and Control (DSMCC) standard in 2 steps: the static review and the dynamic review as defined in ISO/IEC 9646 Conformance Testing standard f 1, 2, 31. The static review requirements are specified in clause 4 of this part of ISO/IEC 13818 in the form of Protocol Implementation Conformance Statement (PICS) proforma. The ATs used for dynamic review is described in clause 5.

This Recommendation | International Standard specifies the coded representation of picture information for digital storage media and digital video communication and specifies the decoding process. The representation supports constant bit rate transmission, variable bit rate transmission, random access, channel hopping, scalable decoding, bitstream editing, as well as special functions such as fast forward playback, fast reverse playback, slow motion, pause and still pictures. This Recommendation | International Standard is forward compatible with ISO/IEC 11172-2 and upward or downward compatible with EDTV, HDTV, SDTV formats.

This part of ISO/IEC 13818 specifies the extension of ISO/IEC 11172-3 to lower sampling frequencies, the encoded representation of multichannel and multilingual high quality audio for broadcasting, transmission and storage media, and the method for decoding of multichannel and multilingual high quality audio signals. The input of the encoder and the output of the decoder are compatible with existing PCM standards.

INCITS/ISO/IEC 13818-4:2004 [R2014], Information technology - Generic coding of moving pictures and associated audio information - Part 4: Conformance testing

This part of ISO/IEC 13818 specifies how tests can be designed to verify whether bitstreams and decoders meet requirements specified in parts 1, 2, 3 and 7 of ISO/IEC 13818. In this part of ISO/IEC 13818, encoders are not addressed specifically. An encoder may be said to be an ISO/IEC 13818 encoder if it generates bitstreams compliant with the syntactic and semantic bitstream requirements specified in parts 1, 2, 3 and 7 of ISO/IEC 13818.

INCITS/ISO/IEC 13818-4:2004/AM3:2009 [R2016], Information technology -- Generic coding of moving pictures and associated audio information -- Part 4: Conformance testing - Amendment 3: Level for 1080@50p/60p conformance testing

INCITS/ISO/IEC 13818-6-1998 [R2012], Information technology - Generic coding of moving pictures and associated audio information - Part 6: Extensions for DSM-CC

The concepts and protocols of this part of ISO/IEC 13818 (DSM-CC) provide the general capability to browse, select, download, and control a variety of bit stream types. DSM-CC also provides a mechanism to manage network and application resources through the concept of a Session, an associated collection of resources required to deliver a Service. The Session complements a 'Service Domain', a collection of interfaces to browse and select services, and control the delivery of bit streams.

INCITS/ISO/IEC 13818-6-1998/AM2:2000 [R2014], Information technology - Generic coding coding of moving pictures and associated audio information - Part 6: Extensions for DSM-CC AM2: Additions to support synchronized download services, opportunistic data services and resource announcement in broadcast and interactive services

INCITS/ISO/IEC 13818-7-2006 [R2014], Information technology - Generic coding of moving pictures and associated audio information - Part 7: Advanced Audio Coding (AAC)

This International Standard describes the MPEG-2 audio non-backwards compatible standard called MPEG-2 Advanced Audio Coding, AAC [1], a higher quality multichannel standard than achievable while requiring MPEG-1 backwards compatibility. This MPEG-2 AAC audio standard allows for ITU-R 'indistinguishable' quality according to [2] at data rates of 320 kbit/s for five full-bandwidth channel audio signals. The AAC decoding process makes use of a number of required tools and a number of optional tools. Table 1 lists the tools and their status as required or optional. Required tools are mandatory in any possible profile. Optional tools may not be required in some profiles.

Amendment 1 to ISO/IEC 13818-7:2006.

This part of ISO/IEC 13818 does not change or supersede any of the requirements in ISO/IEC 13818. All Transport Streams, whether or not they are delivered in accordance with the RTI shall comply with ISO/IEC 13818-1. In particular, the accuracy requirement in ISO/IEC 13818 for PCRs in Transport Streams is not changed by the requirements of this part of ISO/IEC 13818. Compliance with this part of ISO/IEC 13818 is not required for compliance with ISO/IEC 13818-1.

INCITS/ISO/IEC 13842:1995 [S2011], Information Technology - 130 mm optical disk cartridges for information interchange - Capacity: 2 Gbytes per cartridge

Specifies (a) the conditions for conformance testing and the Reference Drive; (b) the environments in which the cartridges are to be operated and stored; (c) the mechanical, physical and dimensional characteristics of the cartridge

This part of ISO/IEC 13888 serves as a general model for subsequent parts specifying non-repudiation mechanisms using cryptographic techniques. ISO/IEC 13888 provides non-repudiation mechanisms for the following phases of non-repudiation: &##9135; evidence generation; &##9135; evidence transfer, storage and retrieval; and &##9135; evidence verification. Dispute arbitration is outside the scope of ISO/IEC 13888.
The goal of the non-repudiation service is to generate, collect, maintain, make available and validate evidence concerning a claimed event or action in order to resolve disputes about the occurrence or non-occurrence of the event or action. ISO/IEC 13888-2:2010 provides descriptions of generic structures that can be used for non-repudiation services, and of some specific communication-related mechanisms which can be used to provide non-repudiation of origin (NRO) and non-repudiation of delivery (NRD).

INCITS/ISO/IEC 13888-3:2009 [R2015],
Information technology - Security techniques - Non-repudiation - Part 3: Mechanisms using asymmetric techniques
This standard specifies mechanisms for the provision of specific, communication related, non-repudiation services using asymmetric cryptographic techniques.

INCITS/ISO/IEC 13923:1996 [S2020],
Information Technology - 3.81 mm Wide Magnetic Tape Cartridge for Information Interchange - Helical Scan Recording - DDS-2 Format Using 120 m Length Tape (formerly ISO/IEC 13923:1997)
This International Standard specifies the physical and magnetic characteristics of a 3.81 mm wide magnetic tape cartridge to enable physical interchangeability of such cartridges between drives.

INCITS/ISO/IEC 13963:1995 [S2009],
Information technology - Data Interchange on 90 mm Optical Disk Cartridges - Capacity: 230 Megabytes Per Cartridge
Specifies the characteristics of 90 mm Optical Disk Cartridges (ODC) with a capacity of 230 Mbytes per cartridge. Specifies three related, but different implementations of such cartridges: Type R/W, type P-ROM and type O-ROM. Provides for interchange between optical disk drives. Together with a standard for volume and file structure, it provides for full data interchange between data processing systems.

INCITS/ISO/IEC 14165-133:2010 [R2016],
Information technology -- Fibre Channel -- Part 133: Switch Fabric-3 (FC-SW-3)
This standard describes the operation and interaction of Fibre Channel Switches and includes: a) EPort Operation and Fabric Configuration; b) Path selection (FSPF and FSPF-Backbone); c) Bridge Port (BPort) Operation; d) distributed server interaction and communication; e) exchange of information between Switches to support zoning; f) distribution of Event Notifications between Switches.

Information technology -- Fibre Channel -- Part 321: Audio-Video (FC-AV)
Specifies the transport of digital Audio and Video formats over Fibre Channel. Specifications are included for a coherent framework (i.e., an FC-AV Container and Objects) for mapping current and future digital Audio and Video formats to Fibre Channel; mapping the formats defined by the ITU-R BT-601 and SMPTE family of standards to Fibre Channel; mapping the formats defined by the ISO/IEC 3818 family of standards (which include MPEG and related compression systems) to Fibre Channel; a profile (i.e., Simple Parametric Digital Video) that parametrically defines the characteristics of Audio and Video information for specific applications; and, data packing guidelines recommended for AV data within the Fibre Channel transmission words.

INCITS/ISO/IEC 14165-331:2007 [R2016],
Information technology -- Fibre Channel -- Part 331: Virtual Interface (FC-VI)
This standard defines the Fibre Channel mapping protocol for the Virtual Interface (VI) Architecture (FC-VI). FC-VI defines the Fibre Channel Information Units in accordance with the VI Architecture model. FC-VI additionally defines how Fibre Channel services are used to perform the services required by the VI Architecture model of its network transport.

INCITS/ISO/IEC 14165-414-2007 [R2012],
Information technology - Fibre Channel Generic Services-4 (FC-GS-4)
FC-GS-4 describes in detail the basic Fibre Channel services introduced in FC-FS. The Fibre Channel services described in this document are &amp;#8226; Directory Service, &amp;#8226; Management Service and &amp;#8226; Alias Service. In addition to the aforementioned Fibre Channel services, the Common Transport (CT) protocol is described. The Common Transport service provides a common FC-4 for use by the Fibre Channel services.

INCITS/ISO/IEC 14169-1995 [S2012],
Information Technology - 90 mm Flexible Disk Cartridges for Information Interchange - 21 Mbytes Formatted Capacity - ISO Type 305
Specifies the characteristics of 90 mm flexible disk cartridges (FDC) of 21 Mbytes formatted capacity recorded on 31 831 fjppardm in the Inner Zone and 47 747 fjppardm in the Outer Zone with sector servo tracking on 326 data tracks on each side, using 2-7 RLL recording.

INCITS/ISO/IEC 14417:1999 [R2014],
Information technology - Data recording format DD-1 for magnetic tape cassette conforming to IEC 1016
This International Standard specifies the media characteristics, the recorded tape format and file structure requirements to enable information interchange between information processing systems using 19.0 mm wide magnetic tape and cassette conforming to IEC 61016 Section 2.

INCITS/ISO/IEC 14443-1:2008 [R2015],
Identification cards - Contactless integrated circuit cards - Proximity cards - Part 1: Physical characteristics
Defines the physical characteristics of proximity cards (PICCs). It is to be used in conjunction with other parts of ISO/IEC 14443.

INCITS/ISO/IEC 14443-2:2016 [R2016],
Identification cards -- Contactless integrated circuit cards -- Proximity cards -- Part 2: Radio frequency power and signal interface
Specifies the characteristics of the fields to be provided for power and bi-directional communication between proximity coupling devices (PCDs) and proximity cards or objects (PICCs). It does not specify the means of generating coupling fields, nor the means of compliance with electromagnetic radiation and human exposure regulations, which can vary according to country.

INCITS/ISO/IEC 14443-3:2016 [R2016],
Identification cards -- Contactless integrated circuit cards -- Proximity cards -- Part 3: Initialization and anticollision
Describes the polling for proximity cards or objects (PICCs) entering the field of a proximity coupling device (PCD); the byte format, the frames and timing used during the initial phase of communication between PCDs and PICCs; the initial Request and Answer to Request command content; methods to detect and communicate with one PICC among several PICCs (anticollision); other parameters required to initialize communications between a PICC and PCD; optional means to ease and speed up the selection of one PICC among several PICCs based on application criteria; optional capability to allow a device to alternate between the functions of a PICC and a PCD to communicate with a PCD or a PICC, respectively. A device which implements this capability is called a PXD.

INCITS/ISO/IEC 14443-4:2016 [R2016],
Identification cards - Contactless integrated circuit cards - Proximity cards - Part 4: Transmission protocol
Specifies a half-duplex block transmission protocol featuring the special needs of a contactless environment and defines the activation and deactivation sequence of the protocol. It is intended to be used in conjunction with other parts of ISO/IEC 14443 and is applicable to proximity cards or objects of Type A and Type B.

INCITS/ISO/IEC 14473-1999 [R2013],
Information technology - Office Equipment - Minimum Information to be specified for image scanners
This International Standard is intended to facilitate user selection of an image scanner. This International Standard specifies the minimum information that shall be included by manufacturers in their specification sheets for scanners.
INCITS/ISO/IEC 14478-1:1998 [S2009],
Information Technology - Computer Graphics and Image Processing - Presentation Environment for Multimedia Objects (PREMO) - Part 1: Fundamentals of PREMO

Defines a flexible environment to encompass modular functionality and is extensible through the creation of future components, both within and outside of standards committees. It supports a wide range of multimedia applications in a consistent way, from simple drawings up to full motion video, sound and virtual reality environments.

Information Technology - Computer Graphics and Image Processing - Presentation Environment for Multimedia Objects (PREMO) - Part 2 - Foundation Component

Lists an initial set of object types and non-object types useful for the construction of, presentation of, and interaction with multimedia information. Dependent on the PREMO object model defined in clause 8 of ISO/IEC 14478-1. The foundation component does not depend on any other components.

INCITS/ISO/IEC 14478-3:1998 [S2009],
Information Technology - Computer Graphics and Image Processing - Presentation Environment for Multimedia Objects (PREMO) - Part 3 - Multimedia Systems Services

This Part of ISO/IEC 14478 defines a standard set of multimedia system services that can be used by multimedia application developers in a variety of computing environments. The focus is on enabling multimedia applications in a heterogeneous, distributed computing environment. Throughout this document this Part of ISO/IEC 14478 will also be referred to as "Multimedia System Services", and abbreviated as MSS.

INCITS/ISO/IEC 14478-4:1998 [S2009],
Information Technology - Computer Graphics and Image Processing - Presentation Environment for Multimedia Objects (PREMO) - Part 4 - Modelling, Rendering and Interaction Component

Describes a set of object types and non-object types to provide the construction of, presentation of, and the interaction with multimedia information. The multimedia information can be graphics, video, audio, or other types of presentable media. This information can be enhanced by time aspects.

INCITS/ISO/IEC 14492:2001 [R2012],
Information technology - Lossy/lossless coding of bi-level images

This Recommendation | International Standard defines methods for coding bi-level images and sets of images (documents consisting of multiple pages). It is particularly suitable for bi-level images consisting of text and dithered (halftone) data.

Information technology - Lossy/lossless coding of bi-level images - Amendment 1: Encoder

Information technology - Lossy/lossless coding of bi-level images - Amendment 2: Extension of adaptive templates for halftone coding

INCITS/ISO/IEC 14495-1:2000 [R2016],
Information technology - Lossless and near-lossless compression of continuous-tone still images: Baseline

Defines a set of lossless (bit-preserving) and nearly lossless (where the error for each reconstructed sample is bounded by a predefined value) compression methods for coding continuous-tone, gray-scale, or color digital still images. This standard specifies a process for converting source image data to compressed image data; specifies processes for converting compressed image data to reconstructed image data; specifies coded representations for compressed image data; and provides guidance on how to implement these processes in practice.

INCITS/ISO/IEC 14495-2-2003 [R2013],
Information technology - Lossless and near-lossless compression of continuous-tone still images: Extensions

ISO/IEC 14495-2:2003 defines a set of lossless (bit-preserving) and nearly lossless (where the error for each reconstructed sample is bounded by a predefined value) compression methods for coding continuous-tone (including bi-level), gray-scale, or colour digital still images.

INCITS/ISO/IEC 14496-1:2010 [2012],
Information technology - Coding of - Coding of audio-visual objects - Part 1: Systems

This part of ISO/IEC 14496 specifies system level functionalities for the communication of interactive audiovisual scenes, i.e. the coded representation of information related to the management of data streams (synchronization, identification, description and association of stream content).

INCITS/ISO/IEC 14496-10:2014 [2015],
Information technology - Coding of audio-visual objects - Part 10: Advanced Video Coding

This Part of ISO/IEC 14496 specifies advanced video coding for coding of audio-visual objects.

INCITS/ISO/IEC 14496-11:2005 [R2014],
Information technology - Coding of audio-visual objects - Part 11: Scene description and application engine

This part of ISO/IEC 14496 specifies: 1. the coded representation of the spatio-temporal positioning of audio-visual objects as well as their behavior in response to interaction (scene description); 2. the Extensible MPEG-4 Textual (XMT) format, a textual representation of the multimedia content described in ISO/IEC 14496 using the Extensible Markup Language (XML); and 3. a system level description of an application engine (format, delivery, lifecycle, and behavior of downloadable Java byte code applications).

This part of ISO/IEC 14496 specifies the ISO base media file format, which is a general format forming the basis for a number of other more specific file formats. This format contains the timing, structure, and media information for timed sequences of media data, such as audio-visual presentations. This part of ISO/IEC 14496 is applicable to MPEG-4, but its technical content is identical to that of ISO/IEC 15444-12, which is applicable to JPEG 2000.

Information technology - Coding of audio-visual objects - Part 13: Intellectual Property Management and Protection (IPMP) extensions

The definition, as well as Extension tags, syntax and semantics for an IPMP_Data_BaseClass to support the following functionalities: Mutual Authentication for IPMP tool to IPMP tool as well as IPMP tool to Terminal communication. The requesting by IPMP tools of the connection/disconnection to requested IPMP tools. The notification to IPMP tools of the connection/disconnection of IPMP tools. Common IPMP processing. IPMP tool to/from User interaction.

INCITS/ISO/IEC 14496-14-2003 [R2013],
Information technology - Coding of audio-visual objects - Part 14: MP4 file format

ISO/IEC 14496-14:2003 specifies the MP4 file format as derived from ISO/IEC 14496-12 and ISO/IEC 15444-12, the ISO base media file format. It revises and completely replaces Clause 13 of ISO/IEC 14496-1, in which the file format was previously specified.

ISO/IEC 14496-15:2014 specifies the storage format for streams of video that is structured as Network Abstraction Layer (NAL) Units, such as Advanced Video Coding, AVC (ISO/IEC 14496-10) and High Efficiency Video Coding, HEVC (ISO/IEC 23008-2) video streams.

INCITS/ISO/IEC 14496-16:2011 [2014], Information technology -- Coding of audio-visual objects -- Part 16: Animation Framework eXtension (AFX)

ISO/IEC 14496-16:2011 specifies MPEG-4 Animation Framework eXtension (AFX) model for representing and encoding 3D graphics assets to be used standalone or integrated in interactive multimedia presentations (the latter when combined with other parts of MPEG-4). Within this model, MPEG-4 is extended with higher-level synthetic objects for geometry, texture, and animation as well as dedicated compressed representations.

INCITS/ISO/IEC 14496-17:2006 [2014], Information technology -- Coding of audio-visual objects -- Part 17: Streaming text format

ISO/IEC 14496-17:2006 was developed in response to the need for a generic method for coding of text at very low bit rate as one of the multimedia components within an audiovisual presentation. ISO/IEC 14496-17:2006 allows for example subtitles and Karaoke song texts to be coded and transported as separate text streams at bitrates that are sufficiently low for use in mobile services over IP. Target applications are in particular found in areas with severe transmission bandwidth constraints, such as mobile services over IP.

This part of ISO/IEC 14496 specifies functionalities for the communication of font data as part of the MPEG-4 encoded audio-visual presentation. More specifically, it defines: 1. Font format representation that is utilized for font data encoding (OpenType); 2. Font compression technology for TrueType and OpenType fonts with TrueType outlines; and 3. The coded representation of information in font data streams.

This part of ISO/IEC 14496 specifies functionalities for the transmission of Synthesized Texture data as part of the MPEG-4 encoded audio-visual presentation. More specifically, it defines: 1. The synthesized texture format representation that is utilized for Synthesized Texture data encoding 2. The coded representation of Synthesized Texture data streams.

This part of ISO/IEC 14496 specifies the coded representation of picture information in the form of natural or synthetic visual objects like video sequences of rectangular or arbitrarily shaped pictures, moving 2D meshes, animated 3D face and body models and texture for synthetic objects. The coded representation allows for content based access for digital storage media, digital video communication and other applications. ISO/IEC 14496 specifies also the decoding process of the aforementioned coded representation.

INCITS/ISO/IEC 14496-20:2008M1:2009 [R2016], Information technology -- Coding of audio-visual objects -- Part 20: Lightweight Application Scene Representation (LÆSER) and Simple Aggregation Format (SAF) AMENDMENT 1: Extensions to support SVG1.2

FC-Pi-4 does not replace FC-Pi-2 but is intended to carry forward the technical requirements specified in FC-Pi-2 for the variants addressed in FC-Pi-4.

This International Standard specifies MPEG-J Graphics Framework eXtension (GFX). This extension enables Java-based applications to control the rendering and composition of synthetic and natural media in a programmatic manner.

This part of ISO/IEC 14496 specifies the Open Font Format (OFF) specification, the TrueType® and Compact Font Format (CFF) outline formats, and the TrueType® hinting language. Many references to both TrueType® and PostScript® exist throughout this document, as Open Font Format fonts combine the two technologies.

This International Standard defines the Symbolic Music Representation technology. By capitalising the Symbolic Music Representation technology the acronym ‘SMR’ has been derived. A symbolic representation of music is a logical structure based on symbolic elements representing audiovisual events, the relationship between those events, and aspects related to how those events can be rendered and synchronized with other media types.

This part of ISO/IEC 14496 (MPEG-4 Audio) is a new kind of audio standard that integrates many different types of audio coding: natural sound with synthetic sound, low bitrate delivery with high-quality delivery, speech with music, complex soundtracks with simple ones, and traditional content with interactive and virtual-reality content. By standardizing individually sophisticated coding tools as well as a novel, flexible framework for audio synchronization, mixing, and downloaded post-production, the developers of the MPEG-4 Audio standard have created new technology for a new, interactive world of digital audio.
INCITS/ISO/IEC 14496-4:2004 [R2016],
Information technology -- Coding of audio-visual objects -- Part 4: Conformance testing
Specifies how tests can be designed to verify whether bitstreams and decoders meet requirements specified in parts 1, 2, and 3 of ISO/IEC 14496 and, for part 6 of ISO/IEC 14496, it specifies how tests can be designed for bitstream delivery over various delivery technologies in an interoperable transparent manner to parts 1, 2, and 3. In this part of ISO/IEC 14496, encoders are not addressed specifically. An encoder may be said to be an ISO/IEC 14496 encoder if it generates bitstreams compliant with the syntactic and semantic bitstream requirements specified in parts 1, 2, 3, 6 of ISO/IEC 14496.

INCITS/ISO/IEC 14496-4:2004/AM 26:2008 [R2014], Information technology -- Coding of audio-visual objects -- Part 4: Conformance testing -- Amendment 26: Conformance levels and bitstreams for Open Font Format

Specifies the Delivery Layer of ISO/IEC 14496, which allows applications to transparently access and view multimedia streams whether the source of the streams is located on an interactive remote end system, the streams are available on broadcast media or they are on storage media.

INCITS/ISO/IEC 14517:1996 [S2012], Information technology - 130 mm optical disk cartridges for information interchange - Capacity: 2.6 Gbytes per cartridge

Defines a series of related 130 mm optical disk cartridges (ODCs). Gives the conditions for conformance testing and the Reference Drive, mechanical, physical and dimensional characteristics, the format of the information, the magneto-optical characteristics and the minimum quality of user-written data.

- A reference comparison method. This method is applicable to two character strings to determine their collating order in a sorted list. The method can be applied to strings containing characters from the full repertoire of ISO/IEC 10646. This method is also applicable to subsets of that repertoire, such as those of the different ISO/IEC 8-bit standard character sets, or any other character set, standardized or not, to produce ordering results valid (after tailoring) for a given set of languages for each script. This method uses collation tables derived either from the Common Template Table defined in ISO/IEC 14651:2011 or from one of its tailoring.

This is the first amendment to ISO/IEC 14651:2012 that defines the following. A reference comparison method. This method is applicable to two character strings to determine their collating order in a sorted list.

ISO/IEC 14662:2010 specifies the framework for coordinating the integration of existing International Standards and the development of future International Standards for the inter-working of Open-edi Parties via Open-edi and provides a reference for those International Standards. As such it serves to guide the work necessary to accomplish Open-edi by providing the context to be used by developers of International Standards to ensure the coherence and integration of related standardized modelling and descriptive techniques, services, service interfaces, and protocols.

INCITS/ISO/IEC 14750:1999 [R2016], Information Technology - Open Distributed Processing - Interface Definition Language
Provides the ODP Reference Model (see ITU-T Rec. X.902 | ISO/IEC 10746-2 and ITU-T Rec. X.903 | ISO/IEC 10746-3) with a language and environment neutral notation to describe computational operation interface signatures. Use of this notation does not imply use of specific supporting mechanisms and protocols.

INCITS/ISO/IEC 14750:1999 [R2016], Information Technology - Open Distributed Processing - Protocol Support for Computational Interactions
Defines how interactions between computational objects in a computational specification of a system relate to protocol support for those interactions in an engineering specification of that system.
INCITS/ISO/IEC 14753:1999 [R2016],
Information Technology - Open Distributed Processing - Interface References and Binding
Interface references are crucial to interworking between ODP systems and federation of groups of ODP systems. An interface reference embodies the information needed to establish bindings, including binding to objects at nodes that support several different communication protocols and binding to objects in different management domains.

INCITS/ISO/IEC 14760:1997 [R2015],
Information Technology - Data interchange on 90 mm overwritable and read only optical disk cartridges using phase change - Capacity: 1,3 Gbytes per cartridge
This Standard specifies the characteristics of 90 mm Optical Disk Cartridges (ODCs) using the phase change technology, with a capacity of 1,3 Gbytes per cartridge. It specifies three related Types of such cartridges.

INCITS/ISO/IEC 14769:2001 [R2016],
Information Technology - Open Distributed Processing - Type Repository Function
Defines a framework for describing types of interest in ODP systems by determining what entities need to be typed and what needs to be said about the identified types.

INCITS/ISO/IEC 14771:1999 [R2016],
Information Technology - Open Distributed Processing - Naming Framework
Defines a general framework for context-relative naming, refining and elaborating on the naming concepts defined in Part 2 of the ODP-RM; identifies and characterizes functions necessary to handle names in the context of a federation of different naming systems; and clarifies the relationship between the concepts of name management (i.e. federation and naming) in distributed computing systems.

INCITS/ISO/IEC 14772-1:1997 [R2015],
Information technology - Computer graphics and image processing - The Virtual Reality Modeling Language - Part 1: Functional specification and UTF-8 encoding
This standard, the Virtual Reality Modeling Language (VRML), defines a file format that integrates 3D graphics and multimedia. Conceptually, each VRML file is a 3D time-based space that contains graphic and aural objects that can be dynamically modified through a variety of mechanisms. This part of ISO/IEC 14772 defines the interface that applications external to the VRML browser may use to access and manipulate the objects defined in ISO/IEC 14772-1.

INCITS/ISO/IEC 14776-115:2004 [S2016],
Information technology -- Small Computer System Interface (SCSI) -- Part 115: Parallel Interface-5 (SPI-5)
The SCSI parallel interface (SPI) is designed to provide an efficient peer-to-peer I/O bus with the maximum number of hosts and peripherals determined by the bus width (i.e., 8 or 16). Data may be transferred asynchronously or synchronously at rates that depend on implementation.

INCITS/ISO/IEC 14776-151:2010 [S2016],
Information technology -- Small Computer System Interface (SCSI) -- Part 151: Serial Attached SCSI - 1.1 (SAS-1.1)
Defines the rules for exchanging information between SCSI devices using a serial interconnect. It defines the rules for exchanging information between ATA hosts and ATA devices using the same serial interconnect. It is a functional description. Conforming implementations may employ any design technique that does not violate interoperability.

INCITS/ISO/IEC 14776-342:2000 [S2016],
Information technology -- Small Computer System Interface -- Part 342: Controller Commands - 2 (SCC-2)
Defines the command set extensions for SCSI storage array devices; commonly known as RAID devices. This standard is principally intended to be used in conjunction with, not as an alternate to, any of the SCSI command standards nor to the SCSI-3 Architecture Model (ISO/IEC 14776-411) standard. This international standard is intended as an alternate to the SCSI-3 Controller Command (ISO/IEC 14776-341) standard.
INCITS/ISO/IEC 14882:2014 [2016], Information technology - Programming languages - C++

This standard specifies requirements for implementations of the C++ programming language. The first such requirement is that they implement the language, and so this International Standard also defines C++. Other requirements and relaxations of the first requirement appear at various places within this International Standard.

This standard specifies several digital signature mechanisms with appendix for messages of arbitrary length. This part of contains general principles and requirements for digital signatures with appendix. It also contains definitions and symbols which are used in all parts of ISO/IEC 14888. Various means are available to obtain a reliable copy of the public verification key, e.g., a public key certificate. Techniques for managing keys and certificates are outside the scope of ISO/IEC 14888.

This part of ISO/IEC 14888 specifies digital signatures with appendix whose security is based on the difficulty of factoring the modulus in use. For each signature scheme, it specifies: a) the relationships and constraints between all the data elements required for signing and verifying; b) a signature mechanism, i.e., how to produce a signature of a message with the data elements required for signing; c) a verification mechanism, i.e., how to verify a signature of a message with the data elements required for verifying.

ISO/IEC 14888-3:2006 specifies digital signature mechanisms with appendix whose security is based on the discrete logarithm problem. It provides a general description of a digital signature with appendix mechanism, and a variety of mechanisms that provide digital signatures with appendix.

ISO/IEC 14888-3:2006 specifies digital signature mechanisms with appendix whose security is based on the discrete logarithm problem. It provides a general description of a digital signature with appendix mechanism, and a variety of mechanisms that provide digital signatures with appendix. For each mechanism, ISO/IEC 14888-3:2006 specifies the process of generating keys, the process of producing signatures, and the process of verifying signatures.

Amendment 2 to ISO/IEC 14888-3:2006

This is the 2nd Corrigendum to INCITS/ISO/IEC 14888-3:2006

This is the first corrigendum to INCITS/ISO/IEC 14888-3:2006

INCITS/ISO/IEC 14957:2010 [2014], Information technology - Representation of data element values - Notation of the format

ISO/IEC 14957:2010 specifies the notation to be used for stating the format, i.e. the character classes, used in the representation of data elements and the length of these representations. It also specifies additional notations relative to the representation of numerical figures. For example, this formatting technique might be used as part of the metadata for data elements. The scope of ISO/IEC 14957:2010 is limited to graphic characters, such as digits, letters and special characters. The scope is limited to the basic datatypes of characters, character strings, integers, reals, and pointers.

INCITS/ISO/IEC 14977:2006 [R2015], Information technology - Syntactic metalanguage - Extended BNF

Defines a notation, Extended BNF, for specifying the syntax of a linear sequence of symbols. It defines both the logical structure of the notation and its graphical representation.

INCITS/ISO/IEC 15041:1997 [S2012], Information Technology - Data Interchange on 90 mm Optical Disk Cartridges - Capacity: 640 Mbytes per Cartridge

Please just use the first sentence and delete second sentence "The Standard specifies five related, but different, implementations of such cartridges, viz."

INCITS/ISO/IEC 15145:1997 [R2015], Information technology - Programming languages - FORTH

This standard specifies an interface between a Forth System and a Forth Program by defining the words provided by a Standard System. This Standard specifies the forms that a program written in the Forth language may take; the rules for interpreting the meaning of a program and its data. This Standard does not specify the mechanism by which programs are transformed for use on computing systems; the operations required for setup and control of the use of programs on computing systems; the method of transcription of programs or their input or output data to or from a storage medium; the program and Forth system behavior when the rules of this Standard fail to establish an interpretation; the size or complexity of a program and its data that will exceed the capacity of any specific computing system or the capability of a particular Forth system; the physical properties of input/output records, files, and units; the physical properties and implementation of storage.

INCITS/ISO/IEC 15286:1999 [S2011], Information technology - 130 mm Rewritable and Read-only Optical Disk Cartridge, Capacity: 5.2 Gigabytes per Cartridge for Information Interchange

This International Standard specifies the characteristics of a series of related 130 mm optical disk cartridges (ODCs) by using a number of Type designations.

ISO/IEC 1539-1:2010 specifies the form and establishes the interpretation of programs expressed in the base Fortran language. Its purpose is to promote portability, reliability, maintainability, and efficient execution of Fortran programs for use on a variety of computing systems. ISO/IEC 1539-1:2010 specifies the forms that a program written in the Fortran language may take, the rules for interpreting the meaning of a program and its data, the form of the input data to be processed by such a program, and the form of the output data resulting from the use of such a program.

This International Standard is intended to facilitate the users in selecting facsimile equipment which meets their requirements. This International Standard specifies the minimum information that shall be included in the specification sheets of facsimile equipment so that users may compare the characteristics of different machines.
This Recommendation | International Standard specifies the framework, concepts, and methodology for securing JPEG 2000 codestreams. The scope of this Recommendation | International Standard is to define: 1) a normative codestream syntax containing information for interpreting secure image data; 2) a normative process for registering JPSEC tools with a registration authority delivering a unique identifier; 3) informative examples of JPSEC tools in typical use cases; 4) informative guidelines on how to implement security services and related metadata.

INCITS/ISO/IEC 15445:2000 [R2015], Information technology - Data interchange on 120 mm optical disk cartridges using phase change PD format - Capacity: 650 Mbytes per cartridge

INCITS/ISO/IEC 15485-1997 [R2015], Information technology - Data interchange on 120 mm optical disk cartridges using phase change PD format - Capacity: 650 Mbytes per cartridge

INCITS/ISO/IEC 15485:1997 [R2015], Information technology - Data interchange on 120 mm optical disk cartridges using phase change PD format - Capacity: 650 Mbytes per cartridge

This Recommendation | International Standard specifies the framework, concepts, and methodology for securing JPEG 2000 codestreams. The scope of this Recommendation | International Standard is to define: 1) a normative codestream syntax containing information for interpreting secure image data; 2) a normative process for registering JPSEC tools with a registration authority delivering a unique identifier; 3) informative examples of JPSEC tools in typical use cases; 4) informative guidelines on how to implement security services and related metadata.

This standard is a conforming application of ISO 8879, SGML. This Standard describes the way in which the HTML language specified by the certain clauses (see standard) in the W3C Recommendation for HTML 4.01 shall be used, and does so by identifying all the differences between the HTML language specified by the W3C Recommendation for HTML 4.01 and the HTML language defined by this Standard.
INCITS/ISO/IEC 15498:1997 [R2015],
Information technology - Data interchange on 90 mm optical disk cartridges - HS-1 format - Capacity: 650 Mbytes per cartridge
This Standard specifies the characteristics of 120 mm Optical Disk Cartridges (ODCs) with a capacity of 650 Mbytes using Phase Change PD format. This present International Standard specifies two related, but different implementations of such cartridges, viz.
Type R/W Provides for data to be written, read and overwritten many times over the whole recording surface of the disk using the phase change recording and read-out method. Type WORM Provides for data to be written once and read many times over the whole recording surface of the disk using the phase change recording and read-out method. This Standard specifies: • the conditions for conformance testing and the Reference Drive; • the environments in which the cartridges are to be operated and stored; • the mechanical and physical characteristics of the cartridge, so as to provide mechanical interchangeability between data processing systems; • the format of the information on the disk known as the PD format; including the physical disposition of the tracks and sectors, the error correction codes, and the modulation method used; • the characteristics of the embossed information on the disk; • the phase change recording characteristics of the disk, enabling data processing systems to write data onto the disk; • the minimum quality of user-written data on the disk, enabling data processing systems to read data from the disk. This Standard provides for interchange between optical disk drives. Together with a Standard for volume and file structure it provides for full data interchange between data processing systems.

INCITS/ISO/IEC 15521:1998 [S2015],
Information technology - 3,81 mm wide magnetic tape cartridge for information interchange - Helical scan recording - DDS-3 format using 125 m length tapes
This Standard specifies the physical and magnetic characteristics of a 3,81 mm wide magnetic tape cartridge to enable physical interchangeability of such cartridges between drives. It also specifies the quality of the recorded signals, the recording method and the recorded format - called Digital Data Storage (DDS) - whereby allowing data interchange between drives by means of such magnetic tape cartridges. Information interchange between systems also requires, at a minimum, agreement between the interchange parties upon the interchange code(s) and the specifications of the structure and labelling of the information on the interchange cartridge. Under information interchange circumstances in which a processing algorithm, e.g. for lossless data compression as specified in ISO/IEC 11558, is applied to the host data prior to recording on the tape and a complementary reprocessing algorithm is applied after the data is read from the tape, agreement upon these by the interchange parties is also required.

INCITS/ISO/IEC 15693-1:2010 [R2016],
Identification cards -- Contactless integrated circuit cards -- Vicinity cards -- Part 1: Physical characteristics
This part of ISO/IEC 15693 defines the physical characteristics of vicinity cards (VICCs). It is used in conjunction with other parts of ISO/IEC 15693.

INCITS/ISO/IEC 15693-2:2006 [R2016],
Identification cards -- Contactless integrated circuit cards -- Vicinity cards -- Part 2: Air interface and initialization
ISO/IEC 15693 forms part of a series of International Standards that specify a contactless smart card. The card can be carried by members of the public in a purse or wallet and when presented nearby a terminal device give access to places, goods or services. In addition, the card can be attached to objects like bags and valuable items which can then be tracked whilst in the vicinity of a reading device. ISO/IEC 15693-2:2006 defines the power and communications interface between the vicinity card and the reading device. Other parts of ISO/IEC 15693 define the physical dimensions of the card and the commands interpreted by the card and reader.

INCITS/ISO/IEC 15693-3:2009 [R2016],
Identification cards -- Contactless integrated circuit cards -- Vicinity cards -- Part 3: Anticollision and transmission protocol
Specifies protocol and commands, other parameters required to initialize communications between a vicinity integrated circuit card and a vicinity coupling device, methods to detect and communicate with one card among several cards ("anticollision"), optional means to ease and speed up the selection of one among several cards based on application criteria. Defines the physical characteristics of vicinity cards (VICCs). It is used in conjunction with other parts of ISO/IEC 15693.

INCITS/ISO/IEC 15718:1998 [R2015],
Information technology - Data interchange on 8 mm wide magnetic tape cartridge - Helical scan recording - HH-1 format
This Standard specifies the physical and magnetic characteristics of an 8 mm wide magnetic tape cartridge so as to provide physical interchange of such cartridges between drives. It also specifies the quality of the recorded signals, the recording method and the recorded format, thereby allowing data interchange between drives by means of such magnetic tape cartridges. Information interchange between systems also requires, at a minimum, agreement between the interchange parties upon the interchange code(s) and the specifications of the structure and labelling of the information on the interchange cartridge.

INCITS/ISO/IEC 15775:1999 [R2013],
Information Technology - Office Machines - Test Chart for colour copying machines - Realisation and application
This International Standard applies to implementation and application of test charts for colour copying machines. This International Standard serves for testing of reproduction properties of colour copying machines, in order to help to recognize the possibilities and limits of various machines and for their comparison.

INCITS/ISO/IEC 15775/AM1-2005 [R2013],
Information technology - Office Machines - Method of specifying image reproduction of colour copying machines by analog test charts Realization and application - Amendment 1
This is the first amendment to ISO/IEC 15775:1999 that applies to the implementation and application of test charts for colour copying machines. This International Standard serves for testing of reproduction properties of colour copying machines, in order to help to recognize the possibilities and limits of various machines and for their comparison.
INCITS/ISO/IEC 15780:1998 [S2015],
Information Technology - 8 mm Wide Magnetic Tape Cartridge - Helical Scan Recording - AIT-1 Format

Specifies the physical and magnetic characteristics of an 8 mm wide magnetic tape cartridge to enable physical interchange of such cartridges between drives. Also specifies the quality of the recorded signals, the recording method and the recorded format - called Advanced Intelligent Tape No. 1 (AIT-1) - thereby allowing data interchange between drives by means of such magnetic tape cartridges. Information interchange between systems also requires, at a minimum, agreement between the interchange parties upon the interchange code(s) and the specifications of the structure and labelling of the information on the interchanged cartridge.

INCITS/ISO/IEC 15816:2002 [S2012],
Information Technology - Security Techniques - Security Information Objects for Access Control

Provides definition of guidelines for specifying the abstract syntax of generic and specific Security Information Objects (SIOs) for Access Control; the specification of specific SIOs for Access Control; the specification of generic SIOs for Access Control. The scope of this Recommendation | International Standard covers only the "statics" of SIOs through syntactic definitions in terms of ASN.1 descriptions and additional semantic explanations. It does not cover the "dynamics" of SIOs, for example rules relating to their creation and deletion. The dynamics of SIOs are a local implementation issue.

INCITS/ISO/IEC 15895:1999 [R2015],
Information technology - Data interchange on 12,7 mm 128-track magnetic tape cartridges - DLT 3-XT format

This Standard specifies the physical and magnetic characteristics of a 12.7 mm wide, 128-track magnetic tape cartridge, to enable physical interchangeability of such cartridges between drives. It also specifies the quality of the recorded signals, a format - called Digital Linear Tape 3 Extended (DLT 3-XT) - and a recording method, thereby allowing data interchange between drives. Together with a labelling standard, for instance International Standard ISO 1001 for Magnetic Tape Labelling, it allows full data interchange by means of such magnetic tape cartridges.

INCITS/ISO/IEC 15896:1999 [R2015],
Information technology - Data interchange on 12.7 mm 208-track magnetic tape cartridges - DLT 5 format

This Standard specifies the physical and magnetic characteristics of a 12.7 mm wide, 208-track magnetic tape cartridge, to enable physical interchangeability of such cartridges between drives. It also specifies the quality of the recorded signals, a format - called Digital Linear Tape 5 (DLT 5) - and a recording method, thereby allowing data interchange between drives. Together with a labelling standard, for instance International Standard ISO 1001 for Magnetic Tape Labelling, it allows full data interchange by means of such magnetic tape cartridges.

INCITS/ISO/IEC 15898:1998 [S2012],
Information Technology - 356 Optical Disk Cartridges, Extended Capacity, Using Phase Change Technology for Information Interchange

Specifies the characteristics of 356 mm Optical Disk Cartridges (ODCs) of the type providing for information to be written once and read many times.

INCITS/ISO/IEC 15938-1:2002 [R2012],
Information technology - Multimedia content description interface - Part 1: Systems

This International Standard defines a Multimedia Content Description Interface, specifying a series of interfaces from system to application level to allow disparate systems to interchange information about multimedia content. It describes the architecture for systems, a language for extensions and specific applications, description tools in the audio and visual domains, as well as tools that are not specific to audio-visual domains.

Amendment 1 to ISO/IEC 15938-1:2002.

This International Standard specifies a metadata system for describing multimedia content. This part of ISO/IEC 15938 specifies the schema definition across all parts of ISO/IEC 15938. This part of ISO/IEC 15938 collects the description tools specified in ISO/IEC 15938, assigns a namespace designation, and specifies the resulting syntax description in a single schema using description definition language from ISO/IEC 15938-2.

This International Standard specifies a metadata system for describing multimedia content. It specifies the Description Definition Language (DDL) that comprises part 2 of the standard (ISO/IEC 15938-2).

This part of ISO/IEC 15938 specifies tools for description of visual content, including still images, video and 3D models. These tools are defined by their syntax in DDL and binary representations and semantics associated with the syntactic elements. They enable description of the visual features of the visual material, such as color, texture, shape and motion, as well as localization of the described objects in the image or video sequence. An overview of the visual description tools is shown in Figure 1.

This International Standard defines a Multimedia Content Description Interface, specifying a series of interfaces from system to application level to allow disparate systems to interchange information about multimedia content. It describes the architecture for systems, a language for extensions and specific applications, description tools in the audio and visual domains, as well as tools that are not specific to audio-visual domains. As a whole, this International Standard encompassing all of the aforementioned components is known as "MPEG-7."

Amendment 2 to IEC 15938-4:2002.
INCITS/ISO 15938-5-2003 [R2013], Information technology - Multimedia content description interface - Part 5: Multimedia description schemes

Specifies a metadata system for describing multimedia content. This document specifies the Multimedia Description Schemes (MDS) description tools (Description Schemes, Descriptors, and datatypes) that comprise ISO/IEC 15938-5.

AMENDMENT 1: Multimedia description schemes extensions

Amendment 2 to Multimedia description schemes user preference extensions

Amendment 3: Improvements to geographic descriptor

INCITS/ISO 15938-6-2003 [R2013], Information technology - Multimedia content description interface - Part 6: Reference software

ISO/IEC 15938-6:2003 is the reference software for ISO/IEC 15938 standard. It implements the normative components of the ISO/IEC 15938 standard, which are the descriptors and description schemes and their coding schemes.

Amendment 1: Reference software extensions

Amendment 2 to Reference software - Amendment 2: Reference software of perceptual 3D shape descriptor

INCITS/ISO 15938-7-2003 [R2013], Information technology - Multimedia content description interface - Part 7: Conformance testing

ISO/IEC 15938-7:2003 specifies a metadata system for describing multimedia content. ISO/IEC 15938-7:2003 specifies how tests can be designed to verify whether descriptions and description consuming terminals meet the specifications of parts 1, 2, 3, 4 and 5 of ISO/IEC IEC 15938. In ISO/IEC 15938-7:2003, the creation or extraction of descriptions from multimedia content is not addressed specifically. A system producing descriptions may be said to be an ISO/IEC 15938 compatible description production system if it produces descriptions (binary or textual) that conform to the specifications of parts 1, 2, 3, 4 and 5 of ISO/IEC 15938.

Amendment 1 to ISO/IEC 15938-7:2003.

This part of 15938-9 collects standard profiles and levels for MPEG-7, specified across all ISO/IEC 15938 parts. While all parts are potential candidates for profiling, current profiles concentrate on the description definition language [ISO/IEC 15938-2], visual [ISO/IEC 15938-3], audio [ISO/IEC 15938-4] and multimedia description schemes [ISO/IEC 15938-5], which are based on the namespace versioning defined in schema definition [ISO/IEC 15938-10].

INCITS/ISO 15944-1-2002 [R2013], Information technology - Business Agreement Semantic Descriptive Techniques

Part 1: Business Operational Aspects of Open-edi for implementation

This standard allows constraints (which include legal requirements, commercial and/or international trade and contract terms, public policy [e.g. privacy/data protection, product or service labelling, consumer protection], laws and regulations) to be defined and clearly integrated into Open-edi through the BOV. This means that terms and definitions in this standard serve as a common bridge among these different sets of business operational requirements allowing the integration of code sets and rules defining these requirements to be integrated into business processes electronically.

INCITS/ISO 15944-10:2014, Information technology - Business Operational View - Part 10: IT-enabled coded domains as semantic components in business transactions

The primary purpose of ISO/IEC 15944-10:2013 is to provide, in a single consolidated document, an integrated approach for the key concepts and their definitions as well as rules pertaining to "coded domains" as they already exist in the multipart ISO/IEC 15944 eBusiness standard, especially Parts 1, 2, 5 and 8. It does so in a systematic and rules-based manner. As such, ISO/IEC 15944-10:2013 serves as a methodology and tool for an IT-enabled approach to existing widely used standards, specifications, authority files, pick-lists, etc.

Part 2: Registration of Scenarios and their components

Integrated business operational view (BOV) The Open-edi Reference Model (ISO/IEC 14662, Section 4) states: 'The intention is that the sending, by an Open-edi Party, of information from a scenario, conforming to Open-edi standards, shall allow the acceptance and processing of that information in the context of that scenario by one or more Open-edi Parties by reference to the scenario and without the need for agreement.'

Part 4: Business Transaction Scenarios - Accounting and Economic Ontology

ISO/IEC 15944-4:2007 focuses on providing a definition of the concepts and the relationships that exist among those concepts in an Open-edi business transaction. Such a repository of conceptual definitions is termed a domain ontology for Open-edi.
INCITS/ISO/IEC 15944-5:2008 [R2013],
Information technology -- Business Operational View -- Part 5: Identification and referencing of requirements of jurisdictional domains as sources of external constraints
ISO/IEC 15944-5:2008 is directed at being able to identify and reference laws and regulations impacting eBusiness scenarios and scenario components as external constraints. The primary source of such external constraints is jurisdictional domains.

INCITS/ISO/IEC 15944-7:2009 [R2015],
Information technology - Business Operational View - Part 7: eBusiness vocabulary
This standard provides a consolidated vocabulary of eBusiness concepts as found and defined in ISO/IEC 14662 and the existing parts of ISO/IEC 15944, namely, Parts 1, 2, 4, 5, 6 and 7 along with their associated terms. This standard provides the rules, guidelines and procedures governing the formation of definitions for concepts relevant to eBusiness and choice of terms as a single, harmonized and integrated controlled vocabulary. This includes those governing multilingual expandability which incorporates and integrates cultural capability. As such, this standard facilitates the production of human interface equivalents (HIEs) of eBusiness terms and definitions in the various official (and de facto) languages of ISO members. This standard identifies the essential elements of an entry in this controlled vocabulary as well as their rules and specifications. It also includes rules for ensuring quality and integrity control requirement for each entry and the interworking among the entries while doing so in an IT-enabled manner. It also addresses maintenance and update procedures. This standard is built on ISO/IEC 14662 and the existing Parts 1, 2, 4, 5, 6 and 7 of ISO/IEC 15944. The exclusions which apply to one or more of these International Standards apply to ISO/IEC 15944-7:2009 This standard does not currently support the following requirements (in no particular order): 1. the more detailed level of rules (and possible more detailed level of granularity) for the essential elements of “eBusiness vocabulary” entry, as currently specified in 5.3; 2. the more detailed level of rules for change management of the eBusiness vocabulary. It is most likely that these will be addressed in the second edition (and will be based on requirements defined in INCITS/ISO/IEC 15944).

INCITS/ISO/IEC 15944-8:2012 [2012],
Information technology - Business Operational View - Part 8: Identification of privacy protection requirements as external constraints on business transactions
ISO/IEC 15944-8:2012 has been developed to support modelling generic international requirements for identifying and providing privacy protection of personal information throughout any kind of information and communications technology (ICT) based business transaction where the individual has the role of a buyer. It provides users and designers with a methodology and tools addressing requirements imposed by jurisdictional domains.

INCITS/ISO/IEC 15945:2002 [S2012],
Information Technology - Security Techniques - Specification of TTP Services to Support the Application of Digital Signatures
Define those TTP services needed to support the application of digital signatures for the purpose of non-repudiation of creation of documents. This document will also define interfaces and protocols to enable interoperability between entities associated with these TTP services. Definitions of technical services and protocols are required to allow for the implementation of TTP services and related commercial applications. This standard focuses on (1) implementation and interoperability, (2) service specifications, and (3) technical requirements.

INCITS/ISO/IEC 15946-1:2002 [R2008],
Information technology - Security techniques - Cryptographic techniques based on elliptic curves - Part 1: General
International Standard ISO/IEC 15946 specifies public-key cryptographic techniques based on elliptic curves. These include the establishment of keys for secret-key systems, and digital signature mechanisms. This part of ISO/IEC 15946 describes the mathematical background and general techniques necessary for implementing any of the mechanisms described in other parts of ISO/IEC 15946.

INCITS/ISO/IEC 15946-1:2008 [R2014],
Information technology - Security techniques - Cryptographic techniques based on elliptic curves - Part 1: General
ISO/IEC 15946 specifies public-key cryptographic techniques based on elliptic curves. These include the establishment of keys for secret-key systems, and digital signature mechanisms. This part of ISO/IEC 15946 describes the mathematical background and general techniques necessary for implementing any of the mechanisms described in other parts of ISO/IEC 15946 and other ISO/IEC standards.

This is the first corrigendum to INCITS/ISO/IEC 15946-1-2008

The scope of this part of ISO/IEC 15946 is restricted to cryptographic techniques based on elliptic curves defined over finite fields of prime power order (including the special cases of prime order and characteristic two). The representation of elements of the underlying finite field (i.e. which basis is used) is outside the scope of this part of ISO/IEC 15946.
ISO/IEC 15946 does not specify the implementation of the techniques it defines. Interoperability of products complying with ISO/IEC 15946 will not be guaranteed.

INCITS/ISO/IEC 15948:2004 [R2014],
Information technology - Computer graphics and image processing - Portable Network Graphics (PNG): Functional specification
ISO/IEC 15948:2004 specifies a datastream and an associated file format, Portable Network Graphics (PNG, pronounced “ping”), for a lossless, portable, compressed individual computer graphics image transmitted across the Internet. Indexed-colour, greyscale, and truecolour images are supported, with optional transparency. Sample depths range from 1 to 16 bits. PNG is fully streamable with a progressive display option. It is robust, providing both full file integrity checking and simple detection of common transmission errors.

INCITS/ISO/IEC 16262-2011 [2012], Information technology - Programming languages, their environments and system software interfaces - ECMAScript language specification
This International Standard defines the ECMAScript scripting language.

INCITS/ISO/IEC 16382-2000 [R2015],
Information technology - Data interchange on 12,7 mm 208-track magnetic tape cartridges - DLT 6 format
This Standard specifies the physical and magnetic characteristics of a 12,7 mm wide, 208-track magnetic tape cartridge, to enable physical interchangeability of such cartridges between drives. It also specifies the quality of the recorded signals, a format - called Digital Linear Tape 6 (DLT 6) - and a recording method, thereby allowing data interchange between drives. Together with a labelling standard, for instance International Standard ISO 1001 for Magnetic Tape Labelling, it allows full data interchange by means of such magnetic tape cartridges.

INCITS/ISO/IEC 16448:2002 [S2012],
Information Technology - 120 mm DVD - Read-only Disk
Specifies the mechanical, physical and optical characteristics of a 120 mm, read-only optical disk to enable the interchange of such disks. It specifies the quality of the recorded signals, the format of the data and the recording method, thereby allowing for information interchange by means of such disks.

INCITS/ISO/IEC 16449:2002 [S2012],
Information Technology - 80 mm DVD - Read-only Disk
Specifies the mechanical, physical and optical characteristics of a 80 mm, read-only optical disk to enable the interchange of such disks. It specifies the quality of the recorded signals, the format of the data and the recording method, thereby allowing for information interchange by means of such disks.
INCITS/ISO/IEC 16485:2000 [R2016],
Information technology -- Mixed Raster Content (MRC)

Defines a means to efficiently represent raster-oriented pages that contain a mixture of multi-level and bi-level images. Any of the many ITU-T recommended encoding schemes, such as T.81 (JPEG) for the encoding of multi-level images and T.6 (MMR) for the encoding of bi-level images, may be combined within the context of this Recommendation.

INCITS/ISO/IEC 16509:1999 [R2015],
Information technology - Year 2000 terminology

This standard identifies terms and concepts pertinent to the resolution of the Year 2000 issue, including the rollover from the year 1999 to 2000, incorrect recognition of leap years, and values in date fields used for non-date purposes, and provides definitions of these terms and descriptions of these concepts. This standard does not specifically address operating system anomalies such as might occur in the year 2038.

INCITS/ISO/IEC 16680:2012 [2012], Information technology - The Open Group Service Integration Maturity Model (OSIMM)

It specifies a model against which the degree of service integration maturity of an organization can be assessed, and a process for assessing the current and desired degree of service integration maturity of an organization, using the model.

INCITS/ISO/IEC 16824:1999 [R2015],
Information technology - 120 mm DVD rewritable disk (DVD-RAM)

This standard specifies the mechanical, physical and optical characteristics of a 120 mm optical disk to enable interchange of such disks. It specifies the quality of the recorded signals, the format of the data and the recording method, thereby allowing for information interchange by means of such disks. The data can be written, read and overwritten many times using the phase change method. This disk is identified as DVD-RAM. This standard specifies: the two related but different Types of this disk (see clause 7), the conditions for conformance, the environments in which the disk is to be tested, operated and stored, the mechanical, physical and dimensional characteristics of the disk, as well as to provide mechanical interchange between data processing systems, the format of the information on the disk, the conversion of the tracks and sectors, the error correcting codes and the coding method, the characteristics of the signals recorded on the disk, thus enabling data processing systems to read the data from the disk. This standard provides for the interchange of disks between optical disk drives. Together with a standard for volume and file structure, it provides for full data interchange between data processing systems. The optical disks specified by this Standard may be enclosed in cases according to ISO/IEC 16825 as specified therein.

INCITS/ISO/IEC 16825:1999 [R2015],
Information technology - Case for 120 mm DVD-RAM disks

This Standard specifies the characteristics of a case for use with 120 mm DVD-RAM disks as specified in Standard ECMA-ppp. The present International Standard specifies three related, but different implementations of such cases, viz. Type 1 Provides a case for a one-sided (Type 1S) or a two-sided (Type 2S) DVD-RAM disk such that the disk cannot be removed from the case. This case is reversible. Type 2 Provides a case for a one-sided DVD-RAM disk (Type 1S) such that the disk may be removed from the case. This case is not reversible. Type 3 Provides a case into which a one-sided DVD-RAM disk (Type 1S) may be inserted, then used as a cartridge. This case is not reversible. This Standard specifies: the environments in which the cases are to be operated and stored; the dimensional and mechanical characteristics of the case, so as to provide mechanical interchangeability between data processing systems; This Standard provides for mechanical interchange between optical disk drives. Together with ISO/IEC for 120 mm DVD-RAM disks* and a standard for volume and file structure, it provides for full data interchange between data processing systems.

INCITS/ISO/IEC 16963:2011 [2014], Information technology - Digitally recorded media for information interchange and storage - Test method for the estimation of lifetime of optical media for long-term data storage

This Standard specifies an accelerated aging test method for estimating the lifetime of information stored on recordable or rewritable optical disks. This test includes details on the following formats: DVD-R/RW/RAM, +R/+RW and CD-R/RW.

INCITS/ISO/IEC 16969:1999 [R2015],
Information technology - Data interchange on 120 mm optical disk cartridges using +R format - Capacity: 3,0 Gbytes and 6,0 Gbytes

This Standard specifies the mechanical, physical and optical characteristics of 120 mm rewritable optical disks with capacities of 3,0 Gbytes and 6,0 Gbytes. It specifies the quality of the recorded and unrecorded signals, the format of the data and the recording method, thereby allowing for information interchange by means of such disks. The data can be written, read and overwritten many times using the phase change method. These disks are identified as +RW. This Standard specifies two related but different Types of this disk (see clause 7), the conditions for conformance, the environments in which the disk is to be tested, operated and stored, the mechanical, physical and dimensional characteristics of the disk, as well as to provide mechanical interchange between data processing systems, the format of the information on the disk, the conversion of the tracks and sectors, the error correcting codes and the coding method, the characteristics of the signals recorded on the disk, thus enabling data processing systems to read the data from the disk. This Standard provides for the interchange of disks between optical disk drives. Together with a standard for volume and file structure, it provides for full data interchange between data processing systems.

INCITS/ISO/IEC 17203-2011 [2012], Information technology - Open Virtualization Format (OVF) specification

The Open Virtualization Format (OVF) Specification describes an open, secure, portable, efficient and extensible format for the packaging and distribution of software to be run in virtual machines.

INCITS/ISO/IEC 17341:2009 [R2014], Information technology - Data interchange on 120 mm and 80 mm optical disk using +RW format - Capacity: 4,7 Gbytes and 1,46 Gbytes per side (recording speed up to 4X)

This International Standard specifies the mechanical, physical and optical characteristics of 120 mm rewritable optical disks with capacities of 4,7 Gbytes and 9,4 Gbytes. It specifies the quality of the recorded and unrecorded signals, the format of the data and the recording method, thereby allowing for information interchange by means of such disks. The data can be written, read and overwritten many times using the phase change method. These disks are identified as +RW.

INCITS/ISO/IEC 17342:2004 [R2015], Information technology - 80 mm (1,46 Gbytes per side) and 120 mm (4,70 Gbytes per side) DVD re-recordable disk (DVD-RW)

This standard specifies the mechanical, physical and optical characteristics of an 80 mm and a 120 mm DVD re-recordable disk to enable the interchange of such disks. It specifies the quality of the pre-recorded, unrecorded and the recorded signals, the format of the data, the format of the information zone, the format of the unrecorded zone, and the recording method, thereby allowing for information interchange by means of such disks.

INCITS/ISO/IEC 17344:2009 [R2014], Information technology - Data interchange on 120 mm and 80 mm Optical Disk using +R Format - Capacity: 4,7 Gbytes and 1,46 Gbytes per Side (Recording speed up to 16X)

This International Standard specifies the mechanical, physical and optical characteristics of 120 mm recordable optical disks with capacities of 4,7 Gbytes and 9,4 Gbytes. It specifies the quality of the recorded and unrecorded signals, the format of the data and the recording method, thereby allowing for information interchange by means of such disks. The data can be written once and read many times using a nonreversible method. These disks are identified as +R.

INCITS/ISO/IEC 17345:2006-2007 [R2012], Information technology - Data Interchange on 130 mm Rewritable and Write Once Read Many Ultra Density Optical (UDO) Disk Cartridges - Capacity: 30 Gbytes per Cartridge - First Generation

This International Standard specifies the mechanical, physical, and optical characteristics of a 130 mm optical disk cartridge (ODC) that employs thermo-optical Phase Change effects to enable data interchange between such disks.

Licensed to Complimentary Copy. ANSI order 2017XX. Downloaded 10/11/2017 10:38 AM. Single user license only. Copying and networking prohibited.
INCITS/ISO/IEC 17346:2005 [R2015], Information technology - Data interchange on 90 mm optical disk cartridges - Capacity: 1,3 Gbytes per cartridge

This standard defines the characteristics of 90 mm Optical Disk Cartridges (ODC) with a capacity of 1.3 GB per cartridge. It specifies only Type R/W for 2 048-byte sectors of such cartridges. Type R/W provides for data to be written, read and erased many times over the entire recording surface of the disk using the thermo-magnetic and magneto-optical effects. It is also referred to as "fully rewritable". ISO/IEC 17346:2004 provides for 2 048-byte sectors only. All sectors on a disk are of the same size. This standard specifies: • the conditions for conformance testing and the Reference Drive; • the environments in which the cartridges are to be operated and stored; • the mechanical and physical characteristics of the cartridge, so as to provide mechanical interchangeability between data processing systems; • the format of the information on the disk, both embossed and user-written; including the physical disposition of the tracks and sectors, the error correction codes, and the modulation method used; • the characteristics of the embossed information on the disk; • the magneto-optical characteristics of the disk, enabling processing systems to write data onto the disk; • the minimum quality of user-written data on the disk, enabling data processing systems to read data from the disk. This standard provides for interchange between optical disk drives. Together with a standard for volume and file structure, it provides for full data interchange between data processing systems.

INCITS/ISO/IEC 17462:2000 [S2011], Information technology - 3,81 mm Wide Magnetic Tape Cartridge for Information Interchange - Helical scan recording - DDS-4 Format

Specifies the physical and magnetic characteristics of a 3,81 mm wide magnetic tape cartridge to enable physical interchangeability of such cartridges between drives. It also specifies the quality of the recorded signals, the recording method and the recorded format - called Digital Data Storage 4 (DDS-4) - thereby allowing data interchange between drives by means of such magnetic tape cartridges.

INCITS/ISO/IEC 17592:2004 [R2015], Information technology - 120 mm (4,7 Gbytes per side) and 80 mm (1,46 Gbytes per side) DVD rewritable disk (DVD-RAM)

This standard specifies the mechanical, physical and optical characteristics of an optical disk, identified as DVD Rewritable Disk (DVD-RAM), to enable interchange of such disks. It specifies the quality of the recorded signals, the format of the data and the recording method, thereby allowing for information interchange by means of such disks. The data can be written, read and overwritten many times using the phase change method. Two Types are specified that differ only by their diameter of 120 mm and 80 mm, and the resulting difference of capacity.

INCITS/ISO/IEC 17594:2004 [R2015], Information technology - Cases for 120 mm and 80 mm DVD-RAM disks

This standard specifies the characteristics of a case for use with the 120 mm and 80 mm DVD-RAM disks specified in ISO/IEC 17592. ISO/IEC 17594:2004 specifies nine related, but different implementations of this case. This standard specifies: • the environments in which the cases are to be operated and stored; • the dimensional and mechanical characteristics of the case, so as to provide mechanical interchangeability between data processing systems. This standard provides for mechanical interchange between optical disk drives. Together with ISO/IEC 17592 for 120 mm (4,7 Gbytes per side) and 80 mm (1,46 Gbytes per side) DVD-RAM disks and a standard for volume and file structure, it provides for full data interchange between data processing systems.

ISO/IEC 17629:2014 specifies a method for measuring first print out time of digital printing devices. It is applicable to digital printing devices and multifunctional devices. It is intended to be used for black and white (B&W) as well as colour digital printing devices and multifunctional devices of any underlying marking technology. It includes instructions for test charts, test setup procedure, test procedure, and the reporting requirements for the digital printing measurements.

INCITS/ISO/IEC 17788:2014 [2017], Information technology - Cloud computing - Overview and vocabulary

Provides an overview of cloud computing along with a set of terms and definitions. It is a terminology foundation for cloud computing standards and is applicable to all types of organizations (e.g., commercial enterprises, government agencies, not-for-profit organizations).

INCITS/ISO/IEC 17789:2014 [2017], Information technology - Cloud computing - Reference architecture

Specifies the cloud computing reference architecture (CCRA). The reference architecture includes the cloud computing roles, cloud computing activities, and the cloud computing functional components and their relationships.

ISO/IEC 17799:2005 establishes guidelines and general principles for initiating, implementing, maintaining, and improving information security management in an organization. The objectives outlined provide general guidance on the commonly accepted goals of information security management. ISO/IEC 17799:2005 contains best practices of control objectives and controls in the following areas of information security management.

ISO/IEC 17799:2005 establishes guidelines and general principles for initiating, implementing, maintaining, and improving information security management in an organization. The objectives outlined provide general guidance on the commonly accepted goals of information security management. ISO/IEC 17799:2005 contains best practices of control objectives and controls in the following areas of information security management.

INCITS/ISO/IEC 17823:2015 [2017], Colour terminology for office colour equipment

Provides definitions for colour terms used with office equipment, in particular for use with colour scanning and printing devices that have digital imaging capabilities, including multi-function devices. This standard is not intended to replace terms and definitions published in documents or user interfaces issued or created by manufacturers.

ISO/IEC 17826:2012 specifies the interface to access cloud storage and to manage the data stored therein. It is applicable to developers who are implementing or using cloud storage.

INCITS/ISO/IEC 17913:2000 [R2015], Information technology - 12,7mm 128-track magnetic tape cartridge for information interchange - Parallel serpentine format

This Standard specifies the physical and magnetic characteristics of a magnetic tape cartridge, using a magnetic tape 12,7 mm wide, so as to provide physical interchange of such cartridges between drives. It also specifies the quality of the recorded signals, the recording method and the recorded format known as Parallel Serpentine, thereby allowing data interchange between drives by means of such cartridges. The format supports variable length Logical Records, high speed search, and the use of the algorithm for data compression specified in ISO/IEC 15200. Information interchange between systems also requires, at a minimum, agreement between the interchange parties upon the interchange code(s) and the specification of the structure and labelling of the information on the interchange cartridge. Together with a standard for volume and file structure, e.g., International Standard ISO 1001, this International Standard provides for full data interchange between data processing systems.

ISO/IEC 17963:2013 describes a Web services protocol based on SOAP for use in management&amp;#8203;&amp;#8203;specific domains. These domains include the management of entities such as PCs, servers, devices, Web services and other applications manageable entities. Services can expose only a WS-Management interface or compose the WS-Management service interface with some of the many other Web service specifications.

Provides definitions for colour terms used with office equipment, in particular for use with colour scanning and printing devices that have digital imaging capabilities, including multi-function devices. This standard is not intended to replace terms and definitions published in documents or user interfaces issued or created by manufacturers.

ISO/IEC 17998:2012 describes a framework that provides context and definitions to enable organizations to understand and deploy service-oriented architecture (SOA) governance.

This part of ISO/IEC 18013 establishes guidelines for the design format and data content of an ISO compliant driving licence (IDL) in regard to both visual human-readable features and ISO machine-readable technologies. It creates a common basis for international use and mutual recognition of the IDL without impeding individual national/community/regional motor vehicle authorities in taking care of their specific needs.

Establishes guidelines for the content and formatting of data stored on an ISO compliant driving license (IDL) using machine-readable technologies. It creates a common basis for the international use of IDL data without restricting individual domestic or regional driver licensing authorities from applying their specific data policies. Specifies the following items. Mandatory and optional machine-readable data. Machine-readable IDL data support the following functions (subject in some cases to the inclusion of appropriate optional data elements): confirming the driving privileges of a driver; etc.

Establishes guidelines for the design format and data content of an ISO-compliant driving license (IDL) with regard to human-readable features [ISO/IEC 18013-1], machine-readable technologies [ISO/IEC 18013-2], and access control, authentication and integrity validation [ISO/IEC 18013-3]. It creates a common basis for international use and mutual recognition of the IDL without impeding individual countries/states to apply their privacy rules and national/community/regional motor vehicle authorities in taking care of their specific needs.

This standard identifies the objective of a time-stamping authority; describes a general model on which time-stamping services are based; defines time-stamping services; and defines the basic protocols between the involved entities.

This standard presents a general framework for the provision of time-stamping services. Time-stamping services may generate, renew and verify time-stamp tokens. Time-stamp tokens are associations between data and points in time, and are created in a way that aims to provide evidence that the data existed at the associated date and time. In addition, the evidence may be used by non-repudiation services. This standard specifies mechanisms that generate independent time-stamps: in order to verify an independent time-stamp token, verifiers do not need access to any other time-stamp tokens. That is, timestamp tokens are not linked, as is the case for the token types defined in ISO/IEC 18014-3.

This part of the standard describes a general model for time-stamping services producing linked tokens, describes the basic components used to construct a time-stamping service producing linked tokens, defines the data structures used to interact with a time-stamping service producing linked tokens, describes specific instances of time-stamping services producing linked tokens, and defines a protocol to be utilized by time-stamping services producing linked tokens for the purpose of extending linked tokens to published values.

ISO/IEC 18023-1:2006 addresses the concepts, syntax and semantics for the representation and interchange of environmental data. It specifies: a data representation model for expressing environmental data; specifications of the data types and classes that together constitute the data representation model; and an application program interface that supports the storage and retrieval of environmental data using the data representation model.

This is Amendment 1 to ISO/IEC 18023-1:2005 which addresses the concepts, syntax and semantics for the representation and interchange of environmental data. It specifies: - a data representation model for expressing environmental data; - specifications of the data types and classes that together constitute the data representation model; and - an application program interface that supports the storage and retrieval of environmental data using the data representation model.

ISO/IEC 18023-2:2006 specifies the abstract syntax of a SEDRIS transmittal. Actual encodings (e.g. binary encoding) are specified in other parts of ISO/IEC 18023.

INCITS/ISO/IEC 18023-3:2006 [R2014], Information technology -- SEDRIS -- Part 3: Transmittal format binary encoding

This is Amendment 1 to ISO/IEC 18023-3:2006 that defines a binary encoding for DRM objects specified in ISO/IEC 18023-1 according to the abstract syntax specified in ISO/IEC 18023-2.

ISO/IEC 18024-4:2006 specifies a language-dependent layer for the C programming language. ISO/IEC 18023-1 specifies a language-independent application program interface (API) for SEDRIS. For integration into a programming language, the SEDRIS API is embedded in a language-dependent layer obeying the particular conventions of that language.

This is Amendment 1 to ISO/IEC 18024-4:2006 that specifies a language-dependent layer for the C programming language. ISO/IEC 18023-1 specifies a language-independent application program interface (API) for SEDRIS. For integration into a programming language, the SEDRIS API is embedded in a language-dependent layer obeying the particular conventions of that language.
INCITS/ISO/IEC 18025-2014, Information technology -- Environmental Data Coding Specification (EDCS)

ISO/IEC 18025:2014 provides mechanisms to specify unambiguously objects used to model environmental concepts. To accomplish this, a collection of nine EDCS dictionaries of environmental concepts are specified: classifications, specify the type of environmental objects; attributes, specify the state of environmental objects; attribute value characteristics, specify information concerning the values of attributes; attribute enumerants, specify the allowable values for the state of an enumerated attribute; units, specify quantitative measures of the state of some environmental objects; unit scales, allow a wide range of numerical values to be stated; unit equivalence classes, specify sets of units that are mutually comparable; organizational schemas, useful for locating classifications and attributes sharing a common context; and groups, into which concepts sharing a common context are collected. A functional interface is also specified. As denoting and encoding a concept requires a standard way of identifying the concept, ISO/IEC 18025:2014 specifies labels and codes in the dictionaries.

INCITS/ISO/IEC 18026:2009 [R2015], Information technology - Spatial Reference Model (SRM)

This standard specifies the Spatial Reference Model (SRM) defining relevant aspects of spatial positioning and related information processing. The SRM allows precise and unambiguous specification of geometric properties such as position (location), direction, and distance. The SRM addresses the needs of a broad community of users, who have a range of accuracy and performance expectations depending on their mission-critical intensive applications. Aspects of this standard apply to, but are not limited to: 1. mapping, charting, geodesy, and imagery; 2. topography; 3. location-based services; 4. oceanography; 5. meteorology and climatology; 6. interplanetary and planetary sciences; 7. embedded systems; and 8. modelling and simulation. The application program interface supports more than 30 forms of position representation. To ensure that spatial operations are performed consistently, the application program interface specifies conversion operations with functionality defined to ensure high precision transformation between alternative representations of geometric properties. This standard is not intended to replace the standards and specifications developed by ISO/TC 211, ISO/TC 184, the International Astronomical Union (IAU), and the International Association of Geodesy (IAG). It is applicable to applications whose spatial information requirements overlap two or more of the application areas that are the scope of the work of ISO/TC 211, ISO/TC 184, the IAU, and the IAG.

This part of ISO/IEC 18028 provides an overview of different techniques of security gateways, of components and of different types of security gateway architectures. It also provides guidelines for selection and configuration of security gateways. Although Personal Firewalls make use of similar techniques, they are outside the scope of this part of ISO/IEC 18028 because they do not serve as security gateways. The intended audiences for this part of ISO/IEC 18028 are technical and managerial personnel, e.g. IT managers, system administrators, network administrators and IT security personnel.

This part of ISO/IEC 18028 provides guidance for securely using remote access - a method to remotely connect a computer either to another computer or to a network using public networks and its implication for IT security. In this it introduces the different types of remote access including the protocols in use, discusses the authentication issues related to remote access and provides support when setting up remote access securely. It is intended to help network administrators and technicians who plan to use this kind of connection or who already have it in use and need advice on how to set it up securely and operate it securely.

This part of ISO/IEC 18028 provides detailed direction with respect to the security aspects of using Virtual Private Network (VPN) connections to inter-connect networks, and also to connect remote users to networks. It builds upon the network management direction provided in ISO/IEC 18028-1.

This International Standard specifies a conceptual model for a random bit generator for cryptographic purposes, together with the elements of this model. This International Standard specifies the characteristics of the main elements required for a non-deterministic random bit generator, specifies the characteristics of the main elements required for a deterministic random bit generator, establishes the security requirements for both the non-deterministic and the deterministic random bit generator.

INCITS/ISO/IEC 18032:2005 [R2014], Information technology - Security techniques - Prime number generation

ISO/IEC 18032:2005 specifies methods for generating and testing prime numbers. Prime numbers are used in various cryptographic algorithms, mainly in asymmetric encryption algorithms and digital signature algorithms. Firstly, ISO/IEC 18032:2005 specifies methods for testing whether a given number is prime. The testing methods included in ISO/IEC 18032:2005 can be divided into two groups: Probabilistic primality tests, which have a small error probability. All probabilistic tests described here may declare a composite to be a prime. One test described here may declare a prime to be composite. Deterministic methods, which are guaranteed to give the right verdict. These methods use so-called primality certificates. Secondly, ISO/IEC 18032:2005 specifies methods to generate prime numbers. Again, both probabilistic and deterministic methods are presented.

This part of ISO/IEC 18033 is general in nature, and provides definitions that apply in subsequent parts of ISO/IEC 18033. The nature of encryption is introduced, and certain general aspects of its use and properties are described. The criteria used to select the algorithms specified in subsequent parts of ISO/IEC 18033 are defined in Annex A.

This is an Amendment 1 to ISO/IEC 18033-1:2005.

INCITS/ISO/IEC 18033-2-2008 [R2013], Information technology - Security techniques - Encryption algorithms - Part 2: Asymmetric ciphers

This part of ISO/IEC 18033 specifies several asymmetric ciphers. These specifications prescribe the functional interfaces and correct methods of use of such ciphers in general, as well as the precise functionality and cipher text format for several specific asymmetric ciphers (although conforming systems may choose to use alternative formats for storing and transmitting cipher-texts).

ISO/IEC 18033 specifies encryption systems (ciphers) for the purpose of data confidentiality. ISO/IEC 18033-3:2010 specifies block ciphers. A block cipher is a symmetric encryption system with the property that the encryption algorithm operates on a block of plaintext, i.e. a string of bits of a defined length, to yield a block of ciphertext.
INCITS/ISO/IEC 18033-4:2011 [2012],
Information technology -- Security techniques -- Encryption algorithms -- Part 4: Stream ciphers
This part of ISO/IEC 18033 specifies a) output functions to combine a keystream with plaintext, b) keystream generators for producing keystream, and c) object identifiers assigned to dedicated keystream generators in accordance with ISO/IEC 9834. NOTE 1 The list of assigned object identifiers is given in Annex A. NOTE 2 Any change to the specification of these algorithms resulting in a change of functional behaviour will result in a change of the object identifier assigned to the algorithms concerned.

INCITS/ISO/IEC 18035:2003 [R2013],
Information technology -- Network management -- Object identifiers
ISO/IEC 18035:2002 defines a consistent set of icons and related functions that are represented by multimedia applications on a computer screen and that users interact with to control such applications. It describes controls applying to such functions as: Play, Pause, Stop, Rewind, Scan forward, Scan backward, Replay backward, Loop, Go to beginning, Go to previous, Go to next, Go to end, Set volume and Mute.

INCITS/ISO/IEC 18041-4:2007 [R2014],
Information technology -- Computer graphics, image processing and environmental data representation -- Environmental Data Coding Specification (EDCS) language bindings -- Part 4: C
ISO/IEC 18041-4:2007 specifies the binding of the application programming interface (API) defined in ISO/IEC 18025 to the C programming language. The Environmental Data Coding Specification (EDCS) is a mapping between data and meaning. Data in a system may need to be identified as to purpose, metric and usage. This specification defines a standard set of terms for providing this information. ISO/IEC 18041-4:2007 defines a standard binding for the C computer programming language.

INCITS/ISO/IEC 18042-4:2006 [R2014],
Information technology -- Computer graphics and image processing -- Spatial Reference Model (SRM) language bindings -- Part 4: C
This document has been packaged as a zipped file to ensure that any links between the files have been structured. Be sure to save all the files in the same folder to ensure that any links between the files function.

INCITS/ISO 18024-2:2006/Amd 1:2011,
Information technology -- Computer graphics and image processing -- Spatial Reference Model (SRM) language bindings -- Part 4: C
AMENDMENT 1
This is the first Amendment to ISO/IEC 18024-2:2005 that specifies a language-independent application program interface (API). For integration into a programming language, the Spatial Reference Model (SRM) API is embedded in a language-dependent layer obeying the particular conventions of that language. ISO/IEC 18024-2:2005 specifies such a language-dependent layer for the C language.

INCITS/ISO/IEC 18043:2006 [R2013],
Information technology -- Security techniques -- Selection, deployment and operations of Intrusion Detection Systems (IDSs)
This International Standard provides guidelines to assist organizations in preparing to deploy Intrusion Detection System (IDS). In particular, it addresses the selection, deployment and operations of IDS. It also provides background information from which these guidelines are derived.

This International Standard is a companion document to the evaluation criteria for IT security defined in ISO/IEC 15408. It defines the minimum actions to be performed by an evaluator in order to conduct an ISO/IEC 15408 evaluation, using the criteria and evaluation evidence defined in ISO/IEC 15408. This International Standard does not define evaluator actions for certain high assurance ISO/IEC 15408 components, where there is as yet no generally agreed guidance.

ISO/IEC 18050:2006 specifies two methodologies for the measurement of specific print quality attributes of two-dimensional bar code symbols printed within the requirements of Digital Postage Marks. One of these methodologies is applicable to multi-row bar code symbologies and the other to two-dimensional matrix symbologies. ISO/IEC 18050:2006 defines methods for grading print quality attributes and deriving an overall assessment of symbol quality.

INCITS/ISO 18092:2013 [2015], Information technology -- Telecommunications and information exchange between systems -- Near Field Communication -- Interface and Protocol (NFCIP-1)
This standard defines communication modes for Near Field Communication Interface and Protocol (NFCIP-1) using inductive coupled devices operating at the centre frequency of 13.56 MHz for interconnection of computer peripherals. It also defines both the Active and the Passive communication modes of Near Field Communication Interface and Protocol (NFCIP-1) to realize a communication network using Near Field Communication devices for networked products and also for consumer equipment. This standard specifies, in particular, modulation schemes, codings, transfer speeds, and frame format of the RF interface, as well as initialization schemes and conditions required for data collision control during initialization. It also defines a transport protocol including protocol activation and data exchange methods.

INCITS/ISO/IEC 1831:1980 [S2013], Printing specifications for optical character recognition includes basic definitions, measurement requirements, specifications and recommendations for OCR paper and print, and deals with three main parameters for OCR media: optical properties of paper; optical properties and dimensions of ink patterns used as OCR characters; basic requirements for positions of OCR characters on paper. References: ISO 216; 1073/1; 1073/2; 2469; 2471; CIE Publication 15 (E 1.3.1) 1971.

INCITS/ISO/IEC 18809-2000 [S2016], Information technology -- 8 mm wide magnetic tape cartridge for information interchange -- Helical scan recording -- AIT-1 with MIC Format
Specifies the physical and magnetic characteristics of an 8 mm wide magnetic tape cartridge containing a memory chip to enable physical interchange of such cartridges between drives. It also specifies the quality of the recorded signals, the recording method and the recorded format -- called Advanced Intelligent Tape No. 1 with Memory In Cartridge (AIT-1 with MIC) -- thereby allowing data interchange between drives by means of such magnetic tape cartridges.

INCITS/ISO/IEC 18810-2001 [S2016], Information technology -- 8 mm wide magnetic tape cartridge for information interchange -- Helical scan recording -- AIT-2 with MIC Format
Specifies the physical and magnetic characteristics of an 8 mm wide magnetic tape cartridge containing a memory chip to enable physical interchange of such cartridges between drives. It also specifies the quality of the recorded signals, the recording method and the recorded format -- called Advanced Intelligent Tape No. 2 with Memory In Cartridge (AIT-2 with MIC) -- thereby allowing data interchange between drives by means of such magnetic tape cartridges. The System Log are recorded in the MIC.
INCITS/ISO/IEC 18836:2001 [S2011], Information technology - 8 mm wide magnetic tape cartridge for information interchange - Helical scan recording - Mammoth Type-2 Format

Specifies the physical and magnetic characteristics of an 8 mm wide magnetic tape cartridge to enable physical interchange of such cartridges between drives. It also specifies the quality of the recorded signals, the recording method and the recorded format called MammothTape-2, and thereby allowing data interchange between drives by means of such magnetic tape cartridges.

INCITS/ISO/IEC 19118:2011 [2012], Geographic information - Encoding

ISO 19118:2011 specifies the requirements for defining encoding rules for use for the interchange of data that conform to the geographic information in the set of International Standards known as the "ISO 19100 series".

INCITS/ISO/IEC 19136:2007 [R2015], Geographic information - Geography Markup Language (GML)

The Geography Markup Language (GML) is an XML encoding in compliance with ISO 19118 for the transport and storage of geographic information modelled in accordance with the conceptual modelling framework used in the ISO 19100 series of International Standards and including both the spatial and non-spatial properties of geographic features. This standard defines the XML Schema syntax, mechanisms and conventions that: • provide an open, vendor-neutral framework for the description of geospatial application schemas for the transport and storage of geographic information in XML; • allow profiles that support proper subsets of GML framework descriptive capabilities; • support the description of geospatial application schemas for specialized domains and information communities; • enable the creation and maintenance of linked geographic application schemas and datasets; • support the storage and transport of application schemas and data sets; • increase the ability of organizations to share geographic application schemas and the information they describe. Implementers may decide to store geographic application schemas and information in GML, or they may decide to convert from some other storage format on demand and use GML only for schema and data transport.

INCITS/ISO/IEC 19395:2015 [2017], Information technology - Sustainability for and by information technology - Smart data centre resource monitoring and control

Provides Messages that facilitate integrated or "smart" monitoring and control of Resources in those islands. The Messages are exchanged between the Management Function and Resources. ISO/IEC 19395:2015 acknowledges that those Resources may be composed of other Resources (e.g. a rack may contain servers, ventilators, etc.). In addition, e.g. those servers may be viewed from their computing, energy consumption or dissipation aspects which ISO/IEC 19395:2015 models as Resource Components and groups into IT, power and fluid Domains, respectively.

ISO/IEC 19502:2005 defines a metamodel (defined using Meta Object Facility, MOF), a set of interfaces (defined using Open Distributed Processing (ODP) Interface Definition Language (IDL) (ITU-T Recommendation X.920 (1997) | ISO/IEC 14750:1999)), that can be used to define and manipulate a set of interoperable metamodels and their corresponding models. ISO/IEC 19502:2005 also defines the mapping from MOF to ODP IDL. These interoperable metamodels include the Unified Modeling Language (UML) metamodel (ISO/IEC 19501:2005), the MOF meta-metamodel, as well as future standard technologies that will be specified using metamodels.

INCITS/ISO/IEC 19503:2005 [R2014], Information technology - XML Metadata Interchange (XMI)

The main purpose of ISO/IEC 19503:2005 (XMI) is to enable easy interchange of metadata between application development lifecycle tools (such as modeling tools based on the Unified Modeling Language (UML), ISO/IEC 19501, and metadata repositories/frameworks based on the Meta Object Facility (MOF), ISO/IEC 19502) in distributed heterogeneous environments. ISO/IEC 19503:2005 integrates three key industry standards: XML, eXtensible Markup Language, a W3C standard; UML, Unified Modeling Language, an OMG modeling specification which is now ISO/IEC 19501; MOF, Meta Object Facility (ISO/IEC 19502).

ISO/IEC 19508:2014 provides the basis for metamodel definition in OMG’s family of MDA languages and is based on a simplification of UML2’s class modeling capabilities. In addition to providing the means for metamodel definition it adds core capabilities for model management in general, including Identifiers, a simple generic Tag capability and Reflective operations that are defined generically and can be applied regardless of metamodel.

ISO/IEC 19509:2014 supports the Meta Object Facility (MOF) Core defined in ISO/IEC 19508. MOF is the foundation technology for describing metamodels. It covers a wide range of domains, and is based on a constrained subset of UML. XML is widely used XML interchange format. It defines the following aspects involved in describing objects in XML: the representation of objects in terms of XML elements and attributes; the standard mechanisms to link objects within the same file or across files; the validation of XML documents using XML Schemas; object identity, which allows objects to be referenced from other objects in terms of IDs and UUIDs.

INCITS/ISO/IEC 19752:2004 [2008], Information technology - Method for the determination of toner cartridge yield for monochromatic electrophotographic printers and multifunction devices that may contain printer components

ISO/IEC 19752:2004 is limited to evaluation of toner cartridge yield for toner containing cartridges (i.e. all-in-one toner cartridges and toner cartridges without a photoconductor) for monochrome electrophotographic printers. ISO/IEC 19752:2004 can also be applied to the printer component of any multifunctional device that has a digital input-printing path (i.e. multi-function devices that contain printer components).

INCITS/ISO/IEC 19752:2004 [R2013], Information technology - Method for the determination of toner cartridge yield for monochrome electrophotographic printers and multi-function devices that may contain printer components

ISO/IEC 19752:2004 is limited to evaluation of toner cartridge yield for toner containing cartridges (i.e. all-in-one toner cartridges and toner cartridges without a photoconductor) for monochrome electrophotographic printers. ISO/IEC 19752:2004 can also be applied to the printer component of any multifunctional device that has a digital input-printing path (i.e. multi-function devices that contain printer components).

INCITS/ISO/IEC 19752:2004/Cor 1:2013, Information technology -- Method for the determination of toner cartridge yield for monochromatic electrophotographic printers and multi-function devices that contain printer components -- Technical Corrigendum 1

This is the first corrigendum to ISO/IEC 19752:2004 that is limited to evaluation of toner cartridge yield for toner containing cartridges (i.e. all-in-one toner cartridges and toner cartridges without a photoconductor) for monochrome electrophotographic printers. ISO/IEC 19752:2004 can also be applied to the printer component of any multifunctional device that has a digital input-printing path (i.e. multi-function devices that contain printer components).

ISO/IEC 19756:2011 (TMCL) is a constraint language for Topic Maps, allowing definitions of Topic Maps schemas to be written in a precise and machine-readable form. This makes it possible to validate a topic map against a TMCL schema to see if it conforms to the constraints in the schema, and also enables other uses, such as schema-driven editors and object mappings. TMCL is defined as a Topic Maps vocabulary consisting of a number of topic, association, occurrence, and role types, identified by Published Subject Identifiers (PSIs), and defined using English prose.
schemata may be written in any schema languages, elements or attributes. An NVDL script also specifies validators, depending on the namespaces of the attributes in a given XML document to different Validation Dispatching Language (NVDL). An NVDL NG schemas and specifies when an XML document is validated. ISO/IEC 19757:2:2008 specifies RELAX NG, a schema language for XML. A RELAX NG schema specifies a pattern for the structure and content of an XML document. The pattern is specified by using a regular tree grammar. It establishes requirements for RELAX NG schemas and specifies when an XML document matches the pattern specified by a RELAX NG schema.

ISO/IEC 19757 defines a set of Document Schema Definition Languages (DSDDL) that can be used to specify one or more validation processes performed against Extensible Markup Language (XML) or Standard Generalized Markup Language (SGML) documents. (XML is an application profile SGML, ISO 8879:1986.) ISO/IEC 19757:3:2006 specifies Schematron, a rules-based schema language for XML. It establishes requirements for Schematron schemas and specifies when an XML document matches the patterns specified by a Schematron schema.

ISO/IEC 19757-4:2006 specifies a Namespace-based Validation Dispatching Language (NVDL). An NVDL script controls the dispatching of elements or attributes in a given XML document to different validators, depending on the namespces of the elements or attributes. An NVDL script also specifies which schemata are used by these validators. These schemata may be written in any schema languages, including those specified by ISO/IEC 19757.

INCITS/ISO/IEC 19757-4:2006/Cor 1:2008 [R2015], Information technology - Document Schema Definition Languages (DSDDL) - Part 4: Namespace-based Validation Dispatching Language (NVDL) - Technical Corrigendum 1

This technical corrigendum corrects a defect in ISO/IEC 19757:8-2008. ISO/IEC 19757:8-2008 specifies a mechanism that allows users to assign locally meaningful names to XML elements, attributes, entities and processing instructions, without having to completely rewrite the Document Type Definition (DTD) or schema against which they are to be validated. In addition, ISO/IEC 19757:8-2008 provides an XML-based format for declaring the replacement text for entity references and provides a mechanism that allows users to define default values for both element content and attribute values.

ISO/IEC 19757-5:2011 specifies an XML language that allows users to create and extend datatype libraries for their own purposes. The datatype definitions in these libraries can be used by XML validators and other tools to validate content and make comparisons between values.

INCITS/ISO/IEC 19757-7:2009 [2013], Information technology -- Document Schema Definition Languages (DSDDL) -- Part 7: Character Repertoire Description Language (CREPDL)
ISO/IEC 19757-7:2009 specifies a Character Repertoire Description Language (CREPDL); a CREPDL schema describes a character repertoire. ISO/IEC 19757-7:2009 introduces kernels and hulls of repertoires, then specifies the syntax of CREPDL schemas and the semantics of a correct CREPDL schema; the semantics specify when a character is in a repertoire described by a CREPDL schema. ISO/IEC 19757-7:2009 defines CREPDL processors and their behaviour. Finally, it describes differences of conformant CREPDL processors, and provides examples of CREPDL schemas.

ISO/IEC 19757-8:2008 specifies a mechanism that allows users to assign locally meaningful names to XML elements, attributes, entities and processing instructions, without having to completely rewrite the Document Type Definition (DTD) or schema against which they are to be validated. In addition, ISO/IEC 19757-8:2008 provides an XML-based format for declaring the replacement text for entity references and provides a mechanism that allows users to define default values for both element content and attribute values.

ISO/IEC 19757-9:2008 defines a language that is designed to extend the declarative functionality of an XML Document Type Definition (DTD) to include declaring one or more namespaces to which some or all of the element and attribute names in a DTD belong, declaring constraints on the content of elements with content model ANY to contain elements whose names belong to one or more specified namespaces, declaring datatypes for elements that contain data content only and for attribute values.

ISO/IEC 19763 specifies a metamodel framework for interoperability. ISO/IEC 19763-1:2007 specifies objectives, the basic concept of the metamodel framework, and requirements for development of each part of ISO/IEC 19763.

Specifies a metamodel framework for interoperability. This part of ISO/IEC 19763 specifies the metamodel that provides a facility to register administrative and evolution information related to ontologies. The metamodel specified is intended to promote interoperation among application systems, by providing administrative and evolution information related to ontologies, accompanied with standardized ontology repositories that register ontologies themselves in specific languages. It does not specify the metamodels of ontologies expressed in specific languages and the mappings among them. They are specified in other specifications such as the Ontology Definition Metamodel from the Object Management Group.

INCITS/ISO/IEC 19772-2009 [R2014], Information technology - Security techniques - Authenticated encryption
This International Standard specifies six methods for authenticated encryption, i.e. defined ways of processing a data string with the following security objectives: &amp;#61630; data confidentiality, i.e. protection against unauthorized disclosure of data, &amp;#61630; data integrity, i.e. protection that enables the recipient of data to verify that it has not been modified, &amp;#61630; data origin authentication, i.e. protection that enables the recipient of data to verify the identity of the data originator.
INCITS/ISO/IEC 19773:2011 [2012], Information technology -- Metadata Registries (MDR) modules
ISO/IEC 19773:2011 specifies small modules of data that can be used or reused in applications. These modules have been extracted from ISO/IEC 11179-3, ISO/IEC 19763, and OASIS EBXML, and have been refined further. These modules are intended to harmonize with current and future versions of the ISO/IEC 11179 series and the ISO/IEC 19763 series. These modules include: reference-or-literal (reflit) for on-demand choices of pointers or data; multitext, multistring, etc. for recording internationalized and localized data within the same structure; slots and slot arrays for standardized extensible data structures; etc.

ISO/IEC 19774, Extensible 3D (X3D), defines a system that integrates three-dimensional (3D) graphics and multimedia. Conceptually, each X3D file is a 3D time-based space that contains graphic and aural objects that can be dynamically modified through a variety of mechanisms. ISO/IEC 19774:2006 defines a mapping of the abstract objects in X3D to a specific X3D encoding using the Extensible Markup Language (XML).

INCITS/ISO/IEC 19776:2:2015 [2016], Information technology - Computer graphics, image processing and environmental data representation - Extensible 3D (X3D) Part 2: Scene access interface (SAI)
Specifies a standard set of services that are made available by a browser so that an author can access the scene graph while it is running. Such access is designed to support inspection and modification of the scene graph.

For integration into a programming language, the X3D abstract interfaces are embedded in a language-dependent layer obeying the particular conventions of that language. ISO/IEC 19777:1:2006 specifies such a language-dependent layer for the ECMAScript language. ISO/IEC 19777:2 specifies a language-independent application programmer interface (API) to a set of services and functions.

INCITS/ISO/IEC 19777:2:2008 [R2013], Information technology - Computer graphics and image processing - Extensible 3D (X3D) language bindings - Part 2: Java
The Extensible 3D (X3D) specification, ISO/IEC 19775, specifies a language-independent application programmer interface (API) to a set of services and functions. For integration into a programming language, the X3D abstract interfaces are embedded in a language dependent layer obeying the particular conventions of that language. ISO/IEC 19777:2:2006 specifies such a language-dependent layer for the Java programming language.

This standard is applicable to collaborative technologies used to support communication among learners, instructors and other participants. The implementation and communicative use of these technologies entails the creation of information related to participant groups, and to the collaborative environments, functions and tools that are set up for, and used by, these groups. This part of ISO/IEC 19778 -- together with its subsequent parts -- defines Data Models that enable the portability and reuse of this data in integrated form, and allow Data Model instantiations to be exchanged, stored, retrieved, reused or analysed by a variety of systems.

INCITS/ISO/IEC 19778:3:2011 [2012], Information technology -- Computer graphics, image processing and environmental data representation -- Extensible 3D (X3D) encodings -- Part 3: Compressed binary encoding
Defines a system that integrates three-dimensional graphics and multimedia. Conceptually, each X3D file is a 3D time-based space that contains graphic and aural objects that can be dynamically modified through a variety of mechanisms. ISO/IEC 19776:2:2008 defines a mapping of the abstract objects in X3D to a specific X3D encoding written out in a compact binary form.
INCITS/ISO 19778-3:2008 [R2015], Information technology - Learning, education and training - Collaborative technology - Collaborative workplace - Part 3: Collaborative group data model

This part of ISO/IEC 19778 specifies the Data Model for a collaborative group. The collaborative group Data Model comprises roles which can be played by the participants of a collaborative group, declares the intended role holders (positions for playing a particular role) for each role, and (at least during the life-span of the collaborative workplace) assigns participants to these role holders. The role names may be used as references to roles specified in detail by further specifications or standards. Where no such specifications or standards are available or identified, the provision of descriptions for human interpretation may support harmonization use of these names.

Provided participant identifiers may be used as references to detailed participant information which may be specified in a provided user management system. NOTE There is a risk of improper access and misuse of personal and private data facilitated by use of the collaborative group Data Model. It is the responsibility of the implementer to ensure proper use of any involved personal information.

ISO/IEC 19784-2:2007 provides an interface that specifies a biometric sensor interface for a Biometric Service Provider (BSP, see ISO/IEC 19784-1). The interface supports a BSP wishing to provide the BioAPI Service Provider Interface (SPI) functions, whilst removing device handling activity from the BSP. Provides an interface that can be used by all types of biometric sensor, including inter alia image streaming sensors (infrared, face, iris, fingerprint, etc.), voice streaming sensors and digital tablets providing dynamic signature data.

Specifies a biometric sensor interface for a Biometric Service Provider (BSP, see ISO/IEC 19784-1). The interface supports a BSP wishing to provide the BioAPI Service Provider Interface (SPI) functions, whilst removing device handling activity from the BSP. ISO/IEC 19784-4:2011 provides an interface that can be used by all types of biometric sensor, including inter alia image streaming sensors (infrared, face, iris, finger, etc.), voice streaming sensors and digital tablets providing dynamic signature data.

This is the first Technical Corrigendum to ISO/IEC 19784-2:2007 that defines the interface between a biometric service provider (BSP) and a biometric archive function provider (BAFP) for BioAPI. A BAFP encapsulates all functionality for the storage, search and management of biometric reference data regardless of the kind of physical storage media. Using a BAFP, a BSP does not have to provide special handling of different storage media like database servers, smartcards, database web services, etc. Whatever media is used, the BSP in all cases handles the same interface for a BAFP.

Amendment 3 to ISO/IEC 19784-1:2006.

This is the first amendment to ISO/IEC 19784-1:2006 that provides a defined interface that allows a software application to communicate with (utilize the services of) one or more biometric technologies. It includes a high-level generic biometric authentication model suited to a broad range of biometrically enabled applications and to most forms of biometric technology. An architectural model is described which enables components of a biometric system to be provided by different vendors, and to interwork through fully-defined Application Programming Interfaces (APIs), corresponding Service Provider Interfaces (SPIs), and associated data structures.

This is the second amendment to ISO/IEC 19784-1:2006 that defines the interface between a biometric service provider (BSP) and a biometric archive function provider (BAFP) for BioAPI. A BAFP encapsulates all functionality for the storage, search and management of biometric reference data regardless of the kind of physical storage media.

This is the third amendment to ISO/IEC 19784-1:2006 that defines the interface between a biometric service provider (BSP) and a biometric archive function provider (BAFP) for BioAPI. A BAFP encapsulates all functionality for the storage, search and management of biometric reference data regardless of the kind of physical storage media.

This is the first amendment to ISO/IEC 19784-1:2006 that provides a defined interface that allows a software application to communicate with (utilize the services of) one or more biometric technologies. It includes a high-level generic biometric authentication model suited to a broad range of biometrically enabled applications and to most forms of biometric technology. An architectural model is described which enables components of a biometric system to be provided by different vendors, and to interwork through fully-defined Application Programming Interfaces (APIs), corresponding Service Provider Interfaces (SPIs), and associated data structures.

INCITS/ISO 19784-1:2006/Cor 1:2013, Information technology - Biometric application programming interface - Part 4: Biometric sensor function provider interface

This is the second amendment to ISO/IEC 19784-1:2006 that defines the interface between a biometric service provider (BSP) and a biometric archive function provider (BAFP) for BioAPI. A BAFP encapsulates all functionality for the storage, search and management of biometric reference data regardless of the kind of physical storage media.

This is the second technical corrigendum to ISO/IEC 19784-2:2007 and ISO/IEC 19784-2:2007 defines the interface between a biometric service provider (BSP) and a biometric archive function provider (BAFP) for BioAPI. A BAFP encapsulates all functionality for the storage, search and management of biometric reference data regardless of the kind of physical storage media.

ISO/IEC 19785-1:2006 defines a basic structure for standardized biometric information records (BIRs) within the Common Biometric Exchange Formats Framework (CBEFF). This structure consists of three parts: the standard biometric header (SBH), the biometric data block (BD), and the security block (SB). CBEFF also defines several data elements and their standardized abstract values that can be used in SBHs and SBS (CBEFF treats the BD as opaque data).
Amendment 1 to ISO/IEC 19785-1:2006

ISO/IEC 19785-2:2006 specifies the requirements for the operation of the Biometric Registration Authority within the Common Biometric Exchange Formats Framework (CBEFF). The Registration Authority is responsible for assigning and publishing, via its website, unique biometric organization identifier values to organizations that own or are otherwise responsible for standardized or proprietary format specifications for biometric data blocks, biometric information record security blocks and/or CBEFF patron formats, and to organizations that intend to assign biometric product identifier values to their products.
Amendment 1 to ISO/IEC 19785-2:2006

ISO/IEC 19785-3:2007 specifies several patron formats that conform to the requirements of ISO/IEC 19785-1. ISO/IEC 19785-1 defines a basic structure for standardized biometric information records (BIRs) that consists of three parts, the standard biometric header (SBH), the biometric data block (BDB), and the security block (SB). CBEFF also defines several data elements and their standardized abstract values that can be used in SBHs and SBs (CBEFF treats the BDB as opaque data). CBEFF also establishes mechanisms by which organizations, called 'patrons' by CBEFF, can specify and publish BIR format specifications, which are in turn called 'patron formats'
Amendment 1 to ISO/IEC 19785-3:2007

This part of ISO/IEC 19785 specifies security block formats (see ISO/IEC 19785-1) registered in accordance with ISO/IEC 19785-2 as formats defined by the CBEFF biometric organization ISO/IEC JTC 1/SC 37, and specifies their registered security block format identifiers.

This is the first technical corrigendum to ISO/IEC 19785-4:2010 and ISO/IEC 19785-4:2010 specifies security block formats (see ISO/IEC 19785-1) registered in accordance with ISO/IEC 19785-2 as formats defined by the CBEFF biometric organization ISO/IEC JTC 1/SC 37, and specifies their registered security block format identifiers. [The security block format identifier is recorded in the standard biometric header (SBH) of a patron format (or defined by that patron format as the only available security block format).]

This International Standard specifies the security requirements for a cryptographic module utilised within a security system protecting sensitive information in computer and telecommunication systems. This International Standard defines four security levels for cryptographic modules to provide for a wide spectrum of data sensitivity (e.g. low value administrative data, million dollar funds transfers, life protecting data, personal identity information, and sensitive information used by government) and a diversity of application environments (e.g. a guarded facility, an office, removable media, and a completely unprotected location).

ISO/IEC 19792:2009 specifies the subjects to be addressed during a security evaluation of a biometric system. It covers the biometric-specific aspects and principles to be considered during the security evaluation of a biometric system. It does not address the non-biometric aspects which might form part of the overall security evaluation of a system using biometric technology (e.g. requirements on databases or communication channels).

Standardized biometric data interchange formats are crucial to the interoperability of biometric components. ISO/IEC 19794-1:2006 describes general aspects of biometric data interchange formats and specifies requirements to be taken into account in standardizing specific formats. It classifies biometric data according to their processing level and establishes a naming concept for biometric data interchange formats on this basis.

This conformance testing methodology amends ISO/IEC 19794-1:2011 which describes the general aspects and requirements for defining biometric data interchange formats. The notation and transfer formats provide platform independence and separation of transfer syntax from content definition. ISO/IEC 19794-1:2011 defines what is commonly applied for biometric data formats, i.e. the standardization of the common content, meaning, and representation of biometric data formats of biometric types considered in the specific parts of ISO/IEC 19794.

ISO/IEC 19794-1-2011 describes the general aspects and requirements for defining biometric data interchange formats. The notation and transfer formats provide platform independence and separation of transfer syntax from content definition. ISO/IEC 19794-1:2011 defines what is commonly applied for biometric data formats, i.e., the standardization of the common content, meaning, and representation of biometric data formats of biometric types considered in the specific parts of ISO/IEC 19794.

ISO/IEC 19794-10:2007 specifies a data record interchange format for storing, recording and transmitting the information from one or more hand silhouettes within a Common Biometric Exchange Formats Framework (CBEFF) data structure. It defines the content, format and units of measurement for the exchange of hand silhouette data that may be used in the verification or identification process of a subject. The information consists of a variety of mandatory and optional items, including data capture parameters, standardized hand position and vendor-specific information.
INCITS/ISO/IEC 19794-11:2013 [2013], Information technology -- Biometric data interchange formats -- Part 11: Signature/sign processed dynamic data

For the purpose of biometric comparison, ISO/IEC 19794-11:2013 specifies a data interchange format for processed signature/sign behavioural data extracted from a time series, captured using devices such as digitizing tablets, pen-based computing devices, or advanced pen systems. The data interchange format is generic, in that it may be applied and used in a wide range of application areas where handwritten signs or signature/signs are used. No application-specific requirements or features are addressed in ISO/IEC 19794-11:2013.

This is the first amendment to ISO/IEC 19794-11:2013 and ISO/IEC 19794-11:2013 specifies a data interchange format for processed signature/sign behavioural data extracted from a time series, captured using devices such as digitizing tablets, pen-based computing devices, or advanced pen systems.

INCITS/ISO/IEC 19794-14:2013 [2013], Information technology -- Biometric data interchange formats -- Part 14: DNA data

ISO/IEC 19794-14:2013 specifies a data interchange format for the exchange of DNA data for person identification or verification technologies that utilize human DNA. It will provide the ability for DNA profile data to be exchanged and used for comparison (subject to privacy regulations) with DNA profile data produced by any other system that is based on a compatible DNA profiling technique and where the data format conforms to ISO/IEC 19794-14:2013.

ISO/IEC 19794-2:2005 specifies a concept and data formats for representation of fingerprints using the fundamental notion of minutiae. It is generic, in that it may be applied and used in a wide range of application areas where automated fingerprint recognition is involved.

This is the second corrigendum to Amendment 1 of ISO/IEC 19794-2:2005 and amendment 1 addresses the Detailed description of finger minutiae location, direction, and type of ISO/IEC 19794-2:2005 which specifies a concept and data formats for representation of fingerprints using the fundamental notion of minutiae. It is generic, in that it may be applied and used in a wide range of application areas where automated fingerprint recognition is involved.

Technical Corrigendum 1 to ISO/IEC 19794-2:2005

ISO/IEC 19794-2:2011 specifies a concept and data formats for representation of fingerprints using the fundamental notion of minutiae. It is generic, in that it may be applied and used in a wide range of application areas where automated fingerprint recognition is involved. It contains definitions of relevant terms, a description of how minutiae are to be determined, data formats for containing the data for both general use and for use with cards, and conformance information. Guidelines and values for matching and decision parameters are provided.

ISO/IEC 19794-2:2005 specifies a concept and data formats for representation of fingerprints using the fundamental notion of minutiae. It is generic, in that it may be applied and used in a wide range of application areas where automated fingerprint recognition is involved. ISO/IEC 19794-2:2005 contains definitions of relevant terms, a description of how minutiae shall be determined, data formats for containing the data for both general use and for use with cards, and conformance information. Guidelines and values for matching and decision parameters are provided in an informative annex.

This is the first amendment for ISO/IEC 19794-2:2011 and ISO/IEC 19794-2:2011 specifies a concept and data formats for representation of fingerprints using the fundamental notion of minutiae. It is generic, in that it may be applied and used in a wide range of application areas where automated fingerprint recognition is involved. It contains definitions of relevant terms, a description of how minutiae are to be determined, data formats for containing the data for both general use and for use with cards, and conformance information. Guidelines and values for matching and decision parameters are provided.

INCITS/ISO/IEC 19794-3-2007 [R2012], Information technology - Biometric Data Interchange Formats - Part 3: Finger Pattern Spectral Data

ISO/IEC 19794-3:2006, the finger pattern spectral data interchange format, specifies requirements for the representation of local or global spectral data derived from a fingerprint image. The format is designed to provide flexibility in the choice of spectral representation in that spectral components may be based on quantized co-sinusoidal triplets, Discrete Fourier Transformations or Gabor filters. The format also allows for a variable number of spectral components to be retained, which enables data representations in a form that is more compact than storage of the entire fingerprint image.

ISO/IEC 19794-4:2005 specifies a data record interchange format for storing, recording, and transmitting the information from one or more fingerprint or palm image areas within an ISO/IEC 19785-1 CBFEF data structure. This can be used for the exchange and comparison of fingerprint image data. It defines the content, format, and units of measurement for the exchange of fingerprint data that may be used in the verification or identification process of a subject. The information consists of a variety of mandatory and optional items, including scanning parameters, compressed or uncompressed images and vendor-specific information.

This is the first Technical Corrigendum to ISO/IEC 19794-4:2005 that specifies a data record interchange format for storing, recording, and transmitting the information from one or more fingerprint or palm image areas within an ISO/IEC 19785-1 CBFEF data structure. This can be used for the exchange and comparison of fingerprint image data. It defines the content, format, and units of measurement for the exchange of fingerprint image data that may be used in the verification or identification process of a subject.
INCITS/ISO/IEC 19794-4:2011 [2013],
Information technology - Biometric data interchange formats - Part 4: Finger image data

ISO/IEC 19794-4:2011 specifies a data record interchange format for storing, recording, and transmitting the information from one or more finger or palm image areas within an ISO/IEC 19785-1 data structure. This can be used for the exchange and comparison of finger image data. It defines the content, format, and units of measurement for the exchange of finger image data that may be used in the verification or identification process of a subject. The information consists of a variety of mandatory and optional items, including scanning parameters, compressed or uncompressed images and vendor-specific information.

INCITS/ISO/IEC 19794-4:2011/Amd 1:2014,
Information technology - Biometric data interchange formats - Part 4: Finger image data - Amendment 1: Conformance testing methodology and clarification of defects

This is the first amendment to ISO/IEC 19794-4:2011 on Conformance testing methodology and clarification of defects and ISO/IEC 19794-4:2011 specifies a data record interchange format for storing, recording, and transmitting the information from one or more finger or palm image areas within an ISO/IEC 19785-1 data structure. This can be used for the exchange and comparison of finger image data.

INCITS/ISO/IEC 19794-4:2011/Cor 1:2014,
Information technology - Biometric data interchange formats - Part 4: Finger image data - Technical Corrigendum 1

This is the first corrigendum to ISO/IEC 19794-4:2011 and ISO/IEC 19794-4:2011 specifies a data record interchange format for storing, recording, and transmitting the information from one or more finger or palm image areas within an ISO/IEC 19785-1 data structure. This can be used for the exchange and comparison of finger image data.

INCITS/ISO/IEC 19794-5:2005 [R2012],
Information technology - Biometric Data Interchange Formats - Part 5: Face Image Data

ISO/IEC 19794-5:2005 specifies scene, photographic, digitization and format requirements for images of faces to be used in the context of both human verification and computer automated recognition. The approach to specifying scene and photographic requirements in this format is to carefully describe constraints on how a photograph should appear rather than to dictate how the photograph should be taken.

INCITS/ISO/IEC 19794-5:2005/Cor 1:2008 [R2014],
Information technology - Biometric data interchange formats - Part 5: Face image data - Technical Corrigendum 2

This is the second corrigendum to ISO/IEC 19794-5:2005 and ISO/IEC 19794-5:2005 specifies scene, photographic, digitization and format requirements for images of faces to be used in the context of both human verification and computer automated recognition. The approach to specifying scene and photographic requirements in this format is to carefully describe constraints on how a photograph should appear rather than to dictate how the photograph should be taken.

INCITS/ISO/IEC 19794-5:2005/Cor 2:2008 [R2014],
Information technology - Biometric data interchange formats - Part 5: Face image data - Technical Corrigendum 3

This is the third corrigendum to ISO/IEC 19794-5:2005 and ISO/IEC 19794-5:2005 specifies scene, photographic, digitization and format requirements for images of faces to be used in the context of both human verification and computer automated recognition.

INCITS/ISO/IEC 19794-5:2011 [2013],
Information technology - Biometric data interchange formats - Part 5: Face image data

ISO/IEC 19794-5:2011 specifies a record format for storing, recording, and transmitting information from one or more facial images or a short video stream of facial images, specifies scene constraints of the facial images, specifies photographic properties of the facial images, specifies digital image attributes of the facial images, and provides best practices for the photography of faces.

Information technology - Biometric Data Interchange Formats - Part 5: Face Image Data AMENDMENT 1: Conformance testing methodology and clarification of defects

This is the first amendment to the 2011 edition of ISO/IEC 19794-5 that: specifies a record format for storing, recording, and transmitting information from one or more facial images or a short video stream of facial images, - specifies scene constraints of the facial images, - specifies photographic properties of the facial images, - specifies digital image attributes of the facial images, and provides best practices for the photography of faces.

INCITS/ISO/IEC 19794-6:2007 [R2012],
Information technology - Biometric Data Interchange Formats - Part 6: Iris Image Data

ISO/IEC 19794-6:2005 specifies two alternative image interchange formats for biometric authentication systems that utilize iris recognition. The first is based on a rectilinear image storage format that may be a raw, uncompressed array of intensity values or a compressed format such as that specified by ISO/IEC 15444. The second format is based on a polar image specification that requires certain pre-processing and image segmentation steps, but produces a much more compact data structure that contains only iris information.

INCITS/ISO/IEC 19794-6:2011 [2013],
Information technology - Biometric data interchange formats - Part 6: Iris image data

ISO/IEC 19794-6:2011 specifies iris image interchange formats for biometric enrollment, verification and identification systems. The image information might be stored as an array of intensity values optionally compressed with ISO/IEC 15948 or ISO/IEC 15444, or an array of intensity values optionally compressed with ISO/IEC 15948 or ISO/IEC 15444 that might be cropped around the iris, with the iris at the centre, and which might incorporate region-of-interest masking of non-iris regions.

INCITS/ISO/IEC 19794-6:2011/Cor 1:2014,
Information technology - Biometric data interchange formats - Part 6: Iris image data - Technical Corrigendum 1

This is the first corrigendum to ISO/IEC 19794-5:2011 and ISO/IEC 19794-6:2011 specifies iris image interchange formats for biometric enrollment, verification and identification systems. The image information might be cropped around the iris, with the iris at the centre, and which might incorporate region-of-interest masking of non-iris regions.
INCITS/ISO 19794-7:2007 [R2012], Information technology - Biometric Data Interchange Formats - Part 7: Sign/Signature Series Data

ISO/IEC 19794-7:2007 specifies two data interchange formats for signature/sign behavioural data captured in the form of time series using devices such as digitizing tablets or advanced pen systems. One data interchange format is for general use and the other one is a compact format for use with smart cards or other tokens. Both data interchange formats can be used for both acquired signature/sign samples (serving as a starting point for feature extraction) and for time-series features (to be compared directly by time-series based comparison algorithms).

Technical Corrigendum 1 to ISO/IEC 19794-7:2007

INCITS/ISO 19794-7:2014, Information technology -- Biometric data interchange formats -- Part 7: Signature/sign time series data

ISO/IEC 19794-7:2014 specifies data interchange formats for signature/sign behavioural data captured in the form of a multi-dimensional time series using devices such as digitizing tablets or advanced pen systems. The data interchange formats are generic, in that they may be applied and used in a wide range of application areas where handwritten signs or signatures are involved. No application-specific requirements or features are addressed in ISO/IEC 19794-7:2014.

INCITS/ISO 19794-8:2006 [R2014], Information technology - Biometric Data Interchange Formats - Part 8: Finger Pattern Skeletal Data

ISO/IEC 19794-8:2006 specifies the interchange format for the exchange of pattern-based skeletal fingerprint recognition data. The data format is generic, in that it may be applied and used in a wide range of application areas where automated fingerprint recognition is involved. The exchange format defined in ISO/IEC 19794-8:2006 describes all characteristics of a fingerprint in a small data record. Thus it allows for the extraction of both spectral information (orientation, frequency, phase, etc.) and features (minutiae, core, ridge count, etc.). Transformations like translation and rotation can also be accommodated by the format defined herein.

INCITS/ISO 19794-8:2006/Cor 1:2013, Information technology - Biometric data interchange formats - Part 8: Finger pattern skeletal data - Technical Corrigendum 1

This is the first Technical Corrigendum to ISO/IEC 19794-8:2006 that specifies the interchange format for the exchange of pattern-based skeletal fingerprint recognition data. The data format is generic, in that it may be applied and used in a wide range of application areas where automated fingerprint recognition is involved.

provides guidance on the operational testing of biometric systems; specifies performance metrics for operational systems; details data that may be retained by operational systems to enable performance monitoring; and specifies requirements on test methods, recording of data, and reporting of results of operational evaluations.

INCITS/ISO/IEC 19795-7:2011 [R2016], Information technology -- Biometric performance testing and reporting -- Part 7: Testing of on-card biometric comparison algorithms

Establishes a mechanism for measuring the core algorithmic capabilities of biometric comparison algorithms running on ISO/IEC 7816 integrated circuit cards. Specifically, the standard instantiates a mechanism for on-card biometric comparison testing; standardizes procedures for the measurement of the accuracy of on-card biometric comparison implementations running on object-based, test-specific sample cards; standardizes procedures for the measurement of durations of the various operations; and gives examples for matching ISO/IEC 19794-2:2005 compact card minutiae templates.

ISO/IEC 19796-1:2005 is a framework to describe, compare, analyze, and implement quality management and quality assurance approaches. It will serve to compare different existing approaches and to harmonize these towards a common quality model. The main aspect is the Reference Framework for the Description of Quality Approaches (RFDAQ).

This part of ISO/IEC 19796 extends the "reference framework for the description of quality approaches" (RFDAQ) defined in ISO/IEC 19796-1 by providing a harmonized description of the methods and metrics required to implement quality management and quality assurance systems for stakeholders designing, developing, or utilizing information technology systems used for learning, education, and training. Activities such as quality planning, quality control, and quality improvement are important for quality management implementations. While these three activities are focused on products, processes and their development, quality assurance is focused more on confirmation and indication for internal and external stakeholders. It should be noted that the reference methods and metrics for this part of ISO/IEC 19796 include issues related to the implementation of quality management and assurance systems for information technologies that are used for learning, education, and training. This part of ISO/IEC 19796 is to be used to help identify methods and metrics to implement a quality assurance and management system of an IT system used for learning, education, and training. For example, it may be used for quality management systems that help to verify items such as IT system effectiveness, compliance with quality objectives including purposes, customer satisfaction, training in the use of the IT system, complaints handling, and auditing.

INCITS/ISO/IEC 19798:2007 [R2013], Information Technology - Method of the determination of toner cartridge yield for Colour printers and multi-function devices that contain printer components

ISO/IEC 19798:2007 defines a method for testing and calculation of average yield measured in the number of standard pages for a colour toner cartridge and specific printer printing in a semi-continuous mode under a defined set of conditions. It uses the test page suite defined in ISO/IEC 24712. ISO/IEC 19798:2007 can also be applied to the printer component of any multifunctional device that has a digital input-printing path (i.e. multi-function devices that contain printer components).

INCITS/ISO/IEC 19798:2007/Cor 1:2013, Method for the determination of toner cartridge yield for colour printers and multi-function devices that contain printer components -- Technical Corrigendum 1

This is the first corrigendum to ISO/IEC 19798:2007 that defines a method for testing and calculation of average yield measured in the number of standard pages for a colour toner cartridge and specific printer printing in a semi-continuous mode under a defined set of conditions. It uses the test page suite defined in ISO/IEC 24712. ISO/IEC 19798:2007 can also be applied to the printer component of any multifunctional device that has a digital input-printing path (i.e. multi-function devices that contain printer components).

ISO/IEC 19799:2007 defines methods and processes for measuring objective print quality attributes for the assessment of gloss non-uniformity on printed pages in reflection mode, and provides transforms, when applicable, that relate the objective results to subjective responses if appropriate. The gloss uniformity attributes included in ISO/IEC 19799:2007 are differential gloss, gloss uniformity within a page, and gloss consistency within a run.

This International Standard specifies the syntax and semantics of COBOL. Its purpose is to promote a high degree of machine independence to permit the use of COBOL on a variety of data processing systems.

This International Standard specifies the syntax and semantics of COBOL. Its purpose is to promote a high degree of machine independence to permit the use of COBOL on a variety of data processing systems.

INCITS/ISO/IEC 20005-2014, Information technology - Sensor networks - Services and interfaces supporting collaborative information processing in intelligent sensor networks

ISO/IEC 20005:2013 specifies services and interfaces supporting collaborative information processing (CIP) in intelligent sensor networks which includes: - CIP functionalities and CIP functional model, - common services supporting CIP, - common service interfaces to CIP.

ISO/IEC 20008-1:2013 specifies principles, including a general model, a set of entities, a number of processes, and general requirements for the following two categories of anonymous digital signature mechanisms: 1.signature mechanisms using a group public key, and 2.signature mechanisms using multiple public keys.
authentication mechanisms that allow the legitimacy requirements and constraints for anonymous entity authentication methods using a group public key; provides a group public key to verify a digital signature. It signature mechanisms, in which a verifier makes use of a general description of an anonymous digital signature mechanism using a group public key; a variety of mechanisms that provide such anonymous digital signatures.

ISO/IEC 20009-1:2013 specifies a model, requirements and constraints for anonymous entity authentication mechanisms that allow the legitimacy of an entity to be corroborated.

INCITS/ISO/IEC 20060:2010 [2013], Information technology - Open Terminal Architecture (OTA) - Virtual machine
ISO/IEC 20060:2010 provides the specifications for the standard Open Terminal Architecture (OTA) kernel in seven layers: definition of the virtual machine (VM); description of the services provided by the VM to terminal programmers; specification of a set of tokens representing the native machine language of the VM; specification of the format in which token modules are delivered to an OTA kernel for processing.

INCITS/ISO/IEC 20061:2001 [2020], Information technology - 12,65 mm wide magnetic tape cassette for information interchange - Helical scan recording DTF-2
This International Standard specifies the physical and magnetic characteristics of magnetic tape cassettes, using magnetic tape 12,65 mm wide so as to provide physical interchange of such cassettes between drives. It also specifies the quality of the recorded signals, the recording method and the recorded format, called Digital Tape Format-2 (DTF-2), thereby allowing data interchange between drives by means of such cassettes.

INCITS/ISO/IEC 20062:2001 [2012], Information technology - 8 mm wide magnetic tape cartridge for information interchange - Helical scan recording VXA-1 format
This International Standard specifies the physical and magnetic characteristics of an 8 mm wide magnetic tape cartridge to enable physical interchange of such cartridges between drives. It also specifies the quality of the recorded signals, the recording method and the recorded format called VXA-1, and thereby allowing data interchange between drives by means of such magnetic tape cartridges. This International Standard specifies three types depending on the length of magnetic tape contained in the case, referred to as Type A, Type B and Type C.
INCITS/ISO/IEC 20944-4:2013 [2013],
Information technology -- Metadata
Registries Interoperability and Bindings
(MDR-IB) -- Part 4: Protocol bindings
The ISO/IEC 20944 series of International Standards provides the bindings and their interoperability for metadata registries, such as those specified in the ISO/IEC 11179 series of International Standards. ISO/IEC 20944-4:2013 contains provisions that are common to protocol bindings and the protocol bindings themselves. The protocol bindings have commonality in their conceptualization of the services provided. Common features include: - common data transfer semantics; - harmonized session services for connection-oriented and connection-less protocols. Bindings for HTTP and WebDAV protocols are provided.

INCITS/ISO/IEC 20944-5:2013 [2013],
Information technology -- Metadata
Registries Interoperability and Bindings
(MDR-IB) -- Part 5: Profiles
The ISO/IEC 20944 series of International Standards provides the bindings and their interoperability for metadata registries, such as those specified in the ISO/IEC 11179 series of International Standards. ISO/IEC 20944-5:2013 contains provisions that are common to the profiles, and the profiles themselves. A profile of ISO/IEC 11179-3:2003 is included, which maps ISO/IEC 11179 metadata to standardized identifiers for navigation and access of ISO/IEC 11179 metadata.

INCITS/ISO/IEC 20970:2002 [S2012],
Information technology - Programming
languages, their environments and system
software interfaces - JEFF file format
This International Standard's most immediate interest is for deploying portable applications on small footprint devices. This International Standard provides dramatic savings of dynamic memory and execution time without sacrificing any of the flexibility usually attached to the use of non-pre-linked portable code.

INCITS/ISO/IEC 21000-10:2006 [R2014],
Information technology - Multimedia
framework (MPEG-21) - Part 10: Digital Item
Processing
This Part of ISO/IEC 21000, entitled Digital Item Processing (DIP), specifies the syntax and semantics of tools that may be used to process Digital Items. The tools provide a normative set of tools that specify the processing of a Digital Item in a predefined manner.

[R2014], Information technology - Multimedia
framework (MPEG-21) - Part 10: Digital Item Processing - Amendment 1: Addition C++ bindings
Amendment 1 to ISO/IEC 21000-10:2006.

INCITS/ISO/IEC 21000-14:2007 [R2014],
Information technology - Multimedia
Framework (MPEG-21) - Part 14: Conformance Testing
This International Standard specifies conformance points and conformance tests for different parts of ISO/IEC 21000. Based on the various conformance points, it is identified which requirements defined in ISO/IEC 21000 apply to those conformance points. The tests are developed to ascertain whether a particular artifact (such as a piece of software or hardware or a document) meets all the requirements for a specific conformance point or not.

INCITS/ISO/IEC 21000-15:2006 [R2014],
Information technology - Multimedia
Framework (MPEG-21) - Part 15: Event
Reporting
This part of ISO/IEC 21000 specifies - how to express Event Report Requests (ER-R) that contain information about which Events to report, what information is to be reported and to whom; - how to express Event Reports (ER) which are created by an MPEG-21 Peer in response to an Event Report Request when the conditions specified by an ER-R are met.

[R2014], Information technology - Multimedia
Framework (MPEG-21) - Part 15: Event
Reporting - Amendment 1: Security in Event Reporting

INCITS/ISO/IEC 21000-16:2005 [R2014],
Information technology - Multimedia
Framework (MPEG-21) - Part 16: Binary
Format
This part of ISO/IEC 21000 specifies the ISO/IEC 21000 binary format which is an alternative serialization format of descriptions as specified within other ISO/IEC 21000 parts, e.g. ISO/IEC 21000-2. This enables the efficient interchange or storage of ISO/IEC 21000 descriptions.

INCITS/ISO/IEC 21000-17:2006 [R2014],
Information technology -- Multimedia
framework (MPEG-21) -- Part 17: Fragment Identification of MPEG Resources
ISO/IEC 21000-17:2006 specifies a normative syntax for Fragment Identifiers to be used in URIs (Uniform Resource Identifiers) for addressing parts of any resource whose Internet Media Type is one of: audio/mpeg; video/mpeg; video/mp4; audio/mp4; application/mp4. ISO/IEC 21000 (MPEG-21) defines an open framework for multimedia delivery and consumption, with both the content creator and content consumer as focal points. The vision for MPEG-21 is to define a multimedia framework to enable transparent and augmented use of multimedia resources across a wide range of networks and devices used by different communities.

INCITS/ISO/IEC 21000-18:2007 [R2014],
Information technology-Multimedia
Framework (MPEG-21) - Part 18: Digital Item
Streaming
This part of ISO/IEC 21000 specifies tools for Digital Item Streaming. The first tool is the Bitstream Binding Language, which describes how Digital Items (comprising the Digital Item Declaration, metadata and resources) can be mapped to delivery channels such as MPEG-2 Transport Streams or the Real-time Transport Protocol.

INCITS/ISO/IEC 21000-2-2003 [R2013],
Information technology - Multimedia
framework (MPEG-21) - Part 2: Digital Item
Declaration
This document describes the MPEG-21 Digital Item Declaration technology, which is part 2 of the MPEG-21 standard.

INCITS/ISO/IEC 21000-2:2005 [2008],
Information technology - Multimedia
framework (MPEG-21) - Part 2: Digital Item
Declaration

INCITS/ISO/IEC 21000-3-2003 [R2013],
Information technology - Multimedia
framework (MPEG-21) - Part 3: Digital Item
Identification
This third part of MPEG-21 (ISO/IEC 21000-3), entitled Digital Item Identification (DIID), specifies how to uniquely identify Digital Items (and parts thereof), IP related to the Digital Items; Description Schemes, etc.

[R2014], Information technology - Multimedia
Framework (MPEG-21) - Part 3: Digital Item
Identification and Description - Amendment 1: relates identifier types

INCITS/ISO/IEC 21000-4:2006 [R2014],
Information technology - Multimedia
framework (MPEG-21) - Part 4: Intellectual
Property Management and Protection
Components
This part of ISO/IEC 21000 specifies how to include IPMP information and protected parts of Digital Items in a DIDL document. It purposely does not specify protection measures, keys, key management, trust management, encryption algorithms, certification infrastructures or other components that would also be needed as part of a complete IPMP solution. The IPMP DIDL encapsulates and protects a part of the hierarchy of a Digital Item, and associates appropriate identification and protection information with it. The description of IPMP governance and tools is required to satisfy IPMP for a Digital Item or its parts to be accessed.

This standard specifies the syntax and semantics of tools that may be used to assist the adaptation of Digital Items, i.e., the Digital Item Declaration and resources referenced by the declaration. The tools could be used to satisfy transmission, storage and consumption constraints, as well as Quality of Service management by the various Users. It is important to emphasize that the adaptation engines themselves are non-normative tools of this part of ISO/IEC 21000.

INCITS/ISO/IEC 21000-8-2008 [R2014], Information technology - Multimedia framework (MPEG-21) - Part 8: Reference software

This International Standard describes reference software implementing the normative clauses of the other parts of ISO/IEC 21000. The information provided is applicable for determining the reference software modules available for parts of ISO/IEC 21000, understanding the functionality of the available reference software modules, and utilizing the available reference software modules.

Amendment 1 to ISO/IEC 21000-8:2008.

This International Standard specifies the MPEG-21 file format, in which an MPEG-21 XML document (e.g. Digital Item Declaration (DID)) and some or all of its referenced content can be placed in a single &amp;#8216;content package' file. This enables the interchange, editing, and &amp;#8216;playback' of MPEG-21 documents.

INCITS/ISO/IEC 21117:2012 [2013], Information technology - Office equipment - Copiers and multi-function devices - Information to be included in specification sheets and related test methods

This International Standard specifies the information to be listed in specification sheets for electrophotographic digital copying machines and multi-function devices. The intention of this International Standard is to allow purchasers and users to compare the characteristics of different models of copying machines and multi-function devices so that they can more easily select copying machines and multi-function devices that meet their requirements.

INCITS/ISO/IEC 22092:2002 [2012], Information technology - Data Interchange on 130 mm Magneto-Optical Disk Cartridges - Capacity: 9.1 Gbytes Per Cartridge

Specifies the mechanical, physical, and optical characteristics of a 130 mm optical disk cartridge (ODC) that employs thermo-magnetic and magneto-optical effects to enable data interchange between such disks. This International Standard specifies two Types, viz. Type R/W provides for data to be written, read and erased many time over the recording surface(s) of the disk.

INCITS/ISO/IEC 22051:2002 [2016], Information technology - Data Interchange on 12,7 mm, 384-track magnetic tape cartridges - SDLT1 format

Specifies the physical and magnetic characteristics of a 12.7 mm wide, 448-track magnetic tape cartridge, to enable physical interchangeability of such cartridges between drives. It also specifies the quality of the recorded signals, the recording method and the recorded format, thereby allowing data interchange between drives by means of such cartridges. The format supports variable length Logical Records, high speed search, and the use of a registered algorithm for data compression.

INCITS/ISO/IEC 22091:2002 [2013], Information technology - Streaming Lossless Data Compression algorithm (SLDC)

Specifies a lossless compression algorithm to reduce the number of 8-bit bytes required to represent data records and File Marks. The algorithm is known as Streaming Lossless Data Compression algorithm (SLDC). One buffer size (1.024 bytes) is specified. The numerical identifier according to ISO/IEC 11576 allocated to this algorithm is 6.

INCITS/ISO/IEC 22050-2002 [2013], Information technology - Data Interchange on 12,7 mm, 384-track magnetic tape cartridges - Ultrium-1 format

This International Standard specifies the physical and magnetic characteristics of magnetic tape cartridges, using magnetic tape 12.65 mm wide so as to provide physical interchange of such cartridges between drives. It also specifies the quality of the recorded signals, the recording method and the recorded format, thereby allowing data interchange between drives by means of such cartridges. The format supports variable length Logical Records, high speed search, and the use of a registered algorithm for data compression.

INCITS/ISO/IEC 22005-2002 [2013], Information technology - Data Interchange on 12,7 mm, 384-track magnetic tape cartridges - SDLT1 format

Specifies the physical and magnetic characteristics of a 12.7 mm wide, 448-track magnetic tape cartridge, to enable physical interchangeability of such cartridges between drives. It also specifies the quality of the recorded signals, a format - called Super Digital Linear Tape 1 (SDLT 1) - and a recording method, thereby allowing data interchange between drives. Together with a labelling standard, for instance ISO 1001 for Magnetic Tape Labelling, it allows full data interchange by means of such magnetic tape cartridges.

INCITS/ISO/IEC 22009:2002 [2013], Information technology - Streaming Lossless Data Compression algorithm (SLDC)

Specifies a lossless compression algorithm to reduce the number of 8-bit bytes required to represent data records and File Marks. The algorithm is known as Streaming Lossless Data Compression algorithm (SLDC). One buffer size (1.024 bytes) is specified. The numerical identifier according to ISO/IEC 11576 allocated to this algorithm is 6.

INCITS/ISO/IEC 21118-2012 [2013], Information technology -- Office equipment -- Information to be included in specification sheets -- Data projectors ISO/IEC 21118:2012 specifies the information to be included in the specification sheets for front projection type data projectors and the form of specification sheets. It is also applicable to data projectors that have a video signal input port as well as a computer signal input port. It is not applicable to units for a rear screen projection or with a video input terminal alone.

INCITS/ISO/IEC 22050-2002 [2013], Information technology - Data Interchange on 12,7 mm, 384-track magnetic tape cartridges - SDLT1 format

This International Standard specifies the physical and magnetic characteristics of magnetic tape cartridges, using magnetic tape 12.65 mm wide so as to provide physical interchange of such cartridges between drives. It also specifies the quality of the recorded signals, the recording method and the recorded format, thereby allowing data interchange between drives by means of such cartridges. The format supports variable length Logical Records, high speed search, and the use of a registered algorithm for data compression.

INCITS/ISO/IEC 22051:2002 [2016], Information technology - Data Interchange on 12,7 mm, 384-track magnetic tape cartridges - SDLT1 format

Specifies the physical and magnetic characteristics of a 12.7 mm wide, 448-track magnetic tape cartridge, to enable physical interchangeability of such cartridges between drives. It also specifies the quality of the recorded signals, a format - called Super Digital Linear Tape 1 (SDLT 1) - and a recording method, thereby allowing data interchange between drives. Together with a labelling standard, for instance ISO 1001 for Magnetic Tape Labelling, it allows full data interchange by means of such magnetic tape cartridges.

INCITS/ISO/IEC 22091:2002 [2013], Information technology - Streaming Lossless Data Compression algorithm (SLDC)

Specifies a lossless compression algorithm to reduce the number of 8-bit bytes required to represent data records and File Marks. The algorithm is known as Streaming Lossless Data Compression algorithm (SLDC). One buffer size (1.024 bytes) is specified. The numerical identifier according to ISO/IEC 11576 allocated to this algorithm is 6.

INCITS/ISO/IEC 22092:2002 [2012], Information technology - Data Interchange on 130 mm Magneto-Optical Disk Cartridges - Capacity: 9.1 Gbytes Per Cartridge

Specifies the mechanical, physical, and optical characteristics of a 130 mm optical disk cartridge (ODC) that employs thermo-magnetic and magneto-optical effects to enable data interchange between such disks. This International Standard specifies two Types, viz. Type R/W provides for data to be written, read and erased many time over the recording surface(s) of the disk.
INCITS/ISO/IEC 22533:2005 [R2015],
Information technology - Data interchange on 90 mm Optical Disk Cartridges - Capacity: 2.3 Gbytes per Cartridge
This Standard defines the characteristics of 90 mm Optical Disk Cartridges (ODC) with a capacity of 2.3 GB per Cartridge. The Standard specifies only Type R/W for 2 048-byte sectors of such cartridge. Type R/W provides for data to be written, read and erased many times over the entire recording surface of the disk using the thermo-magnetic and magneto-optical effects. It is also referred to as "fully rewritable". This International Standard provides for 2 048-byte sectors only. All sectors on a disk are of the same size.

INCITS/ISO/IEC 22536:2013 [2015], Information technology -- Telecommunications and information exchange between systems -- Near Field Communication Interface and Protocol (NFCIP-1) -- RF interface test methods
This standard is part of a suite of standards that specify tests for ISO/IEC 18092. It defines test methods for the RF-interface. This standard specifies RF-test methods for NFCIP-1 devices with antennas fitting within the rectangular area of 50 mm by 40 mm. This test standard, the first of two parts, specifies compliance tests for the RF interface of ISO/IEC 18092 devices. The companion test standard ISO/IEC 23917 specifies protocol tests for ISO/IEC 18092.

INCITS/ISO/IEC 22537:2006 [R2015], Information technology - ECMAScript for XML (E4X) specification
This standard defines the syntax and semantics of ECMAScript for XML (E4X), a set of programming language extensions adding native XML support to ECMAScript.

INCITS/ISO/IEC 23000-10:2009 [R2016], Information technology -- Multimedia application format (MPEG-A) -- Part 10: Video surveillance application format
Specifies a file format designed to provide for a first level of interoperability for video-based surveillance systems. The file format provides the overall structure for storing video content and associated metadata in a single file.

This part of ISO/IEC 23000 presents a basic architecture for constructing an annotated music library. It defines a simple file format for songs and a file format for albums and playlists. A compliant player application has to support all these specified file formats.

This part of ISO/IEC 23000, also known as 'photo player MAF', specifies a file format for digital photo library applications. It establishes a standardized solution for the carriage of images and associated metadata, to facilitate simple and fully interoperable exchange across different devices and platforms. The set of metadata includes MPEG-7 visual content descriptions, as well as acquisition-based metadata (such as date, time and camera settings). This allows compliant devices to support new, content-enhanced functionality, such as intelligent browsing, content-based search or automatic categorization.

INCITS/ISO/IEC 23000-4:2009 [R2016], Information technology -- Multimedia application format (MPEG-A) -- Part 4: Musical slide show application format

INCITS/ISO/IEC 23000-4:2009/AM 1:2009 [R2016], Information technology -- Multimedia application format (MPEG-A) -- Part 4: Musical slide show application format - Amendment 1: Conformance and reference software for musical slide show application format

INCITS/ISO/IEC 23000-5:2011 [2014], Information technology - Multimedia application format (MPEG-A) - Part 5: Media streaming application format
ISO/IEC 23000-5:2011 specifies a digital item structure, a file format, and references a set of protocols used in a media streaming environment for applications where governed audio and video information is streamed to an end-user device by means of existing protocols such as MPEG-2 Transport Stream or Real Time Protocol over User Datagram Protocols over Internet Protocol (RTP/UDP/IP), and provides informative implementation examples corresponding to specific applications.

INCITS/ISO/IEC 23000-6:2009 [R2016], Information technology -- Multimedia application format (MPEG-A) -- Part 6: Professional archival application format
The purpose of the PA-AF is to provide a standardized packaging format for digital files. This packaging format can also serve as an implementation of the information package specified by the reference model of the open archival information system (OAIS). The OAIS reference model is a framework for understanding and applying concepts necessary for long-term digital information preservation (where long-term is long enough to be concerned about changing technologies). In addition, PA-AF can also be used as an intermediate or exchange packaging format for any kind of multimedia content.

INCITS/ISO/IEC 23000-7:2008 [R2014], Information technology -- Multimedia application format (MPEG-A) -- Part 7: Open access application format
This international Standard specifies a container format, which can contain any type of content and can also transport additional metadata. This packaging mechanism offers the possibility to enrich the content with human and machine-readable metadata and is not limited to a specific content type. Unlike other application formats, the open access application format is not a multimedia-based format.

INCITS/ISO/IEC 23000-7:2008/AM 1:2009 [R2016], Information technology -- Multimedia application format (MPEG-A) -- Part 7: Open access application format - Amendment 1: Conformance and reference software for open access application format
Amendment 1 to ISO/IEC 23000-7:2008.

This part of ISO/IEC 23000 specifies a file format that pertains to both terrestrial digital multimedia broadcasting (T-DMB) and satellite digital multimedia broadcasting (S-DMB) contents and services. It integrates the existing DMB contents with appropriate additional information to facilitate storage, interchange, management, editing, and presentation of the contents in protected, governed, and interoperable ways.

This part of ISO/IEC 23001 provides a standardized set of technologies for encoding XML documents. It addresses a broad spectrum of applications and requirements by providing a generic method for transmitting and compressing XML documents.

Amendment 1 to ISO/IEC 23001-1:2006.

Amendment 2 to ISO/IEC 23001-1:2006.

INCITS/ISO 23001-2:2008 [R2014], Information technology -- MPEG systems technologies -- Part 2: Fragment request units

This part of ISO/IEC 23001 specifies the fragment request unit technology. It comprises a syntax and semantics for expressing a request for fragments of XML. It also specifies how such requests can be used in XML based systems such as ISO/IEC 15938-1 and ISO/IEC 23001-1. The technology can be used in resource constrained environments so that only the fragments of XML of interest at a given time need be transmitted to a requesting peer from a responding peer. It can also be used for node-by-node navigation of a remote XML document.

This part of ISO/IEC 23001 specifies XML IPMP messages (hereinafter IPMP Messages) which are a simple and natural extension of the IPMP Information Descriptors defined in ISO/IEC 21000-4. They allow dispatching of the IPMP information related to a protected content element retrieved from the associated digital item to the modules in charge of performing the IPMP operations required to access the protected content element.

INCITS/ISO 23001-5:2008 [R2014], Information technology -- MPEG systems technologies -- Part 5: Bitstream Syntax Description Language (BSDL)

This part of ISO/IEC 23001 specifies BSDL (Bitstream Syntax Description Language), a language based on W3C XML Schema to describe the structure of a bitstream with an XML document named BS Description.

INCITS/ISO 23002-1:2006 [R2014], Information technology -- MPEG video technologies -- Part 1: Accuracy requirements for implementation of integer-output 8x8 inverse discrete cosine transform

A number of image and video coding related standards (see Bibliography) include a requirement for decoders to implement an integer-output 8x8 inverse discrete cosine transform (IDCT) for the generation of inversetransformed sample differences with a nominal range from -28 to 28 - 1 for some integer number of bits B, where B is greater than or equal to 8. This part of ISO/IEC 23002 specifies conformance requirements for establishing sufficient accuracy in such an integer-output IDCT implementation. It is intended to be suitable for reference to establish partial or complete requirements for IDCT accuracy for conformance to other standards that require IDCT accuracy.

INCITS/ISO 23002-1:2006/AM1:2008 [R2014], Information technology -- MPEG video technologies -- Part 1: Accuracy requirements for implementation of integer-output 8x8 transform AMENDMENT 1: Software for integer IDCT accuracy testing

Amendment 1 to ISO/IEC 23002-1:2006.

This part of ISO/IEC 23002 specifies a particular implementation of an integer-output 8&215;8 IDCT that fully conforms to the accuracy requirements specified in ISO/IEC 23002-1 (see Ref. [7] in the Bibliography) and additionally meets or exceeds all accuracy requirements specified for IDCT precision in a number of international video coding standards (see Ref. [2] to [6] in the Bibliography). It additionally provides a (nonnormative) specification of an integer-output 8&215;8 forward DCT based on the same factorization structure.

INCITS/ISO 23002-3:2007 [R2014], Information technology -- MPEG video technologies -- Part 3: Representation of auxiliary video and supplemental information

This part of ISO/IEC 23002 defines auxiliary video streams as data coded as video sequences and supplementing a primary video sequence. Depth maps and parallax maps are the first specified types of auxiliary video streams, relating to stereoscopic-view video content.

This International Standard describes the MPEG Surround standard (Spatial Audio Coding, SAC), that is capable of re-creating N channels based on M+N transmitted channels, and additional control data. In the preferred modes of operating the spatial audio coding system, the M channels can either be a single mono channel or a stereo channel pair. The control data represents a significant lower data rate than required for transmitting all N channels, making the coding very efficient while at the same time ensuring compatibility with both M channel devices and N channel devices.

Amendment 1 to ISO/IEC 23003-1:2007.

This part of ISO/IEC 23004 defines the architecture of the MPEG Multimedia Middleware (M3W) technology.

This part of ISO/IEC 23004 defines the Multimedia application programming interface (API) of MPEG Multimedia Middleware. The context of this Multimedia API is described in ISO/IEC 23004-1.

This part of ISO/IEC 23004 defines the Multimedia Middleware (M3W) Component Model and Core Framework. The context of the M3W Component Model and Core Framework is described in ISO/IEC 23004-1.

This part of ISO/IEC 23004 defines the Resource and Quality Management framework of the MPEG Multimedia Middleware (M3W) technology.
INCITS/ISO/IEC 23004-5:2008 [R2014],
Information technology -- Multimedia Middleware -- Part 5: Component download
This part of ISO/IEC 23004 defines the MPEG Multimedia Middleware (M3W) technology Download Architecture. This definition contains the specification of the part of the M3W application programming interface (API) related to download as well as the realization. The M3W API specification provides a uniform view of the download functionality provided by M3W. The specification of the realization is relevant for those who are making an implementation of a download framework for M3W.

INCITS/ISO/IEC 23004-6:2008 [R2014],
Information technology -- Multimedia Middleware -- Part 6: Fault management
This part of ISO/IEC 23004 defines the MPEG Multimedia Middleware (M3W) technology Fault Management Architecture. It contains the specification of the part of the M3W application programming interface (API) related to Fault Management as well as the realization. The M3W API specification provides a uniform view of the Fault Management functionality provided by M3W. The specification of the realization is relevant for those who are making an implementation of a Fault Management framework for M3W.

INCITS/ISO/IEC 23004-7:2008 [R2014],
Information technology -- Multimedia Middleware -- Part 7: System integrity management
This part of ISO/IEC 23004 defines the MPEG Multimedia Middleware (M3W) technology Integrity Management Architecture. It contains the specification of the part of the M3W application programming interface (API) related to Integrity Management as well as the realization. The M3W API specification provides a uniform view of the Integrity Management functionality provided by M3W. The specification of the realization is relevant for those who are making an implementation of an Integrity Management framework for M3W.

INCITS/ISO/IEC 23004-8:2009 [R2016],
Information technology -- Multimedia Middleware -- Part 8: Reference software
This standard explains the organization of the reference software for ISO/IEC 23004, Parts 1 to 7 (Multimedia Middleware). The electronic attachment to ISO/IEC 23004-8:2009 provides the source code of the actual software.

INCITS/ISO/IEC 23270-2008 [R2013],
Information technology - C# Language Specification
This International Standard specifies the form and establishes the interpretation of programs written in the C# programming language. It specifies; The representation of C# programs; The syntax and constraints of the C# language; The semantic rules for interpreting C# programs; The restrictions and limits imposed by a conforming implementation of C#.

INCITS/ISO/IEC 23271:2012 [2013], Information technology - Common Language Infrastructure (CLI)
ISO/IEC 23271:2012 defines the Common Language Infrastructure (CLI) in which applications written in multiple high-level languages can be executed in different system environments without the need to rewrite those applications to take into consideration the unique characteristics of those environments. It consists of six partitions.

This standard defines a system interface for compiled applications and a minimal environment for support of installation scripts. Its purpose is to enable a uniform industry standard environment for high-volume applications conforming to the LSB.

INCITS/ISO/IEC 23360-3:2006 [R2015], Linux Standard Base (LSB) core specification 3.1 - Part 3: Specification for IA64 architecture This standard is the Itanium(TM) architecture-specific Core part of the Linux Standard Base (LSB). It supplements the generic LSB Core module with those interfaces that differ between architectures. Interfaces described in ISO/IEC 23360-3 are mandatory except where explicitly listed otherwise. Core interfaces may be supplemented by other modules; all modules are built upon the core.

INCITS/ISO/IEC 23360-4:2006 [R2015], Linux Standard Base (LSB) core specification 3.1 - Part 4: Specification for AMD64 architecture This standard is the AMD64 architecture-specific Core part of the Linux Standard Base (LSB). It supplements the generic LSB Core module with those interfaces that differ between architectures. Interfaces described in ISO/IEC 23360-4 are mandatory except where explicitly listed otherwise. Core interfaces may be supplemented by other modules; all modules are built upon the core.

INCITS/ISO/IEC 23360-5:2006 [R2015], Linux Standard Base (LSB) core specification 3.1 - Part 5: Specification for PPC32 architecture This standard is the PPC32 architecture-specific Core part of the Linux Standard Base (LSB). It supplements the generic LSB Core module with those interfaces that differ between architectures. Interfaces described in ISO/IEC 23360-5 are mandatory except where explicitly listed otherwise. Core interfaces may be supplemented by other modules; all modules are built upon the core.

INCITS/ISO/IEC 23360-6:2006 [R2015], Linux Standard Base (LSB) core specification 3.1 - Part 6: Specification for PPC64 architecture This standard is the PPC64 architecture-specific Core part of the Linux Standard Base (LSB). It supplements the generic LSB Core module with those interfaces that differ between architectures. Interfaces described in ISO/IEC 23360-6 are mandatory except where explicitly listed otherwise. Core interfaces may be supplemented by other modules; all modules are built upon the core.

INCITS/ISO/IEC 23360-7:2006 [R2015], Linux Standard Base (LSB) core specification 3.1 - Part 7: Specification for S390 architecture This standard is the S390 architecture-specific Core part of the Linux Standard Base (LSB). It supplements the generic LSB Core module with those interfaces that differ between architectures. Interfaces described in ISO/IEC 23360-7 are mandatory except where explicitly listed otherwise. Core interfaces may be supplemented by other modules; all modules are built upon the core.

INCITS/ISO/IEC 23651:2003 [R2013], Information technology - 8 mm wide magnetic tape cartridge for information interchange - Helical scan recording - AIT-3 format
ISO/IEC 23651:2003 specifies the physical and magnetic characteristics of an 8 mm wide magnetic tape cartridge containing a memory chip to enable physical interchange of such cartridges between drives. It also specifies the quality of the recorded signals, the recording method and the recorded format - called Advanced Intelligent Tape No. 3 (AIT-3 format) - thereby allowing data interchange between drives by means of such magnetic tape cartridges.

INCITS/ISO/IEC 2375-2003 [R2013], Information technology - Procedure for registration of escape sequences and coded character sets ISO/IEC 2375:2003 specifies the procedures to be followed for preparing, maintaining, and publishing a register of escape sequences and of the coded character sets they identify.
INCITS/ISO/IEC 2382-1:1993 [R2013],
Information technology -- Vocabulary - Part 1: Fundamental Terms

Presents, in English and French, 144 terms in the following fields: general terms, information representation, hardware, software, programming, applications and end user, computer security, data management. In order to facilitate their translation into other languages, the definitions are drafted so as to avoid, as far as possible, any peculiarity attached to the language.

INCITS/ISO/IEC 2382-10-1979 [R2013],
Information technology - Vocabulary - Part 10: Operating techniques & facilities

Supports the international communication in information processing. Provides selected English and French terms and their definitions in the main fields of data processing including the used basic processes and device types, of the organization and representation of data, computer programming and operation, input and output devices and peripheral units as well as special applications.

INCITS/ISO/IEC 2382-12:1988 [R2013],
Information technology -- Vocabulary - Part 12: Peripheral equipment

Facilitates the international communication in information processing. Provides selected English and French terms and their definitions in the field of data media, storage devices as well as magnetic tapes and printers.

INCITS/ISO/IEC 2382-13-1996 [R2011],
Information technology - Vocabulary - Part 13: Computer Graphics

This part of ISO/IEC 2382 is intended to facilitate international communication in computer graphics. It presents, in two languages, terms and definitions of selected concepts relevant to the field of information technology and identifies relationships among the entries. In order to facilitate their translation into other languages, the definitions are drafted so as to avoid, as far as possible, any peculiarity attached to a language. This part of ISO/IEC 2382 defines concepts related to computer graphics.

INCITS/ISO/IEC 2382-17:1999 [2013],
Information technology -- Vocabulary -- Part 17: Databases

This part of ISO/IEC 2382 is intended to facilitate international communication in the area of databases. It presents, in two languages, terms and definitions of selected concepts relevant to databases and identifies relationships among the entries. To facilitate their translation into other languages, the definitions are drafted so as to avoid, as far as possible, any peculiarity attached to a language. This part of ISO/IEC 2382 defines concepts related to databases.

INCITS/ISO/IEC 2382-19-1989[S2011],
Information technology -- Vocabulary - Part 19: Analog computing

Serves for the international communication in information processing. Provides selected English and French terms and their definitions in the field of concepts relating to analog and hybrid arithmetic units, function generators, converters and modes of operation of such components.

INCITS/ISO/IEC 2382-2:1976 [R2013],
Information technology -- Vocabulary - Part 2: Arithmetic and logic operations

Facilitates the international communication in information processing. Provides selected English and French terms and their definitions in the field of mathematics and logic. The terms relating to numeric values are dealt with under the aspect of computing techniques as for arithmetic and logical operations.

INCITS/ISO/IEC 2382-20-1990 [R2011],
Information technology - Vocabulary - Part 20: Systems development

Communication in information processing. It presents, in two languages, terms and definitions of selected concepts relevant to the field of information processing and identifies relationships between the entries. In order to facilitate their translation into other languages, the definitions are drafted so as to avoid, as far as possible, any peculiarity attached to a language. This part of ISO/IEC 2382 defines concepts relating to a system life cycle, from the requirements analysis to the implementation, including system design and quality assurance.

INCITS/ISO/IEC 2382-23-1994 [R2011],
Information technology - Vocabulary - Part 23: Text Processing

This part of ISO/IEC 2382 is intended to facilitate international communication in information processing. It presents, in two languages, terms and definitions of selected concepts relevant to the field of information processing and identifies relationships between the entries. In order to facilitate their translation into other languages, the definitions are drafted so as to avoid, as far as possible, any peculiarity attached to a language. This part of ISO/IEC 2382 defines concepts related to text processing, text editors, text output and text editing.

INCITS/ISO/IEC 2382-24-1995 [R2011],
Information technology - Vocabulary - Part 24: Computer-integrated manufacturing (CIM)

This part of ISO/IEC 2382 is intended to facilitate international communication in computer-integrated manufacturing. It presents, in two languages, terms and definitions of selected concepts relevant to the field of information technology and identifies relationships among the entries. In order to facilitate their translation into other languages, the definitions are drafted so as to avoid, as far as possible, any peculiarity attached to a language. This part of ISO/IEC 2382 defines concepts related to computer-integrated manufacturing.

INCITS/ISO/IEC 2382-25-1992 [R2011],
Information technology - Vocabulary - Part 25: Local Area Networks (LAN)

This part of ISO/IEC 2382 is intended to facilitate international communication in information processing. It presents, in two languages, terms and definitions of selected concepts relevant to the field of information processing and identifies relationships between the entries. In order to facilitate their translation into other languages, the definitions are drafted so as to avoid, as far as possible, any peculiarity attached to a language. This part of ISO/IEC 2382 defines different types of local arenetworks, concepts relating to devices, to transmissions and the problems that can appear, and also protocols that govern exchanges.

INCITS/ISO/IEC 2382-26-1993 [R2011],
Information technology - Vocabulary - Part 26: Open Systems Interconnection Architecture

International communication in open systems interconnection. It presents, in two languages, terms and definitions of selected concepts relevant to the field of information technology and identifies relationships among the entries. In order to facilitate their translation into other languages, the definitions are drafted so as to avoid, as far as possible, any peculiarity attached to a language. This part of ISO/IEC 2382 defines concepts related to open system interconnection.

Information technology - Vocabulary - Part 27: Office Automation

This part of ISO/IEC 2382 is intended to facilitate international communication in office automation. It presents, in two languages, terms and definitions of selected concepts relevant to the field of office automation and identifies relationships between the entries. In order to facilitate their translation into other languages, the definitions are drafted so as to avoid, as far as possible, any peculiarity attached to a language. This part of ISO/IEC 2382 defines concepts related to office automation, electronic mail, and text, voice and image transmission.

INCITS/ISO/IEC 2382-28-1995 [R2011],
Information technology - Vocabulary - Part 28: Artificial Intelligence - Basic concepts and expert systems

This part of ISO/IEC 2382 is intended to facilitate international communication in information technology. It presents, in two languages, terms and definitions of selected concepts relevant to this field of information technology and identifies relationships among the entries. In order to facilitate their translation into other languages, the definitions are drafted so as to avoid, as far as possible, any peculiarity attached to a language. This part of ISO/IEC 2382 defines basic concepts related to artificial intelligence and expert systems.
INCITS/ISO/IEC 2382-3:1987 [R2013],
Information technology -- Vocabulary - Part 3: Equipment technology

Supports the international communication in information processing. Provides selected English and French terms and their definitions in the field of circuits and signals, modes of operation and processing and also functional design and logic devices.

INCITS/ISO/IEC 2382-36:2013[2015],
Information technology - Vocabulary - Part 36: Learning, education and training

This standard is intended to facilitate international communication in information technology for learning, education, and training. It presents, in two languages, terms and definitions of selected concepts relevant to the field of information technology for learning, education, and training and identifies relationships among the entries.

INCITS/ISO/IEC 2382-37:2012 [2013],
Information technology - Vocabulary - Part 37: Biometrics

ISO/IEC 2382-37:2012 establishes a systematic description of the concepts in the field of biometrics pertaining to recognition of human beings and reconciles variant terms in use in pre-existing biometric standards against the preferred terms, thereby clarifying the use of terms in this field.

INCITS/ISO/IEC 2382-4:1999 [R2014],
Information technology - Vocabulary - Part 4: Organization of data

This part of ISO/IEC 2382 is intended to facilitate international communication in information technology. It presents, in two languages, terms and definitions of selected concepts relevant to the field of information technology and identifies relationships among the entries. In order to facilitate their translation into other languages, the definitions are drafted so as to avoid, as far as possible, any peculiarity attached to a language. This part of ISO/IEC 2382 deals in particular with character sets, codes, graphic characters, control characters, strings, words, sets of data, separators and identifiers.

INCITS/ISO/IEC 2382-7:2000 [R2014],
Information technology -Vocabulary -- Part 7: Computer Programming

This part of ISO/IEC 2382 is intended to facilitate international communication in information processing. It presents, in two languages, terms and definitions of selected concepts relevant to the field of information processing and identifies relationships between the entries.

INCITS/ISO/IEC 2382-9:1995 [R2013],
Information technology -- Vocabulary - Part 9: Data Communication

Is intended to facilitate international communication in data communication. Presents, in two languages, terms and definitions of selected concepts relevant to the field of data communication and identifies relationships among the entries.

INCITS/ISO/IEC 2382:2015 [2015], Information technology - Vocabulary

Terms and definitions

INCITS/ISO/IEC 23912:2005 [R2015],
Information technology - 80 mm (1,46 Gbytes per side) and 120 mm (4,70 Gbytes per side) DVD Recordable Disk (DVD-R)

This standard specifies the mechanical, physical and optical characteristics of an 80 mm and a 120 mm DVD Recordable disk to enable the interchange of such disks. It specifies the quality of the pre-recorded, unrecorded and the recorded signals, the format of the data, the format of the information zone, the format of the unrecorded zone, and the recording method, thereby allowing for information interchange by means of such disks. This disk is identified as a DVD Recordable (DVD-R) disk. This standard specifies: - 80 mm and 120 mm nominal diameter disks that may be either single or double sided; - the conditions for conformance; - the environments in which the disk is to be operated and stored; - the mechanical and physical characteristics of the disk, so as to provide mechanical interchange between data processing systems; - the format of the pre-recorded information on an unrecorded disk, including the physical disposition of the tracks and sectors, the error correcting codes and the coding method used; - the format of the data and the recorded information on the disk, including the physical disposition of the tracks and sectors, the error correcting codes and the coding method used; - the characteristics of the signals from pre-recorded and unrecorded areas on the disk, enabling data processing systems to read the pre-recorded information and to write to the disks; and - the characteristics of the signals recorded on the disk, enabling data processing systems to read the data from the disk. This standard provides for interchange of disks between disk drives. Together with a standard for volume and file structure, it provides for full data interchange between data processing systems.

INCITS/ISO/IEC 23917:2005 [R2015],
Information technology - Telecommunications and information exchange between systems - NFCIP-1 - Protocol Test Methods

This Standard specifies protocol test methods for ISO/IEC 18092 in addition to those specified in ISO/IEC 22536.

INCITS/ISO/IEC 23988:2008 [R2013],
Information Technology - A code of practice for the use of information technology (IT) in the delivery of assessments

Growth in the power and capabilities of information technology (IT) has led to the increasing use of IT to deliver, score and record responses of tests and assessments in a wide range of educational and other contexts. Suitably used, IT delivery offers advantages of speed and efficiency, better feedback and improvements in validity and reliability, but its increased use has raised issues about the security and fairness of IT-delivered assessments, as well as resulting in a wide range of different practices.

INCITS/ISO/IEC 24700:2005 [R2013],
Information technology - Quality and Performance of Office Equipment that Contain Reused Components

ISO/IEC 24700:2004 specifies product characteristics for use in an original equipment manufacturer’s or authorized third party’s declaration of conformity to demonstrate that a marketed product that contains reused components performs equivalent to new, meeting equivalent to new component specifications and performance criteria, and continues to meet all the safety and environmental criteria required by responsibly built products.

INCITS/ISO/IEC 24703:2008 [R2013],
Information technology - Learning, education and training - Participant identifiers
defines the datatype of identifiers that can be associated with participants in learning, education and training. Participants may be users, teachers, agents, groups, organizations or institutions.

INCITS/ISO/IEC 24707-2007 [R2013],
Information technology - Common Logic (CL): a framework for a family of logic-based languages

ISO/IEC 24707:2007 defines the abstract syntax and semantics, and three concrete dialects are defined in the annexes. The three conforming dialects specified are Common Logic Interchange Format (CLIF), Conceptual Graph Interchange Format (CGIF) and XML for Common Logic (XCL).

INCITS/ISO/IEC 24708:2008 [R2014],
Information technology - BioAPI Interworking Protocol (BIP)

ISO/IEC 24708:2008 specifies the syntax, semantics, and encodings of a set of messages (BIP messages) that enable a BioAPI-conforming application (see ISO/IEC 19784-1) to request biometric operations in BioAPI-conforming biometric service providers (BSPs) across node or process boundaries, and to be notified of events originating in those remote BSPs. It also specifies extensions to the architecture and behaviour of the BioAPI framework (specified in ISO/IEC 19784 -1) that supports the creation, processing, sending and reception of BIP messages. It is applicable to all distributed applications of BioAPI.

INCITS/ISO/IEC 24709-1:2007 [R2014],
Information technology - BioAPI Conformance Testing for the biometric application programming interface (BioAPI) - Part 1: Methods and Procedures

ISO/IEC 24709-1:2007 specifies the concepts, framework, test methods and criteria required to test conformance of biometric products claiming conformance to BioAPI (ISO/IEC 19784-1). Guidelines for specifying BioAPI conformance test suites, writing test assertions and defining procedures to be followed during the conformance testing are provided. The conformance testing methodology is concerned with conformance testing of biometric products claiming conformance to BioAPI. Definitions of schemas of the assertion language are provided in normative annexes.
ISO/IEC 24709-2:2007 defines a number of test assertions written in the assertion language specified in ISO/IEC 24709-1. These assertions enable a user of ISO/IEC 24709-2:2007 (such as a testing laboratory) to test the conformance to ISO/IEC 19784-1 (BioAPI 2.0) of any biometric service provider (BSP) that claims to be a conforming implementation of that International Standard. Each test assertion specified in ISO/IEC 24709-2:2007 exercises one or more features of an implementation under test. Assertions are placed into packages (one or more assertions per package) as required by the assertion language.

INCITS/ISO/IEC 24709-3:2011 [R2016], Information technology -- Conformance testing for the biometric application programming interface (BioAPI) -- Part 3: Test assertions for BioAPI frameworks
Defines a number of test assertions written in the assertion language specified in ISO/IEC 24709-1:2007. Specifies all the test assertions that are to be executed for conformance testing of BioAPI frameworks claiming conformance to ISO/IEC 19784-1 (BioAPI 2.0). Test assertions specified in this part of ISO/IEC 24709 are not claimed to be exhaustive (see also ISO/IEC 24709-1:2007, Clause 6).

INCITS/ISO/IEC 24711:2007 [R2013], Information technology - Method for the determination of ink cartridge yield for color inkjet printers and multi-function devices that contain printer components
ISO/IEC 24711:2007 defines a method for testing and calculation of average yield measured in the number of standard pages for a colour inkjet cartridge and a specific printer printing in a semi-continuous mode under a defined set of conditions. It uses the test page suite defined in ISO/IEC 24712. ISO/IEC 24711:2007 can also be applied to the printer component of any multifunctional device that has a digital input-printing path (i.e. multi-function devices that contain printer components).

INCITS/ISO/IEC 24711:2007/Cor 1:2013, Method for the determination of ink cartridge yield for colour inkjet printers and multi-function devices that contain printer components -- Technical Corrigendum 1
This is the first corrigendum to ISO/IEC 24711:2007 that defines a method for testing and calculation of average yield measured in the number of standard pages for a colour inkjet cartridge and a specific printer printing in a semi-continuous mode under a defined set of conditions. It uses the test page suite defined in ISO/IEC 24712. ISO/IEC 24711:2007 can also be applied to the printer component of any multifunctional device that has a digital input-printing path (i.e. multi-function devices that contain printer components).

ISO/IEC 24712:2007 defines colour test pages for the measurement of consumable yield. The test page suite includes four "customer" type documents and one "diagnostic" page that is used to determine end of ink or toner consumable life. These pages can be used for electro-photographic, inkjet printers and multi-function devices that have a digital printing path, i.e. an all-in-one electro-photographic machine that has digital printing capabilities.

ISO/IEC 24713-1:2008 provides common definitions used within the profile standards and references other standards applicable to the successful implementation of a generic biometric system. A harmonized (with the other part 1 standards in WG 3 and WG5) generic biometric system is described and a diagram is present. The description includes detail of the individual components present in a generic biometric system.

This part of ISO/IEC 24713 specifies a biometric profile including data interchange formats, system requirements, and the operation of biometric procedures on a Seafarers' Identity Document (SID). The domain of applicability can extend to other situations where an interoperable biometrics-based identity document is required, but the main focus is on the use of biometrics on a Seafarers' Identity Document (SID). This part of ISO/IEC 24713 notes that ILO Convention No. 185 already provides the overarching policy guidance on biometric verification and identification of seafarers and it relies on that guidance. Determining any matters of policy beyond those or in contradiction to those included in ILO Convention No. 185 is explicitly out of scope of this part of ISO/IEC 24713.

ISO/IEC 24727 is a set of programming interfaces for interactions between integrated circuit cards and external applications to include generic services for multi-sector use. The organization and the operation of the ICC conform to ISO/IEC 7816-4.

This part of ISO/IEC 24727 defines services as representations of action requests and action responses to be supported at the client-application service interface. The services are described in a programming-language independent way. This part of ISO/IEC 24727 is the application interface of the Open Systems Interconnection Reference Model defined in ISO/IEC 7498-1. It provides a high-level interface for a client-application making use of information storage and processing operations of a card-application as viewed on the generic card interface. This part of ISO/IEC 24727 does not mandate a specific implementation methodology for this interface.

ISO/IEC 24727 defines a set of programming interfaces for interactions between integrated circuit cards and external applications to include generic services for multi-sector use. This part of ISO/IEC 24727 standardizes the connectivity and security mechanisms between the client-application and the card-application. It specifies API-Administration of service-independent and implementation-independent ISO/IEC 24727 compliant modules, including security, that enables action requests to a specific card-application of an ICC such that, when coupled to data model and content discovery operations, the card-application can be used by a variety of client-applications.

INCITS/ISO/IEC 24734-2009 [R2014], Information technology - Office equipment - Method of measuring digital printing productivity
Specifies the minimum information that shall be included in the specification sheets of printers enabling users to compare the characteristics of different machines and select a suitable printer. Applies to Class 3 and Class 4 printers according to annex B for an office environment.
ISO/IEC 24734:2014 specifies a method for measuring the productivity of digital printing devices with various office applications and print job characteristics. It is applicable to digital printing devices, including single-function and multi-function devices, regardless of print technology (e.g. inkjet, laser). Devices can be equipped with a range of paper feed and finishing options either directly connected to the computer system or via a network. It is intended to be used for black and white (B&W) as well as colour digital printing devices.

This International Standard specifies a method for measuring the 'productivity' of digital copying devices and multifunctional devices with various copying modes. It is applicable to digital copying devices and multifunctional devices equipped with automatic document feeder and collating function. This International Standard is intended to be used for black and white (B&W) as well as colour digital copying devices and multifunctional devices of any underlying marking technology. It allows comparison of the throughput copying rates for a machine operated in various available operating modes (simplex, duplex, size of substrates, etc.

ICNITS/ISO/IEC 24739-1:2009 [2012], Information technology - AT Attachment with Packet Interface - 7 - Part 1: Register Delivered Command Set, Logical Register Set (ATA/ATAPI-7 V1)
ISO/IEC 24739-1:2009(E) specifies the AT Attachment Interface between host systems and storage devices. It provides a common attachment interface for systems manufacturers, system integrators, software suppliers and suppliers of intelligent storage devices. It defines the register delivered commands used by devices implementing the standard.

ISO/IEC 24739-2:2009(E) specifies the AT Attachment Interface between host systems and storage devices. It provides a common attachment interface for systems manufacturers, system integrators, software suppliers and suppliers of intelligent storage devices.

ISO/IEC 24739-3:2010(E) specifies the connectors and cables for physical interconnection between host and storage device, the electrical and logical characteristics of the interconnecting signals, and the protocols for transporting of commands, data, and status over the interface for the serial interface.

ICNITS/ISO/IEC 24745:2011 [2012], Information technology -- Security techniques -- Biometric information protection
ISO/IEC 24745:2011 provides guidance for the protection of biometric information under various requirements for confidentiality, integrity and renewability/revocability during storage and transfer. Additionally, ISO/IEC 24745:2011 provides requirements and guidelines for the secure and privacy-compliant management and processing of biometric information.

ICNITS/ISO/IEC 24747:2009 [R2015], Information technology - Programming languages, their environments and system software interfaces - Extensions to the C Library to support mathematical special functions
This standard defines extensions to the C Standard Library that is defined in the International Standard for the C programming language (ISO/IEC 9899). Unless otherwise specified, the whole of the C Standard Library is included in ISO/IEC 24747:2009 by reference, see Clause 2.

ISO/IEC 24752 facilitates operation of information and electronic products through remote and alternative interfaces and intelligent agents. ISO/IEC 24752-1:2008 defines a framework of components that combine to enable remote user interfaces and remote control of network-accessible electronic devices and services through a universal remote console (URC). It provides an overview of the URC framework and its components.

ISO/IEC 24752 facilitates operation of information and electronic products through remote and alternative interfaces and intelligent agents. ISO/IEC 24752-2:2008 describes user interface sockets, an abstract concept that describes the functionality and state of a device or service (target) in a machine interpretable manner. It defines an extensible markup language (XML) based language for describing a user interface socket.

ISO/IEC 24752 facilitates operation of information and electronic products through remote and alternative interfaces and intelligent agents. ISO/IEC 24752-3:2008 defines a language (presentation template markup language) for describing modality-independent user interface specifications, or presentation templates, associated with a user interface socket description as defined by ISO/IEC 24752-2.

This technical corrigendum corrects a defect in ISO/IEC 24754-2008. ISO/IEC 24754-2008 provides the minimum requirements for specifying document rendering systems. ISO/IEC 24754-2008 provides an abstract list of the features that a rendering system for an authored document may have. The list provides a frame of reference, against which the user and implementor can compare the features of document rendering systems. However, ISO/IEC 24754-2008 does not specify a concrete interchange syntax or direct how each document rendering system shall behave.

INCITS/ISO/IEC 24756:2009 [R2014], Information technology - Framework for specifying a common access profile (CAP) of needs and capabilities of users, systems, and their environments

ISO/IEC 24756:2009 defines a framework for specifying a common access profile (CAP) of needs and capabilities of users, computing systems, and their environments, including access supported by assistive technologies. It provides a basis for identifying and dealing with accessibility issues in a standardized manner across multiple platforms. It can be used to evaluate the accessibility of existing systems in particular environments for particular users.

INCITS/ISO/IEC 24759:2014 [2014], Information technology - Security techniques - Test requirements for cryptographic modules

This International Standard specifies the methods to be used by testing laboratories to test whether the cryptographic module conforms to the requirements specified in ISO/IEC 19790:2012. The methods are developed to provide a high degree of objectivity during the testing process and to ensure consistency across the testing laboratories.

ISO/IEC 24761:2009 specifies the structure and the data elements of Authentication Context for Biometrics (ACBio), which is used for checking the validity of the result of a biometric verification process executed at a remote site. ISO/IEC 24761:2009 allows any ACBio instance to accompany any data item that is involved in any biometric process related to verification and enrolment. The specification of ACBio is applicable not only to single modal biometric verification but also to multimodal fusion. ISO/IEC 24761:2009 specifies the cryptographic syntax of an ACBio instance.

Defines an interface for the secure, extensible, and interoperable management of a distributed and heterogeneous storage system. This interface uses an object-oriented, XML-based, messaging-based protocol designed to support the specific requirements of managing devices and subsystems in this storage environment. Using this protocol, this part of ISO/IEC 24775 describes the information available to a WBEM Client from an Information Technology - Storage Management compliant CIM WBEM Server.

Defines the core architecture and protocols in SMI-S. The components of SMI-S architecture include: Transport - communicating management information between constituents of the management system; Health and fault management - detecting failures through monitoring the state of storage components; General information about the object model; Names - how SMI-S uses names to allow applications to correlate across SMI-S and to other standards; Standard messages - how exceptions are presented to client applications; Service discovery - techniques clients use to discover SMI-S services; Installation and upgrade - recommendations for implementations.

Defines profiles that are supported by profiles defined in the other parts of the ISO/IEC 24775 series. The first few clauses provide background material that helps explain the purpose and profiles and recipes (a subset of a profile). Common port profiles are grouped together since they serve as transport-specific variations of a common model. The port profiles are followed by other common profiles.

Defines an interface for the secure, extensible, and interoperable management of a distributed and heterogeneous storage system. This interface uses an object-oriented, XML-based, messaging-based protocol designed to support the specific requirements of managing devices and subsystems in this storage environment. Using this protocol, this International Standard describes the information available to a WBEM Client from an Information technology - Storage Management compliant CIM WBEM Server.

Defines management profiles for Autonomous (top level) profiles for programs and devices whose central function is providing support and access to file data. In addition, it provides documentation of component profiles (or subprofiles) that deal with file systems and management interface functions that may be used by other autonomous profiles not included in this part of the standard.

Defines management profiles for Autonomous (top level) profiles for programs and devices whose central function is providing support for storage networking. This standard includes four autonomous profiles: Fabric, Switch, Extender and iSCSI to FC Gateway.

INCITS/ISO/IEC 24775-7:2014 [2016], Information technology -- Storage management -- Part 7: Host Elements

Defines management profiles for autonomous, component and abstract profiles for management of host-based storage devices. The autonomous profiles describe the management of a stand-alone host-based storage entity. The component profiles (or subprofiles) describe management of aspects of host-based storage entities that may be used by other autonomous profiles. Finally, this standard describes abstract profiles that may be used as a basis for creating additional Host-based autonomous profiles.

Models various details of the following objects of the media library for monitoring: Library, Drives, Changer Devices, Slots, IO Slots, SCSI Interfaces and SCSI and FC Target Ports, Physical Tapes, Physical Package and Magazines.

INCITS/ISO/IEC 24824-1:2007 [R2015], Information technology - Generic applications of ASN.1: Fast infoet

This Recommendation | International Standard specifies an ASN.1 type (see ITU-T Rec. X.680 | ISO/IEC 8824-1) whose abstract values represent instances of the W3C XML Information Set. It also specifies binary encodings for those values, using ASN.1 Encoding Control Notation (see ITU-T Rec. X.692 | ISO/IEC 8825-3). NOTE — These encodings are called fast infoet documents. This Recommendation | International Standard also specifies techniques that minimize the size of fast infoet documents; maximize the speed of creating and processing fast infoet documents; allow the specification (by the generator of a fast infoet document) of additional processing data. This standard specifies also specifies a Multipurpose Internet Mail Extensions (MIME) media type that identifies a Fast Infoet document.
INCITS/ISO/IEC 24824-2:2006 [R2015],
Information technology - Generic applications of ASN.1: Fast Web Services
This Recommendation | Standard specifies the messages and encodings that enable the use of Fast Web Services, together with the means of description of such services. The protocol used to support these services satisfies the requirements of the SOAP processing model (see W3C SOAP Part 1, clause 2) and is based on the transfer of: a) ASN.1 SOAP messages that contain embedded ASN.1 encoded values and embedded fast infoset documents; and b) fast infoset SOAP messages. This Recommendation | Standard also specifies: – an ASN.1 module for ASN.1 SOAP that defines the Envelope type (a value of this type corresponds to an ASN.1 SOAP message); – a conceptual mapping between ASN.1 SOAP messages and W3C SOAP messages (defined as an instance of the XML Infoset, see W3C SOAP Part 1, clause 5); – an extension to the W3C SOAP processing model for the processing of embedded ASN.1 encoded values; – the ASN.1 SOAP HTTP Binding, which is a modification and extension of the W3C SOAP HTTP Binding (see W3C SOAP Part 2, clause 7), for the transfer of ASN.1 SOAP messages; – support for the transfer of W3C SOAP message Infosets serialized as fast Infoset documents (fast Infoset SOAP messages) using the W3C SOAP HTTP Binding (see W3C SOAP Part 2, clause 7); – SOAP-oriented service descriptions that define the interface to and the semantics of Fast Web Services. Two Multipurpose Internet Mail Extensions (MIME) media type names are allocated to identify: – fast Infoset SOAP messages.

INCITS/ISO/IEC 24824-3:2008 [R2015],
Information technology - Generic applications of ASN.1: Fast infoset security
This Recommendation | International Standard specifies four (canonical Fast Infosets) algorithms that can be used in the application of W3C XML Signature (and provides URIs for them). It also specifies application-level extensions to the W3C XML Encryption processing rules for the encryption of part of an XML Infoset (see 8.1) serialized as a fast Infoset document and for the decryption of an encrypted part (see 8.3) that was serialized as a fast Infoset document. The use of any resulting W3C XML Signature information Items or W3C XML Encryption information items is not within the scope of this Recommendation | International Standard.

ISO/IEC 25062:2006 provides a standard method for reporting usability test findings. The format is designed for reporting results of formal usability tests in which quantitative measurements were collected, and is particularly appropriate for summative/comparative testing. The CIF does not indicate how to perform a usability test but provides guidance on how to report the results of a usability test. The CIF targets two audiences: usability professionals and stakeholders in an organization. Stakeholders can use the usability data to help make informed decisions concerning the release of software products or the procurement of such products.

INCITS/ISO/IEC 25434:2008 [R2014],
Information technology - Data interchange on 120 mm and 80 mm optical disk using +R DL format - Capacity: 8,55 Gbytes and 2,66 Gbytes per side (recording speed up to 16X)
This International Standard specifies the mechanical, physical and optical characteristics of 120 mm recordable optical disks with capacities of 8,55 Gbytes and 17,1 Gbytes. It specifies the quality of the recorded and unrecorded signals, the format of the data and the recording method, thereby allowing for information interchange by means of such disks. The data can be written once and read many times using a nonreversible method. These disks are identified as +R DL.

INCITS/ISO/IEC 25435:2006 [R2015], Data interchange on 60 mm Read-Only ODC - Capacity: 1,8 Gbytes (UMDMT)
This standard specifies the mechanical, physical and optical characteristics of a 60 mm, read-only ODC having a maximum capacity of 1,8 Gbytes. It specifies the physical format, the quality of the recorded signals, the format of the data and its modulation method, thereby allowing for information interchange by means of such ODCs. This standard specifies two types of ODCs, Type A and Type B: – Type A: Single layer disk with maximum recorded capacity of 0,9 GBytes; – Type B: Dual layer disk with maximum recorded capacity of 1,8 GBytes

This standard is the S390 architecture-specific Core part of the Linux Standard Base (LSB). It supplements the generic LSB Core module with those interfaces that differ between architectures. Interfaces described in ISO/IEC 23360-7 Core module that are contradictory to the specific Core shall be supplement the second edition of the Core interfaces may be supplemented by other modules; all modules are built upon the core.

INCITS/ISO/IEC 26300:2006 [R2012],
Information technology - Open Document for Office Applications (OpenDocument) v1.0
ISO/IEC 26300:2006 defines an XML schema for office applications and its semantics. The schema is suitable for office documents, including text documents, spreadsheets, charts and graphical documents like drawings or presentations, but is not restricted to these kinds of documents. ISO/IEC 26300:2006 provides high-level information suitable for editing documents. It defines suitable XML structures for office documents and is friendly to transformations using XSLT or similar XML-based tools.

This is the first technical corrigendum to the first amendment of ISO/IEC 26300:2006 and ISO/IEC 26300:2006 defines an XML schema for office applications and its semantics. The schema is suitable for office documents, including text documents, spreadsheets, charts and graphical documents like drawings or presentations, but is not restricted to these kinds of documents.

Technical corrigendum one corrects a defect in ISO/IEC 26300:2006. ISO/IEC 26300:2006 defines an XML schema for office applications and its semantics. The schema is suitable for office documents, including text documents, spreadsheets, charts and graphical documents like drawings or presentations, but is not restricted to these kinds of documents. ISO/IEC 26300:2006 provides high-level information suitable for editing documents. It defines suitable XML structures for office documents and is friendly to transformations using XSLT or similar XML-based tools.

This Technical Corrigendum should be read in conjunction with ISO/IEC 26300:2006 and the associated Technical Corrigendum 1. The current edition of ISO/IEC 26300 should be understood by first applying the changes specified in Technical Corrigendum 1, then the changes specified in this Technical Corrigendum. ISO/IEC 26300:2006 defines an XML schema for office applications and its semantics. The schema is suitable for office documents, including text documents, spreadsheets, charts and graphical documents like drawings or presentations, but is not restricted to these kinds of documents.

This is the third technical corrigendum to ISO/IEC 26300:2006 and ISO/IEC 26300:2006 defines an XML schema for office applications and its semantics. The schema is suitable for office documents, including text documents, spreadsheets, charts and graphical documents like drawings or presentations, but is not restricted to these kinds of documents.

INCITS/ISO/IEC 26925:2009 [R2014], Information technology - Data Interchange on 120 mm and 80 mm Optical Disk using +RW HS Format - Capacity: 4,7 and 1,46 Gbytes per Side (Recording speed 8X)

This International Standard specifies the mechanical, physical and optical characteristics of 120 mm rewriteable optical disks with capacities of 4,7 Gbytes and 9,4 Gbytes. It specifies the quality of the recorded and unrecorded signals, the format of the data and the recording method, thereby allowing for information interchange by means of such disks. The data can be written, read and overwritten many times using the phase change method. These disks are identified as +RW HS (High Speed).

This International Standard describes the overview and the vocabulary of information security management systems, which form the subject of the ISMS family of standards, and defines related terms and definitions. This International Standard is applicable to all types and sizes of organisation (e.g. commercial enterprises, government agencies, not-for-profit organisations).

INCITS/ISO/IEC 27003:2010 [2012], Information technology -- Security techniques -- Information security management system implementation guidance
ISO/IEC 27003:2010 focuses on the critical aspects needed for successful design and implementation of an Information Security Management System (ISMS) in accordance with ISO/IEC 27001:2005. It describes the process of ISMS specification and design from inception to the production of implementation plans. It describes the process of obtaining management approval to implement an ISMS, defines a project to implement an ISMS (referred to in ISO/IEC 27003:2010 as the ISMS project), and provides guidance on how to plan the ISMS project, resulting in a final ISMS project implementation plan.

Provides guidance on the development and use of measures and measurement in order to assess the effectiveness of an implemented information security management system (ISMS) and controls or groups of controls, as specified in ISO/IEC 27001

ISO/IEC 27005:2011 provides guidelines for information security risk management. It supports the general concepts specified in ISO/IEC 27001 and is designed to assist the satisfactory implementation of information security based on a risk management approach. Knowledge of the concepts, models, processes and terminologies described in ISO/IEC 27001 and ISO/IEC 27002 is important for a complete understanding of ISO/IEC 27005:2011. ISO/IEC 27005:2011 is applicable to all types of organizations (e.g. commercial enterprises, government agencies, non-profit organizations) which intend to manage risks that could compromise the organization’s information security.

INCITS/ISO/IEC 27006:2011 [2012], Information technology - Security techniques - Requirements for bodies providing audit and certification of information security management systems

This International Standard specifies requirements and provides guidance for bodies providing audit and certification of an information security management system (ISMS), in addition to the requirements contained within ISO/IEC 17021 and ISO/IEC 27001. It is primarily intended to support the accreditation of certification bodies providing ISMS certification.

This International Standard provides guidance on managing an information security management system (ISMS) audit programme, on conducting the audits, and on the competence of ISMS auditors, in addition to the guidance contained in ISO 19011. This International Standard is applicable to those needing to understand or conduct internal or external audits of an ISMS or to manage an ISMS audit programme.

The scope of this Recommendation | International Standard is to define guidelines supporting the implementation of information security management in telecommunications organizations. The adoption of this Recommendation | International Standard will allow telecommunications organizations to meet baseline information security management requirements of confidentiality, integrity, availability and any other relevant security property.

ISO/IEC 27033-3:2010 describes the threats, design techniques and control issues associated with reference network scenarios. For each scenario, it provides detailed guidance on the security threats and the security design techniques and controls required to mitigate the associated risks. Where relevant, it includes references to ISO/IEC 27033-4 to ISO/IEC 27033-6 to avoid duplicating the content of those documents.

This International Standard provides guidelines for specific activities in handling digital evidence, which are identification, collection, acquisition and preservation of digital evidence that may be of evidential value. This International Standard provides guidance to individuals with respect to common situations encountered throughout the digital evidence handling process and assists organizations in their disciplinary procedures and in facilitating the exchange of potential digital evidence between jurisdictions.

INCITS/ISO/IEC 28360:2012 [2013], Information technology - Office equipment - Determination of chemical emission rates from electronic equipment

This International Standard specifies methods to determine chemical emission rates of analyte from information and communication technology (ICT) and consumer electronics (CE) equipment during intended operation in an Emission Test Chamber (ETC). The methods comprise preparation, sampling (or monitoring) in a controlled ETC, storage and analysis, calculation and reporting of emission rates. This International Standard includes specific methods for equipment using consumables, such as printers, and equipment not using consumables, such as monitors and PCs.

INCITS/ISO/IEC 28361:2007 [R2015], Information technology - Telecommunications and information exchange between systems - Near Field Communication Wired Interface (NFC-WI)

This standard specifies the digital wire interface between a Transceiver and a Front-end. The specification includes the signal wires, binary signals, the state diagrams and the bit encodings for three data rates.

This International Standard provides a privacy framework which - specifies a common privacy terminology; - defines the actors and their roles in processing personally identifiable information (PII); - describes privacy safeguarding considerations; - provides references to known privacy principles for information technology. This International Standard is applicable to natural persons and organizations involved in specifying, procuring, architecting, designing, developing, testing, maintaining, administering, and operating information and communication technology systems or services where privacy controls are required for the processing of PII.

This standard defines the concepts of conformance testing for biometric data interchange formats and defines a general conformance testing framework. It specifies common (modality-neutral) elements of the testing methodology, such as test methods and procedures, implementation conformance claim, and test results reporting. It also provides the assertion language definition and sets forth other testing and reporting requirements, and outlines other aspects of the conformance testing methodology that are generally applicable and not modality-specific. As part of the conformance testing methodology, different types and levels of conformance testing are described, as well as their applicability. The conformance testing methodology specified in ISO/IEC 29109-1:2009 is concerned only with data interchange format records and systems that produce or use these records.

This is the first corrigendum to ISO/IEC 29109-1:2009 and ISO/IEC 29109-1:2009 defines the concepts of conformance testing for biometric data interchange formats and defines a general conformance testing framework. It specifies common (modality-neutral) elements of the testing methodology, such as test methods and procedures, implementation conformance claim, and test results reporting. It also provides the assertion language definition and sets forth other testing and reporting requirements, and outlines other aspects of the conformance testing methodology that are generally applicable and not modality-specific.

Actions

Specifies elements of conformance testing methodology, test assertions, and test procedures as applicable to ISO/IEC 19794-10. This part of the standard establishes test assertions of the structure of the hand geometry silhouette data format; test assertions of internal consistency by checking the types of values that may be contained within each field; and informative guidance for testing the consistency of selected encoded data fields with the input biometric data.

This standard specifies elements of conformance testing methodology, test assertions, and test procedures as applicable to the biometric data interchange format standard relating to finger minutiae data (i.e. ISO/IEC 19794-2).

This standard specifies elements of conformance testing methodology, test assertions, and test procedures as applicable to ISO/IEC 19794-4.

This is the first Technical Corrigendum to ISO/IEC 29109-4:2010 that specifies elements of conformance testing methodology, test assertions, and test procedures as applicable to ISO/IEC 19794-4. ISO/IEC 29109-4:2010 establishes test assertions of the structure of the finger image data format as specified in ISO/IEC 19794-4:2005 (Type A Level 1 as defined in ISO/IEC 29109-1:2009), etc.

ISO/IEC 29109-5:2014 specifies elements of conformance testing methodology, test assertions, and test procedures as applicable to two-dimensional face images defined in the ISO/IEC 19794-5:2005 biometric data interchange format standard for face image data. ISO/IEC 29109-5:2014 establishes test assertions of the structure of the face image data format as specified in ISO/IEC 19794-5:2005 (Type A Level 1 as defined in ISO/IEC 29109-1:2009), test assertions of internal consistency by checking the types of values that may be contained within each field (Type A Level 2 as defined in ISO/IEC 29109-1:2009).

Specifies elements of conformance testing methodology, test assertions, and test procedures as applicable to ISO/IEC 19794-6:2005. ISO/IEC 29109-6:2011 establishes test assertions of the structure of the iris image data format as specified in ISO/IEC 19794-6:2005 (Type A Level 1 as defined in ISO/IEC 29109-1:2009). Test assertions of internal consistency by checking the types of values that may be contained within each field (Type A Level 2 as defined in ISO/IEC 29109-1:2009), etc.

INCITS/ISO/IEC 29109-7:2011 [2013], Information technology -- Conformance testing methodology for biometric data interchange formats defined in ISO/IEC 19794 -- Part 7: Signature/sign time series data

ISO/IEC 29109-7:2011 specifies elements of conformance testing methodology, test assertions, and test procedures as applicable to ISO/IEC 19794-7. ISO/IEC 19794-7 defines two data interchange formats for signature/sign time series data, one for general use and one compact format for use with smart cards and other tokens.

INCITS/ISO/IEC 29109-8:2011 [2013], Information technology -- Conformance testing methodology for biometric data interchange formats defined in ISO/IEC 19794 -- Part 8: Finger pattern skeletal data

Specifies elements of conformance testing methodology, test assertions, and test procedures as applicable to ISO/IEC 19794-8:2006. It establishes test assertions of the structure of the finger pattern skeletal data format as specified in ISO/IEC 19794-8:2006 (Type A Level 1 as defined in ISO/IEC 29109-1:2009). Test assertions of internal consistency by checking the types of values that may be contained within each field (Type A Level 2 as defined in ISO/IEC 29109-1:2009).

Specifies a data record interchange format for recording, storing, and transmitting one or more hand vascular images. Each image is accompanied by image-specific metadata contained in a header record. ISO/IEC 29109-9:2011 establishes tests for checking the correctness of the binary record. It defines a testing methodology to ensure conformance of a vendor's application or service to ISO/IEC 19794-9:2007.

ISO/IEC 29115:2013 provides a framework for managing entity authentication assurance in a given context. In particular, it: - specifies four levels of entity authentication assurance; - specifies criteria and guidelines for achieving each of the four levels of entity authentication assurance; - provides guidance for mapping other authentication assurance schemes to the four LoAs; - provides guidance for exchanging the results of authentication that are based on the four LoAs; and - provides guidance concerning controls that should be used to mitigate authentication threats.

INCITS/ISO/IEC 29120-1:2015 [2016], Information technology - Machine readable test data for biometric testing and reporting - Part 1: Test reports

Establishes machine readable records for documenting the output of a biometric test, formats for data that ISO/IEC 19795 tests are required to report, and an ASN.1 syntax for test reports. This standard specifically does not require, prohibit, or otherwise specify, the format of biometric samples or templates used in a test, require, prohibit or otherwise specify, the encapsulation of biometric samples or templates used in a test, or regulate metrics for tests.

ISO/IEC 29121:2013 specifies a data migration method for long-term data storage. According to the standard, manufacturers are able to construct storage systems that use DVD-R, DVD-RW, DVD-RAM, +R, or +RW disks for information storage.

This International Standard establishes a technical base for the security proof of the specification of cryptographic protocols. This International Standard specifies design evaluation criteria for these protocols, as well as methods to be applied in a verification process for such protocols. This International Standard also provides definitions of different protocol assurance levels consistent with evaluation assurance components in ISO/IEC 15408.

INCITS/ISO/IEC 29136:2012 [2012], Information technology - User interfaces - Accessibility of personal computer hardware

ISO/IEC 29136:2012 provides requirements and recommendations for the accessibility of personal computer hardware, to be used when planning, developing, designing and distributing these computers. While it does not cover the behaviour of, or requirements for, assistive technologies, it does address connectivity of assistive technologies as an integrated component of interactive systems. Some requirements or recommendations in ISO/IEC 29136:2012 require software support; however, requirements and recommendations that solely focus on software are not included in ISO/IEC 29136:2012.

INCITS/ISO/IEC 29141-2009 [R2015], Information technology - Biometrics - Tenprint capture using biometric application programming interface (BioAPI)

This Standard specifies requirements for the use of ISO/IEC 19784-1, as amended by ISO/IEC 19784-1/Amd. 1 (BioAPI) for the purpose of performing a tenprint capture operation. It specifies a BDB format that is used to interact with a BioAPI framework (and hence with BSPs) to support an application wishing to perform a tenprint capture. It specifies a capture control block and a capture output block that conforming BSPs are required to support if they conform to this Standard.

ISO/IEC 29142-1:2013 establishes terms, symbols, notations and a framework for characterizing toner and ink cartridges used in printing devices that have a digital input printing path, including multi-function devices. It is intended for equipment used in office environments.

INCITS/ISO/IEC 29142-2:2013, Information technology -- Print cartridge characterization -- Part 2: Cartridge characterization data reporting

ISO/IEC 29142-2:2013 establishes the product and package labelling, and related reporting provisions for toner and ink cartridges used in printing devices that have a digital input printing path, including multi-function devices. It is intended for equipment used in office environments.

ISO/IEC 29142-3:2013 describes the principles and framework for environmental assessment of ink and toner cartridges used in printing devices that have a digital input printing path, including multi-function devices, including: a) the goals and definitions related to environmental responsibility; b) guidance to determine the relative benefits of reuse, recycling, recovery, and reduction techniques; c) identification and prioritization of environmental attributes according to each phase of the cartridge life-cycle; d) criteria for establishing environmentally sustainable practices.

INCITS/ISO/IEC 29150-2011 [2012], Information technology -- Security techniques -- Signcryption

This International Standard specifies four mechanisms for signcryption that employ public key cryptographic techniques requiring both the originator and the recipient of protected data to have their own public and private key pairs.

INCITS/ISO/IEC 29159-1:2010 [R2016], Information technology -- Biometric calibration, augmentation and fusion data -- Part 1: Fusion information format

Specifies a biometric fusion information format that establishes machine readable data formats to describe the statistics of comparison score inputs to a fusion process. Does not standardize comparison-score normalization processes, nor standardize or define fusion processes.

Provides a standard interface to hardware biometric modules designed to be integrated in embedded systems which can be constrained in memory and computational power. It specifies a full interface for such hardware-based biometric modules. This interface, called Embedded BioAPI, is defined by the specification of commands to be implemented by these modules. Such a specification is done on two levels.

INCITS/ISO/IEC 29171:2009 [R2015], Information technology - Digitally recorded media for information interchange and storage - Information Versatile Disk for Removable usage (iVDR) cartridge

This standard specifies the dimensional, mechanical and physical characteristics of an information Versatile Disk for Removable usage (iVDR) cartridge to enable mechanical interchangeability between data processing systems. An iVDR cartridge can contain hard disk drive technology or other suitable storage technologies. This standard specifies the environment in which iVDR cartridges are to be operated and stored, and specifies the dimensions and pin assignments of a connector employed by iVDR cartridges to enable data interchange. Together with ISO/IEC 24739-3 and a standard for volume and file structure, ISO/IEC 29171 enables full data interchange between data processing systems.

ISO/IEC 29182-1:2013 provides a general overview of the characteristics of a sensor network and the organization of the entities that comprise such a network. It also describes the general requirements that are identified for sensor networks.
ISO/IEC 29182-2:2013 is intended to facilitate the development of International Standards in sensor networks. It presents terms and definitions for selected concepts relevant to the field of sensor networks. It establishes a general description of concepts in this field and identifies the relationships among those concepts. It may also be used as guidance for development of other parts of ISO/IEC 29182 and any other sensor network related standard.

ISO/IEC 29182-3:2014 provides Sensor Network Reference Architecture (SNRA) views. The architecture views include business, operational, systems, and technical perspectives, and these views are presented in functional, logical, and/or physical views where applicable. ISO/IEC 29182-3:2014 focuses on high-level architecture views which can be further developed by system developers and implementers for specific applications and services.

The purpose of the ISO/IEC 29182 series is to provide guidance to facilitate the design and development of sensor networks, improve interoperability of sensor networks, and make sensor network components plug-and-play, so that it becomes fairly easy to add/remove sensor nodes to/from an existing sensor network. ISO/IEC 29182-4 presents models for the entities that enable sensor network applications and services according to the Sensor Network Reference Architecture (SNRA).

ISO/IEC 29182-5:2013 provides the definitions and requirements of sensor network (SN) interfaces of the entities in the Sensor Network Reference Architecture and covers the following aspects: - interfaces between functional layers to provide service access for the modules in the upper layer to exchange messages with modules in the lower layer; - interfaces between entities introduced in the Sensor Network Reference Architecture enabling sensor network services and applications.

ISO/IEC 29182-6:2014, describes and provides a compilation of sensor network applications for which International Standardized Profiles (ISPs) are needed, guidelines for the structured description of sensor network applications, and examples for structured sensor network applications. It does not cover ISPs for which drafting rules are described in ISO/IEC TR 10000. Due to the generic character of ISO/IEC 29182, fully developed ISPs will not be included in this International Standard.

specifies a method for measuring productivity of digital copying devices and multifunctional devices with various copying modes and a single one-sided original. It is applicable to digital copying devices and multifunctional devices. It is intended to be used for black-and-white and colour digital copying devices and multifunctional devices of any underlying marking technology. This International Standard includes instructions for the creation of test charts, test setup procedure, test procedure, and the reporting requirements for the digital copying productivity measurements.

INCITS/ISO/IEC 29191:2012 [2014], Information technology - Security techniques - Requirements for partially anonymous, partially unlinkable authentication
This International Standard provides a framework and establishes requirements for partially anonymous, partially unlinkable authentication.

This part of ISO/IEC 29192 specifies two block ciphers suitable for applications requiring lightweight cryptographic implementations: PRESENT: a lightweight block cipher with a block size of 64 bits and a key size of 80 or 128 bits; CLEFIA: a lightweight block cipher with a block size of 128 bits and a key size of 128, 192 or 256 bits.

This part of ISO/IEC 29192 specifies two dedicated keystream generators for lightweight stream ciphers: &amp;#61623; Enocoro: a lightweight keystream generator with a key size of 80 or 128 bits; Trivium: a lightweight keystream generator with a key size of 80 bits.

ISO/IEC 29192-4:2013 specifies three lightweight mechanisms using asymmetric techniques: a) an unilateral authentication mechanism based on discrete logarithms on elliptic curves; b) an authenticated lightweight key exchange (ALIKE) mechanism for unilateral authentication and establishment of a session key; c) an identity-based signature mechanism.

Addresses the fundamental requirements for planning and execution of environmental performance evaluations for biometric systems based on scenario and operational test methodologies, the specifications to define, establish, and measure specific conditions to assess, including requirements for equipment, the requirements for establishing a baseline performance in order to compare the influence of environmental parameters, a specification of the biometric evaluation including requirements for test population, test protocols, data to record, and test results, and procedures for carrying out the overall evaluation.

ISO/IEC 29361:2008 defines the WS-I Basic Profile 1.1, consisting of a set of non-proprietary Web services specifications, along with clarifications, refinements, interpretations and amplifications of those specifications which promote interoperability.

INCITS/ISO/IEC 29362-2014, Information technology -- Web Services Interoperability -- WS-I Attachments Profile Version 1.0
ISO/IEC 29362:2008 defines the WS-I Attachments Profile 1.0, consisting of a set of non-proprietary Web services specifications, along with clarifications and amendments to those specifications that are intended to promote interoperability. It complements the WS-I Basic Profile 1.1 (ISO/IEC 29361:2008) to add support for interoperable SOAP Messages with Attachments-based Web services.

ISO/IEC 29363:2008 defines the WS-I Simple SOAP Binding Profile 1.0, consisting of a set of non-proprietary Web services specifications, along with clarifications and amendments to those specifications which promote interoperability.

ISO/IEC 29500-1:2012 defines a set of XML vocabularies for representing word-processing documents, spreadsheets and presentations, based on the Microsoft Office 2008 applications. It specifies requirements for Office Open XML consumers and producers that comply to the strict conformance requirements for Office Open XML consumers and on the Microsoft Office 2008 applications. It specifies transitions, or PML transitional.

ISO/IEC 29500-2:2012 specifies a set of conventions that are used by Office Open XML documents to define the structure and functionality of a package in terms of a package model and a physical model.

ISO/IEC 29500-3:2012 describes a set of conventions that are used by Office Open XML documents to clearly mark elements and attributes introduced by future versions or extensions of Office Open XML documents, while providing a method by which consumers can obtain a baseline version of the Office Open XML document (a version without extensions) for interoperability.

ISO/IEC 29500-4:2012 defines features for backward-compatibility and that are useful for high-quality migration of existing binary documents to ISO/IEC 29500. These features are used only by documents of conformance class WML Transitional, XML Transitional, or PML Transitional.

INCITS/ISO/IEC 29642:2009 [R2014], Information technology -- Data interchange on 120 mm and 80 mm optical disk using +RW DL format - Capacity: 8,55 Gbytes and 2,66 Gbytes per side (recording speed 2,4x)

This international Standard specifies the mechanical, physical and optical characteristics of 120 mm rewritable optical disks with capacities of 8,55 Gbytes and 17,1 Gbytes. It specifies the quality of the recorded and unrecorded signals, the format of the data and the recording method, thereby allowing for information interchange by means of such disks. The data can be written, read and overwritten many times using the phase change method. These disks are identified as +RW DL.

For any or all biometric sample types as necessary, this part of ISO/IEC 29794 establishes terms and definitions that are useful in the specification, and use of quality metrics; recommends the purpose and interpretation of biometric quality scores; defines the format and placement of quality data fields in biometric data interchange formats; suggests methods for developing biometric sample datasets for the purpose of quality score normalization; and suggests a format for exchange of quality algorithm results.

INCITS/ISO/IEC 30111:2013 [2014], Information technology - Security techniques - Vulnerability handling processes

ISO/IEC 30111:2013 gives guidelines for how to process and resolve potential vulnerability information in a product or online service. ISO/IEC 30111:2013 is applicable to vendors involved in handling vulnerabilities.

INCITS/ISO/IEC 3561:1976 [R2015], Information processing - Interchangeable magnetic six-disk pack - Track format

This Standard specifies the track format characteristics for the six-disk pack to be used for data interchange (see ISO 2864). The 7-bit coded character set specified in ISO 646 has been adopted, though, by agreement between the interchange parties, the 7-bit or 8-bit extensions specified in ISO 2022 may be used.

INCITS/ISO/IEC 3563:1976 [R2015], Information processing - Interchangeable magnetic single-disk cartridge (top loaded) - Track format

This Standard specifies the track format characteristics for the single-disk cartridge (top loaded) to be used for data interchange (see ISO 3562). The 7-bit coded character set specified in ISO 646 has been adopted, though, by agreement between the interchange parties, the 7-bit or 8-bit code extensions specified in ISO 2022 may be used. However, it should be noted that in this International Standard plain binary numbers in 8-bit bytes are used in the control field to define the control information.

INCITS/ISO/IEC 3564:1976 [R2015], Information processing - Interchangeable magnetic eleven-disk pack - Physical and magnetic characteristics

This Standard specifies the general, physical, and magnetic characteristics for the physical interchange of magnetic eleven-disk packs for use in electronic data processing systems. It does not apply to a specific design. It defines only the parameters relevant for interchange.

INCITS/ISO/IEC 3692:1996 [R2015], Information processing - Reels and cores for 25,4 mm (1 in) perforated paper tape for information interchange - Dimensions

This Standard lays down the dimensions of take-up (or storage) reels with separable flanges, and of cores, so that rolls of perforated tape may be interchanged among machines of various manufacturers. It is also intended to serve as a guide in the co-ordination of equipment design. A compatible reel and core are described. These can be used together or either one can be used separately to transfer tape from one machine to another.

INCITS/ISO/IEC 38500:2015 [2017], Information technology -- Governance of IT for the organization

This Standard provides guiding principles for members of governing bodies of organizations (which can comprise owners, directors, partners, executive managers, or similar) on the effective, efficient, and acceptable use of information technology (IT) within their organizations. It also provides guidance to those advising, informing, or assisting governing bodies.

SOAP Version 1.2 (SOAP) is a lightweight protocol intended for exchanging structured information in a decentralized, distributed environment. It uses XML technologies to define an extensible messaging framework providing a message construct that can be exchanged over a variety of underlying protocols. The framework has been designed to be independent of any particular programming model and other implementation specific semantics.

ISO/IEC 40230:2011 specifies an abstract feature for optimizing the transmission and/or wire format of a SOAP message by selectively encoding portions of the message, while still presenting an XML Infoset to the SOAP application.
Web Services Description Language (WSDL) and mechanisms can be used to associate policies with the subjects to which they apply. ISO/IEC 40270:2011 defines two general purposes for policies: to specify the characteristics of entities in a Web services system, and to provide a set of numeric codes that are independent of language-derived codes and as such is intended to provide a common basis for the international exchange of information containing human sex data.

ISO/IEC 40500:2012 [2014] (Web Content Accessibility Guidelines (WCAG) 2.0) covers a wide range of recommendations for making Web content more accessible. Following these guidelines will make content accessible to a wider range of people with disabilities, including blindness and low vision, deafness and hearing loss, learning disabilities, cognitive limitations, limited movement, speech disabilities, photo-sensitivity and combinations of these. Following these guidelines will also often make your Web content more usable to users in general.

INCITS/ISO/IEC 4337-1977 [R2015], Information processing - Interchangeable magnetic twelve-disk pack (100 Mbytes)

This Standard specifies the general, physical, and magnetic characteristics and the pre-initialization for the physical interchange of 100 Mbytes magnetic twelve-disk packs, for use in electronic data processing systems.

This Standard specifies the general, physical, and magnetic characteristics and the pre-initialization for the physical interchange of 100 Mbytes magnetic twelve-disk packs, for use in electronic data processing systems.

INCITS/ISO/IEC 4909-2006 [R2016], Identification cards -- Financial transaction cards -- Magnetic stripe data content for track 3

This International Standard establishes specifications for financial transaction cards using track 3 and is intended to permit interchange based on the use of magnetic stripe encoded information. It specifies the data content and physical location of read/write information on track 3 and is to be used in conjunction with the relevant parts of ISO/IEC 7811 and ISO/IEC 7812.

INCITS/ISO/IEC 5218:2004 [R2014], Information interchange - Representation of Human Sexes

ISO/IEC 5218:2004 specifies a uniform representation of human sexes for the interchange of information. It provides a set of numeric codes that are independent of language-derived codes and as such is intended to provide a common basis for the international exchange of information containing human sex data.

INCITS/ISO/IEC 5653:1980 [R2015], Information processing - Interchangeable magnetic twelve-disk pack (200 Mbytes)

This Standard specifies the general, physical, and magnetic characteristics and the pre-initialization for the physical interchange of 200 Mbytes magnetic twelve-disk packs, for use in electronic data processing systems.

Defines symbols to be used in information processing documentation and gives guidance on conventions for their use in data flowcharts, program flowcharts, system flowcharts, program network charts, system resources charts. Applicable in conjunction with ISO 2382/1.

INCITS/ISO/IEC 6429:1992 [S2007], Information Technology – Control Functions for Coded Character Sets

This International Standard defines control functions and their coded representations for use in a 7-bit code, an extended 7-bit code, an 8-bit code or an extended 8-bit code, if such a code is structured in accordance with International Standard ISO 2022.

INCITS/ISO/IEC 646-1991 [R2013], Information technology - ISO 7-bit coded Character Set for Information Interchange

Specifies a set of 128 control and graphic characters such as letters, digits and symbols with their coded representation. Applies to alphabets of the Latin script.

This part of ISO/IEC 6523 specifies a structure for globally and unambiguously identifying organizations, and parts thereof, for the purpose of information interchange. This part of ISO/IEC 6523 also makes recommendations regarding cases where prior agreements may be concluded between interchange partners. This part of ISO/IEC 6523 does not specify file organization techniques, storage media, languages, etc. to be used in its implementation.

This part of ISO/IEC 6523 specifies the procedure for registration of organization identification schemes, and the requirements for the administration of International Code Designator values, to designate these organization identification schemes.
INCITS/ISO/IEC 6596-2-1985 [S2012],
Information Processing - Data Interchange on 130 mm (5.25 in) Flexible Disk Cartridges using Two-Frequency Recording at 7,958 fpm (48 tpi), on One Side - Part 2: Track Format

This part of ISO 6596 specifies the magnetic characteristics, the track layout, and a track format to be used on a 130 mm (5.25 in) flexible disk cartridge, recorded at 7,958 fpm on one side using two-frequency recording at a track density of 1.9 tracks per millimetre (tpmm) (48 tracks per inch (tpi)), which is intended for data interchange between data processing systems.

INCITS/ISO/IEC 6937-2001 [R2012], Information technology - Coded graphic character set for text communication - Latin alphabet

This International Standard a) specifies the coded representation of the character; b) specifies a repertoire of the Lating alphabetic and non-alphabetic characters for the communication of text in many European languages using the Lating script; c) specifies rules for the definitions and use of graphic character subrepertoires, i.e., subsets of the specified character repertoire.

INCITS/ISO/IEC 7065-1:1985 [R2015], Information processing - Data interchange on 200 mm (8 in) flexible disk cartridges using modified frequency modulation recording at 13,262 fpm (48 tpi), on both sides - Part 1: Dimensional, physical and magnetic characteristics

This Standard contains the dimensional, physical and magnetic characteristics of 200 mm (8 in) flexible disk cartridges recording at 13,262 fpm, 1.9 tpm (48 tpi), on both sides using modified frequency modulation recording. Together with the labelling scheme specified in ISO 7665, ISO 7065/1 and 2 provide for full data interchange between data processing systems. Provides physical interchangeability between data processing systems.

INCITS/ISO/IEC 7185:1990 [S2008], Programming Language PASCAL

This standard specifies the semantics and syntax of the computer programming language PASCAL by specifying requirements for a processor and for a conforming program. Two levels of compliance are defined for both processors and programs. As this standard is being submitted for stabilization maintenance, INCITS will consider requests for change and information on the submittal of such requests.

Specifies the procedures to be followed in preparing, publishing, and maintaining a register of graphic characters. Annex A (Advisory Group) forms an integral part of this standard. Annex B (Forms for proposal) is for information only.

INCITS/ISO/IEC 7487-1:1993 [R2015], Information technology - Data Interchange on 130 mm (5.25 in) flexible disk cartridges using modified frequency modulation recording at 7,958 fpm (48 tpi), on both sides - ISO type 202 - Part 1: Dimensional, physical and magnetic characteristics

This standard specifies the dimensional (environment and transportation, dimension of jacket, liner and disk), physical (flammability, coercivity magnetic stripe (including any protective overlay) on an identification card, the encoding technique, and coded character sets. It takes into consideration both human and machine aspects and states minimum requirements.

ISO/IEC 7501-3:2005 is a short form endorsement of the International Civil Aviation Organization (ICAO) Document Doc 9303 Part 3 - Size-1 and Size-2 Machine Readable Official Travel Documents. ICAO Doc 9303 Part 3 specifies generic formats and minimum data elements for visual inspection and machine reading of official travel documents in the ID-1 and ID-2 card formats containing standardized, globally interoperable machine readable optical character recognition (OCR) data, which may at the option of Governments, be accepted in lieu of a passport as defined in Annex 9 (Chapter 3, paragraph 3.4) to the Convention on International Civil Aviation year 1946 (as revised).

INCITS/ISO/IEC 7810-2003 [R2013], Identification Cards - Physical Characteristics

One of a series of standards describing the characteristics for identification cards as defined in the definitions clause and the use of such cards for international interchange. This International Standard specifies the physical characteristics of identification cards including card materials, construction, characteristics, and dimensions for four sizes of cards.

This part of ISO/IEC 7811 is one of a series of International Standards describing the parameters for identification cards as defined in the definitions clause and the use of such cards for international interchange. This part of ISO/IEC 7811 specifies requirements for embossed characters on identification cards. The embossed characters are intended for transfer of data either by use of imprinters or by visual or machine reading. It takes into consideration both human and machine aspects and states minimum requirements.

Specifies requirements for a low coercivity magnetic stripe (including any protective overlay) on an identification card, the encoding technique and coded character sets. It takes into consideration both human and machine aspects and states minimum requirements.

This International Standard defines the characteristics for identification cards as defined in Clause 4 of this part of ISO/IEC 7811 and the use of such cards for international interchange. This part of ISO/IEC 7811 specifies requirements for a high coercivity magnetic stripe (including any protective overlay) on an identification card, the encoding technique, and coded character sets. It takes into consideration both human and machine aspects and states minimum requirements.
INCITS/ISO 7811-7:2014, Identification cards - Recording technique - Part 7: Magnetic stripe - High coercivity, high density

This part of ISO/IEC 7811 is one of a series of international Standards describing the characteristics for identification cards as defined in the definitions clause and the use of such cards for international interchange. This part of ISO/IEC 7811 specifies requirements for a high coercivity magnetic stripe (including any protective overlay) on an identification card and encoding technique. It takes into consideration both human and machine aspects and states minimum requirements.

INCITS/ISO 7811-8:2014 [2016], Identification cards - Recording technique - Part 8: Magnetic stripe - Coercivity of 51.7 kA/m (650 Oe)

Defines the characteristics for identification cards as defined in Clause 4 of this part of ISO/IEC 7811, and the use of such cards for international interchange. This part of ISO/IEC 7811 specifies requirements for a 51.7 kA/m (650 Oe) magnetic stripe (including any protective overlay) on an identification card. The encoding technique and coded character sets are not defined, however, the specifications of ISO/IEC 7811-2 may be used. It takes into consideration both human and machine aspects and states minimum requirements.

Specifies the physical characteristics of a tactile identifier mark used by visually-impaired card holders to distinguish their cards. It defines the area on the card for the tactile identifier mark (TIM) and the layout of Braille style embossed dots arranged in patterns to enable easy tactile recognition.

Specifies a numbering system for the identification of the card issuers, the format of the issuer number (PAN). It describes the application and registration procedures for numbers issued in accordance with ISO/IEC 7812-1. ISO/IEC 7812-1 specifies the numbering system for the identification of issuers of identification cards used in international and/or inter-industry interchange.

ISO/IEC 7812-2:2007 is one of a series of International Standards describing the parameters for identification cards, and the use of such cards for international and/or inter-industry interchange. It describes the application and registration procedures for numbers issued in accordance with ISO/IEC 7812-1. ISO/IEC 7812-1 specifies the numbering system for the identification of issuers of identification cards used in international and/or inter-industry interchange.

INCITS/ISO 7813-2001 [R2013], Tactile technology - Identification cards - Financial transaction cards

ISO/IEC 7813-2001 specifies the data structure and data content of magnetic tracks 1 and 2, which are used to initiate financial transactions. It takes into consideration both human and physical aspects and states minimum requirements of conformity. It references layout, recording techniques, numbering systems, registration procedures, but not security requirements.

INCITS/ISO 7813:2006 [2008], Information technology - Identification cards - Financial transaction cards

ISO/IEC 7813-2006 specifies the data structure and data content of magnetic tracks 1 and 2, which are used to initiate financial transactions. It takes into consideration both human and physical aspects and states minimum requirements of conformity. It references layout, recording techniques, numbering systems, registration procedures, but not security requirements.

INCITS/ISO 7816-1:1998/AM1-2003 [R2009], Identification cards - Integrated circuit(s) cards with contacts - Part 1: Physical characteristics - Amendment 1: Maximum height of the IC contact surface

Specifies the physical characteristics of integrating circuit(s) cards with contacts. It applies to identification cards of the ID-1 card type, which may include embossing and/or a magnetic stripe, as specified in American National Standard for Identification.

INCITS/ISO 7816-1:2011[2014], Identification cards - Integrated circuit cards - Part 1: Cards with contacts - Physical characteristics

ISO/IEC 7816-1:2011 specifies the physical characteristics of integrated circuit cards with contacts. It applies to identification cards of the ID-1 card type, which can include embossing and/or a magnetic stripe and/or tactile identifier mark as specified in ISO/IEC 7811. Test methods are specified in ISO/IEC 10373-1. ISO/IEC 7816-1:2011 applies to cards which have a physical interface with electrical contacts. It does not, however, define the nature, number and position of the integrated circuits in the cards.

INCITS/ISO 7816-10:1999 [R2014], Identification cards - Integrated circuit(s) cards with contacts - Part 10: Electronic signals and answer to reset for synchronous cards

This part of ISO/IEC 7816 specifies the power, signal structures, and the structure for the answer to reset between an integrated circuit(s) card with synchronous transmission and an interface device such as a terminal. The specifications in ISO/IEC 7816-3 apply where appropriate, unless otherwise stated here. It also covers signal rates, operating conditions, and communication with the integrated circuit(s) card. This part of ISO/IEC 7816 specifies two types of synchronous cards: type 1 and type 2.

This part of ISO/IEC 7816 specifies security related interindustry commands to be used for personal verification with biometric methods in integrated circuit(s) cards. It also defines the data structure and data access methods for use of the card as a carrier of the biometric reference data and/or as the device to perform the verification of a personal biometric (on-card matching). Identification of persons using biometric methods is outside the scope of this standard.

INCITS/ISO 7816-12:2005 [R2013], Identification cards - Integrated circuit cards - Part 12: Cards with contacts - USB electrical interface and operating procedures

This part of ISO/IEC 7816 specifies the operating conditions of an integrated circuit card that provides a USB interface. Figure 1 shows the assignment of the contact fields for a USB interface and - to illustrate interoperability - the assignment as used in ISO/IEC 7816-3.

ISO/IEC 7816-13:2007 specifies commands for application management in a multi-application environment. These commands cover the entire life cycle of applications in a multi-application integrated circuit card, and the commands can be used before and after the card is issued to the cardholder. ISO/IEC 7816-13:2007 does not cover the implementation within the card and/or the outside world.

This part of ISO/IEC 7816 specifies an application in a card. This application contains information on cryptographic functionality. This part of ISO/IEC 7816 defines a common syntax and format for the cryptographic information and mechanisms to share this information whenever appropriate.
ISO/IEC 7816

ISO/IEC 7816-1:2004 [R2016], Identification cards - Integrated circuit cards -- Part 1: Cryptographic information application - Amendment 1: Examples of the use of the cryptographic information application

ISO/IEC 7816-2:2007 specifies the dimensions and locations for each of the contacts on integrated circuit(s) cards of an ID-1 card type. It also provides information on the way to identify which standards define the use of the contacts.

This part of ISO/IEC 7816 specifies the power and signal structures, and information exchange between an integrated circuit card and an interface device such as a terminal.

Intended to be used in any sector of activity. It specifies: a) contents of command-response pairs exchanged at the interface, b) means of retrieval of data elements and data objects in the card, c) structures and contents of historical bytes to describe operating characteristics of the card, d) structures for applications and data in the card, as seen at the interface when processing commands, e) access methods to files and data in the card, f) a security architecture defining access rights to files and data in the card, g) means and mechanisms for identifying and addressing applications in the card, h) methods for secure messaging, i) access methods to the algorithms processed by the card. It does not describe these algorithms.

ISO/IEC 7816-5:2004 [R2014], Identification cards - Integrated circuit cards - Part 5: Registration of application providers

This part of ISO/IEC 7816 specifies a registration procedure for application providers, and establishes the authorities and procedures to ensure and optimize the reliability of this registration.

This document specifies, directly or by reference, data elements, including composite data elements, that may be used in interindustry interchange. It identifies the following characteristics of each data element: &#63719; identifier; name;&#63719; description and reference; format and coding (if not available in other ISO International Standards or parts of ISO/IEC 7816).

ISO/IEC 7816-7:1999 [R2014], Identification cards - Integrated circuit(s) cards with contacts - Part 7: Interindustry commands for Structured Card Query Language (SCQL)

This part of ISO/IEC 7816 specifies the concept of a SCQL database (SCQL = Structured Card Query Language based on SQL, see ISO 9075) and the related interindustry enhanced commands.

ISO/IEC 7816-8:2004 [R2014], Identification cards - Integrated circuit cards - Part 8: Commands for security operations

ISO/IEC 7816-8:2004 specifies interindustry commands for integrated circuit cards (either with contacts or without contacts) that may be used for cryptographic operations. These commands are complementary to and based on the commands listed in ISO/IEC 7816-4. Annexes are provided that give examples of operations related to digital signatures, certificates and the import and export of asymmetric keys. The choice and conditions of use of cryptographic mechanisms may affect card exportability. The evaluation of the suitability of algorithms and protocols is outside the scope of ISO/IEC 7816-8.

ISO/IEC 7816-9:2004 specifies interindustry commands for integrated circuit cards (both with contacts and without contacts) for card and file management, e.g. file creation and deletion. These commands cover the entire life cycle of the card and therefore some commands may be used before the card has been issued to the cardholder or after the card has expired. An annex is provided that shows how to control the loading of data (secure download) into the card, by means of verifying the access rights of the loading entity and protection of the transmitted data with secure messaging. The loaded data may contain, for example, code, keys and applets.

ISO/IEC 8378-1:1986 [R2015], Information processing - Data interchange on 130 mm (5.25 in) flexible disk cartridges using modified frequency modulation recording at 7 958 fpprd, 3,8 tpmm (96 tpi), on both sides - Part 1: Dimensional, physical and magnetic characteristics

This standard provides the dimensional, physical and magnetic characteristics of 130 mm (5.25 in) flexible disk cartridges for data interchange between EDP systems with modified frequency modulation recording on 80 tracks on each side and recorded at 7 958 fpprd, 3,8 tpmm (96 tpi). Applicable in conjunction with ISO 8378 and ISO 8378/2 or 8378/3.

ISO/IEC 8484-1987 [R2013], Information technology - Magnetic stripes on savingsbooks

ISO/IEC 8484:2007 specifies the characteristics and location of a magnetic stripe on a savingsbook and the use of such savingsbooks for international interchange. Compatibility with international interchange systems is provided through the requirements of ISO/IEC 8484:2007, enabling a savingsbook with a magnetic stripe to be read and possibly encoded in a device that is compatible with reading identification cards used in international interchange. It takes into consideration both human and machine aspects and states minimum requirements.

ISO/IEC 8484:2007 [2008], Information technology - Magnetic stripes on savingsbooks

ISO/IEC 8484:2007 specifies the characteristics and location of a magnetic stripe on a savingsbook and the use of such savingsbooks for international interchange. Compatibility with international interchange systems is provided through the requirements of ISO/IEC 8484:2007, enabling a savingsbook with a magnetic stripe to be read and possibly encoded in a device that is compatible with reading identification cards used in international interchange. It takes into consideration both human and machine aspects and states minimum requirements.

This part of ISO 8630 specifies the quality of recorded signals, the track layout, and a track format to be used on 130 mm (5.25 in), 13 262 fprad flexible disk cartridges intended for data interchange between data processing systems.

ISO/IEC 8632 provides a file format suitable for the storage and retrieval of picture description information. The file format consists of an ordered set of elements that may be used to describe pictures in a way that is compatible between systems of different architectures, compatible with devices of differing capabilities and design, and meaningful to application constituencies. This picture description includes the capability for describing static images. This part of ISO/IEC 8632 describes the format using an abstract syntax.

Technical Corrigendum 1

Technical Corrigendum 2

This part of ISO/IEC 8632 specifies a binary encoding of the Computer Graphics Metafile. For each of the elements specified in ISO/IEC 8632-1, this part specifies an encoding in terms of data types.

This part of ISO/IEC 8632 specifies a clear text encoding of the Computer Graphics Metafile. For each of the elements specified in ISO/IEC 8632-1, a clear text encoding is specified. Allowed abbreviations are specified. The overall format of the metafile and the means by which comments may be interspersed in the metafile is specified.

ISO/IEC 8824-1:2008 specifies a standard notation called Abstract Syntax Notation One (ASN.1) that is used for the definition of data types, values, and constraints on data types. ISO/IEC 8824-1:2008 defines a number of simple types, with their tags, and specifies a notation for referencing these types and for specifying values of these types; defines mechanisms for constructing new types from more basic types, and specifies a notation for defining such types and assigning them tags, and for specifying values of these types; defines character sets (by reference to other ITU-T Recommendations and International Standards) for use within ASN.1

ISO/IEC 8824-2:2008 is part of Abstract Syntax Notation One (ASN.1) and provides notation for specifying information object classes, information objects and information object sets.

ISO/IEC 8824-3:2008 is part of Abstract Syntax Notation One (ASN.1) and provides notation for specifying user-defined constraints, table constraints, and content constraints.

ISO/IEC 8824-4:2008 is part of Abstract Syntax Notation One (ASN.1) and defines notation for parameterization of ASN.1 specifications.

ISO/IEC 8825-1:2008 specifies a set of basic encoding rules that can be used to derive the specification of a transfer syntax for values of types defined using the notation specified in ISO/IEC 8824-1, ISO/IEC 8824-2, ISO/IEC 8824-3, and ISO/IEC 8824-4, collectively referred to as Abstract Syntax Notation One or ASN.1. These basic encoding rules can also be applied for decoding such a transfer syntax in order to identify the data values being transferred. ISO/IEC 8825-1:2008 also specifies a set of canonical and distinguished encoding rules that restrict the encoding of values to just one of the alternatives provided by the basic encoding rules.

ISO/IEC 8825-2:2008 specifies a set of Packed Encoding Rules that can be used to derive a transfer syntax for values of types defined in ISO/IEC 8824-1. These Packed Encoding Rules can also be applied for decoding such a transfer syntax in order to identify the data values being transferred.

ISO/IEC 8825-3:2008 defines Encoding Control Notation (ECN): a notation for specifying encodings of ASN.1 types or of parts of types. It provides several mechanisms for such specification, including direct specification of the encoding using standardized notation; specification of the encoding by reference to standardized encoding rules; specification of the encoding of an ASN.1 type by reference to an encoding structure; specification of the encoding using non-ECN notation. It also provides the means to link the specification of encodings to the type definitions to which they are to be applied.

This Recommendation / International Standard specifies a set of Basic XML Encoding Rules (XER) that may be used to derive a transfer syntax for values of types defined in ITU-T Rec. X.680 | ISO/IEC 8824-1 and ITU-T Rec. X.681 | ISO/IEC 8824-2.
ISO/IEC 8825-4:2008 specifies a set of basic XML Encoding Rules (XER) that can be used to derive a transfer syntax for values of types defined in ISO/IEC 8824-1 and ISO/IEC 8824-2. It also specifies a set of Canonical XML Encoding Rules (CXER) which provide constraints on the basic XML Encoding Rules and produce a unique encoding for any given ASN.1 value. ISO/IEC 8825-4:2008 further specifies a set of extended XML Encoding Rules (EXTENDED-XER) which adds further encoder options, and also allows the ASN.1 specifier to vary the encoding that would be produced by BASIC-XER.

INCITS/ISO/IEC 8859-1-1998 [R2013],
Information technology - 8-bit single-byte coded graphic character sets - Part 1: Latin Alphabet No. 1 (8-Bit ASCII) (Revision and Resignation of X3.134.2)
This part of ISO/IEC 8859 specifies a set of 191 coded graphic characters identified as Latin alphabet No. 1. This set of coded graphic characters is intended for use in data and text processing applications and also for information interchange.

INCITS/ISO/IEC 8859-10-1998 [R2013],
Information technology - 8-bit single-byte coded graphic character sets - Part 10: Latin alphabet No. 6
This part of ISO/IEC 8859 specifies a set of 191 coded graphic characters identified as Latin alphabet No. 6. This set of coded graphic characters is intended for use in data and text processing applications and also for information interchange. The set contains graphic characters used for general purpose applications in typical office environments in at least the following languages: Danish, English, Estonian, Finnish, German, Latin, Lithuanian, Norwegian, Polish, Slovene and Swedish.

INCITS/ISO/IEC 8859-13-2008 [R2013],
Information technology - 8-bit single-byte coded graphic character sets - Part 13: Latin Alphabet No. 7
This part of ISO/IEC 8859 specifies a set of 191 coded graphic characters identified as Latin alphabet No. 7. This set of coded graphic characters is intended for use in data and text processing applications and also for information interchange. The set contains graphic characters used for general purpose applications in typical office environments in at least the following languages: Danish, English, Estonian, Finnish, German, Latin, Latvian, Lithuanian, Norwegian, Polish, Slovene and Swedish.

INCITS/ISO/IEC 8859-14-2008 [R2013],
Information technology - 8-bit single-byte coded graphic character sets - Part 14: Latin alphabet No. 8
This set of coded graphic characters is intended for use in data and text processing applications and also for information interchange. The set contains graphic characters used for general purpose applications in typical office environments in at least the following languages: Albanian, Basque, Breton, Catalan, Cornish, Danish, Dutch, English, French (with restrictions, see Annex A.1, Notes), Frisian, Galician, German, Greenlandic, Irish Gaelic (old and new orthographies), Italian, Latin, Luxembourgish, Manx Gaelic, Norwegian, Portuguese, Rhaeto-Romantic, Scottish Gaelic, Spanish, Swedish, and Welsh.

Information technology - 8-bit single-byte coded graphic character sets - Part 15: Latin Alphabet No.9
This set of coded graphic characters is intended for use in data and text processing applications and also for information interchange. The set contains graphic characters used for general purpose applications in typical office environments in at least the following languages: Albanian, Basque, Breton, Catalan, Cornish, Danish, Dutch, English, Estonian, Faroese, Finnish, French, Friisian, Galician, German, Greenlandic, Icelandic, Irish Gaelic (new orthography), Italian, Latin, Luxembourgish, Norwegian, Portuguese, Rhaeto-Romantic, Scottish Gaelic, Spanish, and Swedish.

INCITS/ISO/IEC 8859-11:2001 [R2013],
Information technology - 8-bit single-byte coded graphic character sets - Part 11: Latin/Thai alphabet character set
This part of ISO/IEC 8859 specifies a set of 183 coded graphic characters identified as Latin/Thai alphabet character set. This set of coded graphic characters is intended for use in data and text processing applications and also for information interchange. The set contains graphic characters used for general purpose applications in typical office environments in at least the following languages: Thai, English and Latin.

INCITS/ISO/IEC 8859-16:2001 [R2015],
Information technology - 8-bit single-byte coded graphic character sets - Part 16: Latin alphabet No. 10
This part of ISO/IEC 8859 specifies a set of 191 coded graphic characters identified as Latin alphabet No. 10. This set of coded graphic characters is intended for use in data and text processing applications and also for information interchange. The set contains graphic characters used for general purpose applications in typical office environments in at least the following languages: Albanian, Croatian, English, Finnish, French, German, Hungarian, Irish Gaelic (new orthography), Italian, Latin, Polish, Romanian, and Slovenian. This set of coded graphic characters may be regarded as a version of an 8-bit code according to ISO/IEC 2022 or ISO/IEC 4873 at level 1. This part of ISO/IEC 8859 may not be used in conjunction with any other parts of ISO/IEC 8859. If coded characters from more than one part are to be used together, by means of code extension techniques, the equivalent coded character sets from ISO/IEC 10367, or their corresponding G1 sets from the ISO International Register of Coded Character Sets to be Used with Escape Sequences, should be used instead within a version of ISO/IEC 4873 at level 2 or level 3. The coded characters in this set may be used in conjunction with coded control functions selected from ISO/IEC 6429. However, control functions are not used to create composite graphic symbols from two or more graphic characters (see clause 6).

INCITS/ISO/IEC 8859-2:1999 [R2015],
Information technology - 8-bit single-byte coded graphic character sets - Part 2: Latin alphabet No. 2
This part of ISO/IEC 8859 specifies a set of 191 coded graphic characters identified as Latin alphabet No. 10. This set of coded graphic characters is intended for use in data and text processing applications and also for information interchange. The set contains graphic characters used for general purpose applications in typical office environments in at least the following languages: Albanian, Croatian, English, Finnish, French, German, Hungarian, Irish Gaelic (new orthography), Italian, Latin, Polish, Romanian, and Slovenian. This set of coded graphic characters may be regarded as a version of an 8-bit code according to ISO/IEC 2022 or ISO/IEC 4873 at level 1. This part of ISO/IEC 8859 may not be used in conjunction with any other parts of ISO/IEC 8859. If coded characters from more than one part are to be used together, by means of code extension techniques, the equivalent coded character sets from ISO/IEC 10367, or their corresponding G1 sets from the ISO International Register of Coded Character Sets to be Used with Escape Sequences, should be used instead within a version of ISO/IEC 4873 at level 2 or level 3. The coded characters in this set may be used in conjunction with coded control functions selected from ISO/IEC 6429. However, control functions are not used to create composite graphic symbols from two or more graphic characters (see clause 6).

This part of ISO/IEC 8859 specifies a set of 184 coded graphic characters identified as Latin alphabet No. 3. This set of coded graphic characters is intended for use in data and text processing applications and also for information interchange. The set contains graphic characters used for general purpose applications in typical office environments in at least the following languages: Esperanto and Maltese, and if needed in conjunction with these, English, French (with restrictions, see Annex A.1, Notes), German, Italian, Latin and Portuguese. Coding of Turkish characters using this part is deprecated, that specified in part 9 is to be used. This set of coded graphic characters may be regarded as a version of an 8-bit code according to ISO/IEC 10367 should be used instead within a version of ISO/IEC 4873 at level 2 or level 3. The ISO/IEC 10367 should be used instead within a version of ISO/IEC 4873 at level 1. This part of ISO/IEC 8859 may not be used in conjunction with any other parts of ISO/IEC 8859. If coded characters from more than one part are to be used together, by means of code extension techniques, the equivalent coded character sets from ISO/IEC 10367 should be used instead within a version of ISO/IEC 4873 at level 2 or level 3. The coded characters in this set may be used in conjunction with coded control functions selected from ISO/IEC 6429. However, control functions are not used to create composite graphic symbols from two or more graphic characters (see clause 6).

INCITS/ISO/IEC 8859-4:1998 [R2013], Information technology - 8-bit single-byte coded graphic character sets Part 4: Latin alphabet No. 4

This part of ISO/IEC 8859 specifies a set of 191 coded graphic characters identified as Latin alphabet No. 4. This set of coded graphic characters is intended for use in data and text processing applications and also for information interchange. The set contains graphic characters used for general purpose applications in typical office environments in at least the following languages: Danish, English, Estonian, Finnish, German, Greenlandic, Latin, Latvian, Lithuanian, Norwegian, Sami (but see Annex A.1, Notes), Slovene and Swedish.

This part of ISO/IEC 8859 specifies a set of 191 coded graphic characters identified as the Latin/ Cyrillic alphabet. This set of coded graphic characters is intended for use in data and text processing applications and also for information interchange. The set contains graphic characters used for general purpose applications in typical office environments in at least the following languages: Bulgarian, Byelorussian, English, Latin, (Slavic) Macedonian, Russian, Serbian and Ukrainian. This set of coded graphic characters may be regarded as a version of an 8-bit code according to ISO/IEC 2022 or ISO/IEC 4873 at level 1. This part of ISO/IEC 8859 may not be used in conjunction with any other parts of ISO/IEC 8859. If coded characters from more than one part are to be used together, by means of code extension techniques, the equivalent coded character sets from ISO/IEC 10367 should be used instead within a version of ISO/IEC 4873 at level 2 or level 3. The coded characters in this set may be used in conjunction with coded control functions selected from ISO/IEC 6429. However, control functions are not used to create composite graphic symbols from two or more graphic characters (see clause 6).

This part of ISO/IEC 8859 specifies a set of 146 coded graphic characters identified as Latin/Arabic alphabet. This set of coded graphic characters is intended for use in data and text processing applications and also for information interchange. The set contains graphic characters used for general purpose applications in typical office environments in at least the following languages: Arabic, English and Latin. Some of the characters in this set are combining characters (see clause 6). This set of coded graphic characters may be regarded as a version of an 8-bit code according to ISO/IEC 2022 or ISO/IEC 4873 at level 1. This part of ISO/IEC 8859 may not be used in conjunction with any other parts of ISO/IEC 8859. If coded characters from more than one part are to be used together, by means of code extension techniques, the equivalent coded character sets from ISO/IEC 10367 should be used instead within a version of ISO/IEC 4873 at level 2 or level 3. The coded characters in this set may be used in conjunction with coded control functions selected from ISO/IEC 6429. However, control functions are not used to create composite graphic symbols from two or more graphic characters (see clause 6).

INCITS/ISO/IEC 8859-7:2003 [R2013], Information technology - 8-bit single-byte coded graphic character sets - Part 7: Latin/Greek alphabet

ISO/IEC 8859-7:2003 specifies a set of 188 coded graphic characters identified as Latin/Greek alphabet. This set of coded graphic characters is intended for use in data and text processing applications and also for information interchange. The set contains graphic characters used for general purpose applications in typical office environments in at least the following languages: English, Greek, and Latin.

INCITS/ISO/IEC 8859-8:1999 [R2015], Information technology - 8-bit single-byte coded graphic character sets - Part 8: Latin/Hebrew alphabet

This part of ISO/IEC 8859 specifies a set of 155 coded graphic characters identified as Latin/Hebrew alphabet. This set of coded graphic characters is intended for use in data and text processing applications and also for information interchange. The set contains graphic characters used for general purpose applications in typical office environments in at least the following languages: English, Hebrew, Latin. It is not intended for pointed Hebrew. This set of coded graphic characters may be regarded as a version of an 8-bit code according to ISO/IEC 2022 or ISO/IEC 4873 at level 1. This part of ISO/IEC 8859 may not be used in conjunction with any other parts of ISO/IEC 8859. If coded characters from more than one part are to be used together, by means of code extension techniques, the equivalent coded character sets from ISO/IEC 10367 should be used instead within a version of ISO/IEC 4873 at level 2 or level 3. The coded characters in this set may be used in conjunction with coded control functions selected from ISO/IEC 6429. However, control functions are not used to create composite graphic symbols from two or more graphic characters (see clause 6).

This part of ISO/IEC 8859 specifies a set of 191 coded graphic characters identified as Latin alphabet No. 5. This set of coded graphic characters is intended for use in data and text processing applications and also for information interchange. The set contains graphic characters used for general purpose applications in typical office environments in at least the following languages: Albanian, Basque, Breton, Catalan, Danish, Dutch, English, Faroese, Finnish, French (with restrictions, see Annex A.1, Notes), Frisian, Galician, German, Greenlandic, Irish Gaelic (new orthography), Italian, Latin, Luxemburgish, Norwegian, Portuguese, Rhaeto-Romanc, Scottish Gaelic, Spanish, Swedish and Turkish.

INCITS/ISO/IEC 8860-1:1987 [R2015], Information processing - Data interchange on 90 mm (3.5 in) flexible disk cartridges using modified frequency modulation recording at 7 958 fptrad on 80 tracks on each side - Part 1: Dimensional, physical and magnetic characteristics

This standard provides the dimensional, physical and magnetic characteristics of the cartridge so as to provide physical interchangeability between data processing systems. Provides for full data interchangeability between data processing systems in conjunction with the ISO standards 8860-2 and 9293, and applies, moreover, in conjunction with ISO 683-13.
INCITS/ISO/IEC 9075-2:10-2008 [R2013], Information technology -- Database Languages -- SQL -- Part 10: Object language bindings (SQL/OLB) ISO/IEC 9075-10:2008 defines extensions to the SQL language to support embedding of SQL statements into programs written in the Java programming language (Java is a registered trademark of Sun Microsystems, Inc.). In addition, it specifies mechanisms to ensure binary portability of resulting applications.

INCITS/ISO/IEC 9075-10:2008/Cor 1:2012, Information technology -- Database languages -- SQL -- Part 10: Object Language Bindings (SQL/OLB) TECHNICAL CORRIGENDUM 1 This is the first Technical Corrigendum to ISO/IEC 9075-10:2008 that defines extensions to the SQL language to support embedding of SQL statements into programs written in the Java programming language (Java is a registered trademark of Sun Microsystems, Inc.). In addition, it specifies mechanisms to ensure binary portability of resulting applications.

INCITS/ISO/IEC 9075-13-2008 [R2013], Information technology -- Database languages -- SQL -- Part 13: SQL Routines and Types Using the Java TM Programming Language (SQL/JRT) ISO/IEC 9075-13:2008 specifies the ability to invoke static methods written in the Java programming language as SQL-invoked routines and to use classes defined in the Java programming language as SQL structured user-defined types. (Java is a registered trademark of Sun Microsystems, Inc.)

INCITS/ISO/IEC 9075-13-2008/Cor 1:2012, Information technology -- Database languages -- SQL -- Part 13: SQL Routines and Types Using the Java TM Programming Language (SQL/JRT) TECHNICAL CORRIGENDUM 1 This is the first Technical Corrigendum to ISO/IEC 9075-13:2008 that specifies the ability to invoke static methods written in the Java programming language as SQL-invoked routines and to use classes defined in the Java programming language as SQL structured user-defined types. (Java is a registered trademark of Sun Microsystems, Inc.)

INCITS/ISO/IEC 9075-14:2011/Cor 1:2013 [2014], Information technology -- Database languages -- SQL -- Part 14: XML-Related Specifications (SQL/XML), TECHNICAL CORRIGENDUM 1 This corrigendum corrects a technical defect in the base standard, ISO/IEC 9075-14:2011, which defines ways in which SQL can be used in conjunction with XML. It defines ways of importing and storing XML data in an SQL database, manipulating it within the database and publishing both XML and conventional SQL-data in XML form.

INCITS/ISO/IEC 9075-2:2011 [2012], Information technology -- Database languages -- SQL -- Part 2: Foundation (SQL/Foundation) ISO/IEC 9075-2:2011 defines the data structures and basic operations on SQL-data. It provides functional capabilities for creating, accessing, maintaining, controlling, and protecting SQL-data. Both static and dynamic variants of the language are proved. In addition to direct invocation, bindings are provided for the programming languages Ada, C, COBOL, Fortran, M, Pascal, and PL/I.

INCITS/ISO/IEC 9075-2:2011/Cor 1:2013[2014], Information technology -- Database languages -- SQL -- Part 2: Foundation (SQL/Foundation), TECHNICAL CORRIGENDUM 1 This corrigendum corrects a technical defect in the base standard, ISO/IEC 9075-2:2011, which defines the data structures and basic operations on SQL-data. It provides functional capabilities for creating, accessing, maintaining, controlling, and protecting SQL-data. Both static and dynamic variants of the language are proved. In addition to direct invocation, bindings are provided for the programming languages Ada, C, COBOL, Fortran, M, Pascal, and PL/I.
INCITS/ISO/IEC 9075-4:2011 [2012],
Information technology - Database languages - SQL - Part 4: Persistent Stored Modules (SQL/PSM)
ISO/IEC 9075-4:2011 specifies the syntax and semantics of statements to add a procedural capability to the SQL language in functions and procedures. It includes statements to direct the flow of control, define variables, make assignments and handle exception conditions.

INCITS/ISO/IEC 9075-4:2011/Cor 1:2013 [2014],
Information technology -- Database languages -- SQL - Part 4: Persistent Stored Modules (SQL/PSM), TECHNICAL CORRIGENDUM 1
This corrigendum corrects a technical defect in the base standard, ISO/IEC 9075-4:2011, which specifies the syntax and semantics of statements to add a procedural capability to the SQL language in functions and procedures. It includes statements to direct the flow of control, define variables, make assignments and handle exception conditions.

INCITS/ISO/IEC 9075-9-2008 [R2013],
Information technology - Database Languages - SQL - Part 9: Management of External Data (SQL/MED)
ISO/IEC 9075-9:2008 defines extensions to SQL to support management of external data through the use of foreign-data wrappers and datalink types.

INCITS/ISO/IEC 9075-9-2008/Cor 1:2012,
Information technology -- Database languages -- SQL - Part 9: Management of External Data (SQL/MED) TECHNICAL CORRIGENDUM 1
This is the first Technical Corrigendum to ISO/IEC 9075-9:2008 that defines extensions to SQL to support management of external data through the use of foreign-data wrappers and datalink types.

INCITS/ISO/IEC 9160-1988 [S2008],
Information Processing - Data Encipherment - Physical Layer Interoperability Requirements
Applies to systems for encipherment of ADP information in the physical layer of data communications. This is the second public review for this standard. It originated in the February 14, 1997 issue of Standards Action and is being resubmitted now due to substantive changes to the text

INCITS/ISO/IEC 9171-1:1990 [S2009],
Information Technology - 130 mm Optical Disk Cartridge, Write Once, for Information Interchange - Part 1: Unrecorded Optical Disk Cartridge
This part of ISO/IEC 9171 specifies definitions of essential concepts, the environment in which the characteristics are to be tested, the environments in which the cartridge is to be operated and stored, the mechanical, physical and dimensional characteristics of the case and of the optical disk, the optical characteristics and the recording characteristics for recording the information once and for reading it many times, so as to provide physical interchangeability between data processing systems.

INCITS/ISO/IEC 9171-2:1990 [S2008],
Information Technology - 130 mm Optical Disk Cartridge, Write Once, for Information Interchange - Part 2: Recording Format
Specifies two formats for the physical disposition of the tracks and sectors, the error correction codes, the modulation methods used for recording and the quality of the recorded signals. A prerequisite for conformance with this part of ISO/IEC 9171 is the conformance with its part One.

INCITS/ISO/IEC 9281-1-1990 [R2013],
Information Technology - Picture Coding Methods - Part 1: Identification
This part of ISO/IEC 9281 specifies the identification methods for coding of pictorial information in digital form. It does not specify the contents of the data field of a picture entity. For instance, this field may also contain audio and/or animation data associated with the data specifying the picture(s).

INCITS/ISO/IEC 9281-2-1990 [R2013],
Information technology -- Picture coding methods -- Part 2: Procedure for registration
This part of ISO/IEC 9281 specifies the procedures to be followed by a Registration Authority in preparing, maintaining and publishing a register of identifiers allocated to picture coding methods.

INCITS/ISO/IEC 9282-1-1988 [R2013],
Information processing - Coded representation of pictures - Part 1: Encoding principles for picture representation in a 7-bit or 8-bit environment
This part of ISO 9282 defines the coding principles to be used in interchanging pictures consisting of graphic images in a /-bit or 8-bit environment - the data structures to be used to represent the primitives describing a picture - the general datatypes which can be used as operands within a primitive.

Specifies the volume and file structure of disk cartridges for the interchange of information between users of information processing systems. It also specifies an optional record structure.

INCITS/ISO/IEC 9496:2003 [R2015], CHILL - The ITU-T programming language
This standard defines the ITU-T programming language CHILL. CHILL is a strongly typed, block structured and object-oriented language designed primarily for the implementation of large and complex embedded systems. CHILL was designed to provide reliability and run time efficiency, at the same time sufficient flexibility and powerfulness to encompass the required range of applications. CHILL also provides facilities that encourage piecewise and modular development of large systems.

INCITS/ISO/IEC 9529-1:1989 [R2015],
Information processing systems - Data interchange on 90 mm (3,5 in) flexible disk cartridges using modified frequency modulation recording at 15 916 fprad, on 80 tracks on each side - Part 1: Dimensional, physical and magnetic characteristics
This standard specifies the dimensional, physical and magnetic characteristics of the 90 mm (3,5 in) flexible disk cartridge using modified frequency modulation recording at 15 916 fprad on 80 tracks on each side, so as to provide physical interchangeability between data processing systems.

INCITS/ISO/IEC 9541-1:2012 [2013],
Information technology -- Font information interchange -- Part 1: Architecture
ISO/IEC 9541 defines a method of naming glyphs and glyph collections, independent of any document encoding technique; it assumes that one or more methods of associating document encoding techniques with glyph identifiers used in font resources will be provided by text processing systems. ISO/IEC 9541-1:2012 specifies the architecture of a font resource, i.e. the font description, font metrics, glyph description and glyph metrics properties required for font references and the interchange of font resources.

INCITS/ISO/IEC 9541-2:2012 [2013],
Information technology - Font information interchange - Part 2: Interchange format
ISO/IEC 9541 specifies the architecture of font resources, as well as the formats for font interchange amongst information processing systems. ISO/IEC 9541 also specifies the architecture and formats that can be used to construct font references in general electronic document interchange. ISO/IEC 9541-2:2012 specifies the interchange formats for font information, and the minimum subsets of that information required for interchange. ISO/IEC 9541-2:2012 requires the property definitions as defined in ISO/IEC 9541-1.

INCITS/ISO/IEC 9541-3:2012 [2013],
Information technology - Font information interchange - Part 3: Glyph shape representation
ISO/IEC 9541-3:2012 specifies the architecture and interchange formats of glyph shape representations. Font resources represented using the architecture and interchange formats defined in ISO/IEC 9541-1 and ISO/IEC 9541-2 are used in various document processing environments in which the RELAX NG (ISO/IEC 19757-2) parsing algorithm is recognized. The encoding of font resource information as defined in ISO/IEC 9541-3:2012 is specified in RELAX NG representation for persistent generation of font resources for use in these processing environments.
INCITS/ISO 9541-1:2009 [R2014], Information Technology - Font Information Interchange - Part 4: Application-Specific Extensions

ISO/IEC 9541 specifies the architecture of font resources, as well as the formats for font interchange among information processing systems. It also specifies the architecture and formats that can be used to construct font references in general electronic document interchange. ISO/IEC 9541-4:2009 specifies the correspondence between ISO/IEC 9541 font resource and ISO/IEC 14496-22 Open Font Format file (OFF), to define ISO/IEC 9541 font resource from a given OFF file. The classification (required or optional), syntax, and possible values of the properties are defined in ISO/IEC 9541-1 and ISO/IEC 9541-2.

INCITS/ISO/IEC 9541-4:2009/Cor 1:2013, Information technology - Font information interchange -- Part 4: Harmonization to Open Font Format, TECHNICAL CORRIGENDUM 1

This International Standard specifies a protocol which is used by Network Layer entities operating ISO 8473 in End Syst.ems and Intermediate Systems (referred to herein as ES and IS respectively) to maintain routing information. The Protocol herein described relies upon the provision of a connectionless-mode underlying service.

Specifies a set of functions for computer graphics programming, the Programmer's Hierarchical Interactive Graphics Systems (PHIGS). PHIGS is a graphics system for application programs that produce computer generated pictures on output devices.

This part of ISO/IEC 9592 specifies a language independent nucleus of a graphics system. For integration into a programming language, PHIGS is embedded in a language-dependent layer obeying the particular conventions of that language. This standard specifies such a language-dependent layer for the FORTRAN language.

This part of ISO/IEC 9592 specifies a clear-text encoding of the PHIGS archive file. For each of the archive file elements specified in ISO/IEC 9592-2, a clear text encoding is specified. This part of ISO/IEC 9592 specifies the overall format of the archive file and the means by which comments may be interspersed in the archive file.

This Amendment 1 to ISO/IEC 9593-1:1990 that specifies a language-independent nucleus of a graphics system. For integration into a programming language, PHIGS is embedded in a language-dependent layer obeying the particular conventions of that language. This standard specifies such a language-dependent layer for the FORTRAN language.

This is Amendment 1 to ISO/IEC 9592-1:1990 that specifies a language-independent nucleus of a graphics system. For integration into a programming language, PHIGS is embedded in a language-dependent layer obeying the particular conventions of that language. This standard specifies such a language-dependent layer for the FORTRAN language.

This is Amendment 2 to ISO/IEC 9593-1:1990 that specifies a language-independent nucleus of a graphics system. For integration into a programming language, PHIGS is embedded in a language-dependent layer obeying the particular conventions of that language. This standard specifies such a language-dependent layer for the FORTRAN language.

This is Amendment 1 to ISO/IEC 9593-2:1995 that specifies a language-independent nucleus of a graphics system. For integration into a programming language, PHIGS is embedded in a language-dependent layer obeying the particular conventions of that language. This standard specifies such a language-dependent layer for the FORTRAN language.

This is Amendment 1 to ISO/IEC 9593-3:2009 that specifies a language independent nucleus of a graphics system. For integration into a programming language, PHIGS is embedded in a language-dependent layer obeying the particular conventions of that language. This standard specifies such a language-dependent layer for the Ada computer programming language.

This is Technical Corrigendum 1 to ISO/IEC 9593-3:2009/AM1:1995 that specifies a language-independent nucleus of a graphics system. For integration into a programming language, PHIGS is embedded in a language-dependent layer obeying the particular conventions of that language. This standard specifies such a language-dependent layer for the C language.

This is Technical Corrigendum 2 to ISO/IEC 9593-3:2009/AM1:1995 that specifies a language-independent nucleus of a graphics system. For integration into a programming language, PHIGS is embedded in a language-dependent layer obeying the particular conventions of that language. This standard specifies such a language-dependent layer for the C language.

This is Amendment 1 to ISO/IEC 9593-4:1991 that specifies a language-independent nucleus of a graphics system. For integration into a programming language, PHIGS is embedded in a language-dependent layer obeying the particular conventions of that language. This standard specifies such a language-dependent layer for the C language.
Information technology - Computer Graphics - Programmers Hierarchical Interactive Graphics System (PHIGS) language bindings - Part 4: C - Amendment 2: Incorporation of PHIGS amendments
This is the second amendment to ISO/IEC 9593-4:1991 that specifies a language independent nucleus of a graphics system. ISO/IEC 9593-4:1991 specifies also a language dependent layer for the C language. Annexes A, B, C, D and E are for information only.

This Recommendation | International Standard specifies the behaviour of DSAs taking part in the distributed Directory application. The allowed behaviour has been designed so as to ensure a consistent service given a wide distribution of the DIB across many DSAs. The Directory is not intended to be a general purpose database system, although it may be built on such systems. It is assumed that there is a considerably higher frequency of queries than of updates.

INCITS/ISO 9594-1:2005 [2005],
Information Technology - Open Systems Interconnection - The Directory: Overview of concepts, models and services
ISO/IEC 9594-1:2005 includes specifications for how information about objects, e.g. persons, is organized, created, maintained and retrieved. It provides provisions for protecting stored information through authentication and access control specifications. ISO/IEC 9594-1:2005 introduces the concepts of the Directory and the DIB (Directory Information Base), and overviews the services and capabilities which they provide. It is intended to give an introduction to the other parts of ISO/IEC 9594. It is not an implementation specification.

INCITS/ISO 9594-1:2008 [2013],
Information Technology - Open Systems Interconnection - The Directory: Overview of concepts, models and services
The Directory provides the directory capabilities required by OSI applications, OSI management processes, other OSI layer entities, and telecommunications services.

INCITS/ISO 9594-2:2005 [2005],
Information Technology - Open Systems Interconnection - The Directory: Models
ISO/IEC 9594-2:2005 includes specifications for how information about objects, e.g. persons, is organized, created, maintained and retrieved. It also gives provisions for protecting stored information through authentication and access control specifications. ISO/IEC 9594-2:2005 provides a number of different models for the Directory as a framework for the other ISO/IEC 9594 parts

INCITS/ISO 9594-2:2008 [2013],
Information Technology - Open Systems Interconnection - The Directory: Models
The models defined in ISO/IEC 9594-2:2008 provide a conceptual and terminological framework for the other parts of ISO/IEC 9594, which define various aspects of the Directory.

INCITS/ISO 9594-3:2008 [2013],
Information Technology - Open Systems Interconnection - The Directory: Abstract service definition
ISO/IEC 9594-3:2008 defines in an abstract way the externally visible service provided by the Directory.

INCITS/ISO 9594-4:2005 [2008],
Information Technology - Open Systems Interconnection - The Directory: Procedures for distributed operation
ISO/IEC 9594-4:2005 provides specifications for how information about objects, e.g. persons, is organized, created, maintained and retrieved. It also gives provisions for protecting stored information through authentication and access control specifications. ISO/IEC 9594-4:2005 specifies the procedures by which the distributed components of the Directory interwork in order to provide a consistent service to its users. This includes defining procedures for interworking with LDAP.

INCITS/ISO 9594-4:2008 [2013],
Information Technology - Open Systems Interconnection - The Directory: Procedures for distributed operation
ISO/IEC 9594-4:2008 specifies the behaviour of DSAs taking part in the distributed Directory application. The allowed behaviour has been designed so as to ensure a consistent service given a wide distribution of the DIB across many DSAs.

INCITS/ISO 9594-5:2005 [2005],
Information Technology - Open Systems Interconnection - The Directory: Protocol specifications

INCITS/ISO 9594-5:2008 [2013],
Information Technology - Open Systems Interconnection - The Directory: Protocol specifications

INCITS/ISO 9594-6:2005 [2005],
Information Technology - Open Systems Interconnection - The Directory: Selected attribute types
ISO/IEC 9594-6:2005 provides specifications for how information about objects, e.g. persons, is organized, created, maintained and retrieved. It also gives provisions for protecting stored information through authentication and access control specifications. ISO/IEC 9594-6:2005 defines a number of attribute types, matching rules and context types which may be found useful across a range of applications of the Directory. One particular use for many of the attributes defined is in the formation of names, particularly for the classes of object defined in ISO/IEC 9594-7.

INCITS/ISO 9594-6:2008 [2013],
Information Technology - Open Systems Interconnection - The Directory: Selected attribute types
ISO/IEC 9594-6:2008 defines a number of attribute types and matching rules which may be found useful across a range of applications of the Directory.

INCITS/ISO 9594-7:2005 [2005],
Information Technology - Open Systems Interconnection - The Directory: Selected object classes
ISO/IEC 9594-7:2005 provides specifications for how information about objects, e.g. persons, is organized, created, maintained and retrieved. It also gives provision for protecting stored information through authentication and access control specifications. ISO/IEC 9594-7:2005 defines a number of selected object classes and name forms which may be useful across a range of applications of the Directory. An object class definition specifies the attribute types which are relevant to the objects of that class. A name form definition specifies the attributes to be used in forming names for the objects of a given class.

INCITS/ISO 9594-7:2008 [2013],
Information Technology - Open Systems Interconnection - The Directory: Selected object classes
ISO/IEC 9594-7:2008 defines a number of object classes and name forms that may be found useful across a range of applications of the Directory. The definition of an object class involves listing a number of attribute types that are relevant to objects of that class. The definition of a name form involves naming the object class to which it applies and listing the attributes to be used in forming names for objects of that class. These definitions are used by the administrative authority that is responsible for the management of the directory information. 
ISO/IEC 9594-8:2005 specifies three frameworks and a number of data objects that can be used to authenticate and secure the communication between two entities, e.g. between two directory service entities or between a web browser and web server. The data objects can also be used to prove the source and integrity of data structures such as digitally signed documents.

ISO/IEC 9594-8:2008 addresses some of the security requirements in the areas of authentication and other security services through the provision of a set of frameworks upon which full services can be based.

ISO/IEC 9594-9:2005 provides specifications for how information about objects, e.g. persons, is organized, created, maintained and retrieved. It also gives provisions for protecting stored information through authentication and access control specifications.
ISO/IEC 9594-9:2005 specifies a shadow service which DSAs may use to replicate Directory information. The service allows Directory information to be replicated among DSAs to improve service to Directory users, and provides for the automatic updating of this information.

ISO/IEC 9594-9:2008 specifies a shadow service which DSAs may use to replicate Directory information. The service allows Directory information to be replicated among DSAs to improve service to Directory users. The shadowed information is updated, using the among DSAs to improve service to Directory users, service allows Directory information to be replicated with virtual device management, coordinate space control, and error control. Annexes A and B form an integral part of this standard. Annex C is for information only.

Describes those functions of the interface concerned with virtual device management, coordinate space control, and error control. Annexes A and B form an integral part of this standard. Annex C is for information only.

Describes those functions of the interface concerned with output primitives and associated attributes and controls for creating graphical pictures. Annexes A and B form an integral part of this standard. Annexes C, D, E, F, G and H are for information only.

Describes those functions of the interface concerned with the creation, modification, and manipulation of graphical pictures using segments. Annexes A and B form an integral part of this standard. Annexes C and D are for information only.

Describes those functions of the interface concerned with obtaining graphical and non-graphical input from a virtual device. Defines also functions to support echoing of input operations on separate virtual devices.

Describes those functions of the interface concerned with creating, modifying, retrieving, and displaying portions of an image stored as pixel data. Annexes A and B form an integral part of this standard. Annexes C, D, E and F are for information only.

Specifies a character encoding of the Computer Graphics Interface. For each of the functions specified in ANSI/ISO/IEC 9637 an encoding is specified. Provides a highly compact representation of the data, suitable for applications that require the data to be of minimum size and suitable for transmission with character-oriented transmission services.

Specifies a Binary Encoding of the Computer Graphics Interface (CGI) data stream. For each of the functions syntaxes in clause 5 and clause 6 of ISO/IEC 9636-2, ISO/IEC 9636-3, ISO/IEC 9636-4, ISO/IEC 9636-5, and ISO/IEC 9636-6, an encoding is specified in terms of an opcode and a sequence of parameters of specified data types. For each of these data types, an explicit representation in terms of bits, 8-bit and 16-bit entities is specified. For some data types, the exact representation depends on a type and/or precision for the data as used in the data stream.

The Computer Graphics Interface (CGI) (ISO/IEC 9636), specifies a language independent standard interface between device-independent and device-dependent parts of a graphics system. For integration into a programming language, CGI is embedded in a language dependent layer obeying the particular conventions of that language. This part of ISO/IEC 9638 specifies such a language dependent layer for the Ada programming language.

ISO/IEC 9796-2:2010 specifies three digital signature schemes giving message recovery, two of which are deterministic (non-randomized) and one of which is randomized. The security of all three schemes is based on the difficulty of factorizing large numbers. All three schemes can provide either total or partial message recovery.

INCITS/ISO/IEC 9796-3-2008 [R2013], Information technology - Security techniques - Digital signature schemes giving message recovery - Part 3: Discrete logarithm based mechanisms
This part of ISO/IEC 9796 specifies six digital signature schemes giving message recovery. The security of these schemes is based on the difficulty of the discrete logarithm problem, which is defined on a finite field or an elliptic curve over a finite field. This part of ISO/IEC 9796 also defines an optional control field in the hash-token, which can provide added security to the signature. This part of ISO/IEC 9796 specifies randomized mechanisms. The mechanisms specified in this part of ISO/IEC 9796 give either total or partial message recovery.

ISO/IEC 9797-1:2011 specifies six MAC algorithms that use a secret key and an n-bit block cipher to calculate an m-bit MAC. ISO/IEC 9797-1:2011 can be applied to the security services of any security architecture, process, or application.
This part of ISO/IEC 9797 specifies three MAC algorithms that use a secret key and a hash-function (or its round-function) with an n-bit result to calculate an m-bit MAC. These mechanisms can be used as data integrity mechanisms to verify that data has not been altered in an unauthorized manner. They can also be used as message authentication mechanisms to provide assurance that a message has been originated by an entity in possession of the secret key.

ISO/IEC 9797-3:2011 specifies the following Message Authentication Code (MAC) algorithms that use a secret key and a universal hash-function with an n-bit result to calculate an m-bit MAC based on the block ciphers specified in ISO/IEC 18033-3 and the stream ciphers specified in ISO/IEC 18033-4: 1. UMAC; 2. Badger; 3. Poly1305-AES; 4. GMAC.

ISO/IEC 9798-1:2010 specifies an authentication model and general requirements and constraints for entity authentication mechanisms which use security techniques. These mechanisms are used to corroborate that an entity is the one that is claimed. An entity to be authenticated proves its identity by showing its knowledge of a secret. The mechanisms are defined as exchanges of information between entities and, where required, exchanges with a trusted third party.

ISO/IEC 9798-2:2008 specifies entity authentication mechanisms using symmetric encryption algorithms. Four of the mechanisms provide entity authentication between two entities where no trusted third party is involved; two of these are mechanisms to unilaterally authenticate one entity to another, while the other two are mechanisms for mutual authentication of two entities. The remaining mechanisms require a trusted third party for the establishment of a common secret key, and realize mutual or unilateral entity authentication.

This standard specifies entity authentication mechanisms using symmetric encryption algorithms. Four of the mechanisms provide entity authentication between two entities where no trusted third party is involved; two of these are mechanisms to unilaterally authenticate one entity to another, while the other two are mechanisms for mutual authentication of two entities. The remaining mechanisms require a trusted third party for the establishment of a common secret key, and realize mutual or unilateral entity authentication. The mechanisms specified in ISO/IEC 9798-2:2008 use time variant parameters such as time stamps, sequence numbers, or random numbers to prevent valid authentication information from being accepted at a later time or more than once. If no trusted third party is involved and a time stamp or sequence number is used, one pass is needed for unilateral authentication, while two passes are needed to achieve mutual authentication. If no trusted third party is involved and a challenge and response method employing random numbers is used, two passes are needed for unilateral authentication, while three passes are required to achieve mutual authentication. If a trusted third party is involved, any additional communication between an entity and the trusted third party requires two extra passes in the communication exchange.

This part of ISO/IEC 9798 specifies entity authentication mechanisms using digital signatures based on asymmetric techniques. Two mechanisms are concerned with the authentication of a single entity (unilateral authentication), while the remaining mechanisms for mutual authentication of two entities. A digital signature is used to verify the identity of an entity. A trusted third party may be involved.

This part of ISO/IEC 9798 specifies entity authentication mechanisms using a cryptographic check function. Two mechanisms are concerned with the authentication of a single entity (unilateral authentication), while the remaining mechanisms are for mutual authentication of two entities.

This standard specifies entity authentication mechanisms using zero-knowledge techniques: - mechanisms based on identities and providing unilateral authentication; - mechanisms based on integer factorization and providing unilateral authentication; - mechanisms based on discrete logarithms with respect to numbers that are either prime or composite, and providing unilateral authentication; - mechanisms based on asymmetric encryption systems and providing either unilateral authentication, or mutual authentication; - mechanisms based on discrete logarithms on elliptic curves and providing unilateral authentication. These mechanisms are constructed using the principles of zero-knowledge techniques, but they are not necessarily zero-knowledge according to the strict definition for every choice of parameters.

ISO/IEC 9798-6:2010 specifies eight entity authentication mechanisms based on manual data transfer between authenticating devices. Four of these mechanisms are improved versions of mechanisms specified in ISO/IEC 9798-6:2005 since they use less user input and achieve more security. Such mechanisms can be appropriate in a variety of circumstances where there is no need for an existing public key infrastructure, shared secret keys or passwords.

This standard is intended for reference by other specifications when the functionality of commitment, concurrency and recovery is required.

This standard is to be applied by reference from other specifications. This is done within such specifications by reference to the CCR services defined in ITU-T Rec. X.8511/ISO/IEC 9804.

This standard is one of a set of international standards produced to facilitate the interconnection of information processing systems.
INCITS/ISO/IEC 9834-6:2005 [R2015], Information technology - Open Systems Interconnection - Procedures for the operation of OSI Registration Authorities: Registration of application processes and application entities

This standard specifies the procedures applicable to the registration of application processes and application entities. No requirement for an international registration authority has been identified; therefore these procedures apply to registration at any point in the ASN.1 object identifier tree. This standard does not cover the registration of application-process types or application-entity types. No requirement for such registration has been identified.

INCITS/ISO/IEC 9834-9:2008 [R2015], Information technology - Open Systems Interconnection - Procedures for the operation of OSI Registration Authorities: Registration of object identifier arcs for applications and services using tag-based identification

This standard specifies the procedures for operating the Registration Authority for object identifiers under the arc (joint-iso-itu-t(2) tag-based(27)), that supports tag-based applications and services.

INCITS/ISO/IEC 9899:2011 [2012], Information technology - Programming language - C

This International Standard specifies the form and establishes the interpretation of programs written in the C programming language.

INCITS/ISO/IEC 9973:2014, Information technology - Computer graphics, image processing and environmental data representation - Procedures for registration of items

ISO/IEC 9973:2013 specifies procedures to be followed in preparing, maintaining and publishing the International Register of Items for any standard whose classes of items are applicable to this register. The items that may be registered fall into several broad categories including: - computer graphics concepts, - data structures used by relevant standards, - spatial and environmental concepts, and - profiles of relevant standards.

INCITS/ISO/IEC 9983:1995 [S2008], Information Technology - Designation of Unrecorded Flexible Disk Cartridges

Specifies an identifier to appear on each flexible disk cartridge (FDC) and the minimum information to appear on packages of unrecorded flexible disk cartridges. The information according to this International Standard shall appear on cartridges and on packages of unrecorded flexible disk cartridges available to end uses.

INCITS/ISO/IEC TR 11580-2009, Information technology - Framework for describing user interface objects, actions and attributes

ISO/IEC TR 11580:2007 defines a format for describing user interface objects, actions and attributes. It provides a basis for standardizing the names and properties of user interface objects, actions and attributes across multiple applications and platforms.

Amendment 1 to ISO/IEC 19794-2:2005

ITSDF (Industrial Truck Standards Development Foundation, Inc.)

ANSI/ITSDF B56.1-2016, Safety Standard for Low Lift and High Lift Trucks

This Standard defines the safety requirements relating to the elements of design, operation, and maintenance of low lift and high lift powered industrial trucks controlled by a riding or walking operator, and intended for use on compacted, improved surfaces.

ANSI/ITSDF B56.10-2006 (R2012), Safety Standard for Manually Propelled High Lift Industrial Trucks

This Standard defines the safety requirements relating to the elements of design, operation, and maintenance of manually propelled high-lift industrial trucks controlled by a walking operator, and intended for use on compacted, improved surfaces.

ANSI/ITSDF B56.11-8-2015, Safety Standard for Seat Belt (Lap-Type) Anchorage Systems for Powered Industrial Trucks

This procedure provides the performance and testing requirements for anchorage systems of lap-type belts (seat belts) provided with counterbalanced, center control, high lift trucks that have a sit-down, non-levitating operator.

ANSI/ITSDF B56.11.1-2012, Double Race or Bi-Level Swivel and Rigid Industrial Casters

This standard establishes dimensional standards and load capacity criteria for double race or bi-level swivel and rigid industrial casters in order to provide for the overall interchangeability of a complete caster.

ANSI/ITSDF B56.11.4-2013, Hook-Type Forks and Fork Carriers for Powered Industrial Forklift Trucks

The scope of this Standard encompasses standards relative to hook-type fork carriers and the attaching elements of fork arms and load handling attachments for forklift trucks, in relation to manufacturers rated capacities of trucks up to and including 11,000 kg (24,000 lb).

ANSI/ITSDF B56.11.5-2014, Measurement of Sound Emitted by Low Lift, High Lift, and Rough Terrain Powered Industrial Trucks

This Standard establishes the conditions, test procedures, environment, and instrumentation for the determination and reporting of the A-weighted sound pressure level of electric battery and internal combustion engine powered, low lift, high lift, and rough terrain industrial trucks.

ANSI/ITSDF B56.11.6-2005 (R2013), Evaluation of Visibility From Powered Industrial Trucks

This Standard establishes the conditions, procedures, equipment, and acceptability criteria for evaluating visibility from powered industrial trucks. It applies to internal combustion engine powered and electric high lift, counterbalanced, sit-down rider industrial trucks up to and including 10 000 kg (22,000 lb) capacity.

ANSI/ITSDF B56.11.7-2011, Liquidified Petroleum Gas (LPG) Fuel Cylinders (Horizontal or Vertical) Mounting - Liquid Withdrawal - for Powered Industrial Trucks

This Standard establishes dimensions for LPG fuel cylinders used on powered industrial trucks.

ANSI/ITSDF B56.14-200x, Safety Standard for Vehicle Mounted Forklift Trucks

This Standard defines the safety requirements relating to the elements of design, operation, and maintenance of industrial and rough terrain vehicle mounted forklifts controlled by a riding operator.

ANSI/ITSDF B56.5-2012, Safety Standard for Guided Industrial Vehicles and Automated Functions of Manned Industrial Vehicles

This Standard defines the safety requirements relating to the elements of design, operation, and maintenance of powered, not mechanically restrained, unmanned automatic guided industrial vehicles and the system of which the vehicles are apart.

ANSI/ITSDF B56.6-2016, Safety Standard for Rough Terrain Forklift Trucks

This Standard defines the safety requirements relating to the elements of design, operation, and maintenance of rough terrain forklift trucks. These trucks are intended for operation on unimproved natural terrain as well as the disturbed terrain of construction sites.

ANSI/ITSDF B56.8-2011, Standards Safety for Personnel and Burden Carriers

This Standard defines safety requirements relating to the elements of design, operation, and maintenance of powered personnel and burden carriers having three or more wheels, a maximum speed not exceeding 40 km/h (25 mph), and a payload capacity not exceeding 4536 kg (10,000 lb). This Standard does not include vehicles intended primarily for earth moving or over-the-road hauling, or unmanned automatic guided vehicles.
ANSI/ITSDF B56.9-2012, Safety Standard for Operator Controlled Industrial Tow Tractors
This Standard defines the safety requirements relating to the elements of design, operation, and maintenance of operator controlled industrial tow tractors up to and including 66750 N (15,000 lb) maximum rated drawbar pull of a non-braked load.

JCSEE (Joint Committee on Standards for Educational Evaluation)
This standard has 27 component parts, which together represent a national consensus of what is most important to sound personnel evaluations and personnel evaluation systems in education. The component parts require that personnel evaluations be ethical, fair, useful, feasible, and accurate. Propriety is addressed in 7 components, utility in 6, feasibility in 3, and 11 address accuracy.

ANSI/JCSEE PgES3-2010, The Program Evaluation Standard
This standards addresses the quality of educational program and project evaluations and metaevaluations of educational evaluations.

KCMA (Kitchen Cabinet Manufacturers Association)
Performance and construction standard for factory manufactured, factory finished kitchen and vanity cabinets.

LEO (Leonardo Academy, Inc.)
ANSI/LEO 4000-2015, LEO-4000 American National Standard for Sustainable Agriculture
Establishes a comprehensive framework and common set of environmental, social, and economic metrics by which to determine whether an agricultural crop has been produced and handled in a sustainable manner, from soil preparation and seed planting through production, harvest, post-harvest handling, and distribution for sale. In the future this standard language will be expanded to include animal production.

ANSI/LEO 5000-2011, LEO 5000 - Standard for Emissions Inventories, Offsets and Reduction Credits
Develop a comprehensive framework and sustainability metrics that (1) Provide transparent reporting of the scope of emissions sources being addressed and how emissions, sequestration and offsets are calculated, which will help companies and consumers to make sense of claims made by businesses about their emission reduction and offset achievement, (2) Avoid the traditional one-dimensional approach of targeting single emissions by addressing the full range of emissions types, including those that negatively affect climate and those that negatively affect human health and (3) Fill in the gap left by current climate emissions standards by addressing existing forests.

ANSI/LEO 8000-2011, Standard for Sustainable Electronic Gaming Machines
The goal of this process has been to help the gaming industry identify and communicate the sustainability parameters of their products and services and to allow industry purchasers to identify their sustainability preferences when purchasing gaming equipment and services. The standard development committee has developed comprehensive frameworks and sustainability metrics that assess environmental, social, and economic performance at all levels of the gaming industry’s supply and delivery chain and encourages continuous improvement in overall sustainability performance.

LIA (ASC Z136) (Laser Institute of America)
ANSI Z136.1-2013, Standard for Safe Use of Lasers
This standard provides recommendations for the safe use of lasers and laser systems that operate at wavelengths between 180 nm and 1 mm.

ANSI Z136.2-2012, Standard for Safe Use of Optical Fiber Communication Systems Utilizing Laser Diode and LED Sources
This standard addresses the hazards of and provides guidance for the safe use, maintenance, service, and installation (manufacture) of optical communications systems (OCS) utilizing laser diodes or light-emitting diodes (LED) operating at wavelengths between 600 nm and 1 mm, and not intended for visual communications. For purposes of the standard, optical communication systems include end-to-end optical fiber based links (optical fiber communications systems - OFCS), fixed terrestrial point-to-point free-space links (free space optical communications systems - FSOCs), or a combination of both.

ANSI Z136.3-2011, Standard for Safe Use of Lasers in Health Care
This standard provides guidance for the safe use of lasers in health care. Specific processes are provided to protect anyone who might become exposed to laser radiation and to assist in establishing a program that promotes the safe use of health care lasers.

ANSI Z136.4-2010, Recommended Practice for Laser Safety Measurements for Hazard Evaluation
This document provides adequate, practical guidance for necessary measurement procedures used for classification and hazard evaluation of lasers. This document is intended to provide guidance for manufacturers, laser safety officers (LSOs), and trained laser users.

ANSI Z136.5-2009, American National Standard for Safe Use of Lasers in Educational Institutions
This standard addresses laser safety concerns and situations characteristic of the educational environment. This standard is intended for faculty and students using lasers at primary, secondary and college levels of education excluding graduate level research laboratories. The wavelength range of interest includes the ultraviolet, visible, and infrared regions of the electromagnetic spectrum, specifically the wavelength range from 0.18 micrometer (micrometer) to 1 millimeter (mm).

ANSI Z136.6-2015, Standard for Safe Use of Lasers Outdoors
This standard provides guidance for the safe use of potentially hazardous lasers and laser systems in outdoor environments. Products and applications covered include laser light shows, lasers used for outdoor scientific research, and military lasers. It also provides guidance for controlling disability glare from exposure to non-injurious levels of visible laser light, which might interfere with sensitive or critical tasks. Lasers used for fixed, terrestrial point-to-point free-space optical telecommunications are not covered in this document.

This standard provides recommendations for the testing requirements and labeling of protective equipment (devices) designed for use with lasers and laser systems that operate at wavelengths between 180 nm and 1 mm.

ANSI Z136.8-2012, Standard for Safe Use of Lasers in Research, Development or Testing
This standard provides recommendations for the safe use of lasers and laser systems that operate at wavelengths between 180 nm and 1 mm, and are used to conduct research or use in a research, development, or testing environment.

ANSI Z136.9-2013, Standard for Safe Use of Lasers in Manufacturing Environments
This standard provides recommendations for the safe use of lasers and laser systems that operate at wavelengths between 180 nm and 1 mm, used in the manufacturing environment. Laser applications in the manufacturing environment include, but not limited to: laser alignment, leveling, inventory, metrology, fabrication, material processing, and machine vision.

MedBiq (MedBiquitous Consortium)
Activity Report leverages the Healthcare Professional Profile and the Healthcare Learning Object Metadata. It contains one or more activity reports that describe in detail the healthcare professional, the continuing education or certification activity in which he/she participated, the professional’s interaction with the activity, the continuing education credit certificate awarded, point-of-care learning data, and the organization reporting the activity.

ANSI/MEDBIQ CF.10.1-2012, Competency Framework
Competency Framework leverages the Healthcare Learning Object Metadata and references external competency definitions of different formats. It contains metadata about the framework as well as relationships (hierarchical and non-hierarchical) among competency objects and potentially existing frameworks that comprise the competency framework.
ANSI/MEDBIQ CI.10.1-2013 Corrigenda, Curriculum Inventory Corrigenda
The id attributes for events, sequence blocks, and integration blocks are defined as strings, and their use is required. Unfortunately, the string datatype allows for null values, and XML documents containing null values for id attributes validate against this scheme. The logic of the Curriculum Inventory architecture is dependent on referencing the identifiers for events, sequence blocks, and integration blocks, so the validation of documents with null ids poses a significant problem. The corrigenda for the standard correct these errors.

ANSI/MEDBIQ CI.10.1-2013, Curriculum Inventory
Curriculum Inventory reports on the events, objectives/outcomes/competencies, milestones/performance levels, themes, and structure of a program of health professions education and provides some metadata about the program and reporting period. It supports the description of curricula across the continuum of professional education and training.

Healthcare Learning Object Metadata extends the IEEE Learning Object Metadata standard for describing educational resources. Healthcare-specific extensions include metadata relevant to learning objects, assets, and events, including credit information, target audience, content expiry date, date and location information for live events, modality, commercial support information, disclosures, clinical history, magnification, orientation, radiograph type, and specimen type, among others. It also supports referencing medical terminologies.

ANSI/MEDBIQ ME.10.1-2009, MedBiquitous Medical Education Metrics
The MedBiquitous Medical Education Metrics standard (MEMs) provides a common XML format for exchanging evaluation data for clinical education designed to improve the performance of healthcare professionals. Version 1 of MEMs includes an activity description, participation metrics, learner demographics, participant activity evaluation, and knowledge assessment data.

ANSI/MEDBIQ PF.10.1-2015, Performance Framework
Performance Framework leverages the Healthcare Learning Object Metadata and references competency definitions. It contains metadata about the framework as well as definitions of performance levels, relationships of performance levels to one another on a continuum, and relationships of performance levels to competency objects.

ANSI/MEDBIQ PP.10.1-2008, Healthcare Professional Profile
The Professional Profile provides a common XML format for describing the following information about one or more healthcare professionals: Name, Address, Unique identifiers, Education, Training, Certifications, Licenses, Notices and disciplinary actions from state boards, Academic appointments, Occupation (including privileges and specialty), Personal data, Membership in professional organizations.

ANSI/MEDBIQ VP.10.1-2010, MedBiquitous Virtual Patient
The MedBiquitous Virtual Patient standard provides a common XML format for describing computer-based clinical simulation for medical education, including Virtual Patient Data (patient demographics, clinical data, narrative text, and educational feedback), media resources, data availability model (allows for aggregations of data to be constructed), activity model (creates paths through the content and dictates how the learner interacts with the virtual patient), and a player specification (indicates how a player interprets other components for delivery to the learner).

MHI (ASC MHC) (Material Handling Industry)
ANSI MH1-2016, Pallets, Slip Sheets, and Other Bases for Unit Loads
Applies to pallets used in the Unit-load method of assembling, stacking, storing, handling, and transporting materials and products. Defines terminology and nomenclature associated with pallets; applies to pallets irrespective of components and materials used in their fabrication; provides a series of recommended pallet dimensions and sizes; describes procedures for pallet sampling, inspection and testing; indicates procedures for designating pallet requirements. Intended for designers, manufacturers, distributors and users of pallets.

ANSI MH1-14-2016, Pallets - Molded, Wood-Based Composite
This standard applies to molded, wood-based composite pallets commonly referred to as presswood pallets. They are made entirely of compression molded, highly processed wood flakes and resin. This standard is in 3 parts. Part #1 - Prescriptive standard applying to the manufacture of the pallet. Part #2 - Performance and use standard applying to the functionality and environmental aspects of the pallet, and, Part #3 - Addresses the recycling of the pallet. The standard does not address safety associated with the use of presswood pallets.

ANSI MH10.8.12-2011, Unit loads and transport packages - Component marking
Provides for common structure for encoding data to be marked on electronic components to facilitate automation. Provides a means for components to be marked and read in a fixed environment for subsequent manufacturing operations. Intended applications include, but are not limited to component traceability and component tracking.

ANSI MH10.8.13-2016, Material Handling - Label testing procedures for pressure-sensitive adhesive labels to be used for bar codes, other markings, and as carriers for other AIDC media.
This standard will include the language lost in the migration of CEAS56 to MH10.8.1 and then to ANSI ISO 15394, CEAS624 to MH10.8.6 and then to ANSI ISO 23742, CEAS211 to MH10.8.7 and then to ANSI ISO 28219. This standard will also codify in an ANSI standard the valuable guidance provided in MIL-L-61002, Labels, pressure-sensitive adhesive, for bar codes and other markings.

ANSI MH10.8.2-2016, Data Identifier and Application Identifier Standard
This standard provides a comprehensive dictionary of MH 10/SC 8 Data Identifiers and GS1 Application Identifiers, provides for the assignment of new Data Identifiers, as required, and provides a document detailing the correlation, or mapping, of Data Identifiers to Application Identifiers, where a correlation exists.

ANSI MH10.8.3-2002 (R2012), Standard for Material Handling - Syntax for High Capacity ADC Media
Specifies a transfer structure, syntax, and coding of messages and data formats when using high-capacity ADC media between trading partners, specifically between suppliers and recipients, and where applicable, in support of carrier applications, such as bills of lading and carrier sortation and tracking.

ANSI MH10.8.6-2013, Standard for Material Handling - Bar Codes and Two-Dimensional (2D) Symbols for Product Packaging
This standard is an application standard for the marking of product packages with linear bar code and two-dimensional symbols. It defines minimum requirements for identifying product packages that are distributed outside the originating location. It specifies label data content and requirements, including data element requirements; data representation; rules for encoding of mandatory and optional elements in machine-readable symbols; and human readable information.

ANSI MH10.8.8-2011, Radio Frequency Identification for Packages, Parcels, and Flat Mail
Provides guidance for the use of radio frequency identification (RFID) for the handling and tracking of packages, parcels, and flat mail. Identifies minimum data requirements as well as semantic and syntactical recommendations. Further provides specific recommendations for the air interface communications of RFID devices based on the application requirements identified by the carriers.

This standard is being developed to consistently guide a reader through the correct processes of validating an implementation of IUID policy, specifically in the creation of properly formatted, decoded, and displayed Data Matrix Symbols.
MHI (Material Handling Industry)

Specifies, for an Automatic Identification and Data Capture (AIDC) reader manufacturer, the preferred output of an AIDC reader when processing ISO/IEC 15434 formatted data. The standard is intended to cover the processing of all AIDC media. It specifies that the output be provided in an XML format suitable for display in Internet Explorer and usable in other applications. The specifications are intended to cover the output from processing of all current and future Format Indicators included in ISO/IEC 15434.

The standard applies to industrial pallet racks, movable shelf racks, and stacker racks made of cold-formed or hot-rolled steel structural members. It does not apply to other types of racks, such as drive-in or drive-through racks, cantilever racks, portable racks, etc. or to racks made of material other than steel.

ANSI MH24.2-2016, Power-Operated Vertical Carousels and Vertical Lift Modules

This proposed Standard applies to power-operated storage equipment typically referred to as vertical storage carousels and vertical lift modules. The objective of this standard is to provide guidance to the user so they may eliminate or minimize the hazards described within Section 4 of the proposed standard. These hazards can arise during installation, start up, operation, maintenance, testing, and dismantling of the equipment.

This standard is established to provide a guideline for design, testing, fabrication and utilization of welded-wire mesh rack decking utilized as an accessory for industrial steel storage racks. It applies to uniformly loaded rack decking fabricated from welded-wire mesh with permanently attached reinforcements for use in storage racks. The purpose for such rack decking is to provide storage capability by creating a surface in conjunction with a rack, upon which to place materials that may be on pallets, in containers, or in some other form.

ANSI MH27.1-2016, Patented Track Underhung Cranes and Monorail Systems

This standard applies to underhung cranes whose end trucks operate on the lower flange of a patented-track runway section; and to carriers (trolleys) operating on single-track patented-track monorail systems, including all curves, switches, transfer devices, lift and drop sections, and associated equipment.

ANSI MH27.2-2017, Enclosed Track Underhung Cranes and Monorail Systems

This standard applies to underhung cranes whose end trucks operate on the inner flange of a runway using enclosed track section & S94; and to trolleys (carriers) operating on singlerack monorail systems, including all curves, switches, transfer devices, lift and drop sections, and associated equipment.

ANSI MH28.2-2012, Design and Testing of Boltless Metal-Wood Shelving

This standard applies to Boltless Metal-Wood Shelving exclusively used for the storage by hand of small to bulky type material. The shelving framing is composed of boltless connections. Units consist of cold-formed steel members supporting a surface of particleboard, mat-formed wood particle-board, plywood or other wood products.

ANSI MH28.3-2009, Design, Manufacture, and Installation of Industrial Steel Work Platforms

Addresses means of egress, guarding, materials, structural design, fabrication, and loading for an industrial steel work platform. This standard is intended to be applied to the design, manufacturing, installation, and maintenance of such structures. An industrial steel work platform is a prefabricated elevated platform in an industrial environment, pre-designed using a steel framing system. Flooring may include other structural or non-structural elements such as, but not limited to, concrete, steel, or engineered wood products.

ANSI MH29.1-2012, Safety Requirements for Industrial Scissors Lifts

Mobile and stationary industrial scissors lifts raise, lower and position materials and personnel in various applications, but are different from aerial work platforms (AWP) and elevators. This revision better illustrates that personnel operate and may be raised or lowered by industrial scissors lifts. This standard now defines dock lifts, work access lifts and lift tables as the three categories of industrial scissors lifts and identifies their differences and similarities. The responsibilities of manufacturers, users, owners and operators have been enhanced.

ANSI MH30.1-2015, Performance and Testing Requirements for Dock Leveling Devices

A dock leveling device spans and compensates for space and height differentials between a loading dock and a transport vehicle to facilitate freight transfers in an effective and efficient manner. This standard serves as a guide for designers, manufacturers, sellers, installers, owners, users and government bodies of dock levelers and to provide guidelines for the design and testing of dock levelers, promote the understanding of the responsibilities and to provide a uniform means of comparison.

This proposed Specification applies to free-standing and top-tiered cantilevered storage racks made of cold formed or hot rolled steel members. The Specification covers integrity of installations, loading and forces (including seismic), design procedures, design of columns and arms, bracing design, connections and special design provisions.

ANSI/MH30.2-2015, Performance and Testing of Portable Dock Leveling Devices

Defines performance and testing requirements for the design, use and maintenance of portable dock leveling devices of the type generally referred to as dockboards and dockplates. Provides definitions of dockboard and dockplate types and component parts, product requirements and considerations, and owner responsibilities. Buyers and specifiers may use this standard to ensure equal comparison of various manufacturers’ representations as to the features and performance of the dock leveling devices.

ANSI/MH30.3-2015, Performance and Testing of Vehicle Restraining Systems

This standard defines performance and testing requirements with regard to design, use, and maintenance of trailer restraining devices. This standard provides definitions of trailer restraining device types and component parts. Requirements and owner responsibilities are discussed. Buyers and specifiers of loading dock trailer restraint devices may use this standard to ensure equal comparison of various manufacturers’ representations as to features and performance of the devices.

ANSI/MHI ECMA 15-2010, Specifications for Cable-less Controls for Electric Overhead Traveling Cranes

Provides information regarding the requirements, safety benefits and applications for radio-frequency directional devices used in controlling the movements and actions of electric overhead traveling cranes in material handling applications. The scope is limited to remote or cable-less controlling devices that utilize radio frequency as a means of transmitting directions and information to electric overhead traveling cranes.

ANSI/MHI ICWM-2012, The ICWM Performance Standard for Casters and Wheels

Provides a common basis for evaluating the safety, durability, structural adequacy, and technical requirements for category specific casters and wheels (Furniture Chair Casters, Furniture Non-Chair Casters, Industrial Casters, Institutional and Medical Equipment Bed Casters). Defines industry terms, specific tests, equipment/methods that can be used, conditions of tests, and minimum acceptance levels used in evaluation. These acceptance levels are based on field and test experiences.

MSS (Manufacturers Standardization Society)

ANSI/MSS SP-114-2007, Corrosion Resistant Pipe Fittings Threaded and Socket Welding Class 150 and 1000

This Standard Practice is for corrosion resistant pipe fittings, threaded and socket welding; involving Class 150 and 1000. This standard establishes requirements for the following: a) Pressure-temperature ratings, b) Size and method of designating openings of reducing fittings, c) Marking, d) Minimum requirements for materials, e) Dimensions and tolerances, f) Threading, and g) Tests. This Standard Practice also applies to Class 150 and Class 1000 square head plugs, hex head plugs and bushings, locknuts, and threaded and socket welding unions.
ANSI/MSS SP-134-2012, Valves for Cryogenic Service, including Requirements for Body/Bonnet Extensions

This Standard Practice covers requirements for material, design, dimensions, fabrication, non-destructive examination and pressure testing of stainless steel and other alloy cryogenic service valves with body/bonnet extensions. Requirements for check valves for cryogenic service, which may not require body/bonnet extensions, are also covered. This standard applies to cryogenic gate, globe, butterfly, ball, and check valves, and may be used in conjunction with other valve-specific standards; including the following identified in this Standard Practice as a parent standard: ASME B16.34, API 600, API 602, API 603, API 608, API 609, and API 6D (identical to ISO 14313).

ANSI/MSS SP-135-2016, High Pressure Knife Gate Valves

MSS SP-135 covers the construction requirements for lug- and wafer- type, knife gate valves made from ASME Code materials and meeting the applicable gate valve requirements of ASME B16.34. This Standard Practice covers flanged body designs compatible with ASME B16.5 flanges for NPS 2 (DN 50) through NPS 24 (DN 600) and ASME B16.47 Series A flanges for NPS 26 (DN 650) through NPS 48 (DN 1200). As an alternative, it also pertains valves that do not meet the body wall thickness of ASME B16.34, but shall be qualified by a proof test. The Class 150, 300, and 600 dimensional, material, and other requirements of this Standard Practice shall apply to these valves.

ANSI/MSS SP-138-2014, Quality Standard Practice for Oxygen Cleaning of Valves and Fittings

This Standard Practice outlines the general requirements for cleaning, inspection, testing, and packaging of valves and fittings intended to be used in Oxygen service environments. Proper design and material compatibility for Oxygen systems is outside the scope of this Standard Practice. Review copy is a BSR draft only. Revises previous BSR/MSS SP-138-2009 (orig. BSR-8 submission). Identified stakeholder are unchanged. Originally developed under MSS Committee 407 & 304. Committee Chair: C. Davilla.

ANSI/MSS SP-144-2013, Pressure Seal Bonnet Valves

This Standard Practice covers construction requirements for steel and alloy valves having pressure seal bonnets in the size range of NPS 2 (DN 50) through NPS 50 (DN 1250) and Pressure Classes 600, 900, 1500, 2500, and 4500. This standard applies to gate, globe, and check valves and may be used in conjunction with other valve-specific standards; including the following identified in this Standard Practice as parent valve standards: API 594, API 600, API 603, API 623, and ASME B16.34.

ANSI/MSS SP-25-2013, Standard Marking System for Valves, Fittings, Flanges, and Unions

This marking system applies to valves, fittings, flanges, and unions used in piping connections which include (but are not limited to) flanged, soldered, brazed, threaded, or welded joints. These specified markings serve to identify the manufacturer, the rating designation, materials of construction and special service limitations imposed by the manufacturer. They are used for product identification and to assist in proper application. Review copy is a marked-up BSR draft. Revises previous BSR/MSS SP-25-2008 (orig. BSR-8 submission). Due to previous ANSI/MSS ballot results the draft standard was revised/approved by MSS and is being re-balloted (showing mark-up) within ANSI process. Identified stakeholder are unchanged. Originally developed under MSS Committee 302 (Committee Chair: J. Ballun). U.S. customary units in this Standard Practice are the standard; the SI (metric) units are also included for reference.

ANSI/MSS SP-44-2016, Steel Pipeline Flanges

Covers pressure-temperature ratings, materials, dimensions, tolerances, marking, and testing for steel pipeline flanges. The welding neck type flanges shall be forged steel, and the blind flanges may be made from either forged steel or from steel plate. Dimensional and tolerance requirements for NPS 10 and smaller are provided by reference to ASME B16.5. Note that SP-44 covers construction details not covered by another current standard, including P/T ratings, of products made of high-yield strength materials (e.g., for users that have flanged joints, flanged valves, and flanged fittings).

Allows visual evaluation of surface irregularities in steel castings for valves, flanges, fittings, and other piping components. This standard establishes requirements for the following: (a) Visual surface irregularity acceptance standards for steel parts; (b) Supplements requirements in identified ASTM Standards; (c) Provides a series of referenced photographs typical of the various surface irregularities; and (d) Illustrations of generally acceptable and generally rejectable quality.

ANSI/MSS SP-96-2017, Terminology for Valves, Fittings, and Their Related Components

The SP-96 standard lists and defines principle terms, acronyms, and abbreviations that are widely used to describe valves, fittings, and related components. It is comprised of separate sections which contain (1) Acronyms for organizations whose documents are applicable to valves, fittings, and related components, and a brief summary of the applicable area of interest; (2) A glossary of terms used within the valve and fittings industry, including standards developers, to describe design, operation, and performance characteristics; and (3) Abbreviations commonly used in the valve and fittings industry.

MTS (Institute for Market Transformation to Sustainability)

The 2.0 Integrative Process Standard defines how key building and design professionals work together in the design and construction of sustainable buildings & Communities, to best achieve the project goals efficiently and at a lower cost and risk.

NAAMM (National Association of Architectural Metal Manufacturers)

This standard provides guidance for those specifying or designing pipe railings systems. The standard is in the process of being incorporated into a more extensive document, but until that document is complete, it is desired to reaffirm the current version.

Standard provides a method to determine size of flagpole based on wind load on both pole and flag. Calculation procedure utilizes charts and tables based on variables including wind speed, height of pole, pole material, and flag size.

ANSI/NAAMM HMMA 801-2012, Glossary of Terms for Hollow Metal Doors and Frames

This standard was developed by the HMMA Division of NAAMM to provide their opinion and guidance on the definition of terms used with hollow metal doors and frames.

ANSI/NAAMM HMMA 841-2013, Tolerances and Clearances for Commercial Hollow Metal Doors and Frames

This standard was developed by the HMMA Division of NAAMM to provide guidance on tolerances and clearances for commercial hollow metal doors and frames. It has been reviewed and updated for consistency with other NAAMM/HMMA standards.
ANSI/NACE Standard MR0103-2012, Materials Resistant to Sulfide Stress Cracking in Corrosive Petroleum Refining Environments
This standard establishes material requirements for resistance to sulfide stress cracking (SSC) in sour refinery process environments, i.e., environments that contain wet hydrogen sulfide (H2S). Specifically, this standard is directed at the prevention of SSC of equipment (including pressure vessels, heat exchangers, piping, valve bodies, and pump and compressor cases) and components used in the refining industry.

ANSI/NACE Standard TM0177-2016, Laboratory Testing of Metals for Resistance to Sulfide Stress Cracking and Stress Corrosion Cracking in H2S Environments
This standard addresses testing of metals subjected to tensile stresses for resistance to cracking failure in low-pH aqueous environments containing H2S. The test method covers sulfide stress cracking (room temperature, atmospheric pressure) and stress corrosion cracking (elevated temperatures and pressures). Four test methods are described.

ANSI/NACE Standard TM0284-2016, Evaluation of Pipeline and Pressure Vessel Steels for Resistance to Hydrogen-Induced Cracking
This standard establishes a test method for evaluating the resistance of pipeline and pressure vessel steels to HIC caused by hydrogen absorption from aqueous sulfide corrosion. Details are provided on the size, number, location, and orientation of test specimens to be taken from each steel product form - pipes, plates, fittings, and flanges.

ANSI/NACE Standard TMXXXX-2016, Test Method for Monitoring Atmospheric Corrosion Rate by Electrochemical Measurements
This standard test method provides guidance on the specification, selection, and use of sensors for monitoring atmospheric corrosion using electrochemical techniques. It addresses the use of electrochemical sensors in a bare metal condition or with protective coatings. It encompasses sensor elements for measurement of free corrosion, galvanic corrosion, and conductance for assessing atmospheric corrosion. This standard is intended to be submitted for consideration as an ISO standard.

NALFA (North American Laminate Flooring Association)

ANSI/NALFA LF-01-2010, Laminate Flooring Specifications and Test Methods
The product standard shall apply to the performance of residential and commercial uses of laminate flooring. The Standard will be useful in guiding/assisting manufacturers and educating suppliers and consumers about the minimum performance of laminate flooring in residential, light commercial, commercial and heavy commercial settings.

ANSI/NALFA LF-02-2010, Sustainability Assessment of Laminate Flooring
The performance standard shall provide an assessment tool for the sustainability properties, the “green” value, and related performance of consumer and commercial laminate flooring.

NASBLA (National Association of State Boating Law Administrators)

ANSI/NASBLA 102-2017, Basic Boating Knowledge - Sailing
This Standard applies to basic sailing knowledge education and proficiency assessment in the United States, U.S. territories, and the District of Columbia. This document establishes the national standard for basic recreational sailing knowledge with a primary focus on safety and mitigation of risks associated with recreational sail boating. This Standard contains the basic knowledge elements that a beginner (entry-level) operator should have in order to safely operate a small sailboat of less than 26 feet in length by day in light to moderate winds (up to 12 knots) and sea conditions. Auxiliary power knowledge is not included. On-water skills are not included.

ANSI/NASBLA 103-2016, Basic Boating Education - Power
This is the minimum required standard that applies to all basic boating courses in the U.S. states and territories and District of Columbia. Its purpose is to establish the national standard for use by course providers to meet the needs of recreational boaters for basic boating knowledge in order to identify and reduce primary risk factors and mitigate their effects on recreational boating.

NASPO (North American Security Products Organization)

ANSI/NASPO SA-2015, NASPO Security Management System
The requirements set forth in this standard apply to the management of common security risks that an organization must treat to protect its sustainability, the interest of the customer, and its goods and services. While the common criteria defined in this standard typify a great majority of the security risks that must be mitigated, it cannot anticipate all specific risks to an organization.

ANSI/NASPO SD 01-2014, Minimum security requirements for security documents
The scope of this standard is to establish the minimum security requirements for security documents. Based upon a risk assessment, these requirements shall establish the minimum number and types of security technologies that shall be incorporated into a class or type of security document. In addition this standard shall establish the minimum requirements necessary for the secure manufacture and distribution of those security documents.

NBBPVI (National Board of Boiler and Pressure Vessel Inspectors)

ANSI/NB-23-2017, National Board Inspection Code (NBIC)
NB-23 provides requirements and guidelines for the installation, inspection, repair, and alteration of pressure retaining items and pressure relief valves.

NCPDP (National Council for Prescription Drug Programs)

The NCPDP Audit Transaction Standard Implementation Guide was developed to meet the industry needs for electronic communication for audit requests, responses and final outcomes especially as they affect the pharmacy industry.

The NCPDP Audit Transaction Standard Implementation Guide was developed to meet the industry needs for electronic communication for audit requests, responses and final outcomes especially as they affect the pharmacy industry.

The NCPDP Audit Transaction Standard Implementation Guide was developed to meet the industry needs for electronic communication for audit requests, responses and final outcomes especially as they affect the pharmacy industry.

The NCPDP Audit Transaction Standard Implementation Guide was developed to meet the industry needs for electronic communication for audit requests, responses and final outcomes especially as they affect the pharmacy industry.

The NCPDP Audit Transaction Standard Implementation Guide was developed to meet the industry needs for electronic communication for audit requests, responses and final outcomes especially as they affect the pharmacy industry.

The Benefit Integration Standard Implementation Guide supports the communication of accumulator data in a standard format via transactions that are used to facilitate the delivery and receipt of this information. These transactions provide administrative efficiencies and allow for an industry standard to be used to share accumulator data (such as deductible and out of pocket) between Benefit Partners to administer integrated benefits for a member.
The Benefit Integration Standard Implementation Guide supports the communication of accumulator data in a standard format via transactions that are used to facilitate the delivery and receipt of this information. These transactions provide administrative efficiencies and allow for an industry standard to be used to share accumulator data (such as deductible and out of pocket) between Benefit Partners to administer integrated benefits for a member.

The NCPDP Billing Unit Standard Implementation Guide is intended to meet two needs within the pharmaceutical drug claim industry: 1) provide practical guidelines for software developers and 2) to ensure a consistent implementation of standardized billing units.

ANSI/NCPDP BUS v3.1-2015, NCPDP Billing Unit Standard v3.1
The NCPDP Billing Unit Standard Implementation Guide is intended to meet two needs within the pharmaceutical drug claim industry: 1) provide practical guidelines for software developers and 2) provide guidelines for consistent implementation of drug/product packaging for use in all applicable NCPDP Standards.

ANSI/NCPDP FB V2.0-2008, Formulary and Benefit Standard Version 2.0
Formulary and Benefit Standard provides a standard means for pharmacy benefit payers (including health plans and Pharmacy Benefit Managers) to communicate formulary and benefit information to prescribers via technology vendor systems.

ANSI/NCPDP FB V2.1-2008a, Formulary and Benefit Standard Version 2.1
Formulary and Benefit Standard provides a standard means for pharmacy benefit payers (including health plans and Pharmacy Benefit Managers) to communicate formulary and benefit information to prescribers via technology vendor systems.

ANSI/NCPDP FB v3.0-2011, Formulary and Benefit Standard v3.0
Formulary and Benefit Standard provides a standard means for pharmacy benefit payers (including health plans and Pharmacy Benefit Managers) to communicate formulary and benefit information to prescribers via technology vendor systems.

ANSI/NCPDP FB v4.0-2013, NCPDP Formulary and Benefit Standard v4.0-201x
Formulary and Benefit Standard provides a standard means for pharmacy benefit payers (including health plans and Pharmacy Benefit Managers) to communicate formulary and benefit information to prescribers via technology vendor systems.

ANSI/NCPDP FB v4.1-2013, NCPDP Formulary and Benefit Standard v4.1-201x
Formulary and Benefit Standard provides a standard means for pharmacy benefit payers (including health plans and Pharmacy Benefit Managers) to communicate formulary and benefit information to prescribers via technology vendor systems.

ANSI/NCPDP FB v4.2-2014, NCPDP Formulary and Benefit Standard v4.2-201x
Formulary and Benefit Standard provides a standard means for pharmacy benefit payers (including health plans and Pharmacy Benefit Managers) to communicate formulary and benefit information to prescribers via technology vendor systems.

ANSI/NCPDP FB v4.3-2015, NCPDP Formulary and Benefit Standard v4.3
Formulary and Benefit Standard provides a standard means for pharmacy benefit payers (including health plans and Pharmacy Benefit Managers) to communicate formulary and benefit information to prescribers via technology vendor systems.

ANSI/NCPDP FB v4.4-2015, NCPDP Formulary and Benefit Standard v4.4
Formulary and Benefit Standard provides a standard means for pharmacy benefit payers (including health plans and Pharmacy Benefit Managers) to communicate formulary and benefit information to prescribers via technology vendor systems.

ANSI/NCPDP FB v50-2016, NCPDP Formulary and Benefit Standard v50
Formulary and Benefit Standard provides a standard means for pharmacy benefit payers (including health plans and Pharmacy Benefit Managers) to communicate formulary and benefit information to prescribers via technology vendor systems.

Financial Information Reporting is a process whereby a patient, under one plan sponsor, has changed from one benefit plan PBM to another benefit plan PBM and point-in-time financial information is moved from the previous PBM to the new PBM. This information is necessary for the new PBM to accurately process claims and attribute plan balances and status for reporting to the plan sponsor. The implementation guide addresses the industry need to standardize the exchange of this information between plans.

Financial Information Reporting is a process whereby a patient, under one plan sponsor, has changed from one benefit plan PBM to another benefit plan PBM and point-in-time financial information is moved from the previous PBM to the new PBM. This information is necessary for the new PBM to accurately process claims and attribute plan balances and status for reporting to the plan sponsor. The implementation guide addresses the industry need to standardize the exchange of this information between plans.

ANSI/NCPDP FIR v1.3-2017, NCPDP Financial Information Reporting Standard v1.3
Financial Information Reporting is a process whereby a patient, under one plan sponsor, has changed from one benefit plan PBM to another benefit plan PBM and point-in-time financial information is moved from the previous PBM to the new PBM. This information is necessary for the new PBM to accurately process claims and attribute plan balances and status for reporting to the plan sponsor. The implementation guide addresses the industry need to standardize the exchange of this information between plans.

ANSI/NCPDP Medical Rebate Standard v01.00 -2011, NCPDP Medical Rebate Data Submission Implementation Guide v1.0-201x
Provides a uniform data format for health plans’ rebate submissions to multiple manufacturers throughout the industry. Implementation of the medical template also eliminates the need for manufacturers to create internal mapping processes to standardize unique data formats from each health plan or third party administrator.

ANSI/NCPDP Medical Rebate Standard v02.00 -2013, NCPDP Medical Rebate Data Submission Implementation Guide v02.00 -201x
The purpose of the medical rebate template is to provide a uniform data format for health plans’ rebate submissions to multiple manufacturers throughout the industry. Implementation of the medical template also eliminates the need for manufacturers to create internal mapping processes to standardize unique data formats from each health plan or third party administrator.

ANSI/NCPDP Medical Rebate Standard v02.01 -2013, NCPDP Medical Rebate Data Submission Standard v02.01
The purpose of the medical rebate template is to provide a uniform data format for health plans’ rebate submissions to multiple manufacturers throughout the industry. Implementation of the medical template also eliminates the need for manufacturers to create internal mapping processes to standardize unique data formats from each health plan or third party administrator.

ANSI/NCPDP Medical Rebate Standard v02.02 -2014, NCPDP Medical Rebate Data Submission Implementation Guide v02.02 -201x
The purpose of the medical rebate template is to provide a uniform data format for health plans’ rebate submissions to multiple manufacturers throughout the industry. Implementation of the medical template also eliminates the need for manufacturers to create internal mapping processes to standardize unique data formats from each health plan or third party administrator.
The Standard provides a standardized format for the electronic submission of rebate information from Pharmacy Management Organizations (PMOs) to Pharmaceutical Industry Contracting Organizations (PICOs). The four (4) file formats are intended to be used in an integrated manner, with the utilization file being supported by the plan, formulary, and market basket files. However, any of the four (4) files may be used independently. The Standard Flat File layouts provide detailed information on the file design and requirements for each of the four (4) files.

ANSI/NCPDP MR v05.00-2011, Manufacturer Rebate Utilization, Plan, Formulary, Market Basket, and Reconciliation Flat File Standard v05.00

The Standard provides a standardized format for the electronic submission of rebate information from Pharmacy Management Organizations (PMOs) to Pharmaceutical Industry Contracting Organizations (PICOs). The four (4) file formats are intended to be used in an integrated manner, with the utilization file being supported by the plan, formulary, and market basket files. However, any of the four (4) files may be used independently. The Standard Flat File layouts provide detailed information on the file design and requirements for each of the four (4) files.

ANSI/NCPDP MR v06.00-2013, NCPDP Manufacturer Rebate Utilization, Plan, Formulary, Market Basket, and Reconciliation Flat File Standard v06.00-201x

The Standard provides a standardized format for the electronic submission of rebate information from Pharmacy Management Organizations (PMOs) to Pharmaceutical Industry Contracting Organizations (PICOs). The four (4) file formats are intended to be used in an integrated manner, with the utilization file being supported by the plan, formulary, and market basket files. However, any of the four (4) files may be used independently. The Standard Flat File layouts provide detailed information on the file design and requirements for each of the four (4) files.

The standard is intended to meet an industry need to standardize communication of claim information from the payer of last resort to other payers.

ANSI/NCPDP MS v4.0-2013, NCPDP Medicaid Subrogation Implementation Guide v4.0-201x

The standard is intended to meet an industry need to standardize communication of claim information from the payer of last resort to other payers.

The NCPDP Prior Authorization Transfer Standard Implementation Guide was developed to define the file format and correct usage for electronically transferring existing prior authorization data between payer/processors. This standard can be used between payer/processors when transitioning clients, performing system database or platform changes, or other scenarios where an existing prior authorization record is stored in one location and needs to be moved to another.

ANSI/NCPDP PA Transfer v2.0-2013, NCPDP Prior Authorization Transfer Standard v2.0 -201x

The NCPDP Prior Authorization Transfer Standard Implementation Guide was developed to define the file format and correct usage for electronically transferring existing prior authorization data between payer/processors. This standard can be used between payer/processors when transitioning clients, performing system database or platform changes, or other scenarios where an existing prior authorization record is stored in one location and needs to be moved to another.

Client Groups, Pharmacy Benefit Managers (PBMs), Fiscal Agents, Vendors, and Administrative Oversight Organizations need the ability to share post-adjudicated pharmacy claim data. The data is used to support 1) Auditing of services 2) Retrospective DUR review 3) Statistical reporting 4) Evaluate Health Care 5) Evaluate Contractor performance 6) Develop and evaluate capitation rates 7) Pay reinsurance (stop loss) to contractors and 8) Develop fee for service payment rates. In the current environment, data is shared in an inefficient manner because a common industry-wide format does not exist.

Client Groups, Pharmacy Benefit Managers (PBMs), Fiscal Agents, Vendors, and Administrative Oversight Organizations need the ability to share post-adjudicated pharmacy claim data. The data is used to support 1) Auditing of services 2) Retrospective DUR review 3) Statistical reporting 4) Evaluate Health Care 5) Evaluate Contractor performance 6) Develop and evaluate capitation rates 7) Pay reinsurance (stop loss) to contractors and 8) Develop fee for service payment rates. In the current environment, data is shared in an inefficient manner because a common industry-wide format does not exist.

The goal of this implementation guide is to support the development of a common format for post-adjudicated pharmacy claim data, which is used to meet the needs of the pharmacy industry to support the communication of patient pharmacy transaction data. The implementation of this standard will provide administrative efficiencies and allow for an industry standard to be used for all entities sharing historical health care data.

The goal of this implementation guide is to support the development of a common format for post-adjudicated pharmacy claim data, which is used to meet the needs of the pharmacy industry to support the communication of patient pharmacy transaction data. The implementation of this standard will provide administrative efficiencies and allow for an industry standard to be used for all entities sharing historical health care data.

The implementation of this standard will provide administrative efficiencies and allow for an industry standard to be used for all entities sharing historical health care data.

The basic function of the Prescription Transfer Standard is to be able to transfer prescription data in a standardized layout. Two layouts, a fixed length and a variable length format, were developed to provide more flexibility in the amount of data that needs to be transferred without making it a requirement in all cases. Both layouts include data elements required for the transfer of prescription data.

The basic function of the Prescription Transfer Standard is to be able to transfer prescription data in a standardized layout. ANSI/NCPDP SC 2013011-2013, NCPDP SCRIPT Standard 2013011
The standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP SC 2013012-2013, NCPDP SCRIPT Standard 2013012
The standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP SC 2014101-2014, NCPDP SCRIPT Standard 2014101
The standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP SC 2015071-2015, NCPDP SCRIPT Standard 2015071
The SCRIPT Standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP SC 20130401-2013, NCPDP SCRIPT Standard 20130401
The standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP SC 2013071-2013, NCPDP SCRIPT Standard 2013071
The standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP SC Standard 2013011-2013, NCPDP SCRIPT Standard 2013011
The standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP SC Standard 2014072-2014, NCPDP SCRIPT Standard 2014072
The standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP SC Standard 2016041-2016, NCPDP SCRIPT Standard 2016041
The SCRIPT Standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP SC Standard 2016071-2016, NCPDP SCRIPT Standard 2016071
The SCRIPT Standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP SC Standard 2017011-2017, NCPDP SCRIPT Standard 2017011
The SCRIPT Standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP SC Standard 2017011-2017, NCPDP SCRIPT Standard 2017011
The SCRIPT Standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

The standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP SC V10.1-2007, Prescriber/Pharmacist Interface SCRIPT Version 10.1
The standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP SC V10.10-2010, NCPDP SCRIPT Standard v10.10
The standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP SC V10.11-2010, NCPDP SCRIPT Standard v10.11
The standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP SC V10.3-2008, Prescriber/Pharmacist Interface SCRIPT Version 10.3
The standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP SC V10.4-2008, Prescriber/Pharmacist Interface SCRIPT Version 10.4
The standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.
ANSI/NCPDP SC V10.5-2008, SCRIPT Standard v10.5
The standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP SC V10.6-2008, SCRIPT Standard Implementation Guide Version 0.6
The standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP SC V10.7-2009, SCRIPT Standard v10.7
The standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP SC V10.8-2009, SCRIPT Standard v10.8
The standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP SC V10.9-2009, SCRIPT Standard v10.9
The standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP SCRIPT 2015041-2015, NCPDP SCRIPT Standard 2015041
The standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

The standard provides general guidelines for developers of pharmacy or physician management systems who wish to provide prescription transmission functionality to their clients. The standard addresses the electronic transmission of new prescriptions, prescription refill requests, prescription fill status notifications, and cancellation notifications.

ANSI/NCPDP Sig V1.0-2008, Sig Standard Version 1.0
This NCPDP Structured and Codified Sig Format Implementation Guide is intended to standardize the portion of an electronic prescription containing the directions for using existing, accepted electronic transmission standards, such as NCPDP SCRIPT, Health Level 7 (HL7), and ASTM Continuity of Care Records (CCR). This document is intended to facilitate communication between prescribers and pharmacists, to improve the efficiency of the prescribing and dispensing activities and to help reduce the opportunity for errors.

ANSI/NCPDP Specialized Standard 2010121
-2011, NCPDP Specialized Standard 2010121xxxx
The NCPDP Specialized Standard will house transactions that are not eprescribing but are part of the NCPDP XML environment. The standard provides general guidelines for developers of systems who wish to provide business functionality of these transactions to their clients. The guide describes a set of transactions and the implementation of these transactions.

ANSI/NCPDP Specialized Standard 2011071
-2011, NCPDP Specialized Standard 2011071
Houses transactions that are not eprescribing but are part of the NCPDP XML environment. The standard provides general guidelines for developers of systems who wish to provide business functionality of these transactions to their clients. The guide describes a set of transactions and the implementation of these transactions.

ANSI/NCPDP Specialized Standard 2012031
-2012, NCPDP Specialized Standard 2012031
The NCPDP Specialized Standard will house transactions that are not eprescribing but are part of the NCPDP XML environment. The standard provides general guidelines for developers of systems who wish to provide business functionality of these transactions to their clients. The guide describes a set of transactions and the implementation of these transactions.

ANSI/NCPDP Specialized Standard 2013011
-2013, NCPDP Specialized Standard 2013011
The NCPDP Specialized Standard will house transactions that are not eprescribing but are part of the NCPDP XML environment. The standard provides general guidelines for developers of systems who wish to provide business functionality of these transactions to their clients. The guide describes a set of transactions and the implementation of these transactions.

ANSI/NCPDP Specialized Standard 20130401
-2013, NCPDP Specialized Standard 20130401
The NCPDP Specialized Standard will house transactions that are not eprescribing but are part of the NCPDP XML environment. The standard provides general guidelines for developers of systems who wish to provide business functionality of these transactions to their clients. The guide describes a set of transactions and the implementation of these transactions.

ANSI/NCPDP Specialized Standard 2013071
-2013, NCPDP Specialized Standard 2013071
The NCPDP Specialized Standard will house transactions that are not eprescribing but are part of the NCPDP XML environment. The standard provides general guidelines for developers of systems who wish to provide business functionality of these transactions to their clients. The guide describes a set of transactions and the implementation of these transactions.

ANSI/NCPDP Specialized Standard 2013101
-2013, NCPDP Specialized Standard 2013101
The NCPDP Specialized Standard will house transactions that are not eprescribing but are part of the NCPDP XML environment. The standard provides general guidelines for developers of systems who wish to provide business functionality of these transactions to their clients. The guide describes a set of transactions and the implementation of these transactions.

ANSI/NCPDP Specialized Standard 2014072
-2014, NCPDP Specialized Standard 2014072
The NCPDP Specialized Standard will house transactions that are not eprescribing but are part of the NCPDP XML environment. The standard provides general guidelines for developers of systems who wish to provide business functionality of these transactions to their clients. The guide describes a set of transactions and the implementation of these transactions.

ANSI/NCPDP Specialized Standard 2014101
-2014, NCPDP Specialized Standard 2014101

ANSI/NCPDP TC VC.4-2007, Telecommunication Standard Version C.4
The standard supports the format for electronic communication of pharmacy service-related billing, prior authorization processing, and information reporting between pharmacies and other responsible parties. This standard addresses the data format and content and other appropriate telecommunication requirements.

ANSI/NCPDP TC VD.0-2007, Telecommunication Standard Version D.0
The standard supports the format for electronic communication of pharmacy service-related billing, prior authorization processing, and information reporting between pharmacies and other responsible parties. This standard addresses the data format and content and other appropriate telecommunication requirements.

ANSI/NCPDP TC VD.1-2009, Telecommunication Standard Version D.1
The standard supports the format for electronic communication of pharmacy service-related billing, prior authorization processing, and information reporting between pharmacies and other responsible parties. This standard addresses the data format and content, the transmission protocol and other appropriate telecommunication requirements.

ANSI/NCPDP TC VD.2-2009, Telecommunication Standard Version D.2
The standard supports the format for electronic communication of pharmacy service-related billing, prior authorization processing, and information reporting between pharmacies and other responsible parties. This standard addresses the data format and content, the transmission protocol and other appropriate telecommunication requirements.

ANSI/NCPDP TC VD.3-2010, Telecommunication Standard Version D.3
The standard supports the format for electronic communication of pharmacy service-related billing, prior authorization processing, and information reporting between pharmacies and other responsible parties. This standard addresses the data format and content, the transmission protocol and other appropriate telecommunication requirements.

ANSI/NCPDP TC VD.4-2010, NCPDP Telecommunication Standard Version D.4
The standard supports the format for electronic communication of pharmacy service-related billing, prior authorization processing, and information reporting between pharmacies and other responsible parties. This standard addresses the data format and content, the transmission protocol and other appropriate telecommunication requirements.

ANSI/NCPDP TC VD.5-2010, NCPDP Telecommunication Standard vD.5
The standard supports the format for electronic communication of pharmacy service-related billing, prior authorization processing, and information reporting between pharmacies and other responsible parties. This standard addresses the data format and content, the transmission protocol and other appropriate telecommunication requirements.

ANSI/NCPDP TC VD.6-2011, NCPDP Telecommunication Standard vD.6
The standard supports the format for electronic communication of pharmacy service-related billing, prior authorization processing, and information reporting between pharmacies and other responsible parties. This standard addresses the data format and content, the transmission protocol and other appropriate telecommunication requirements.

ANSI/NCPDP TC VD.7-2011, NCPDP Telecommunication Standard vD.7
Supports the format for electronic communication of pharmacy service-related billing, prior authorization processing, and information reporting between pharmacies and other responsible parties. This standard addresses the data format and content, the transmission protocol and other appropriate telecommunication requirements.

ANSI/NCPDP TC VD.8-2011, NCPDP Telecommunication Standard vD.8
The standard supports the format for electronic communication of pharmacy service-related billing, prior authorization processing, and information reporting between pharmacies and other responsible parties. This standard addresses the data format and content, the transmission protocol and other appropriate telecommunication requirements.

ANSI/NCPDP TC vD.9-2012, NCPDP Telecommunication Standard Implementation Guide D.9 201x
The standard supports the format for electronic communication of pharmacy service-related billing, prior authorization processing, and information reporting between pharmacies and other responsible parties. This standard addresses the data format and content, the transmission protocol and other appropriate telecommunication requirements.

ANSI/NCPDP TC vE.0-2013, NCPDP Telecommunication Standard vE.0-201x
The standard supports the format for electronic communication of pharmacy service-related billing, prior authorization processing, and information reporting between pharmacies and other responsible parties. This standard addresses the data format and content, the transmission protocol and other appropriate telecommunication requirements.

ANSI/NCPDP TC vE.1-2013, NCPDP Telecommunication Standard vE.1-201x
The standard supports the format for electronic communication of pharmacy service-related billing, prior authorization processing, and information reporting between pharmacies and other responsible parties. This standard addresses the data format and content, the transmission protocol and other appropriate telecommunication requirements.

ANSI/NCPDP TC vE.2-2013, NCPDP Telecommunication Standard vE.2-2013
The standard supports the format for electronic communication of pharmacy service-related billing, prior authorization processing, and information reporting between pharmacies and other responsible parties. This standard addresses the data format and content, the transmission protocol and other appropriate telecommunication requirements.

ANSI/NCPDP TC vE.3-2013, NCPDP Telecommunication Standard vE.3-2013
The standard supports the format for electronic communication of pharmacy service-related billing, prior authorization processing, and information reporting between pharmacies and other responsible parties. This standard addresses the data format and content, the transmission protocol and other appropriate telecommunication requirements.

ANSI/NCPDP TC vE.4-2014, NCPDP Telecommunication Standard vE.4-2014
The standard supports the format for electronic communication of pharmacy service-related billing, prior authorization processing, and information reporting between pharmacies and other responsible parties. This standard addresses the data format and content, the transmission protocol and other appropriate telecommunication requirements.
ANSI/NCPDP TC vE5-2014, NCPDP Telecommunication Standard vE5-201x
The standard supports the format for electronic communication of pharmacy service-related billing, prior authorization processing, and information reporting between pharmacies and other responsible parties. This standard addresses the data format and content, the transmission protocol and other appropriate telecommunication requirements.

ANSI/NCPDP TC vE6-2014, NCPDP Telecommunication Standard vE6
The standard supports the format for electronic communication of pharmacy service-related billing, prior authorization processing, and information reporting between pharmacies and other responsible parties. This standard addresses the data format and content, the transmission protocol and other appropriate telecommunication requirements.

ANSI/NCPDP TC vE7-2015, NCPDP Telecommunication Standard vE7
The standard supports the format for electronic communication of pharmacy service-related billing, prior authorization processing, and information reporting between pharmacies and other responsible parties. This standard addresses the data format and content, the transmission protocol and other appropriate telecommunication requirements.

ANSI/NCPDP TC vE8-2016, NCPDP Telecommunication Standard vE8
The standard supports the format for electronic communication of pharmacy service-related billing, prior authorization processing, and information reporting between pharmacies and other responsible parties. This standard addresses the data format and content, the transmission protocol and other appropriate telecommunication requirements.

ANSI/NCPDP vEB-2017, NCPDP Telecommunication Standard vEB
The standard supports the format for electronic communication of pharmacy service-related billing, prior authorization processing, and information reporting between pharmacies and other responsible parties. This standard addresses the data format and content, the transmission protocol and other appropriate telecommunication requirements.

This implementation guide is to support the development of a common format for pharmacy claim data, which is used to meet the needs of the pharmacy industry to support the reporting requirements of claim data to states or their designees. The implementation of this standard will provide administrative efficiencies and allow for an industry standard to be used for all entities sharing historical health care data.

This implementation guide is to support the development of a common format for pharmacy claim data, which is used to meet the needs of the pharmacy industry to support the reporting requirements of claim data to states or their designees. The implementation of this standard will provide administrative efficiencies and allow for an industry standard to be used for all entities sharing historical health care data.

ANSI/NCSBN 001-2015, Criminal Background Checks for Licensure as a Nurse
The National Council of State Boards of Nursing proposes this standard which would require a biometrics-based state and federal criminal background check for all applicants consistent with Public Law 92-544. It is the purpose of this Standard to assist each state to pass legislation consistent with Public Law 92-544 to require state and federal fingerprint-based criminal background checks. The Standard is written to allow the use of new biometric technologies as they emerge. The Standard applies specifically to applications for licensure by examination, endorsement, reactivation, reinstatement and renewal.

ANSI/NCSBN-002-2016, Reporting of Disciplinary Actions by Boards of Nursing
This 30 day review period is restricted to enhancements made to standard NCSBN - 002. The changes revolve around providing a more flexible and consistent period of time for boards of nursing to report disciplinary action. The change from 10 working days to no later than 15 calendar days received a much wider acceptance from the boards, recognizing that different states have different calendars that they manage by.

ANSI/NCSBN-003-2016, Primary Source Verification of Licensure by Endorsement
This 30 day review period is restricted to enhancements made to standard NCSBN - 003. A definition for Secure Electronic Transmission was added to clarify action taken and intent.

NCSLI (ASC Z540) (National Conference of Standards Laboratories)
ANSI NCSLI Z540.3-2006 (R2013), Requirements for the Calibration of Measuring and Test Equipment
This National Standard will establish the technical requirements for the calibration of measuring and test equipment through the use of a system of functional components. Collectively, these components are used to manage and assure that the accuracy and reliability of the measuring and test equipment are in accordance with identified performance requirements. In addition, this National Standard includes and updates the relevant calibration system requirements for measuring and test equipment described by the previous standards such as Part II of ANSI/NCSL Z540.1 (R2002) and Military Standard 49662A.

NEBB (National Environmental Balancing Bureau)
ANSI/NEBB 5120-2016, Technical Retro-Commissioning of Existing Buildings Standard
This standard describes the technical retro-commissioning procedures utilized for existing building technical systems for the improvement and optimization of Indoor Environmental Quality and Comfort and Energy and Water utility usage reduction. It defines the technical work procedures, testing and system adjustments that are required to improve system performance by optimizing existing systems. This standard may be utilized in tandem with existing energy audit standards as a technical performance standard.

NECA (National Electrical Contractors Association)
ANSI/NECA 1-2006 (R2015), Standard for Good Workmanship in Electrical Construction
This standard describes what is meant by installing equipment in a ‘neat and workmanlike manner’ in accordance with A chapter 20221, as required by the National Electrical Code, Section 110.12.
ANSI/NECA 100-2006 (R2013), Symbols for Electrical Construction Drawings

This publication describes graphic symbols used to represent electrical wiring and equipment on construction drawings. In this publication, the term "electrical" is used to include electrical, electronic, and communications systems covered by the National Electrical Code (NFPA 70). This publication also summarizes recommended drawing practices for electrical construction drawings.

ANSI/NECA 101-2006 (R2013), Standard for Installing Steel Conduits (Rigid, IMC, EMT)

This standard describes installation procedures for steel metal conduit (RMC), steel intermediate metal conduit (IMC), and steel electrical metallic tubing (EMT). Conduit with supplementary PVC coating is also included. This publication is intended to enhance electrical safety by: 1. Aiding installer in meeting the "neat and workmanlike" requirements 2. Reducing future repair needs 3. Providing for future expansion to avoid electrical overload 4. Creating an installation which will protect the wire conductors from mechanical abuse 5. Providing electrical continuity of the raceway system

ANSI/NECA 104-2012, Standard for Installing Aluminum Building Wire and Cable

Describes installation procedures and design considerations for aluminum building wire and cable in residential, commercial, institutional and industrial applications not exceeding 600 volts.

ANSI/NECA 120-2012, Standard for Installing Armored Cable (Type AC) and Metal-Clad Cable (Type MC)

This standard covers the installation of Type AC cable and Type MC cables, which are used for electrical wiring for residential, commercial and industrial occupancies. It also includes information on fittings and other accessories necessary for a quality installation of these cable systems.

ANSI/NECA 130-2016, Standard for Installing and Maintaining Wiring Devices

This standard describes the installation and maintenance procedures for wiring devices. Consumer Product

ANSI/NECA 169-2016, Standard for Installing and Maintaining Arc-Fault Circuit Interrupters (AFCIs) and Ground-Fault Circuit Interrupters (GFCIs)

This standard describes the installation and maintenance procedures for arc-fault circuit interrupters (AFCIs) and ground-fault circuit interrupters (GFCIs).

ANSI/NECA 200-2016, Standard for Installing and Maintaining Temporary Electric Power at Construction Sites

This standard describes temporary electrical power and lighting systems at construction sites, operating at 600 volts or less. It covers the planning, installation, expansion, maintenance, cutover, and removal of the temporary power system. This standard is intended to ensure a safe, adequate, functional, and reliable temporary electrical power system for all trades at construction sites

ANSI/NECA 202-2013, Installing and Maintaining Industrial Heat Tracing Systems

This standard describes procedures for installation, testing, and documentation of electrical freeze protection and process heat tracing systems. Heat tracing cable types covered by this publication include: self-regulating heating cables, and mineral insulated (MI) heating cables.

ANSI/NECA 230-2016, Standard for Selecting, Installing, and Maintaining of Electric Motors and Motor Controllers

This standard describes recommended procedures for selecting and installing stationary electric motors and motor controllers rated 1000 volts or less. It also covers routine maintenance procedures to be followed after the installation is complete.

ANSI/NECA 305-2010, Standard for Fire Alarm System Job Practices

This standard describes practices for installing, testing, and maintaining fire alarm systems. These job practices represent a minimum level of quality for fire alarm system installations.

ANSI/NECA 402-2014, Standard for Installing and Maintaining Motor Control Centers

This standard describes the installation and maintenance procedures for low-voltage motor control centers (MCCs) rated 600 VAC or less with a horizontal bus rating of 2,500 amperes or less. MCCs may be assembled with factory-installed dry-type transformers and panelboards. The testing and maintenance of such dry-type transformers is addressed in NEC 409, Standard for Installing and Maintaining Dry-Type Transformers (ANSI). The testing and maintenance of such panelboards is addressed in NECA 407, Standard for Installing and Maintaining Panelboards (ANSI).

ANSI/NECA 404-2014, Standard for Installing Generator Sets

This standard describes installation procedures for generators and related accessories and systems that are permanently installed for on-site standby or emergency power generation that are typically fueled by natural gas or diesel. Such generators may be defined as 'emergency systems' or 'legally-required standby systems' intended to supply power for emergency or life-safety applications in accordance with NFPA 70, National Electrical Code.

ANSI/NECA 407-2015, Standard for Installing and Maintaining Panelboards

This standard describes installation and maintenance procedures for panelboards, and special procedures used after adverse operating conditions such as a short-circuit, ground-fault, or immersion in water. This standard applies to panelboards rated 600 Volts AC or less, with main disconnects or lugs rated 1600 Amperes or less, and with feeder or branch circuit overcurrent devices rated 1200 Amperes or less. This publication applies to single panelboards, multi-section panelboards, and load centers that are installed in the field and used for distributing power for commercial, institutional, and industrial loads in nonhazardous locations both indoors and outdoors.

ANSI/NECA 408-2015, Standard for Installing and Maintaining Busways

This standard describes the installation and maintenance procedures for feeder and plug-in busways and accessories rated 600 Volts AC or less, and 100 Amperes or more, installed above ground. It also covers periodic routine maintenance procedures for busway, and special procedures used after adverse operating conditions such as a short-circuit, ground-fault, or immersion in water.

ANSI/NECA 409-2015, Standard for Installing and Maintaining Dry-Type Transformers

This standard describes the installation and maintenance procedures for single- and three-phase general purpose dry-type distribution and power transformers and associated accessories rated 600 Volts AC or less, and 0.25 kVA or more. This publication applies to indoor and outdoor, ventilated and non-ventilated, two-winding transformers used for supplying power, heating, and lighting loads for commercial, institutional, and industrial use in nonhazardous locations.

ANSI/NECA 410-2013, Standard for Installing and Maintaining Liquid-Filled Transformers

This standard describes installation procedures for pad-mounted, sealed, self-cooled or fan-cooled, compartmental, single- and three-phase liquid filled distribution and power transformers with primary windings rated from 2400 volts to 35 kV AC, nominal, and rated from 75 kVA through 5000 kVA, and associated accessories, designed for outdoor installation at grade level with underground entrance of primary and secondary conductors, and used for supplying power, heating and lighting loads for commercial, institutional, and industrial use in nonhazardous locations. It also covers periodic routine maintenance procedures for transformers.

ANSI/NECA 411-2014, Standard for Installing and Maintaining Uninterruptible Power Supplies (UPS)

This standard describes installation and maintenance procedures for permanently installed, static, three-phase Uninterruptible Power Supplies (UPSs) rated 30 kVA or more and rated 600 Volts or less, and related battery systems installed indoors or outdoors for commercial and industrial applications. UPSs described herein are solid-state power systems that provide continuous regulated AC power at the output terminals, while operating from either an AC power source or from a battery system.

ANSI/NECA 412-2012, Standard for Installing and Maintaining Photovoltaic Power Systems

Describes the application procedures for installing photovoltaic power systems and components.

ANSI/NECA 413-2012, Standard for Installing and Maintaining Electric Vehicle Supply Equipment (EVSE)

This standard describes the procedures for installing and maintaining AC Level 1, AC Level 2 and fast charging DC (initially known in the industry as AC Level 3 and currently known in the industry as DC Level 2) Electric Vehicle Supply Equipment (EVSE).
ANSI/NECA 416-2016, Recommended Practice for Installing Stored Energy Systems
This standard describes installation practices for stored energy systems such as battery systems, flywheels, capacitors, and smart chargers used for vehicle-to-grid (V2G) applications.

ANSI/NECA 420-2014, Standard for Fuse Applications
This standard describes application and installation practices and procedures for low-voltage, medium-voltage, and high-voltage fuses. This publication applies to all classifications of fuses used for overcurrent protection of distribution, utilization, and control equipment used for power, heating, and lighting loads for commercial, and industrial use in nonhazardous indoor and outdoor locations.

ANSI/NECA 430-2016, Standard for Installing and Maintaining Medium-Voltage Switchgear
This standard describes site preparation, installation, and maintenance procedures for medium-voltage switchgear. This standard is not intended to cover manufacturing or types of switchgear. These switchgears may be classified as either metal-clad switchgear or metal-enclosed switchgear.

ANSI/NECA 505-2010, Standard for Installing and Maintaining High Mast, Roadway and Area Lighting
This Standard describes the installation and maintenance procedures for high mast, roadway, area, and sport lighting systems installed outdoors for commercial, institutional, and industrial applications. This Standard applies to high intensity discharge lighting luminaires rated 600 Volts and less and mounted on poles. This Standard does not apply to specialized applications or installations with special environmental or regulatory conditions.

ANSI/NECA 600-2014, Standard for Installing and Maintaining Medium-Voltage Cable
This standard describes installation procedures for shielded and non-shielded solid-dielectric medium-voltage cables rated from 2001 Volts to 35,000 Volts AC and installed in conduits or ducts, or direct-buried. This publication applies to single-and multi-conductor cables used for distributing power for commercial, institutional, and industrial locations both indoors and outdoors.

ANSI/NECA 700-2016, Standard for Installing Overcurrent Protection to Achieve Selective Coordination
This standard describes the application procedures for selecting and adjusting low-voltage overcurrent protective devices to achieve selective coordination.

ANSI/NECA 701-2013, Standard for Energy Management, Demand Response and Energy Solutions
This standard describes methods and procedures used for performing energy conservation surveys, controlling and managing energy consumption, implementing and evaluating energy conservation measures for residential, commercial and industrial applications.

ANSI/NECA 90-2015, Standard for Commissioning Building Electrical Systems
This standard describes installation procedures for commissioning newly installed or retrofitted building electrical systems and equipment. It defines the process of commissioning building electrical systems and provides sample guidelines for attaining optimum system performances that conform to design, specification, and industry accepted codes and standards. This standard is not intended to cover commissioning processes for every type of electrical system and references other specific NEIS documents where such information is provided.

ANSI/NECA/BICSI 607-2010, Telecommunications - Bonding and Grounding - Planning and Installation Methods for Commercial Buildings
This (proposed) American National Standard specifies aspects of planning and installation of telecommunications bonding and grounding systems within a commercial building (see Figure 1). This standard is intended to enhance the planning, specification and layout of an effective telecommunications bonding and grounding system. Additionally, this standard specifies installation requirements for components of the telecommunications bonding and grounding system.

ANSI/NECA/FOA 301-2016, Standard for Installing and Testing Fiber Optic Cables
This standard describes procedures for installing and testing cabling networks that use fiber optic cables and related components to carry signals for communications, security, control and similar purposes. It defines a minimum level of quality for fiber optic cable installations.

ANSI/NECA/NEMA 105-2015, Standard for Installing Metal Cable Tray Systems
NEMA VE 2 addresses shipping, handling, storing, and installing cable tray systems and provides information on maintenance and system modification.

NEMA (ASC C119) (National Electrical Manufacturers Association)

ANSI C119.0-2015, Testing Methods and Equipment Common to the ANSI C119 Family of Standards - For Electric Connectors
This standard covers methods and equipment for performing the connector qualification tests common to the ANSI C119 family of standards. Tests that are unique to only one ANSI C119 product standard are not covered in this document and are described in the applicable product standard.

ANSI C119.1-2016, Electric Connectors - Sealed Insulated Underground Connector Systems Rated 600 V
Covers sealed insulated underground connector systems rated at 600 V for utility applications and establishes electrical, mechanical and sealing requirements.

ANSI C119.4-2016, Connectors for Use between Aluminum-to-Aluminum and Aluminum-to-Copper Conductors Designed for Normal Operation at or Below 93°C and Copper-to-Copper Conductors Designed for Normal Operation at or Below 100°C
This standard covers connectors used for making electrical connections between aluminum-to-aluminum or aluminum-to-copper or copper-to-copper conductors used on distribution and transmission lines for electric utilities. This standard establishes the electrical and mechanical test requirements for electrical connectors. Additional optional tests are shown in the annexes. This standard is not intended to recommend operating conditions or temperatures.

ANSI C119.5-2009, Insulation Piercing Connector Systems, rated 600 volts or less (low voltage aerial bundled cables and insulated and non-insulated line wires)
This standard covers insulation piercing connectors used for making electrical connections between insulated, insulated-to-bare, and bare-to-bare conductors rated 600 V or less and 90°C (low voltage aerial bundled cables and bare and insulated line wires) on overhead distribution lines for electric utilities. Underground insulation piercing connector systems rated at 600 V are covered by ANSI C119.1. Since cable and insulation types exist in very different types and configurations, insulation piercing connectors can not be designed for the full range of cable and insulation possibilities (cable cross-section and material, insulation material and thickness). The manufacturer is to indicate the cable and insulation types the connector is designed for, and conformity to this standard shall be established by testing with these cable and insulation types. This standard establishes the electrical, mechanical and environmental test requirements for electrical insulation piercing connectors. This standard is not intended to recommend operating conditions or temperatures.

ANSI C119.6-2011, Standard for Electric Connectors - Non-Sealed, Multipoor Connector Systems Rated 600 V or Less for Aluminum and Copper Conductors
Covers non-sealed, multipoint distribution connectors rated 600 V or less used to make electrical connections between aluminum-to-aluminum, aluminum-to-copper or copper-to-copper conductors for above-grade electric utility applications.

NEMA CC 1-2009, Electric Power Connection for Substations
This standard covers uninsulated connectors and bus supports that are made of metal and intended for use with conductors or bus made of copper or aluminum alloy and found in substations. Connectors that are supplied in equipment are covered by the equipment standards and are excluded from this standard.
NEMA (ASC C12) (National Electrical Manufacturers Association)

ANSI C12.1-2016, Code for Electricity Metering
Establishes acceptable performance criteria for new types of ac watthour meters, demand meters, demand registers, pulse devices and auxiliary devices. Describes acceptable in-service performance levels for meters and devices used in revenue metering.

ANSI C12.10-2011, Physical Aspects of Watthour Meters - Safety Standard
Covers the physical aspects of both detachable and bottom-connected watthour meters and associated registers. These include ratings, internal wiring arrangements, pertinent dimensions, markings and other general specifications. Refer to the latest versions of ANSI C12.1 and ANSI C12.20 for performance requirements.

ANSI C12.11-2006 (R2014), Standard for Instrument Transformers for Revenue Metering 10kV Bil through 350 kV Bil (0.6 kV NSV through 69 kV NSV)
This Standard covers the general requirements, metering accuracy, thermal ratings, and dimensions applicable to current transformers and inductively coupled voltage transformers for revenue metering. 10 kV basic lightning impulse insulation level (BIL) through 350 kV Bil for 0.6 kV nominal system voltage (NSV) through 69 kV NSV.

ANSI C12.18-2006 (R2015), Protocol Specification for ANSI Type 2 Optical Port
This Standard details the criteria required for communications between a C12.18 Device and a C12.18 Client via an optical port. The C12.18 Client may be a handheld reader, a portable computer, a master station system or some other electronic communications device. This Standard provides details for a complete implementation of an OSI 7-layer model. The protocol specified in this document was designed to transport data in Table format. The Table definitions are in ANSI C12.19 Utility Industry End Device Data Tables.

ANSI C12.19-2014, Standard for Utility Industry End Device Data Tables
Defines a table structure for utility application data to be passed between an end device and a computer. Does not define device design criteria nor specify the language or protocol used to transport that data. The purpose of the tables is to define structures for transporting data to and from end devices.

ANSI C12.20-2017, Standard for Electricity Meters - 0.1, 0.2 and 0.5 Accuracy Classes
This standard establishes the physical aspects and acceptable performance criteria for 0.1, 0.2, and 0.5 accuracy class electricity meters meeting Blondel's Theorem. Where differences exist between the requirements of this Standard and the most current version of C12.2 and C12.10, the requirements of this Standard shall prevail.

ANSI C12.21-2006 (R2015), Protocol Specification for Telephone Modem Communications
This Standard details the criteria required for communications between a C12.21 Device and a C12.21 Client via a modem connected to the switched telephone network. The C12.21 Client could be a laptop or portable computer, a master station system or some other electronic communications device. This Standard does not specify the implementation requirements of the telephone switched network to the modem, nor does it include definitions for the establishment of the communication channel. This document provides details for an implementation of the OSI 7-layer model. The protocol specified in this Standard was designed to transport data in Table format.

ANSI C12.22-2012, Protocol Specification for Interfacing to Data Communication Networks
Describes the process of transporting C12.19 table data over a variety of networks, with the intention of advancing interoperability among communications modules and meters.

ANSI C12.4-1984 (R2011), Registers, Mechanical Demand
Covers the voltage and frequency rating, full-scale values, scale classes, demand intervals, multiplying constants, timing mechanism and other general features of mechanical demand registers required for use on watthour meters.

ANSI C12.5-1978 (R2011), Meters, Thermal Demand
Establishes the physical aspects and acceptable performance criteria for 0.2 and 0.5 accuracy class electricity meters meeting Blondel's Theorem.

ANSI C12.6-1987 (R2016), Phase-Shifting Devices Used In Metering, Marking and Arrangement of Terminals
This specification applies to phase-shifting devices designed to provide the proper lagged voltages required for kvar and kVA measurement.

ANSI C12.7-2005 (R2014), Requirements for Watthour Meter Sockets
This standard covers the general requirements and pertinent dimensions applicable to watthour meter sockets rated up to and including 600 V and up to and including 320 A continuous duty per socket opening.

ANSI C12.8-1981 (R2011), Test Blocks and Cabinets for Installation of Self-Contained A-Base Watthour Meters
Covers the dimensions and functions of test blocks and cabinets used in self-contained A-base watthour meters.

ANSI C12.9-2014, Standard For Test Switches for Transformer-Rated Meters
Encompasses the dimensions and functions of meter test switches used with transformer-rated watthour meters in conjunction with instrument transformers.

NEMA (ASC C136) (National Electrical Manufacturers Association)

This is a guide for the proper selection of filament lamps for use in roadway and area lighting equipment covered by the following American National Standards: ANSI C136.4, ANSI C136.5, ANSI C136.6, and ANSI C136.11.

ANSI C136.10-2010, Locking-type Photocontrol Devices and Mating Receptacles - Physical and Electrical Interchangeability and Testing
This standard covers the following roadway and area lighting equipment, which may be physically and electrically interchanged to operate within established values: a) Locking-type photocontrol, herein referred to as 'photocontrol.' b) Locking-type mating receptacle, herein referred to as 'receptacle.' c) Shorting and non-shorting caps.

ANSI C136.11-2011 (R2016), Standard for Roadway and Area Lighting Equipment - Multiple Sockets
This standard covers medium and mogul multiple sockets as used in luminaires designed and intended for use in lighting roadways and other areas open to general use by the public.

This standard covers the selection of mercury vapor lamps recommended for use in roadway and area lighting equipment.

ANSI C136.13-2014, Roadway and Area Lighting Equipment - Metal Brackets for Wood Poles
This standard covers metal pipe, tubing, and structural brackets for wood poles designed to support luminaires of generally spherical, ellipsoidal, or rectangular shapes used in roadway and area lighting.

ANSI C136.14-2014, Roadway and Area Lighting Equipment - Elliptically Shaped, Enclosed Side-mounted Luminaires for Horizontal-burning High-intensity Discharge Lamps
This standard covers dimensional, maintenance and light distribution features that permit the interchange of enclosed side-mounted luminaires for horizontal-burning high-intensity discharge lamps used in roadway and area lighting equipment. Luminaires of similar size, shape, and weight meeting the requirements of this standard may be used interchangeably within a system with assurance that they will fit the bracket arm, pole strength requirements will not change, light distribution will be similar and similar maintenance procedures can be used.

ANSI C136.15-2015, For Roadway and Area Lighting Equipment - Luminaire Field Identification
The intent of this standard is to provide a simple, uniform method for identifying the type and wattage rating of a luminaire used for roadway and area lighting.
ANSI C136.16-2014, Standard for Roadway and Area Lighting: Enclosed, Post Top-Mounted Luminaires
This standard covers dimensional, maintenance, and light distribution features that permit the interchange of enclosed, post top-mounted high intensity discharge (HID), solid state (SSL) source (also referred to as LED (Light Emitting Diode), and magnetic induction luminaires whose center of mass is approximately over the mounting tenon. Luminaires of similar size, shape, and weight meeting the requirements of this standard may be used interchangeably within a system with assurance that: dECE They will fit the mounting tenon dECE Pole strength requirements will not change dECE Light distribution will be similar dECE Similar maintenance procedures can be used

This standard covers the dimensional features and the materials of refractors of the approximate shape shown in Figures 1 through 3, and as described in ANSI C136.14, American National Standard for Roadway and Area Lighting Equipment—Enclosed Side-mounted Luminaires for Horizontal-burning High-intensity Discharge Lamps.

ANSI C136.18-2006 (R2010), High-mast Side-mounted Luminaires for Horizontal- or Vertical-burning High-intensity Discharge Lamps
This standard is intended to cover physical, operational, maintenance, and light-distribution features that permit use of high-mast luminaires in roadway applications when specified. It is not intended that compliance with this standard will permit interchangeability with existing roadway equipment without thorough engineering review and evaluation.

ANSI C136.19-2017, High-Pressure Sodium and Retrofit High-Pressure Sodium Lamps for Mercury Ballasts - Guide for Selection
This standard covers the selection of high-pressure sodium lamps recommended for use in roadway and area lighting equipment.

ANSI C136.2-2015, Standard for Roadway and Area Lighting Equipment - Dielectric Withstand and Electrical Transient Immunity Requirements
This standard covers luminaires and control devices classified for 600 volt operation and intended for use in roadway and area lighting applications. This standard contains minimum performance requirements and test procedures for evaluating luminaire and control devices under test (DUTs) for the following: a) Dielectric withstand b) Electrical transient immunity

ANSI C136.20-2012 , Roadway and Area Lighting Equipment - Fiber Reinforced Composite (FRC) Lighting Poles
This standard applies to fiber-reinforced composite (FRC) lighting poles used for roadway and area lighting. This standard includes nomenclature, dimensional data, performance criteria, and some interchangeability features for standard poles as well as those that must meet breakaway requirements for poles as described in Standard Specifications for Structural Supports for Highway Signs, Luminaires, and Traffic Signals, AASHTO LTS.

ANSI C136.21-2014, Standard for Roadway and Area Lighting Equipment - Vertical Tenons
Used with Post Top-mounted Luminaires
This standard covers the attachment features of vertical tenons on pole tops or brackets used in roadway and area lighting that permit the interchangeability of post-top-mounted luminaires.

ANSI C136.22-2004 (R2014), For Roadway and Area Lighting Equipment - Internal Labeling of Luminaires
This standard covers internal luminaire identification labels for all styles of luminaires used for roadway lighting.

This standard is intended to cover physical, operating, maintenance, and light distribution features that permit use of architectural luminaires in roadway applications when so specified. The architectural luminaires covered by this standard include side-mounted, square, rectangular, cylindrical, spherical, and other types of decorative or nostalgic historical style luminaires that are considered to be any significant deviation from the luminaire style that has evolved in the industry as predominantly (commonly) known as the "cobra head" style covered in ANSI C136.14.

ANSI C136.24-2005 (R2010), Nonlocking (Button) Type Photocontrols
Covers the electrical and mechanical interchangeability of nonlocking type photocontrols for mounting within a roadway or off-roadway luminaire, herein called "controls." These controls are commonly called "button" photocontrols. Members in the "general interest" and "user" categories are actively being sought by this committee.

ANSI C136.25-2013, Roadway and Area Lighting Equipment - Ingress Protection (Resistance to Dust, Solid Objects and Moisture) for Luminaire Enclosures
This standard details the requirements for ingress protection of luminaires in roadway and area lighting equipment, installed for their intended use and specified by end user. While these requirements are suitable for most types of lighting equipment, it should not be assumed that all the listed degrees of protection are applicable to a particular type of equipment. The manufacturer of the equipment should be consulted to determine the degree of protection available. The adoption of this standard should promote uniform methods of describing the protection provided by the lighting equipment (luminaire) enclosure.

This troubleshooting guide is intended to help the service person quickly diagnose an HID luminaire with magnetic ballast and also ensure that the problem is fixed on the first attempt. This guide addresses the four commonly encountered problems in two manners: 1) Summary of possible actions for those needing only a checklist; and 2) A detailed report on possible actions for those needing additional information. The commonly encountered problems are: 1. Lamp on continually 2. Lamp cycles on and off 3. Lamp will not start 4. Lamp burns dimly

ANSI C136.27-2012, Roadway and Area Lighting Equipment - Tunnel and Underpass Lighting Luminaires
This standard covers luminaires used for illuminating roadway tunnels and underpasses. The requirements in this standard are limited to general attributes of tunnel luminaires due to the wide variety of designs possible.

ANSI C136.28-2006 (S2017), Standard for Roadway and Area Lighting Equipment Glass Lenses Used in Luminaires
This standard covers flat and molded glass of soda-lime and borosilicate materials used as lenses for roadway and area lighting luminaires. This standard includes definitions, criteria, and test methods for mechanical and impact strength, thermal shock resistance, and temper for both materials.

ANSI C136.29-2011, Roadway and Area Lighting Equipment - Metal Halide Lamps - Guide for Selection
Includes screw-base single-ended metal halide lamps that can be used in roadway and area lighting equipment.

ANSI C136.3-2014, Standard for Roadway and Area Lighting - Luminaire Attachments
This standard covers attachment features of luminaires used in roadway and area lighting equipment. The features covered apply to luminaires that are side, post-top or pendant-mounted.
ANSI C136.30-2015, Standards for Roadway and Area Lighting Equipment - Pole Vibration
This guide covers the minimum vibration withstand requirements and testing procedures for poles used in roadway and area lighting. The guide is intended for poles of 50 ft mounting height and under.

ANSI C136.31-2010, ANS for Roadway and Area Lighting Equipment - Luminaire Vibration
This standard covers the minimum vibration withstand capability and vibration test methods for roadway and area luminaires.

ANSI C136.32-2012, Standard for Roadway and Area Lighting - Enclosed Setback Luminaires and Directional Floodlights
This standard covers dimensional, maintenance, and electrical features that permit the interchange of similar style enclosed luminaires having the same light distribution classification or type used in roadway or area lighting equipment. Luminaires covered by this standard are generally yoke, trunnion, or tenon mounted. They are traditionally called floodlights or setback luminaires.

ANSI C136.34-2014, Roadway and Area Lighting Equipment - Vandal Shields for Roadway and Area Lighting Luminaires
This standard covers supplementary vandal shields used to protect luminaires and luminaire accessories used for roadway and area lighting.

ANSI C136.35-2009 (R2014), Roadway and Area Lighting Equipment - Luminaire Electrical Ancillary Devices (LEAD)
This standard covers the electrical and mechanical interchangeability of electrical devices mounted on or in luminaires, brackets, or remotely mounted on the support structure of the luminaire and that may draw power from the luminaire. These devices are used in conjunction with roadway and area lighting luminaires and may be mounted or plugged into the photocell receptacle. This standard does not cover such things as flag banners, flower containers, or decorative holiday/seasonal lights.

ANSI C136.37-2011, Roadway and Area Lighting Equipment - Solid State Light Sources Used in Roadway and Area Lighting
This standard defines interchangeability of and some minimum requirements for solid state light (SSL) source fixtures, also referred to as luminaires, and also called LED (light-emitting diode) fixtures, used in roadway and off-roadway luminaires that meet various ANSI C136 standards. This Standard does not address replacement or interchangeability of lamps/light sources.

ANSI C136.38-2015, Roadway and Area Lighting Equipment - Induction Lighting
This standard defines the electrical and mechanical requirements of induction-type light sources for use in roadway and area lighting luminaires.

ANSI C136.4-2003 (R2013), Roadway and Area Lighting Equipment - Series Sockets and Series Socket Receptacles
This standard covers the following equipment for roadway and area luminaires: a) Series sockets having medium impact strength and intended for service at high temperatures. b) Series sockets having high impact strength and intended for service at limited temperatures. c) Series-socket receptacles (here-in-after called the receptacles) in the 5000 V classification.

ANSI C136.40-2014, Roadway and Area Lighting - Solar Lighting Systems
This standard defines the electrical and mechanical requirements of standalone solar-type light systems for use in roadway and area lighting equipment.

ANSI C136.41-2013, Roadway and Area Lighting Equipment - Dimming Control between an External Locking Type Photocontrol and Ballast or Driver
This standard describes methods of light level control between an external locking type photocontrol (or similar device) and a dimmable ballast or driver for street and area lighting equipment. Mechanical, electrical, and marking requirements are established for dimming, locking type photocontrols and mating receptacles. All requirements of ANSI C136.10-2010, for photocontrols and receptacles, shall apply except where specifically superseded by this standard.

ANSI C136.45-2011 (R2016), Standard for Roadway and Area Lighting Equipment - Aluminum Lighting Poles
This standard applies to aluminum lighting poles and includes nomenclature, dimensional data, performance criteria, and some interchangeability features for standard poles as well as those that must meet breakaway requirements for poles as described in AASHTO LTS Standard Specifications for Structural Supports for Highway Signs, Luminaires, and Traffic Signals.

ANSI C136.46-2013, Roadway and Area Lighting Equipment - Concrete Lighting Poles
This standard applies to concrete lighting poles used in roadway and area lighting equipment and includes nomenclature, performance criteria, marking and recordkeeping requirements, and certain minimal material needs. It does not cover concrete poles manufactured with any modified concrete mix incorporating the use of polymers or other modifiers.

ANSI C136.47-2010 (R2015), Standard for Roadway and Area Lighting Equipment - Steel Roadway and Area Lighting Poles
This standard applies to steel lighting poles. This standard includes nomenclature, dimensional data, performance criteria, and some interchangeability features for standard poles as well as those that must meet breakaway requirements for poles as described in Standard Specifications for Structural Supports for Highway Signs, Luminaires, and Traffic Signals, AASHTO LTS.
NEMA (ASC C18) (National Electrical Manufacturers Association)
ANSI C18.1M, Part 1-2015, Standard for Portable Primary Cells and Batteries with Aqueous Electrolyte - General and Specifications
This standard applies to portable primary cells and batteries with aqueous electrolyte and a zinc anode (non-lithium). This edition includes the following electrochemical systems: a) Carbon zinc (Leclanche and zinc chloride types); b) Alkaline manganese dioxide; c) Silver oxide; d) Zinc air; and e) Nickel oxyhydroxide. The purpose of this publication is to: a) Ensure the electrical and physical interchangeability of products from different manufacturers; b) Minimize proliferation of cell and battery types; c) Define a standard of performance and provide guidance for its assessment; and d) Provide guidance to consumers, manufacturers, and designers.

This American National Standard specifies tests and requirements for portable primary batteries with aqueous electrolyte and a zinc anode (non-lithium) to ensure their safe operation under normal use and reasonably foreseeable misuse. For reference, the chemical systems standardized in ANSI C18.1M, Part 1 are: Lithium carbon monofluoride; Lithium manganese dioxide; Lithium iron disulfide.

ANSI C18.3M, Part 2-2011, Portable Lithium Primary Cells and Batteries - Safety Standard
This standard applies to portable lithium primary cells and batteries. This edition includes the following electrochemical systems: a) Lithium/carbon monofluoride; b) Lithium/manganese dioxide; and c) Lithium/iron disulfide.

ANSI C18.4-2015, Standard for Portable Cells and Batteries - Environmental
- Raise awareness that provisions in battery standards can affect the environment in negative and positive ways; 
- Outline the relationship between battery standards and the environment; 
- Help avoid provisions in battery standards that may lead to adverse environmental effects; 
- Emphasize that addressing environmental aspects in battery standards is a complex process which requires a balance in competing priorities; 
- Recommend the use of recognized scientific methodologies when developing battery standards that incorporate environmental aspects.

ANSI C18.2M, Part 1-2013, Portable Rechargeable Cells and Batteries - General and Specifications
This publication applies to portable rechargeable, or secondary, cells and batteries based on the following electrochemical systems: a) Nickel-cadmium b) Nickel-metal hydride c) Lithium-ion including lithium ion polymer Section 1 of this standard contains general information and all standardized performance and mechanical tests upon which all the specifications in Section 2 are based. Section 2 specification sheets list those tests and requirements described herein that are required for each battery.

ANSI C18.2M, Part 2-2014, Portable Rechargeable Cells and Batteries - Safety Standard
This American National Standard specifies performance requirements for standardized portable lithium-ion, nickel cadmium, and nickel metal hydride rechargeable cells and batteries to ensure their safe operation under normal use and reasonably foreseeable misuse, and includes information relevant to hazard avoidance.

ANSI C18.3M, Part 1-2013, Portable Lithium Primary Cells and Batteries - General and Specifications
This standard applies to portable lithium primary cells and batteries. This edition includes the following electrochemical systems: a) Lithium/carbon monofluoride; b) Lithium/manganese dioxide; and c) Lithium/iron disulfide.

ANSI C18.2M, Part 1-2013, Portable Rechargeable Cells and Batteries - General and Specifications
This American National Standard specifies performance requirements for standardized portable lithium-ion, nickel cadmium, and nickel metal hydride rechargeable cells and batteries to ensure their safe operation under normal use and reasonably foreseeable misuse, and includes information relevant to hazard avoidance.

This standard comprises a manual of test methods to be followed in making tests to determine the characteristics of wet-process porcelain electrical power insulators.

ANSI C29.10-1989 (R2012), Standard for Wet Process Porcelain Insulators - Indoor Apparatus Type
Covers high-voltage indoor-apparatus insulators made of wet-process porcelain and used in the transmission and distribution of electrical energy.

ANSI C29.11-2012, Composite Suspension Insulators for Overhead Transmission Lines - Test
Comprises a manual of test methods to be followed in making tests to determine the characteristics of composite electrical power insulators.

ANSI C29.12-2013, Standard for Composite Insulators - Transmission Suspension Type
This standard covers composite suspension (tension) insulators with a minimum section length of 46 inches (1168.4 mm) made of a fiberglass-reinforced resin matrix core, polymer material weathersheds, and metal end fittings intended for use on overhead transmission lines for electric power systems.

ANSI C29.13-2012, Standards for Insulators - Composite Distribution Deadend Type
This standard covers composite distribution deadend insulators made of a fiberglass-reinforced resin matrix core, polymer material weathersheds, and metal end fittings intended for use on overhead lines for electric power systems, 69 kV and below.

ANSI C29.17-2013, Standard for Insulators-Composite-Line Post Type
This standard describes the qualification test procedures for composite line post insulators that are made of a fiberglass-reinforced resin matrix core, elastomeric weathersheds and metal end fittings. These insulators are intended for use on overhead lines in electric power systems, 70kV and above.

ANSI C29.18-2013, Standard for Composite Insulators -Distribution Line Post Type
This standard covers composite distribution line post insulators made of a fiberglass-reinforced resin rod core, polymer material weathersheds, and metal end fittings designed for use on overhead lines for electric power systems, 69 kV and below.

ANSI C29.2A-2013, Standard for Insulators - Wet-Process and Toughened Glass - Distribution Suspension Type
This standard covers distribution suspension-type insulators, 4-1/4 inches (108 millimeters) to 8 inches (203 millimeters) in diameter, made of wet-process porcelain or of toughened glass and used in the distribution of electrical energy.

ANSI C29.28-2013, Standard for Insulators - Wet Process Porcelain and Toughened Glass - Transmission Suspension Type
This standard covers transmission suspension-type insulators, 9 inches (228.6 millimeters) in diameter and larger, made of wet-process porcelain or of toughened glass and used in the transmission of electrical energy.

ANSI C29.8-1985 (R2012), Standard for Wet Process Porcelain Insulators - Apparatus, Cap, and Pin Type Type
Covers high-voltage indoor-apparatus insulators made of wet-process porcelain and used in the transmission and distribution of electrical energy.

ANSI C29.9-1983 (R2012), Standard for Wet-Process Porcelain Insulators—Apparatus, Post Type
Covers outdoor high-voltage post-type apparatus insulators made of wet-process porcelain and used in the transmission and distribution of electrical energy.

NEMA C29.3-2015, Standard for Wet Process Porcelain Insulators - Spool Type
This standard covers spool-type insulators made of wet-process porcelain and used in the transmission and distribution of electric energy.

NEMA C29.4-2015, Standard for Wet Process Porcelain Insulators-Strain Type
This standard covers strain-type insulators made of wet-process porcelain and used in the transmission and distribution of electric energy.

NEMA C29.5-2015, Standard for Wet Process Porcelain Insulators- Low and Medium Voltage Types
This standard covers low- and medium-voltage-type insulators made of wet-process porcelain and used in the transmission and distribution of electric energy.
NEMA C29.6-2015, Standard for Wet Process Porcelain Insulators-High Voltage Pin Type
This standard covers high-voltage pin-type insulators made of wet-process porcelain and used in the transmission and distribution of electrical energy

NEMA C29.7-2015, Standard for Wet Process Porcelain Insulators- High-Voltage Line Post Type
This standard covers high-voltage line post - type insulators made of wet-process porcelain and used in the transmission and distribution of electrical energy

NEMA (ASC C37) (National Electrical Manufacturers Association)

ANSI C37.50-2012, Low Voltage AC Power Circuit Breakers Used in Enclosures - Test Procedures
Covers the test procedures for enclosed low-voltage ac power circuit breakers as follows: 1) Stationary or drawout circuit breakers of two or three-pole construction, with one or more rated maximum voltages of 635 (600 for units incorporating fuses), 508, and 254 V for application on systems having nominal voltages of 600, 480, and 250 V. a) Unfused circuitbreakers b) Fused circuit breakers 3) Manually operated or power-operated circuit breakers with or without electromechanical or solid-state trip devices.

ANSI C37.51-2003 (R2010), Metal-Enclosed Low-Voltage AC Power Circuit Breaker Switchgear Assemblies - Conformance Test Procedures
Conformance testing standard optionally applicable to all metal-enclosed low-voltage ac power circuit breaker switchgear assemblies designed, tested, and manufactured in accordance with ANSI/IEEE C37.20.1-2002, Metal-Enclosed Low-Voltage AC Power Circuit Breaker Switchgear. Tests demonstrate conformance of the basic switchgear section (including the structure, circuit breaker compartments, instrument compartments, buses, and internal connections) with Sec 6, Tests, of ANSI/IEEE C37.20.1-2002.

This amendment has been developed to coordinate selected conformance tests and procedures with ANSI/IEEE C37.20.1-2002 Metal Enclosed Low-Voltage AC Power Circuit Breaker Switchgear, and particularly, to recognize the amendment C37.20.1a-2005.

ANSI C37.54-2003 (R2010), Indoor Alternating Current High-Voltage Circuit Breakers Applied as Removable Elements in Metal-Enclosed Switchgear - Conformance Test Procedures
Specifies tests to demonstrate that the circuit breaker being tested conforms with the ratings assigned by ANSI/IEEE C37.04. Preferred ratings are listed in ANSI C37.06.

ANSI C37.55-2003 (R2010), Medium-Voltage Metal-Clad Assemblies - Conformance Test Procedures
This Standard is a conformance testing standard optionally applicable to all medium voltage metal-clad switchgear assemblies designed, tested, and manufactured in accordance with ANSI/IEEE C37.20.2, Metal-Clad Switchgear. This standard covers selected tests to demonstrate conformance with Section 6, Tests, of ANSI/IEEE C37.20.2.

ANSI C37.57-2003 (R2010), Metal-Enclosed Interrupter Switchgear Assemblies – Conformance Testing
This standard is a conformance testing standard optionally applicable to all metal-enclosed interrupter switchgear assemblies designed, tested, and manufactured in accordance with ANSI/IEEE C37.20.3.

This standard applies to the conformance test procedure for ac medium-voltage switches rated above 1000 volts as designed, manufactured, and tested in accordance with ANSI/IEEE C37.20.4. It is intended for use in metal-clad switchgear, as described in ANSI/IEEE C37.20.2, and metal-enclosed interrupter switchgear, as described in ANSI/IEEE C37.20.3.

ANSI C37.85-2002 (R2010), Alternating-Current High-Voltage Power Vacuum Interrupters – Safety Requirements for X-Radiation Limits
This standard specifies the maximum permissible X-radiation emission from alternating-current high-voltage power vacuum interrupters that are intended to be operated at voltages above 1000 volts and up to 38,000 volts when tested in accordance with procedures described in this standard.

NEMA (ASC C50) (National Electrical Manufacturers Association)

ANSI C50.41-2012, Polyphase Induction Motors for Power Generating Stations
The requirements in this standard apply to Polyphase induction motors intended for use in power generating stations, including the following: a)Frame size larger than NEMA 440 series b)Squirrel-cage type c)Single speed or multispeed d)Horizontal or vertical construction e)Form wound

NEMA MG-1-2011, Motors and Generators
Assists users in the proper selection and application of motors and generators. Practical information concerning performance, safety, test, construction and manufacture of ac and dc motors and generators.

NEMA (ASC C78) (National Electrical Manufacturers Association)

ANSI ANSI C78.43-2013, Single-Ended Metal Halide Lamps
This standard sets forth the physical and electrical requirements for single-ended metal halide lamps operated on 60 Hz ballasts to ensure interchangeability and safety. The data … provides the basis for the electrical requirements for ballasts and igniters, as well …lamp-related requirements for luminaires. Includes lamps whose arc tubes are made of quartz or ceramic materials. Luminous flux and lamp color are not part of this standard.

This International Standard specifies the safety requirements for double-capped fluorescent lamps for general lighting purposes of all groups having Fa6, Fa8, G5, G13, 2G13, R17q and W4.3 8.5d caps. It also specifies the method a manufacturer should use to show compliance with the requirements of this standard on the basis of whole production appraisal in association with his test records on finished products. This method can also be applied for certification purposes. Details of a batch test procedure which can be used to make limited assessment of batches are also given in this standard.

ANSI C78.1199-2016, ANSI for Electric Lamps - Single-capped fluorescent lamps - Safety Specifications
This International Standard specifies the safety requirements for single-capped fluorescent lamps for general lighting purposes of all groups having 2G7, 2GX7, GR8, 2G10, G10q, GR10q, GX10q, GY10q, 2G11, G23, GX23, G24, GX24 and GX32 caps. It also specifies the method a manufacturer should use to show compliance with the requirements of this standard on the basis of whole production appraisal in association with his test records on finished products. This method can also be applied for certification purposes. Details of a batch test procedure which can be used to make limited assessment of batches are also given in this standard.

ANSI C78.1401-2004 (R2016), Dimensions for Projection Lamps - Double-Contact, Medium Ring (Special B), Base-up Type
This standard establishes the dimensions essential to the interchangeability of lamps of the double-contact, medium ring (Special B), base-up type. It is not intended to prescribe either operating characteristics or details of design, such as the shape of the ventilation ports or the method of attachment of the prefocus ring to the base.

ANSI C78.1402-2004 (R2011), Dimensions for Projection Lamps - G17q and GX17q Based Four-pin, Prefocus, for Base-down Operation. Establishes the dimensions essential to the interchangeability of four-pin, prefocus projection lamps for base-down operation of T10 and T12 bulb sizes.
ANSI C78.1403-1997 (R2011), Tungsten Halogen Lamps with 6.35, GX6.35 and GY6.35 Bases
Covers tungsten halogen lamps with 6.35, GX6.35 and GY6.35 bases.

ANSI C78.1404-2006 (R2015), Electric Lamps - P28 Single-Contact Medium Prefocus Based Projection Lamps for Base-Down Operation - Dimensions
This standard establishes the dimensions essential to interchangeability of single-contact medium prefocus based projection lamps of T-10 and T-12 bulb sizes. It is not the intent of this standard to prescribe operating characteristics or details of design.

ANSI C78.1407-2004 (R2015), Electric Lamps - Condenser-Reflector, Four-Pin Prefocus-Base Projection Lamps - Dimensions
This standard specifies the dimensions essential to the interchangeability of condenser-reflector lamps having four-pin prefocused bases, T12 or T14 bulbs, and used in 8mm motion-picture projectors. It is not the intent of this standard to prescribe operating characteristics or details of design.

ANSI C78.1408-2004 (R2015), Electric Lamps - CBA Projection Lamp
This standard provides information on the description, ratings, restrictions, physical characteristics, dimensions, life, illumination, seal temperature, and operating temperature of a lamp that has been Lamp Code Designated as a CBA projection lamp.

ANSI C78.1420-2001 (R2011), Microfilm Projection Lamps - Two Inch (51mm), Integral Reflector, Rim-Reference TH Lamps with GX5.3 Bases
Details microfilm projection lamps; specifically, integral reflector, rim-reference TH lamps with GX5.3 bases.

ANSI C78.1430-1997 (R2016), Slide Projector Lamps, Condensing, Dichroic, Two-inch (51 mm), Integral Reflector, Rim Reference Tungsten-Halogen Lamps with GX5.3 Bases
This standard consolidates the lamps commonly used for slide projectors into a single standard. The lamps contained in this standard are not to be considered as interchangeable. Physically they will all fit the common GX5.3 sockets. The photometry of each lamp is dependent upon the system for which it was designed and on the system in which it is used. A sample system and representative photometric values are found in the Annex.

ANSI C78.1431-1997 (R2016), Slide Projector Lamps, Condensing, Dichroic, Two-inch (51 mm), Integral Reflector, Rim Reference Tungsten-Halogen Lamps with GV 5.3 Bases
This standard consolidates the lamps commonly used for slide projectors into a single standard. The lamps contained in this standard are not to be considered as interchangeable. Physically they will all fit the common socket used for these lamps. The photometry of each lamp is dependent upon the system for which it was designed and on the system in which it is used. A sample system and representative photometric values are found in the Annex.

ANSI C78.1432-1997 (R2011), Tungsten-Halogen Lamps with GZ9.5 Two-Pin Prefocus Bases and 36.5mm Nominal LCL
Covers tungsten-halogen lamps with GZ9.5 two-pin prefocus bases and 36.5-mm nominal LCL.

ANSI C78.1433-2001 (R2011), Two-inch (51mm) Dichroic Coated Integral Reflector, Rim Reference, Tungsten Halogen Large Screen Projection Lamps with GX5.3 Bases
Covers two-inch (51-mm) dichroic coated integral reflector, rim reference, tungsten-halogen large-screen projection lamps with GX5.3 bases.

ANSI C78.1434-2001 (R2011), Condensing Dichroic Coated Integral Reflector Side Pin Tungsten Halogen Projection Lamps with GX7.9 Bases
Details condensing dichroic coated integral-reflector side-pin tungsten-halogen projection lamps with GX7.9 bases.

ANSI C78.1435-2002 (R2011), Projection-Lamps - Tungsten-Halogen Lamps with G5.3 Bases
Covers projection-lamps; specifically, tungsten-halogen lamps with G5.3 bases.

Details the method for life testing of incandescent projection lamps.

ANSI C78.1451-2002 (R2011), Use of Protective Shields with Tungsten-Halogen Lamps - Cautionary Notice
Covers the cautionary notice for use of protective shields with tungsten-halogen lamps.

ANSI C78.1452-2004 (R2015), Standard for Electric Lamps - Projection Lamps - Vocabulary
This standard provides definitions for a wide range of terms used in the design, manufacturing, and application of photographic lamps. It serves as a common reference for all ANSI lamp standards in the C78.1400 series, thus reducing the number of terms that need to be defined in individual standards. With strong input from the consumer or user side, this standard covers many terms in use by the laity.

ANSI C78.1460-2004 (R2015), Single-Ended Tungsten-Halogen Lamps G29.5 Base, T6 Bulb, 36.5 mm LCL, 76.2 mm MOL with Proximity Reflector
This standard defines the dimensional, physical, and other characteristics to assist in the proper application of tungsten-halogen lamps with G29.5 bases, T6 (T19) bulbs at 36.5 mm LCL and 76.2 mm maximum overall length with internal proximity reflectors. Lamps of various wattage and voltage designs are included. The grouping of lamps in this standard is based on general physical characteristics. It does not imply that the lamps listed are interchangeable with each other in a particular application. Lamps included in this standard are intended for photographic projection applications.

ANSI C78.1501-2016, Electric Lamps - Tungsten-Halogen Lamps with G22 Bases and 63.5 mm LCL
This scope defines the dimensional limits and other physical characteristics required to ensure interchangeability and assist in the proper application of a specific category of tungsten-halogen lamps with G22 bases and 63.5 mm nominal light center length.

ANSI C78.180-2003 (R2016), Standard for electric lamps: Specifications for Fluorescent Lamp Starters
This standard is intended to cover performance of glow switch starters used with preheat-type fluorescent and similar discharge lamps. It does not include starters that are an integral part of a lamp or manually operated switches that may be used for lamp starting.

This standard sets forth physical and electrical characteristics of the group of incandescent lamps that have A, G, PS, and similar bulb shapes with E26 single and double contact medium screw bases including the reduced wattage versions. Only clear, inside frost, frost-equivalent, and white bulb finishes are acknowledged. Excluded from this standard are tungsten-halogen and projection lamps.

ANSI C78.21-2011 (R2016), Incandescent lamps: PAR and R Shapes
This standard provides physical and electrical characteristics of the group of incandescent lamps that have PAR and R bulb shapes. Lamps with clear, frosted, and lens end bulbs, with clear and prescription lenses, and with various reflector coatings are covered. Lamps covered in this standard may contain either of two basic types of light sources; an incandescent filament or a tungsten halogen inner bulb. Sunlamps and heat lamps of the R type are included. Lamps with discharge arc tubes are not included.

ANSI C78.22-1995 (R2011), A, G, PS and Similar Shapes with E39 Mogul Screw Bases
Details A, G, PS, and similar shapes with E39 mogul screw bases.
ANSI C78.23-1995 (R2011), Incandescent Lamps - Miscellaneous Types
Details miscellaneous types of incandescent lamps.

ANSI C78.260-2002 (R2011), Tubular Tungsten-Halogen Lamps, Physical Characteristics
Covers the dimensional limits and other physical characteristics required to assure the interchangeability and proper application of tubular tungsten halogen lamps.

ANSI C78.261-1997 (R2011), Specification for Tubular Incandescent Infrared Lamps
Details the specification for tubular incandescent infrared lamps.

ANSI C78.30-1997 (R2011), Procedure for Use in Preparations of Lamp Space Drawings
Describes the procedure for use in preparations of lamp space drawings.

ANSI C78.370-1997 (R2011), Method of Designation for Electric Lamps - Photographic, Stage, and Studio
Details the method of designation for photographic, stage, and studio electric lamps.

ANSI C78.370/390 Icd-2002 (R2011), Method of Designation for Electric Lamps - Photographic, Stage, and Studio
Details amendments to the method of designation for electric lamps - photographic, stage, and studio.

ANSI C78.374-2015, ANS for electric lamps: Light Emitting Diode Specification Sheet for General Illumination Applications
The purpose of this standard is to specify the standardized white light emitting diode (LED) package specification sheet, or data reporting format, as the means of communication between LED package producers and users in general illumination applications.

This standard describes the procedures to be followed and the precautions to be observed in obtaining uniform and reproducible measurements of the electrical characteristics of fluorescent lamps under standard conditions when operated on alternating current (ac) circuits. These methods are applicable both to lamps having hot cathodes -- switch-start (preheat-start), rapid-start (continuously heated cathodes), or instant-start -- and to lamps of the cold-cathode variety. The electrical characteristics usually measured are lamp current, lamp voltage, and lamp power. In the case of rapid-start lamps, the power measurements may include both the arc watts and the cathode watts. Total lamp power is the sum of arc watts and cathode watts. The methods noted in this standard apply to fluorescent lamps operated at common power-line frequencies (50 and 60 Hz) or high frequency.

ANSI C78.376-2014, ANS for electric lamps: Specifications for the Chromaticity of Fluorescent Lamps
This standard covers the objectives and tolerances for the chromaticity of T8, T10, and T12 fluorescent lamps with a nominal loading of from 5 to 10 watts per foot at their normal 100 hour rating point.

The purpose of this standard is to specify the range of chromaticities recommended for general lighting with solid state lighting (SSL) products, as well as to ensure that the white light chromaticities of the products can be communicated to consumers. This standard applies to LED lamps, LED light engines and LED luminaires for general indoor lighting applications. This document does not apply to lighting fixtures sold without a light source. This standard does not apply to SSL products for outdoor applications. This standard also does not apply to SSL products for some indoor applications that intentionally produce tinted or colored light. This document does not include OLED products.

ANSI C78.379-2006 (R2015), Electric Lamps - Classification of the Beam Pattern of Reflector Lamps
This standard describes a system for classification of beam patterns and beam angles of reflector lamps. Also a method of describing light output is defined.

ANSI C78.379a-1997 (R2011), MR and PAR Beam Designation and Tolerance
Covers MR and PAR beam designation and tolerance.

ANSI C78.380-2016, ANS for electric lamps: High-Intensity Discharge Lamps, Method of Designation
This standard describes a system for the designation of high-intensity discharge lamps, including compact, enclosed-arc discharge light sources such as mercury, metal halide, high-pressure sodium, and similar types of lamps. For convenience, low-pressure sodium lamps, although technically not high-intensity discharge lamps, are included with the group.

ANSI C78.381-1961 (S2016), Standard for Electric Lamps: Method for the Designation of Glow Lamps
This standard describes a designation system for glow lamps.

ANSI C78.385-1961 (S2016), Standard for Electric Lamps: Methods of Measurement of Glow Lamps
This standard outlines the procedures to be followed and the precautions to be observed in testing glow lamps.

ANSI C78.389-1989 (R2009), High-Intensity Discharge Lamps-Methods of Measuring Characteristics
This standard describes the procedures to be followed and the precautions to be observed in measuring the electrical characteristics of high intensity discharge lamps as specified in the American National Standard Specifications for Mercury (Hg), High-pressure Sodium (HPS) and Metal Halide (MH) Lamps.

This standard describes a system for the designation of miniature and sealed-beam lamps. A form is provided for the use of lamp manufacturers to request a designation assignment, alternative, or change.

ANSI C78.391-2004 (R2016), Characteristics of Subminiature Lamps of T1 and T1-3/4 Shapes
This standard sets forth the physical and electrical characteristics of those groups of subminiature incandescent lamps with T1 and T1-3/4 bulb shapes. Lamps with various base or termination configurations are included.

ANSI C78.40-2016, Standard - Electric Lamps: Specifications for Mercury Lamps
This standard sets forth the physical and electrical requirements for single-ended metal halide lamps operated on 60 Hz ballasts to ensure interchangeability and safety. The data given also provides the basis for the electrical requirements for ballasts as well as the lamp-related requirements for luminaires. Luminous flux and lamp color are not part of this standard.

ANSI C78.41-2016, Electric lamps: Guidelines for Low Pressure Sodium Lamps
This standard describes the physical and electrical requirements of the principal types of single-ended low pressure sodium lamps. The electrical data provides the specific basis for ballast requirements.

ANSI C78.42-2016 (R2014), Electric Lamps - High-Pressure Sodium Lamps
This standard sets forth the physical and electrical requirements for HPS lamps, to ensure performance and interchangeability. The data given also provide the basis for the electrical requirements for ballasts and igniters, as well as the lamp-related requirements for luminaires. This standard covers only single-ended HPS lamps. Lamps with internal starting devices are not covered. This standard does include &quot;improved color&quot;; HPS lamps (those lamps that have a color rendering index 60 or 60 and that operate on the same ballasts as the conventional lamps that they are intended to replace). However, color is not a standardized parameter. Luminous flux is not a standardized parameter either. This standard covers only 60 Hz operation of HPS lamps, on ballasts designed for HPS lamps.
ANSI C78.44-2016, For Electric Lamps: Double-Ended Metal Halide Lamps
Standardize the M134 LCD and revise and update the standard.

ANSI C78.45-2016, Self-balled Mercury Lamps
This standard sets forth the physical and electrical requirements for self-balled mercury lamps operated on 60 Hz supply lines to ensure interchangeability and safety. The data given also provides the lamp-related requirements for luminaires. Luminous flux and lamp color are not part of this standard.

ANSI C78.5-2003 (R2015), Specifications for Performance of Self-balled Compact Fluorescent Lamps
This standard specifies the performance requirements together with the test methods and conditions required to show compliance of self-ballasted compact fluorescent lamps up to 60 watts which are intended for domestic and similar general lighting purposes. Globe and reflector types are excluded. Such lamps shall have a rated input voltage of 120 or 127 volts at 60 Hz and an Edison screw base.

ANSI C78.50-2016, Electric Lamps - Assigned LED Lamp Codes
This standard provides physical and electrical characteristics of the group of integrally ballasted Solid State Lighting (SSL) lamps that have standardized characteristics. Lamps with clear, frosted, opaque, and lens end windows and with various reflector and/or emitting coatings are covered. Lamps covered in this standard contain LED based light sources.

ANSI C78.51-2016, Electric Lamps: LED (Light Emitting Diode) Lamps - Method of Designation
This standard describes a system for the designation of integrally ballasted Solid State Lighting (SSL) lamps that have standardized characteristics. The lamps may be connected to the branch circuit or connected to another voltage suitable for lighting applications, such as 12 V AC or DC. This document is intended to allocate lamp codes for new lamps that are not direct replacements for lamps with existing ANSI Lamp Codes or Lamp Designations. OLED lamps are not included at this time.

This standard describes a system for the designation of LED lamps that are direct replacements for existing ANSI standardized non-LED lamps. Lamps covered in this standard contain LED-based light sources. Direct replacement is defined as LED lamps that shall not require modification of existing equipment.

ANSI C78.60360-2002 (S2016), Standard for Electric Lamps - Standard Method of Measurement of Lamp Cap Temperature Rise
This International Standard describes the standard method of measurement of lamp cap temperature rise which is to be used when testing incandescent or discharge lamps for compliance with the limits. Temperature-rise limits for particular lamp types are, for example, listed in ICE 60432. It covers the method of test and the specifications for test lampholders for lamps fitted with various sizes of Edison screw (ES) and Bayonet (BC) caps. This method has been used widely for incandescent lamps but its application is not limited to that kind of lamp.

Covers USA deviations to the safety specifications for incandescent lamps, specifically, tungsten filament lamps for domestic and similar general lighting purposes.

ANSI C78.60432.2-2004 (R2011), Incandescent Lamps - Safety Specifications - Part II: Tungsten Halogen Lamps for Domestic and Similar General Lighting Purposes
This part covers USA deviations to the safety specifications for incandescent lamps, specifically: tungsten halogen lamps for domestic and similar general lighting purposes.

ANSI C78.60432.3-2007 (R2011), Incandescent Lamps - Safety Specifications - Part III: Tungsten Halogen Lamps (non vehicle)
Covers USA deviations to the safety specifications for incandescent lamps, specifically: tungsten halogen lamps (non vehicle).

ANSI C78.62035-2016, ANSI for electric lamps - Discharge Lamps (Excluding fluorescent lamps) Safety Specifications
This standard specifies the safety requirements for discharge lamps (excluding fluorescent lamps) for general lighting purposes.

ANSI C78.682-1997 (R2016), Standard for electric lamps: Standard Method of Measuring the Pinch Temperature of Quartz Tungsten-Halogen Lamps
This standard specifies details of the type of thermocouple to be used to measure the pinch temperature of quartz-tungsten-halogen lamps, the methods of preparation of the lamp and thermocouple, and the measurement to be made.

ANSI C78.79-2014, Electric Lamps - Nomenclature for Envelope Shapes Intended for use with Electric Lamps
This standard describes a system of nomenclature that provides designations for envelope shapes used for all electric lamps. These envelope shapes are intended to be used with ANSI standardized base and holder systems. The included general shapes are not associated with specific base and holder systems, they may be used with one or more of these systems.

ANSI C78.81-2016, For Electric Lamps - Double-Capped Fluorescent Lamps-Dimensional and Electrical Characteristics
This standard sets forth the physical and electrical characteristics of the principal types of FL lamps intended for application on conventional line frequency circuits, and electronic high frequency circuits. Some datasheets may specify more than one circuit application. Specifications for both the lamp itself and the interactive features of the lamp and ballast are given. Only double-based lamps of the regular linear shape are included. Single-based lamps including compact, circular, square shaped and U-shaped are found in ANSI C78.901. Lamps for conventional systems relying on auxiliary support from external ballasts are described. These lamps are those designed for 60Hz and/or high frequency operation. Lamp color is not specified herein. Certain lamp types covered in this standard may be similar to those in ICE 60081. However, additional types are included that are used only in North America and are not specified in the IEC standard.

ANSI C78.901-2016, Electric Lamps - Single-Based Fluorescent Lamps-Dimensional and Electrical Characteristics
The scope of this project is to update the Programmed Start Requirements for 3 datasheets and slightly revise Section 6 to help clarify which lamps are included in the Methods of Measurement.

ANSI C78.LL1256-2003 (R2015), Procedures for Fluorescent Lamp Sample Preparation and the Toxicity Characteristic Leaching Procedure
Procedures for preparation of fluorescent lamps for Toxicity Characteristic Leaching Procedure (TCLP) are presented below. These guidelines are intended to supplement the TCLP by supplying specific instructions for size reduction of lamps including integral electronic compact, pin-based compact, linear and U-shaped fluorescent lamps. This standard specifically covers integral electronic compact, pin-based compact, linear and U-shaped fluorescent lamp types. Additional standards have been prepared and are in preparation for high intensity discharge lamps, and other lamp types that require specific sample preparation instructions because of their design or construction. It consolidates and supersedes the following 4 NEMA standards; NEMA LL 1 â€“ 1997, Procedures For Linear Fluorescent Lamp sample Preparation And The TCLP, NEMA LL 2 â€“ 1997, Procedures For Pin-Based Compact Fluorescent Lamp Sample Preparation and the TCLP, NEMA LL 5 â€“ 1999, Procedures For U-shaped Fluorescent Lamp Sample Preparation and the TCLP, and NEMA LL 6-1996, Procedures For Integral Electronic Compact Fluorescent Lamp Sample Preparation and the TCLP. The protocol that follows is grouped to include general requirements, safety considerations, lamp preparation, leaching, filtration, storage, and leaching vessel reuse.
ANSI C78.11-2003 (R2015), Procedures for High Intensity Discharge Lamp Sample Preparation and the Toxicity Characteristic Leaching Procedure

Procedures for preparation of high-intensity discharge (HID) lamps for the Toxicity Characteristic Leaching Procedure (TCLP) are presented below. These procedures are intended to supplement the TCLP by supplying specific instructions for size reduction and for other critical procedures specific to the testing of HID lamps. This standard specifically covers high-intensity discharge lamp types.

Additional standards are in preparation or have been prepared for fluorescent lamps and for other types that require specific sample preparation instructions because of their design or construction. The protocol that follows is grouped to include general requirements, lamp preparation, leaching, filtration, storage, and leaching vessel reuse.

ANSI C78.14-2003 (R2011), Procedures for Incandescent Lamp Sample Preparation and the TCLP

Details the procedures for preparation of incandescent lamps for Toxicity Characteristic Leaching Procedure (TCLP). These procedures are intended to supplement the TCLP by supplying specific instructions for size reduction and for other critical procedures specific to the testing of incandescent lamps.

NEMA (ASC C8) (National Electrical Manufacturers Association)

ANSI C78.1-101-699-2011, Category 3 Individually Unshielded Twisted Pair Indoor Cable for Use in General Purpose Non-LAN Telecommunications Wiring Systems Technical Requirements

The purpose of this Standard is to establish generic technical requirements that may be referenced by individual telecommunications cable specifications covering thermoplastic insulated and jacketed inside wiring products intended for normal indoor premises use in the wiring systems of communication users. The parameters covered provide material, construction, performance requirements, and test procedures.

This Standard covers mechanical and electrical requirements for insulated, copper conductor wires, intended primarily for use as telecommunications central office distribution frame wire.

ANSI C78.1-115-730-2012, Standard for Multi-Dwelling Unit (MDU) Optical Fiber Cable

Multi Dwelling Unit (MDU) cables covered by this standard include two classes of cables. The first class is described by a cable used for distribution and delivery of optical fiber from a demarcation point starting at a conventional optical fiber cable, optical fiber splitter or active optical device. The second class of cable, the Rugged Indoor Drop, is described as a cable that usually terminates at the customer electronics, or Optical Network Terminal (ONT). The second cable may be stapled, routed around corners under tension, and coiled in tight diameter.

ANSI C78.1-122-744-2017, STANDARD FOR OPTICAL FIBER OUTSIDE PLANT MICRODUST CABLES

This Standard covers performance requirements for microduct optical fiber outside plant cables intended for installation in microducts, typically by blowing in using commercially available equipment intended for this application. Products covered by this Standard are intended only for operation under conditions normally found in outside plant communication systems. Typically, these products are installed in protected ducts but may also be run for short distances in both exposed areas and in concealed areas (such as handholes), with or without external protection. Due to the thinner jacket usually associated with microduct cables, they typically do not have the jacket durability to be pulled into conduit for long distances even at or below the rated tensile strength. Additionally, the impact resistance, compression resistance and tensile strength requirements for cables covered by this Standard may be significantly lower than those for conventional outside plant cables covered by ICEA-640. Therefore, installation of cables covered by this Standard by techniques such as capstan pulling, aerial lashing, trenching and direct burial is not recommended.

ANSI ICEA S-76-474-2011, Standard for Neutral-Supported Power Cable Assemblies with Weather-Resistant Extruded Insulation Rated 600 Volts

Standard applies to materials, constructions, and testing of assemblies of current carrying conductors and bare or covered neutral conductors for overhead distribution of electrical energy.

ANSI ICEA S-84-608-2017, Standard for Telecommunications Cable Filled, Polyolefin Insulated, Copper Conductor Technical Requirements

This Standard covers mechanical and electrical requirements for filled, polyolefin insulated, copper conductor telecommunications cable. It provides alternative choices for type of insulation, type of filling compound, core lay-ups, color code, sheath design (shielding materials, single or double jackets, and jacket thicknesses), and screened or non-screened core.

ANSI ICEA S-89-648-2011, Standard for Aerial Service Wire

The purpose of this Standard is to establish generic technical requirements that may be referenced by individual telecommunications wire specifications covering products intended for normal outside plant use. The parameters covered provide material, construction, and performance requirements.

The purpose of this Standard is to establish generic technical requirements that may be referenced by individual telecommunications wire specifications covering products intended for the aerial outside plant use. The parameters covered provide material, construction, and performance requirements.

ANSI/I C78.113-684-2016, PERFORMANCE BASED STANDARD FOR ELECTRIC UTILITY EXTRUDED DIELECTRIC SHIELDED POWER CABLES RATED 5 THROUGH 46 KV

This standard provides the basis for designing non-traditional shielded power cables that will be rated 5 to 46 kV and be used for the transmission and distribution of electrical energy. These non-traditional cables will normally have overall diameters that are less than the diameters of what are considered shielded power cables. Manufacturers will design their cables based on what they have determined to be the maximum acceptable electrical stress levels that will not adversely affect their cable’s performance.

ANSI/I C86A-117-734-2016, Ampacities for Single-Conductor Solid Dielectric Power Cable 15 kV through 35 kV

This publication presents calculated ampacities for single-conductor solid-dielectric 15 through 35 kV power cables with multiple bonded shields, copper or aluminum conductors, single or three phase operation, spaced or trefoil configurations, single or double circuits, directly buried, or in buried ducts. Ampacities are given for three or four different shield resistances for each conductor size.

ANSI/I C86B-32-382-2006 (R2013), Short Circuit Characteristics of Insulated Conductors

This publication discusses factors for consideration in approximating the operability of insulated and/or covered wire and cable under the influence of uninterrupted short circuit currents encountered as a result of cable or other equipment faults. The duration of such a fault is considered to be up to approximately 2 seconds. Calculation for single short circuits of longer durations yield increasingly conservative results.

ANSI/I C86C-45-482-2013, Short-Circuit Performance of Metallic Shields and Sheaths on Insulated Cable

This publication discusses factors for consideration in approximating the operability of insulated and/or covered wire and cable under the influence of uninterrupted short circuit currents encountered as a result of cable or other equipment faults. The duration of such a fault is considered to be up to approximately 2 seconds. Calculation for single short circuits of longer durations yield increasingly conservative results.
ANSI/ICEA P-45-482-2017, Short Circuit Performance of Metallic Shields and Sheaths on Insulated Cable

Equations and parameters have been established for short circuit calculations for sheaths or shields made of aluminum, bronze, copper, lead, steel, zinc and cupronickel alloys. The types of sheaths or shields included are: \( \delta \)C Wires, applied either helically, as braid or serving; or longitudinally with corrugations. \( \delta \)C Helically applied flat tape, not overlapped. \( \delta \)C Helically applied, overlapped, flat tape. \( \delta \)C Corrugated tape, longitudinally applied. \( \delta \)C Tubular sheath. The types of cable materials in contact with the sheath or shield are: crosslinked (thermoset), thermoplastic, impregnated paper, and varnished cloth. The materials which determine the maximum allowable short circuit temperatures are: paper, varnished cloth and several thermoplastic and thermosetting materials presently appearing in ICEA standards. Temperature limits, considered safe, were established for the various coverings and insulation materials. The equations may be used to determine: \( \delta \)C The maximum short circuit current permitted for a specific sheath/shield and short circuit duration. \( \delta \)C The sheath/shield size necessary to carry a specific short circuit current for a given duration. \( \delta \)C The maximum duration a specific sheath/shield can carry a specific short circuit current.

This Standards Publication covers the ampacity ratings for 600-15,000 volt solid dielectric cables installed in cable trays. Ampacity ratings are tabulated for single conductor cables, triplexed assemblies of single conductor cables, and three-conductor cables incorporating an overall jacket. Ampacities have been tabulated for the cable constructions and the operating conditions normally encountered for tray applications. Correction factors to adjust the tabulated values to better reflect specific conditions are provided. These include adjustments to account for ambient and operating temperatures, cable construction, tray covers, and diversification of the cable loading. This standard is intended primarily for use by the utility industry. It is not intended for use where compliance with the National Electrical Code or other regulations is mandatory.

ANSI/ICEA P-79-561-2008 (R2013), Guide for Selecting Aerial Cable Messengers and Lashing Wires

This guide has been prepared to facilitate the selection of messengers and lashing wires for both field and factory-assembled self-supporting aerial cables. The cables used for attachment to the messenger shall be suitable for the service and shall be manufactured and tested in accordance with the applicable ICEA Standards and installed in accordance with the applicable provisions of the National Electrical Code (NFPA-70) and/or the National Electrical Safety Code/ANSI Standards Publication No. C2. This guide does not cover all possible messenger configurations. Reference should be made to other publications for service drop and neutral supported applications.

ANSI/ICEA S-100-685-2014, Standard for Thermoplastic Insulated and Jacketed Telecommunications Station Wire for Indoor/Outdoor Use

This Standard covers station wire intended primarily for application on the premises of communications users. The wire is intended for use in transition applications requiring a combination of fire and weather resistance, such as between the point of demarcation (the network interface device/protector) and the telephone termination device within single and multi-family dwellings. Materials, construction and performance requirements are included in the Standard, together with applicable test procedures.

ANSI/ICEA S-103-701-2004 (R2011), Standard for Riser Cables Technical Requirements

The purpose of this Standard is to establish generic technical requirements that may be referenced by individual telecommunications cable specifications covering products intended for normal indoor premises use in the wiring systems of communications users. The parameters covered provide material, construction, and performance requirements.

ANSI/ICEA S-104-696-2013, Standard for Indoor-Outdoor Optical Fiber Cable

Indoor-outdoor cables covered by this Standard are generally derived from outdoor cable designs having the thermal and mechanical robustness that makes them suitable for use in the Outside Plant. Material changes are made, as required, to allow the designs to meet their intended fire rating. These cables can be expected to comply with all specification requirements stipulated in this Standard.

This standard applies to the materials, constructions, and testing of single conductor cables and assemblies of completed single conductor thermostat insulated cables, with an insulated or bare copper or an insulated aluminum neutral, used for the distribution of electrical energy at phase-to-phase voltages not exceeding 600 volts, or phase-to-ground voltage not exceeding 480 volts, 60 Hz, and at conductor temperatures not exceeding 90 °C/176°F for use in direct burial and underground ducts.

ANSI/ICEA S-106-703-2012, ICEA Standard for Broadband Aerial Service Wire

This Standard covers materials, mechanical, and electrical requirements for Broad band Aerial Service Wire (BB-ASW) of less than or equal to 12 pair, intended for use principally in extending a circuit from a broadband distribution cable terminal to a subscriber's network interface device (NID).

ANSI/ICEA S-107-704-2012, ICEA Standard for Broadband Buried Service Wire

This standard covers materials, mechanical, and electrical requirements for Broad band Buried Service Wire (BB-FSW) or less than or equal to 6 pair, intended for use principally in extending a circuit from a broadband cable terminal to a subscriber's network interface device (NID).
ANSI/ICEA S-1-20-742-2016, Hybrid Optical Fiber and Power Cable for Use in Limited Power Circuits

This Standard covers performance requirements for limited power hybrid copper and fiber communications cables intended for use in the buildings, or for short distances external to the building of communications users. The optical fiber is intended for communications use while the copper conductors are intended for limited power applications in accordance with Articles 725 and 800 of the National Electric Code (NEC) ANSI/NFPA 70.

Typically, these cables utilize conductor sizes that range from 10 AWG to 20 AWG. Generally these cables are limited to a maximum of 100 VA. However, refer to NEC document for detailed requirements.

Materials, constructions and performance requirements are included in the Standard, together with applicable test procedures. Products covered by this standard are intended only for operation under conditions normally found in communication systems. Typically, these products are installed both in exposed areas (surface mounted to walls or building baseboards or in non-stationary configurations) and in concealed areas (within walls, attics, etc.), with or without external protection (such as conduit), depending upon product type and specific use. These products normally convey communications signals (voice, video, data, etc.) from place to place within a building. Products covered by this Standard may be factory terminated with connectors or splicing modules. This standard is intended to serve as a reference to the most recent appropriate standards.

ICEA S-83-596 for optical fiber communications cables intended for indoor use, ICEA S-104-696 for optical fiber communications cables intended for indoor-outdoor use and UL13 for Power Limited Circuit Conductors are also covered.

ANSI/ICEA S-121-733-2016, Tree Wire and Messenger Supported Spacer Cable

This standard applies to the materials, constructions, and testing of tree wire and messenger supported spacer cable. These conductors are intended primarily for the distribution of electrical energy under normal conditions of overhead (aerial) installations. This standard covers both thermoplastic and crosslinked polyethylene constructions, rated for 75°C or 90°C normal service temperature. They are considered as covered conductors therefore the cables carry no voltage rating. The conductors must be installed on insulators and/or spacers adequate for the service voltage. The user may want to give consideration to the dielectric compatibility of the covering, insulator, spacer and tie wire. Wire line constructions are covered in ANSI/ICEA S-70-547 BE Standard for Weather-Resistant Polyethylene Covered Conductors. Messenger wires are covered in ANSI/ICEA P-79-561 - Guide for Selecting Aerial Cable Messengers and Lashing Wires.

SCOPE This standard contains recommendations for conductor and circuit identification of control, instrumentation and thermocouple extension cables when such identification is used.

ANSI/ICEA S-70-547-2016, Standard for Weather-Resistant Polyethylene Covered Conductors

This standard applies to the materials, construction and testing of weather-resistant polyethylene covered conductors rated at 75°C and 90°C normal service temperatures. Conductors covered under this standard are intended for the distribution of electrical energy under normal overhead (aerial) conditions and installations.

ANSI/ICEA S-75-381-2008/NEMA WC 58-2008, Portable and Power Feeder Cables for Use In Mines and Similar Applications

These standards apply to materials, construction and testing of insulated cables used for the utilization of electrical energy in surface and underground mines and similar applications. Included are portable cables for use in mining machines, dredges, shovels and similar equipment, and mine power cables for use as connections between mine distribution systems.

ANSI/ICEA S-81-570-2012, Standard for 600 Volt Rated Cables of Ruggedized Design for Direct Burial Installation As Single Conductors or Assemblies of Single Conductors

This standard applies to the materials, constructions, and testing of single conductor cables and assemblies of completed single conductor cables used for the distribution of electrical energy at phase-to-phase voltages not exceeding 600 volts or phase to ground not exceeding 480V, and at temperatures not exceeding 75°C or 90°C, as applicable to the construction. It requires the use of ruggedized extruded insulations.

ANSI/ICEA S-83-596-2011, ANSI Standard for Indoor Optical Fiber Cable

The project is a revision to the standard for indoor optical fiber cables capable of being used as parat of an indoor communication cable system. This standard brings the language, terminology, and testing up to current industry practices and helps to harmonize, where particular, with other industry standards.

ANSI/ICEA S-84-608-2010, Telecommunications - Cable-Filled, Polyolefin-Insulated, Copper Conductor - Technical Requirements

This standard covers mechanical and electrical requirements for filled, polyolefin insulated, copper conductor telecommunication cables. It provides alternative choices for type of insulation, type of filling compound, core lay-ups, color code, sheath design (shielding materials, single or double jackets, and jacket thickness), and screened or non-screened core.

ANSI/ICEA S-85-625-2016, Telecommunications Cable Aircore, Polyolefin Insulated, Copper Conductor Technical Requirements

This Standard covers mechanical and electrical requirements for aircore, polyolefin insulated, copper conductor telecommunications cable. It provides alternative choices for type of insulation, core assembly, color code, sheath design (shielding materials, single or double jackets, and jacket thickness), and screened or non-screened core.

ANSI/ICEA S-86-634-2011 (R2017), Buried Distribution & Service Wire, Filled Polyolefin Insulated Copper Conductor

This Standard covers mechanical and electrical requirements for filled, polyolefin insulated, copper conductor, buried telecommunications wire. It provides alternative choices for type of insulation, type of filling compound, sheath design (shielding materials, single or double jackets, and jacket type and thickness) and armoirng. Buried wire is used to extend buried telephone plant from the distribution cable to the subscriber.

ANSI/ICEA S-87-640-2016, Standard for Optical Fiber Outside Plant Communications Cable

This Standard covers optical fiber communications cable intended for outdoor use and normally installed aerially, directly buried, or placed in underground ducts. Additional requirements are included in Annex D for aerial self-supporting cables and in Annex E for all-dielectric self-support cables, as appropriate. Materials, constructions, and performance requirements are included in the Standard, together with applicable test procedures.

ANSI/ICEA S-90-661-2012, Standard for Category 3, 5, and 5e Individually Unshielded Twisted Pair Indoor Cables (With or Without an Overall Shield) for Use in General Purpose and LAN Communication Wiring Systems

This standard establishes generic technical requirements that may be referenced by individual telecommunications cable specifications covering products intended for normal indoor premises use in the wiring systems of communications users. The parameters covered provide material, construction, and performance requirements.

ANSI/ICEA S-94-649-2013, Standard for Concentric Neutral Cables Rated 5 Through 46 kV

These standards apply to materials, constructions, and testing of crosslinked polyethylene, tree retardant crosslinked polyethylene and ethylene propylene rubber insulated single conductor or multiplexed concentric neutral cables rated 5 to 46 kV which are used for the transmission and distribution of electrical energy.

ANSI/ICEA S-97-682-2013, Standard for Utility Shielded Power Cables Rated 5 Through 46 kV

These standards apply to materials, constructions, and testing of crosslinked polyethylene, tree retardant crosslinked polyethylene and ethylene propylene rubber insulated single conductor or multiplexed concentric neutral cables rated 5 to 46 kV which are used for the transmission and distribution of electrical energy.

ANSI/ICEA S-98-688-2012, ICEA Standard for Broadband TP Aircore, PE, CU

This standard covers mechanical and electrical requirements for aircore broadband twisted pair telecommunications cable with polyolefin insulated copper conductors.
This publication describes procedures for long term testing of extruded wire and cable insulations for service in wet (submerged) locations. It is intended to apply to insulations rated for service up to 2000 volts inclusive. Tests may be conducted on single or multiple wall insulations, using either ac or dc volatage, as applicable.

ANSI/ICEA T-24-380-2013, Standard for Partial Discharge Test Procedure
This Factory Test Procedure applies to the detection and measurement of partial discharges occurring in the following solid dielectric cables; single conductor shielded cables and assemblies and multiple conductor cables with individually shielded conductors within an outer covering.

ANSI/ICEA T-26-465/NEMA WC 54-2013, Guide For Frequency of Sampling Extruded Dielectric Power, Control, Instrumentation, and Portable Cables for Test
This guide provides a combination of plans for the frequencies at which cable samples may be obtained for tests to determine conformance to the appropriate requirements of ICEA Standards Publications. Valid statistical sampling frequencies other than those listed herein are acceptable if evidence of statistical control can be demonstrated. This guide applies only to extruded dielectric power, control, instrumentation, and portable cables.

This Standard applies to the testing of extruded dielectric insulated power, control, instrumentation, and portable cables.

This standard provides a procedure, which is suited for determining the relative degree of crosslinking of polymeric electric cable insulation.

This test method provides for qualification and production test procedures for determining the effectiveness of water blocking components incorporated into the interstices of the stranded and insulated conductor as an impediment to longitudinal water penetration into the conductor.

This test method provides for qualification and production test procedures for determining the effectiveness of non-metallic water barriers incorporated in a cable construction which are designed as an impediment to longitudinal water penetration along the cable interstices.

This test method provides procedures for establishing volume resistivity compatibility of water blocking components with extruded semiconducting shields utilized in MV, HV or EHV power cables. The compatibility test is designed to verify that the electrical properties of a semiconducting material used as a conductor or insulation shield are not adversely affected when exposed to a water blocking component. These water blocking components can be incorporated in a conductor, over a conductor, over an insulation shield, or around a metallic shield or concentric neutral. It describes a test method of demonstrating that the volume resistivity and volume resistivity stability remain within their specified limits when a semiconducting material is exposed to a water blocking component at the emergency operating temperature of the cable.

NEMA HP 3-2011, Electrical & Electronic PTFE (Polytetrafluoroethylene) Insulated High Temperature Hook-Up Wire; Types ET, (250 Volts), E (600 Volts) and EE (1000 Volts)
Covers specific requirements for PTFE (polytetrafluoroethylene) -insulated solid and stranded wire, designed for the internal wiring of high reliability electrical and electronic equipment. This Standards Publication addresses 250-volt (Type ET), 600-volt (Type E), and 1000-volt (Type EE) wire and permits continuous conductor temperature ratings of -65°C to +200°C with silver-coated conductors and -65°C to +260°C with nickel-coated conductors.

NEMA HP 4-2012, Electrical and Electronic FEP (Fluorinated Ethylene Propylene) Insulated High Temperature Hook-Up Wire, Types KT (250 Volt) and KK (1000 Volt)
This Standards Publication covers specific requirements for FEP (fluorinated ethylene propylene) insulated solid and stranded wire, designed for the internal wiring of high reliability electrical and electronic equipment. This Standards Publication addresses 250 volt (Type KT), 600 volt (Type K), and 1000 volt (Type KK) wire and permits continuous conductor temperature ratings of -65°C to +200°C with silver-coated or nickel-coated conductors and -65°C to +150°C with tin-coated conductors.

NEMA HP 5-2013, Electrical and Electronic Crosslinked, Modified Polyethylene (XLPE) Insulated, 125 C Hook-Up Wire, Types L (600 V), LL (1000 V), and LX (3000 V)
This Standards Publication covers specific requirements for crosslinked, modified polyethylene insulated solid and stranded wire, designed to the internal wiring of high reliability electrical and electronic equipment. This Standards Publication addresses 250 volt (Type S, ZHS) and 1000 volt (Type SS, ZHSS and SSB) wire and permits continuous conductor temperature ratings of -55°C to +150°C with tin-coated copper or -55°C to +200°C with silver-coated copper.

NEMA HP 8-2013, Electrical and Electronic Crosslinked, Modified Low Smoke Polyolefin (XLPO) Insulated Hook-Up Wire, Types LS (105°C & 176°C-600 V), ZHDM (90°C & 176°C-600 V), ZHDH (90°C & 176°C-600 V), ZH (125°C & 176°C-600 V), and ZHX (125°C & 176°C-1000 V)
This Standards Publication covers specific requirements for crosslinked, modified polyolefin insulated solid and stranded wire, designed to the internal wiring of high reliability electrical and electronic equipment. This Standards Publication addresses 600 volt (Type LS, ZHDM, ZHDH, ZH), and 1000 volt (Type ZH) wire and permits continuous conductor temperature ratings of -40°C to +90°C, or 105°C & 180°C, or 125°C & 180°C with either tin- or silver-coated conductors.

NEMA HP 9-2014, Electrical and Electronic Ethylene-Propylene Diene Elastomer (EPDM) Insulated Hook-Up Wire, Types EP (rated 125 C; 600 V), and EPD (rated 125 C; 5000 V)
This Standards Publication covers specific requirements for Ethylene Propylene Diene Elastomer insulated solid and stranded wire, designed to the internal wiring of high reliability electrical and electronic equipment. This Standards Publication addresses 600 volt (Type EP), and 5000 volt (Type EPD) wire and permits continuous conductor temperature ratings of -25°C to +125°C with tin-coated conductors.

NEMA IEC 5-93-639/WC 74-2012, 5-46 kV Shielded Power Cable for Use in the Transmission and Distribution of Electricity
This standard applies to materials, constructions, and testing of 5 kV to 46 kV shielded XLPE and EPR insulated wires and cables which are used for the transmission and distribution of electrical energy for normal conditions of installation and service, either indoors, outdoors, aerial, underground, or submarine.
NEMA WC 27500-2015, Standard for Aerospace and Industrial Electrical Cable
This standard contains requirements for finished cables. Component wires are covered by other referenced standards. These cables are intended for signal and low-voltage power applications with defined environment or temperature conditions found in commercial aircraft, military aircraft, and high performance vehicles.

NEMA WC 55021-2013, Standard for Military Internal Electrical Cable
This Standards Publication covers specific requirements for finished cables. The cables are intended for internal wiring of electrical equipment for use in the hook-up of various electronic assemblies. The component wires are covered by other reference standards. Cables constructed with PVC insulated wires or jackets are not to be used for aerospace applications.

NEMA WC 57/ICEA S-73-532-2014, Standard for Control, Thermocouple, Extension And Instrumentation Cable
This standard applies to materials, construction, and testing of multi-conductor cables that convey electrical signals used for monitoring or controlling electrical power systems and their associated processes.

NEMA WC 61-1992 (R2015), Transfer Impedance Testing
This standard is intended to provide a reliable surface transfer impedance test method for coaxial cables and shielded multi-conductor cables over the frequency range from DC to 100 MHz.

NEMA WC 66/ICEA S-116-732-2013, Standard for Category 6 and 6A, 100 Ohm Individually Unshielded Twisted Pairs, Indoor Cables (With or Without an Overall Shield) for Use in LAN Communication Wiring Systems
This standards publication covers the minimum performance requirements for cables up to four pairs, with transmission characteristics specified up to 250 MHz for Category 6 cables and up to 500 MHz for Category 6A cables. These Category cables are intended for voice, text, data, video and image transmission and low voltage power supply (POE & POE+). The cables are categorized by electrical transmission characteristics based on existing system requirements and projected application needs determined by IEEE 802.3.

NEMA WC 67-2015, Standard for Uninsulated Conductors Used in Electrical and Electronic Applications
This standard covers the following uninsulated conductors: Δ C Single end (solid) and stranded; Δ C coated and uncoated copper; Δ C coated copper alloy; Δ C coated copper-clad steel; Δ C aluminum conductors; and, Δ C thermocouple extension conductors. These conductors are used primarily in insulated wires for aerospace, electrical, electronic and other high performance applications.

This standard applies to materials, constructions and testing of 2001 through 5000 volt nonshielded power cables having insulations of crosslinked polyethylene (both XLPE and TR-XLPE) or crosslinked rubber (EPR) of the types shown in Section 4 of the standard. They are intended for use for the distribution of electrical energy in normal conditions of service in indoors, outdoors, aerial, underground or subsea installations.

NEMA WC 75-2015, Standard for Controlled Impedance in Internal Electrical Cable
This Standards Publication was developed to cover specific requirements for finished cables with controlled impedance twisted pair(s). This standard uniquely enables a user to specify various numbers of pairs (1 - 61) with a required impedance requirement, and tailor the materials to meet a specific end application. The cables are intended for wiring of electrical equipment.

NEMA (ASC C80) (National Electrical Manufacturers Association)

ANSI C80.1-2015, Standard for Electrically Rigid Steel Conduit
This standard covers the requirements for electrical rigid steel conduit for use as a raceway for wires or cables of an electrical system. Finished conduit is produced in nominal 10 ft (3.05 m) lengths, threaded on each end with one coupling attached. It is protected on the exterior surface with a metallic zinc coating or alternate corrosion protection coating (as specified in the 13th edition of UL 6 in Clauses 5.3.3, 6.2.4, 7.8 and 7.9) and on the interior surface with a zinc or organic coating. This standard also covers conduit couplings, elbows, nipples and conduit lengths other than 10 ft (3.05 m).

ANSI C80.3-2015, Electrical Metallic Tubing Steel (EMT-S)
This standard covers the requirements for steel metallic tubing, for use as a raceway for wires or cables of an electrical system. Finished tubing is typically furnished in nominal 10ft (3.05 m) lengths. It is protected on the exterior surface with a metallic zinc coating or alternate corrosion protection coating (see UL 797 Eighth Edition Clauses 5.3, 6.2.4, 7.5 and 7.6) and on the interior surface with a zinc or organic coating. This standard also covers electrical metallic tubing elbows.

ANSI C80.5-2015, Electrical Rigid Metal Conduit - Aluminum (ERMC - A)
This standard covers the requirements for porthole-extruded aluminum-alloy conduit for use as a raceway for the wires or cables of an electrical system. The finished conduit is produced in nominal 10 ft. (3.05 m) lengths, threaded on each end with one coupling attached. This standard also covers aluminum conduit couplings, elbows, nipples and conduit lengths other than 10 ft (3.05 m).

NEMA (ASC C81) (National Electrical Manufacturers Association)

ANSI C81.61-2017, Standard for Electrical Lamp Bases (Caps) - Specifications for Bases (Caps) for Electric Lamps
This standard sets forth the specifications for bases (caps) used on electric lamps.

ANSI C81.62-2017, Electric Lampholders
This standard sets forth the specifications for lampholders for electric lamps.

ANSI C81.63-2007 (R2014), ANSI for Gauges for Electric Lamp Bases and Lampholders
This standard sets forth the specifications for gauges for bases (caps) and lampholders for electric lamps.

ANSI C81.64-2005 (R2014), ANSI for Guidelines and General Information for Electric Lamp Bases, Lampholders and Gauges
This standard gives guidance and information to designers and testing personnel on the use of ANSI_IEC C81.61, ANSI_IEC C81.62 and ANSI_IEC C81.63 and their supplements. It includes the designation system and general information regarding bases (caps), lampholders and gauges. Many parts of this standard reference the adopted parts of IEC 60061-4 Lamp Caps and Holders Together with Gauges for Control of Interchangeability and Safety-Part 4: Guidelines and General Information. This standard is intended for use by standards engineers. In those cases where new proposals have to be prepared, so as to achieve uniformity in base/ lampholder/gauge standards and testing procedures. It contains information from ANSI and the IEC in regard to bases (caps) and holders in general use today, together with their relevant gauges. The gauges illustrated, although generally accepted in principle, are not necessarily the only form in which they can be made. This standard is applicable to bases, lampholders and gauges with the object of securing international interchangeability and safety.

NEMA (ASC C82) (National Electrical Manufacturers Association)

ANSI C82.1-2004 (R2015), Lamp Ballast - Line Frequency Fluorescent Lamp Ballast
This standard is intended to cover ballasts which have rated open circuit voltages of 2000 volts or less and are intended to operate lamps at a frequency of 50 Hz or 60 Hz. This comprises ballasts for hot cathode fluorescent lamps, either switch start (preheat start), rapid start (continuously heated cathodes), modified rapid start (cathode cutout), or instant start, and also ballasts for cold cathode fluorescent lamps, used primarily for lighting purposes, which come within this voltage range. The ballast and lamp combinations covered by this specification normally are intended for use in room ambient temperatures of 10°C to 40°C. At ambient temperatures outside this range, certain special operating characteristics may be required.
ANSI C82.11-2017, Lamp Ballasts - High Frequency Fluorescent Lamp Ballasts
This standard is intended to cover high frequency ballasts which have rated open-circuit voltages of 2000 volts or less, operate the lamp at frequencies between 10 kHz and 500 kHz, and are intended to operate at a supply frequency of 50 Hz or 60 Hz. This comprises ballasts for hot-cathode fluorescent lamps, either switch-start (preheat-start), rapid-start (continuously heated cathodes), modified rapid start, programmed start, or instant start used primarily for lighting purposes. The ballast and lamp combinations covered by this specification are normally intended for use in room ambient temperatures of 10°C to 40°C. At ambient temperatures outside this range, certain special operating characteristics may be required.

ANSI C82.13-2002 (R2010), Definitions for Fluorescent Lamps and Ballasts
Provides definitions of terms used in ANSI C78 and C82 series standards for fluorescent lamps and ballasts.

ANSI C82.14-2016, Lamp ballasts: Low-Frequency Square Wave Electronic Ballasts - for Metal Halide Lamps
This standard provides specifications for and operating characteristics of low frequency square wave electronic ballasts for metal halide lamps. Electronic ballasts are devices that use semiconductors to control lamp starting and operation. The ballasts operate from multiple supply sources of 600V maximum at a frequency of 60 hertz. The output frequency of electronic ballasts may be of some frequency other than 60 hertz. This standard only covers lamp operating current frequencies of greater than 60 hertz up to 400 hertz (some exclusionary frequency ranges may apply). An electronic square wave ballast is defined as an electronic ballast whose operating lamp current waveform is essentially a square wave with defined rise/fall times stated in the C78.43 lamp standards.

ANSI C82.16-2015, For Lighting Equipment - Light Emitting Diode Drivers - Methods of Measurement
This is a new standard to set forth and describe procedures to be followed and precautions to be taken in measuring performance of LED Drivers.

ANSI C82.17-2017, Lighting Equipment: High Frequency (HF) Electronic Ballasts for Metal Halide Lamps
This standard provides specifications for, and operating characteristics of, high frequency electronic ballasts for metal halide lamps. Electronic ballasts are devices that use semiconductors to control lamp starting and operation. The ballasts operate from multiple supply sources up to 600V maximum at a frequency of 60 hertz. This standard covers electronic ballasts with sinusoidal lamp operating current frequencies above 40 kHz.

ANSI C82.2-2002 (R2016), Standard For Lamp Ballasts - Method of Measurement of Fluorescent Lamp Ballasts
This standard outlines the procedures to be followed and the precautions to be observed in measuring and testing line frequency fluorescent lamp ballasts as specified in C82.1 with either hot-cathode or cold-cathode fluorescent lamps.

ANSI C82.3-2016, Lamp Ballasts - Reference Ballasts for Fluorescent Lamps
This standard describes the essential design features and operating characteristics of reference ballasts for fluorescent lamps. The items specified are those that have been found necessary to ensure accurate and reproducible results when either lamps or ballasts are being tested. It includes requirements for both line frequency and high frequency circuits. The specific values of rated input voltage and impedance for each size of lamp are listed in the applicable ANSI C78 lamp standard.

ANSI C82.4-2017, Standard for Lamp Ballasts - Ballasts for High-Intensity-Discharge and Low-Pressure Sodium Lamps (Multiple-Supply Type)
This standard provides specifications for and operating characteristics of ballasts for mercury, metal-halide, high-pressure sodium (HPS), and low-pressure sodium (LPS) lamps. The ballasts operate from multiple-supply sources of 600V maximum at a frequency of 60 hertz. They may be designed for operation under either indoor or outdoor conditions. The following types of ballasts are excluded from this standard: (1) Ballasts consisting of resistance only (2) Transformers for constant current (series) operation of mercury lamps (see American National Standard for Mercury Lamp Transformers - Constant Current (Series) Supply Type, ANSI C82.7-1983 (R1988) (3) All ballasts that use semiconductors to control the lamp power.

ANSI C82.5-2016, Reference Ballasts - High-Intensity-Discharge and Low-Pressure Sodium Lamps
This standard describes the essential features and operating characteristics of reference ballasts for high-intensity discharge and low-pressure sodium lamps to operate on 60-Hz sinusoidal ballast systems. The items specified are those that have been found necessary to ensure accurate and reproducible results when either lamps or ballasts are being tested. The specific values of rated input voltage and impedance needed for each size of lamp are listed in the appropriate American National Standards for high-intensity-discharge and low pressure sodium lamps, ANSI C78.1300 series (ANSI C78.40-1992, Specifications for Mercury Lamps, ANSI C78.41-2006, Guidelines for Low-Pressure Sodium Lamps, ANSI C78.42-2007, High-Pressure Sodium Lamps, ANSI C78.43-2007, Single-Ended Metal Halide Lamps, and ANSI C78.44-2006, Double-Ended Metal Halide Lamps).

ANSI C82.6-2015, Lamp Ballasts - Ballasts for High-Intensity Discharge Lamps - Methods of Measurement
Revise current ballast standard to include Methods of Measurement for low frequency square wave electronic ballasts operating metal halide lamps

ANSI C82.77-2014, ANSI for Ballasts: Harmonic Emission Limits-Related Power Quality Requirements
Supersedes the requirements for power factor (PF) and total harmonic distortion (THD) of ANSI C82.11 and ANSI C82.14. This standard specifies harmonic limits and methods of measurement for all types of lighting equipment used for general illumination (typically found in residential, commercial, and industrial applications). This standard covers lighting equipment regardless of wattage (operating input power level) or operating input current. Emission limits are only specified over a range of power or current deemed warranted at this time.

ANSI C82.77-2015, Lighting Equipment-Voltage Surge Requirements
This standard specifies voltage surge limits and testing requirements for lighting equipment. The lighting equipment covered in this standard is used for general illumination typically found in residential, commercial, and industrial applications.

ANSI C82.9-2016, ANSI for lamp ballasts: High-Intensity Discharge and Low-Pressure Sodium Lamps &™ Definitions
This standard provides definitions related to specific terms contained in HID and LPS lamps and ballast standards.

NEMA (ASC C84) (National Electrical Manufacturers Association)

ANSI C84.1-2016, Standard for Electric Power Systems and Equipment - Voltage Ratings (60 Hertz)
This standard establishes nominal voltage ratings and operating tolerances for 60-hertz electric power systems above 100 volts. It also makes recommendations to other standardizing groups with respect to voltage ratings for equipment used on power systems and for utilization devices connected to such systems. This standard includes preferred voltage ratings up to and including 1200 kV maximum system voltage, as defined in the standard. In defining minimum system voltage, voltage transients and temporary overvoltages caused by abnormal system conditions such as faults, load rejection, and the like are excluded. However, voltage transients and temporary overvoltages may affect equipment operating performance and are considered in equipment application.

NEMA (ASC W1) (National Electrical Manufacturers Association)

Safety and performance requirements for power sources applicable in welding, cutting and allied processes, and designed for industrial and professional use.
Safety and performance requirements for electrode holders applicable for welding, cutting and allied processes, and designed for industrial and professional use

ANSI/IEC 60974-12-2009, Arc Welding Equipment - Part 12: coupling devices
Safety and performance requirements for coupling devices applicable for welding, cutting and allied processes, and designed for industrial and professional use

Safety and performance requirements for cooling systems applicable for welding, cutting and allied processes, and designed for industrial and professional use

Safety and performance requirements for arc striking/stabilizing devices applicable for welding, cutting and allied processes, and designed for industrial and professional use

Safety and performance requirements for wire feeders applicable for welding, cutting and allied processes, and designed for industrial and professional use

ANSI/IEC 60974-7-2009, Arc Welding Equipment - Part 7: torches
Safety and performance requirements for torches applicable for welding, cutting and allied processes, and designed for industrial and professional use

ANSI/IEC 60974-8-2009, Arc Welding Equipment - Part 8: Gas Consoles
Safety and performance requirements for gas consoles intended to be used with combustible gases or oxygen. These gas consoles are designed to supply gases for use in arc welding, plasma cutting, gouging and allied processes in non-explosive atmospheres. The gas console can be external or internal to the power source enclosure. In the latter case, this standard also applies to the power source.

NEMA (ASC Z535) (National Electrical Manufacturers Association)
This standard sets forth the technical definitions, color standards, and color tolerances for safety colors.

ANSI Z535.2-2011, Standard for Environmental and Facility Safety Signs
Establishes requirements for a uniform visual system of identification related to potential hazards in the environment. Provides for the design, application and use of signs and placards employing this visual alerting system.

ANSI Z535.3-2011, Criteria for Safety Symbols
Provides general criteria for the design, evaluation and use of safety symbols to identify and warn against specific hazards and to provide information to avoid personal injury.

ANSI Z535.4-2011, Standard for Product Safety Signs and Labels
Sets forth performance requirements for the design, application, use and placement of safety signs and labels intended to identify potential hazards for persons using, operating, servicing or in proximity to a variety of products.

ANSI Z535.5-2011, Safety Tags and Barricade Tapes (for Temporary Hazards)
Sets forth requirements for safety tags and barricade tapes to be used to identify temporary hazards.

ANSI Z535.6-2011, Product Safety Information in Product Manuals, Instructions, and Other Collateral Materials
Sets forth requirements for the design and location of product safety messages in collateral materials for a variety of products.

NEMA (Canvas) (National Electrical Manufacturers Association)
ANSI/ICEA S-83-596-2016, Standard for Indoor Optical Fiber Cable
This standard defines optical fiber cables intended for use in the buildings of communications users. Materials, constructions and performance requirements are included in the Standard, together with applicable test procedures. Products covered by this standard are intended only for operation under conditions normally found in communication systems. Typically, these products are installed both in exposed areas (surface mounted to walls or building baseboards or in non-stationary configurations) and in concealed areas (within walls, attics, etc.), with or without external protection (such as conduit), depending upon product type and specific use. These products normally convey communications signals (voice, video, data, etc.) from place to place within a building. Products covered by this Standard may be factory terminated with connectors or splicing modules.

ANSI/ICEA S-83-596-2016, Standard for Nonmetallic Sheathed Cable, and Service Entrance Cable
This standard covers nonmetallic sheathed cable (NM) and service entrance cable applicable for residential, farm, and light industrial buildings and for Class 2 and Class III cord and Conduit Bodies for Conduit, Electrical Metallic Tubing, and fittings for use with flexible conduit and cable raceways—Rigid and Intermediate Metal Tubing, and including 1000 V 50/60 Hz AC or AC/DC.

NEMA Z535.7-2014, Standards for Cord and Conduit Bodies for Conduit, Electrical Metallic Tubing, and Fittings
This standard covers fittings for use with non-flexible tabular raceways—Rigid and Intermediate Metal Conduit, Electrical Metallic Tubing, and fittings for use with flexible conduit and cable raceways—Rigid and Intermediate Metal Tubing, and including Flexible Metal Conduit and liquidtight flexible conduits, Armored Cable, Metal Clay Cable, Tray Cable, Mineral Insulated Cable, Flexible Cord, Nonmetallic Sheathed Cable, and Service Entrance Cable

NEMA 2011, Standard for Environmental Colors
This standard sets forth the technical definitions, color standards, and color tolerances for safety colors.

NEMA 2011, Standard for Safety Colors
This standard sets forth the technical definitions, color standards, and color tolerances for safety colors.

NEMA 2011, Standard for Safety Colors
This standard sets forth the technical definitions, color standards, and color tolerances for safety colors.

NEMA 2011, Standard for Safety Colors
This standard sets forth the technical definitions, color standards, and color tolerances for safety colors.

NEMA 2011, Standard for Safety Colors
This standard sets forth the technical definitions, color standards, and color tolerances for safety colors.

NEMA 2011, Standard for Safety Colors
This standard sets forth the technical definitions, color standards, and color tolerances for safety colors.

NEMA 2011, Standard for Safety Colors
This standard sets forth the technical definitions, color standards, and color tolerances for safety colors.

NEMA 2011, Standard for Safety Colors
This standard sets forth the technical definitions, color standards, and color tolerances for safety colors.

NEMA 2011, Standard for Safety Colors
This standard sets forth the technical definitions, color standards, and color tolerances for safety colors.

NEMA 2011, Standard for Safety Colors
This standard sets forth the technical definitions, color standards, and color tolerances for safety colors.

NEMA 2011, Standard for Safety Colors
This standard sets forth the technical definitions, color standards, and color tolerances for safety colors.

NEMA 2011, Standard for Safety Colors
This standard sets forth the technical definitions, color standards, and color tolerances for safety colors.

NEMA 2011, Standard for Safety Colors
This standard sets forth the technical definitions, color standards, and color tolerances for safety colors.

NEMA 2011, Standard for Safety Colors
This standard sets forth the technical definitions, color standards, and color tolerances for safety colors.
NEMA GR 1-2007, Ground Rods and Ground Rod Couplings
This Standards Publication applies to ground rod electrodes and ground rod electrode couplings that function in accordance with the National Electrical Code? (NFPA 70-2005) and/or the National Electrical Safety Code (ANSI C2-2002). Included are materials, construction, and performance of copper bonded ground rod electrodes, zinc-coated ground rod electrodes, and stainless steel clad ground rod electrodes. This standards publication also includes information for electrode products that have been successfully used for many years but are not defined within the National Electrical Code or the National Electrical Safety Code. The items described in this Standards Publication are defined in Section 1.

NEMA KS 3-2012, Guidelines for Inspection and Preventive Maintenance of Switches Used in Commercial and Industrial Applications
Sets forth, for use by qualified personnel, a number of basic procedures that may be used for the inspection and preventive maintenance of switches used in industrial and commercial applications rated up to and including 600 V 50/60 Hz ac or ac/dc.

NEMA KS2-2013, Distribution Equipment Switch Guide, A User’s Reference
This publication covers application information for distribution equipment switches that are: a) Rated at not more than 600V and 6000A with or without a horse-power rating b) With or without provision for fuses c) With current-carrying parts and mechanisms enclosed in metallic or non-metallic cases, or that are enclosed when mounted in an enclosed switchboard, panelboard, or the like d) Manually operable by means of external handles

NEMA MW 1000-2016, Magnet Wire
MW 1000 presents in concise and convenient form all existing NEMA standards for round, rectangular, and square film-insulated and/or fibrous-covered copper and aluminum magnet wire for use in electrical apparatus. Included are the definitions, type designations, dimensions, constructions, performance, and test methods for magnet wire generally used in the winding of coils for electrical apparatus.

NEMA OS 1-2014, Sheet-Steel Outlet Boxes, Device Boxes, Covers, and Box Supports
Covers general-purpose metallic outlet and device boxes, covers and supports widely used by the consumer and designed to facilitate wire pulling, mounting of devices and connecting of conduit, cable and tubing systems.

NEMA OS 2-2014, Nonmetallic Outlet Boxes, Device Boxes, Covers, and Box Supports
Covers general-purpose nonmetallic outlet and device boxes, covers and supports widely used by the consumer and designed to facilitate wire pulling, mounting of devices and connecting of conduit, cable and tubing systems.

NEMA PB 1.1-2013, General Instructions for Proper Handling, Installation, Operation, and Maintenance of Panelboards Rated 600 Volts or less
This publication covers single panelboards or groups of panel units suitable for assembly in the form of single panelboards, including buses, and with or without switches or automatic overload protective devices (fuses or circuit breakers), or both. These units are used in the distribution of electricity at 600 volts and less with: 1600 - amperes mains or less 1200 - ampere branch circuits or less Specifically excluded are live-front panelboards, panelboards employing cast enclosures for special service conditions, and panelboards designed primarily for residential and light commercial service equipment.

NEMA PB 2.1-2013, General Instructions for Proper Handling, Installation, Operation, and Maintenance of Deadfront Distribution Switchboards Rated 600 Volts or less
This publication covers floor-mounted deadfront switchboards which consist of an enclosure, molded case and low-voltage power circuit breakers, fusible or non-fusible switches, instrument, and metering, monitoring, or control equipment, with associated interconnections and supporting structures. These units are used in the distribution of electricity at: a) 600 volts and less b. 6000 amperes or less

NEMA SB 40-2014, Communications Systems for Life Safety in Schools
This Standard covers the application, installation, location, performance, and maintenance of school emergency communications systems and their components.

The Interoperability Process Reference Manual (IPRM) defines a process by which industry stakeholders may procure, test, and assert interoperability between disparate vendors of Smart Grid products to identified standards. This is accomplished by defining the relationships between Smart Grid stakeholders invested in this goal. This Standard defines requirements and recommendations for general test policies, test suite specifications, test profiles, interoperability testing and certification authority technical programs, governance, laboratory qualifications, and (process) improvements. Finally, this Standard describes an implementation approach.

NEMA SGIC-1-2013, Smart Grid Interoperable & Conformant (SG-IC) Testing and Certification Scheme Operator Guidelines
This standard will be an implementation of the governance aspects of smart grid interoperability testing as developed in the SGIP Interoperability Process Reference Manual. The objective is to identify a single scheme to manage interoperability testing in the U.S. that will work across multiple standards (regardless of source) and electric grid domains including generation, transmission, distribution, and consumer product interoperability.

These specifications describe the systematic process of documenting, and placing into service newly installed, or retrofitted electrical power equipment and systems. This document shall be used in conjunction with the most recent edition of the ANSI/NETA ATS Standard for Acceptance Testing Specifications for Electrical Power Equipment and Systems. The individual electrical components shall be subjected to factory and field tests, as required, to validate the individual components. It is not the intent of these specifications to provide comprehensive details on the commissioning of mechanical equipment, mechanical instrumentation systems, and related components.

ANSI/NETA ETT-2015, ANSI/NETA Standard for Certification of Electrical Testing Technicians

This standard establishes minimum requirements for qualification and certification of the electrical testing technician (ETT). This standard details the minimum training and experience requirements for electrical testing technicians and provides criteria for documenting qualifications and certification. This standard details the minimum qualifications for an independent and impartial certifying body to certify electrical testing technicians.

These specifications cover the suggested field tests and inspections that are available to assess the suitability for continued service and reliability of electrical power equipment and systems. The purpose of these specifications is to assure that tested electrical equipment and systems are operational, are within applicable standards and manufacturer’s tolerances, and are suitable for continued service.

NFPA (National Fire Protection Association)

ANSI/NFPA 1-2011, Fire Code

1.1 Scope. 1.1.1 The scope includes, but is not limited to, the following: (1) Inspection of permanent and temporary buildings, processes, equipment, systems, and other fire and related life safety situations (2) Investigation of fires, explosions, hazardous materials incidents, and other related emergency incidents (3) Review of construction plans, drawings, and specifications for life safety systems, fire protection systems, access, water supplies, processes, hazardous materials, and other fire and life safety issues (4) Fire and life safety education of fire brigades, employees, responsible parties, and the general public (5) Existing occupancies and conditions, the design and construction of new buildings, remodeling of existing buildings, and additions to existing buildings (6) Design, alteration, modification, construction, maintenance, and testing of fire protection systems and equipment (7) Access requirements for fire department operations (8) Hazards from outside fires in vegetation, trash, building debris, and other materials (9) Regulation and control of special events including, but not limited to, assemblage of people, exhibits, trade shows, amusement parks, haunted houses, outdoor events, and other similar special temporary and permanent occupancies (10) Interior finish, decorations, furnishings, and other combustibles that contribute to fire spread, fire load, and smoke production (11) Storage, use, processing, handling, and on-site transportation of flammable and combustible gases, liquids, and solids (12) Storage, use, processing, handling, and on-site transportation of hazardous materials (13) Control of emergency operations and scenes (14) Conditions affecting fire fighter safety (15) Arrangement, placement, and control of on-site and supporting resources (16) Assessment of the adequacy of fire service (17) Planning, coordination, training, and exercises for fire suppression operations (18) Operational procedures (19) Planning, coordination, training, and exercises for emergency medical services operations (20) The requirements given herein are minimum. The requirements do not apply to permanently installed systems for fire extinguishment, even where portions of such systems are portable (such as hose and nozzles attached to a fixed supply of extinguishing agent)

ANSI/NFPA 10-2012, Standard for Portable Fire Extinguishers

The provisions of this standard apply to the selection, installation, inspection, maintenance, and testing of portable extinguishing equipment. Portable fire extinguishers are intended as a first line of defense to cope with fires of limited size. The selection and installation of extinguishers is independent of whether the building is equipped with automatic sprinklers, standpipe and hose, or other fixed protection equipment. (See 5.5.5, 6., 6.2.1.1, and 6.2.1.5.) The requirements given herein are minimum. The requirements do not apply to permanently installed systems for fire extinguishment, even where portions of such systems are portable (such as hose and nozzles attached to a fixed supply of extinguishing agent)

ANSI/NFPA 1000-2011, Standard for Fire Service Professional Qualifications Accreditation and Certification Systems

This standard establishes the minimum criteria for accrediting bodies; and for the assessment and validation of the process used to certify fire and related emergency response personnel to professional qualifications standards; and of nonengineering, fire-related, academic, degree-granting programs offered by institutions of higher education.

1.1* Scope. 1.1.1 Title. NFPA 101, Life Safety Code, shall be known as the Life Safety Code®, is cited as such, and shall be referred to herein as “this Code” or “the Code.” 1.1.2 Danger to Life from Fire. The Code addresses those construction, protection, and occupancy features necessary to minimize danger to life from the effects of fire, including smoke, heat, and toxic gases created during a fire. 1.1.3 Egress Facilities. The Code establishes minimum criteria for the design of egress facilities so as to allow prompt escape of occupants from buildings or, where desirable, into safe areas within buildings. 1.1.4 Other Fire-Related Considerations. The Code addresses other considerations that are essential to life safety in recognition of the fact that life safety is more than a matter of egress. The Code also addresses protective features and systems, building services, operating features, maintenance activities, and other provisions in recognition of the fact that achieving an acceptable degree of life safety depends on additional safeguards to provide adequate egress time or protection for people exposed to fire. 1.1.5* Considerations Not Related to Fire. The Code also addresses other considerations that, while important in fire conditions, provide an ongoing benefit in other conditions of use, including non-fire emergencies. 1.1.6 Areas Not Addressed. The Code does not address the following: (1)*General fire prevention or building construction features that are normally a function of fire prevention codes and building codes

This guide consists of a number of alternative approaches to life safety. Each chapter is a different system independent of the others and is to be used in conjunction with the NFPA 101, Life Safety Code.

ANSI/NFPA 102-2011, Standard for Grandstands, Folding and Telescopic Seating, Tents, and Membrane Structures

1.1 Scope. This standard addresses the following: (1) The construction, location, protection, and maintenance of grandstands and bleachers, folding and telescopic seating, tents, and membrane structures (2) Seating facilities located in the open air or within enclosed or semi-enclosed structures such as tents, membrane structures, and stadium complexes.

ANSI/NFPA 1021-2013, Standard for Fire Officer Professional Qualifications

This test shall apply to upholstered furniture mock-ups. Mock-up testing is used in assessing the relative resistance to continuing combustion of individual materials used in furniture, such as cover fabrics, filling materials, and welt tape, in realistic combinations and in an ideal geometric arrangement of the seat cushions, back, and arms of furniture items

ANSI/NFPA 1026-2013, Standard for Incident Management Personnel Professional Qualifications

This shall be a fire-test-response standard. This test method shall provide a means of measuring smoke obscuration resulting from subjecting essentially flat materials, products, or assemblies (including surface finishes) not exceeding 25 mm in thickness, to specified levels of thermal irradiance from a conical heater, in a single closed chamber, in the absence or presence of a pilot flame, and when placed in a horizontal orientation. The principal fire-test-response characteristic obtained from this test method shall be the specific optical density of smoke from the specimens tested, which is obtained as a function of time, for a period of 10 minutes. Other fire-test-response characteristics shall also be permitted to be determined. An optional fire-test-response characteristic measurable with this test method shall be the mass optical density, which is the specific optical density of smoke divided by the mass lost by the specimens during the test. This test method shall be based on ISO 5659-2, Determination of Specific Optical Density by a Single-Chamber Test, and shall provide equivalent results to ISO 5659-2. The fire-test-response characteristics obtained from this test shall be specific to the specimen tested, in the form and thickness tested, and shall not be inherent properties of the material, product, or assembly. This test method shall not provide information on the fire performance of the test specimens under fire conditions other than those conditions specified in this test method. This standard shall measure and describe the response of materials, products, or assemblies to heat and flame under controlled conditions, but shall not by itself incorporate all factors required for fire hazard or fire safety.

ANSI/NFPA 1031-2013, Standard for Professional Qualifications for Fire Inspector and Plan Examiner

This standard describes a method for determining the heat release and the smoke generation of pipe insulation assemblies mounted on steel pipes in a full-scale pipe chase.

ANSI/NFPA 1033-2013, Standard for Professional Qualifications for Fire Investigator

This standard describes a fire test method for determining the fire test response characteristics of individual fuel packages when exposed to various ignition sources. This fire test method is applicable to individual fuel packages. This fire test method is not intended to evaluate fire resistance. This standard contains detailed descriptions of three types of individual fuel packages to be investigated, as follows: (1) Single decorative object This test method shall not apply to seating furniture, mattresses, stacking chairs, interior finish, textile wall coverings, or mattress sets.

ANSI/NFPA 1035-2014, Standard for Professional Qualifications for Fire and Life Safety Educator, Public Information Officer, and Juvenile Firesetter Intervention Specialist

This standard identifies the levels of professional performance required for fire and life safety educators, public information officers (PIOs), and juvenile firesetter intervention specialists. 1.1.2 This standard specifically identifies the job performance requirements (JPRs) for a fire and life safety educator, a PIO, and a JFIS.

ANSI/NFPA 1037-2015, Standard for Professional Qualifications for Fire Marshal

This standard identifies the professional level of performance required for Fire Marshal, specifically identifying the minimum job performance requirements (JPRs) necessary to perform as a Fire Marshal.

ANSI/NFPA 1041-2011, Standard for Fire Service Instructor Professional Qualifications

1.1 Scope. This standard identifies minimum job performance requirements (JPRs) for fire service instructors

ANSI/NFPA 105-2015, Standard for the Installation of Smoke Door Assemblies and Other Opening Protective

This standard shall prescribe minimum requirements for smoke door assemblies for use in providing safety to life and protection of property from smoke.

ANSI/NFPA 1051-2015, Standard for Wildland Fire Fighter Professional Qualifications

This standard shall identify the minimum job performance requirements (JPRs) for wildland fire duties and responsibilities. A.1.1 This standard does not address prescribed fire requirements. Authorities having jurisdiction can choose to use any or all of these requirements as they deem appropriate.

ANSI/NFPA 1061-2013, Standard for Professional Qualifications for Public Safety Telecommunicator

1.1 Scope. This standard identifies the minimum job performance requirements for public safety telecommunicators.

This standard shall identify and define the minimum job performance requirements (JPRs) for a person to be considered qualified as an emergency vehicle technician (EVT) and shall apply to personnel who are engaged in the inspection, diagnosis, maintenance, repair, and testing of emergency response vehicles.

ANSI/NFPA 1081-2011, Standard for Industrial Fire Brigade Member Professional Qualifications

1.1* Scope. This standard identifies the minimum job performance requirements (JPRs) necessary to perform the duties as a member of an organized industrial fire brigade providing services at a specific facility or site.
ANSI/NFPA 1091-2014, Standard for Traffic Control Incident Management Professional Qualifications
This Committee shall have primary responsibility for documents on professional qualifications required for emergency responders in relation to their operations on roadways.

ANSI/NFPA 11-2015, Standard for Low-, Medium-, and High-Expansion Foam
This standard covers the design, installation, operation, testing, and maintenance of low-, medium-, and high-expansion foam systems for fire protection. Criteria apply to fixed, semi-fixed, or portable systems for interior and exterior hazards.

This standard covers performance requirements for emergency and standby power systems providing an alternate source of electrical power to loads in buildings and facilities in the event that the primary power source fails. Power systems covered in this standard include power sources, transfer equipment, controls, supervisory equipment, and all related electrical and mechanical auxiliary and accessory equipment needed to supply electrical power to the load terminals of the transfer equipment.

This standard shall cover performance requirements for stored electrical energy systems providing an alternate source of electrical power in buildings and facilities in the event that the normal electrical power source fails. Systems covered in this standard shall include power sources, transfer equipment, controls, supervisory equipment, and accessory equipment, including integral accessory equipment, needed to supply electrical power to the selected circuits.

ANSI/NFPA 1122-2012, Code for Model Rocketry
1.1 Scope. 1.1.1 This code shall apply to the design, construction, limitation of model rocket motors and model rocket motor reloading kits and their components, produced commercially for sale to or for use by the public for purposes of education, recreation, and sporting competition. 1.1.2 This code also shall apply to the design and construction of model rockets propelled by model rocket motors specified in 1.1.1. 1.1.3 This code also shall apply to the conduct of launch operations of model rockets specified in 1.1.2. 1.1.4 This code shall not apply to the design, construction, production, manufacture, fabrication, maintenance, launch, flight, test, operation, use, or other activity that is connected with a rocket or rocket motor where carried out or engaged in by any of the following: (1) National, state, or local government (2) Individual, firm, partnership, joint venture, corporation, or other business entity engaged as a licensed business in the research, development, production, testing, maintenance, or supply of rockets, rocket motors, rocket propellant chemicals, or rocket components or parts (3) Colleges or universities 1.1.5 This code shall not apply to the design, construction, fabrication, maintenance, production, manufacture, launch, flight, test, operation, or use of rocket-propelled model aircraft that sustain their mass against the force of gravity by aerodynamic lifting surfaces that support the aircraft during the entire duration of its flight in the air, but shall apply to the model rocket motors and their components that provide the propulsion for such model aircraft. 1.1.6 This code shall not apply to model or toy rockets propelled by compressed air, propellants, or gas. 1.1.7 This code shall apply to stored electrical energy systems.

ANSI/NFPA 1123-2013, Code for Fireworks Display
This code shall apply to the manufacture, transportation, storage, sale, and use of explosive materials. This code shall not apply to the transportation of explosive materials where under the jurisdiction of the U.S. Department of Transportation (DOT). It shall apply, however, to state and municipal supervision of compliance with “Hazardous Materials Regulations,” U.S. Department of Transportation, Title 49, Code of Federal Regulations, Parts 100-199. This code shall not apply to the transportation and use of military explosives by federal or state military agencies, nor shall it apply to the transportation and use of explosive materials by federal, state, or municipal agencies while engaged in normal or emergency performance of duties. This code shall not apply to the manufacture of explosive materials under the jurisdiction of the U.S. Department of Defense. This code also shall not apply to the distribution of explosive materials to or storage of explosive materials by military agencies of the United States, nor shall it apply to arsenals, navy yards, depots, or other establishments owned by or operated by or on behalf of the United States. This code shall not apply to pyrotechnics such as flares, fuses, and railway torpedoes. It also shall not apply to fireworks and pyrotechnic special effects as defined in NFPA 1123, Code for Fireworks Display; NFPA 1124, Code for the Manufacture, Transportation, and Storage of Fireworks and Pyrotechnic Articles; and NFPA 1126, Standard for the Use of Pyrotechnics before a Proximate Audience. This code shall not apply to model and high power rocketry as defined in NFPA 1122, Code for Model Rocketry. NFPA 1125, Code for the Manufacture of Model Rocket and High Power Rocket Motors and NFPA 1127 Code for High Power Rocket Motors

ANSI/NFPA 1125-2011, Code for the Manufacture of Model Rocket and High Power Rocket Motors
1.1 Scope. 1.1.1* This code shall apply to the manufacture of model and high power rocket motors designed, sold, and used for the purpose of propelling recoverable aero models. 1.1.2 This code shall apply to the design, construction, and reliability of model and high power rocket motors and model rocket and high power motor-reloading kits and their components, and to the limitation of propellant mass and power. 1.1.3 This code shall not apply to the sale and use of the following: (1) Model rocket motors (covered by NFPA 1122, Code for Model Rocketry) (2) High power rocket motors (covered by NFPA 1127, Code for High Power Rocketry) 1.1.4* This code shall not apply to the manufacture, transportation, and storage of fireworks. 1.1.5 This code shall not apply to the manufacture, transportation, and storage of rocket motors by the United States military or other agencies or political subdivisions of the United States. 1.1.6 This code shall not apply to the assembly of reloadable model or high power rocket motors by the user. 1.1.7 This code shall not apply to the fabrication of model rocket motors or high power rocket motors by individuals for their personal use.
ANSI/NFPA 1126-2015, Standard for the Use of Pyrotechnics Before a Proximate Audience
This standard shall provide requirements for the protection of property, operators, performers, support personnel, and the viewing audiences where pyrotechnic effects are used indoors or outdoors with a proximate audience.

ANSI/NFPA 1127-2013, Code for High Power Rocketry
Applies to the design, construction, limitation of propellant mass and power, and reliability of all high power rocket motors produced commercially for sale to and/or use by the certified user for education, recreation, and sporting competition.

ANSI/NFPA 1141-2011, Fire Protection Infrastructure for Land Development in Wildland, Rural, and Suburban Areas
1.1* Scope. This standard covers the requirements for the fire protection infrastructure in suburban and rural areas where there is an intended change of use or intended land development. A.1.1 Land use changes in suburban and rural areas often occur in areas where there might be an inadequate water supply, inadequate fire department resources, extended fire department response time, limited access, hazardous vegetation, unusual terrain, or unusual characteristics. Without the involvement of the fire department from the outset, the resulting changes could create a situation where the fire department cannot properly access structures or have the resources necessary to deal with emergencies at the property and where the occupants might not be able to escape the incident. This standard addresses the design of subdivisions and development in areas where threats of natural disasters or human-caused hazards in suburban/rural areas not addressed by other planning and development documents. Moreover, in many areas of the United States, building and fire codes may not have been adopted, in which case this standard is meant to apply.

ANSI/NFPA 1142-2011, Standard on Water Supplies for Suburban and Rural Fire Fighting
1.1 Scope. 1.1.1 This standard identifies a method for determining the minimum requirements for alternative water supplies for structural fire-fighting purposes in areas where the authority having jurisdiction determines that adequate and reliable water supply systems for fire-fighting purposes do not otherwise exist. 1.1.2 An adequate and reliable municipal-type water supply is one that is sufficient every day of the year to control and extinguish anticipated fires in the municipality, particular building, or building group served by the water supply.

ANSI/NFPA 1143-2013, Standard for Wildland Fire Management
This standard applies to purging and pressurizing for the following: (1) Electrical equipment located in areas classified as hazardous by Article 500 or Article 505 of NFPA 70 (2) Electrical equipment containing sources of flammable vapors or gases and located in either classified or unclassified areas (3) Control rooms or buildings located in areas classified as hazardous by Article 500 or Article 505 of NFPA 70 (4) Analyzer rooms containing sources of flammable vapors or gases and located in areas classified as hazardous by Article 500 or Article 505 of NFPA 70. This standard does not apply to electrical equipment located in: (1) Areas classified as Class I, Zone 0 (2) Areas classified as Class III (3) Areas where flammable liquids may be splashed or spilled on the electrical equipment.

ANSI/NFPA 1144-2013, Standard for Reducing Structure Ignition Hazards from Wildland Fire
1.1* Scope. This standard provides a methodology for assessing wildland fire ignition hazards around existing structures, residential developments, and subdivisions and improved property or planned property improvement that will be located in a wildland/urban interface area, and provides minimum requirements for new construction to reduce the potential of structure ignition from wildland fires. A.1.1 Residential developments and subdivisions are intended to include clubhouses, community meeting and activity centers, municipal buildings, offices, farm and ranch structures, and other structures within development boundaries.

ANSI/NFPA 1145-2011, Guide for the Use of Class A Foams in Manual Structural Fire Fighting
1.1.1 This document presents fundamental information for agencies planning to use Class A foam for structural fire-fighting and protection. It presents necessary and useful information on foam properties and characteristics, proportioning and discharge hardware, application techniques, and safety considerations. 1.1.2 This document describes the use and application of Class A foams that meet the requirements of NFPA 1150, Standard on Foam Chemicals for Fires in Class A Fuels. 1.1.3 This document does not apply to the use of Class A Foam in sprinkler systems or on fires involving Class B flammable or combustible liquids. 1.1.4 This document is not written for applications of Class A foam in the wildland fire environment. However, much of the material in this guide can be helpful to those who use Class A foam in wildland fire applications. See Annex B for publications that address use of Class A foam in wildland applications. 1.1.5 This document is not intended to discourage the use of future technologies and practices provided that the recommended level of safety is not lessened.

1.1 Scope. 1.1.1 This document shall provide minimum fire protection requirements for the design, manufacture, installation, and use of lasers and associated equipment. 1.1.2 Criteria for training for and responding to fire emergencies involving lasers shall be included.

ANSI/NFPA 1150-2010, Standard on Foam Chemicals for Fires in Class A Fuels
This standard specifies requirements for foam and the chemicals used to produce foam that is used to control, suppress, or prevent fires in Class A fuels.

ANSI/NFPA 1192-2011, Standard on Recreational Vehicles
1.1* Scope. This standard shall cover fire and life safety criteria for recreational vehicles.

ANSI/NFPA 1194-2013, Standard for Recreational Vehicle Parks and Campgrounds
This standard shall provide minimum construction requirements for safety and health for occupants using facilities supplied by recreational vehicle parks and campgrounds offering temporary living sites for use by recreational vehicles, recreational park trailers, and other camping units. * This standard shall not cover the design of recreational vehicles, recreational park trailers, or other forms of camping units. This standard shall not cover operational and maintenance practices for recreational vehicle parks and campgrounds.

ANSI/NFPA 12-2014, Standard on Carbon Dioxide Extinguishing Systems
1.1* Scope A.1.1 Portable carbon dioxide equipment is covered in NFPA 10. The use of carbon dioxide for inerting is covered in NFPA 69.1.1.1 This standard contains minimum requirements for carbon dioxide fire-extinguishing systems. A.1.2 This standard includes only the necessary essentials to make it workable in the hands of those skilled in this field.

This standard shall cover minimum requirements for reducing loss of life and property from fire and explosion in the following: (1) Underground bituminous coal mines (2) Coal preparation plants designed to prepare coal for shipment (3) Surface building and facilities associated with coal mining and preparation (4) Surface coal and lignite mines.

ANSI/NFPA 1201-2014, Standard for Providing Fire and Emergency Services to the Public
This standard contains requirements on the structure and operations of fire emergency service organizations (FESOs). A.1.1 Fire and emergency service organizations provide a myriad of services to the community. Public fire protection services can include, but are not limited to, fire suppression, fire prevention, public life safety education, emergency management, rescue, emergency medical service, hazardous materials response, response to other emergencies, and law enforcement (e.g., incident investigation, code application enforcement).

Because of the uniqueness and often remoteness of metal and nonmetal mines and ore processing facilities, provisions in this standard could differ from commonly accepted fire protection standards and guides devised for other types of occupancies. The provisions of this document are considered necessary to provide a reasonable level of protection from loss of life and property from fire and explosions. They reflect situations and the state of the art at the time the standard was issued.

ANSI/NFPA 1221-2015, Standard for the Installation, Maintenance, and Use of Emergency Services Communications Systems

This standard shall cover the installation, operation, and maintenance of public emergency services communications systems and facilities. This standard shall not be used as a design specification manual or an instruction manual.

ANSI/NFPA 1250-2014, Recommended Practice in Fire and Emergency Service Organization Risk Management

This recommended practice establishes minimum criteria to develop, implement, or evaluate a fire and emergency service organization (FESO) risk management program for effective risk identification, control, and financing.

ANSI/NFPA 12A-2014, Standard on Halon 1301 Fire Extinguishing Systems

This standard contains minimum requirements for total flooding Halon 1301 fire extinguishing systems. It includes only the essentials to make the standard workable in the hands of those skilled in this field. Only those skilled in this work are competent to design, install, maintain, decommission, and remove this equipment. It might be necessary for many of those charged with purchasing, inspecting, testing, approving, operating, and maintaining this equipment to consult with an experienced and competent fire protection engineer to effectively discharge their respective duties.

ANSI/NFPA 13-2015, Standard for the Installation of Sprinkler Systems

This standard provides a range of sprinkler system approaches, design development alternatives, and component options that are all acceptable. Building owners are advised to carefully evaluate proposed selections for appropriateness and preference. It shall provide requirements for the design and installation of automatic fire sprinkler systems and exposure protection sprinkler systems covered within this standard.

ANSI/NFPA 130-2013, Standard for Fixed Guideway Transit and Passenger Rail Systems

This guide applies to the design, installation, and operation of piping systems containing flammable gases, where there is a potential for ignition.

ANSI/NFPA 13D-2015, Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes

This standard shall cover the design, installation, and maintenance of automatic sprinkler systems for protection against the fire hazards in one- and two-family dwellings and manufactured homes. This standard assumes that the sprinkler system is designed to protect against a fire originating from a single ignition location.

ANSI/NFPA 13E-2014, Recommended Practice for Fire Department Operations in Properties Protected by Sprinkler and Standpipe Systems

1.1 Scope. This recommended practice provides basic procedures and information for use in fire department operations concerning properties equipped with certain fixed fire protection systems. The fixed systems covered in this recommended practice are interior automatic sprinkler systems, exterior sprinkler systems, and standpipe systems.

This standard shall cover the design and installation of automatic sprinkler systems for protection against fire hazards in residential occupancies up to and including four stories in height. This standard assumes that the sprinkler system shall be designed to protect against a fire originating from a single ignition location.

ANSI/NFPA 14-2015, Standard for the Installation of Standpipe and Hose Systems

This standard covers the minimum requirements for the installation of standpipes and hose systems.

ANSI/NFPA 140-2012, Standard on Motion Picture and Television Production Studio Soundstages, Approved Production Facilities, and Production Locations

This standard shall cover the fire protection, property protection, and life safety in motion picture and television industry soundstages, approved production facilities, and production locations. Practices, processes, materials, and facilities that are addressed by other NFPA standards shall be governed by those standards unless modified herein.

ANSI/NFPA 1401-2011, Recommended Practice for Fire Service Training Reports and Records

1.1 Scope. It is the intent of this document that fire service organizations be considered an all-inclusive term used to describe those local, municipal, state, federal, military, industrial, and private organizations with fire protection responsibilities and institutions that provide training for such organizations. 1.1.2 Fire service organizations utilizing this document for the establishment, upgrade, or evaluation of their training records and report systems should be able to document clearly the performance and ability of individual and group activities related to the following: (1) Compliance with applicable standards (2) Documentation of both internally and externally obtained career development training and education (3) Documentation for the purposes of certification and recertification (4) Cooperation with other agencies with which the organization executes joint specialty operations (e.g., emergency medical services) (5) Training required by regulatory and/or other agencies [e.g., Occupational Safety and Health Administration (OSHA), International Standards Organization (ISO)] (6) Training required to provide emergency medical care (e.g., first responder, emergency medical technician, first aid, cardiopulmonary resuscitation, automatic external defibrillations)

ANSI/NFPA 1402-2011, Guide to Building Fire Service Training Centers

1.1 Scope. This guide addresses the design and construction of facilities for fire service training. It covers the aspects that should be considered when planning a fire service training center. It should be understood that it is impractical to list every item that might be included in a training center or every type of specialty training facility that might be constructed. Therefore, the main components of a training center necessary to accomplish general fire fighter training effectively, efficiently, and safely are presented here.

ANSI/NFPA 1403-2011, Standard on Live Fire Training Evolutions

1.1 Scope. 1.1.1 This standard shall contain the minimum requirements for training all fire suppression personnel engaged in firefighting operations under live fire conditions. 1.1.2 The minimum requirements for training shall comprise a basic system that can be adapted to local conditions to serve as a standard mechanism for live fire training.

This standard shall contain minimum requirements for the training component of the Respiratory Protection Program found in NFPA 1500, Standard on Fire Department Occupational Safety and Health Program.
ANSI/NFPA 1405-2011, Guide for Land-Based Fire Departments that Respond to Marine Vessel Fires

1.1 Scope. 1.1.1 This guide identifies the elements of a comprehensive marine fire-fighting response program including, but not limited to, vessel familiarization, training considerations, pre-fire planning, and special hazards that enable land-based fire fighters to extinguish vessel fires safely and efficiently. In general, the practices recommended in this publication apply to vessels that call at United States ports or that are signatory to the Safety of Life at Sea (SOLAS) agreement. 1.1.2 This document does not consider offshore terminals or vessels on the high sea.

ANSI/NFPA 1407-2014, Standard for Training Fire Service Rapid Intervention Crews

This standard specifies the basic training procedures for fire service personnel to conduct fire fighter rapid intervention operations as specified in NFPA1710, Standard for the Organization and Deployment of Fire Suppression Operations, Emergency Medical Operations, and Special Operations to the Public by Career Fire Departments, and NFPA 1720, Standard for the Organization and Deployment of Fire Suppression Operations, Emergency Medical Operations, and Special Operations to the Public by Volunteer Fire Departments. This standard specifies basic evolutions that can be adapted to local conditions and serves as a standard mechanism for the evaluation of minimum acceptable performance during training for rapid intervention activities.

ANSI/NFPA 1408-2014, Standard on Thermal Imaging Training

This standard shall contain minimum requirements for training fire service personnel to utilize fire service thermal imagers (TI).

ANSI/NFPA 1410-2014, Standard on Training for Initial Emergency Scene Operations

This standard contains the minimum requirements for evaluating training for initial fire suppression and rescue procedures used by fire department personnel engaged in emergency scene operations. A.1.1.1 It is recognized that most successful emergency scene operations efforts involve a coordinated engine, ladder, and rescue company operation. When performing the evolutions included in this standard for the purpose of training, departments should use the number of personnel normally assigned to perform the initial operations at the scene of an emergency incident. 1.1.2 This standard specifies basic evolutions that can be adapted to local conditions and serves as a standard mechanism for the evaluation of minimum acceptable performance during training for initial fire suppression and rescue activities.

ANSI/NFPA 1451-2012, Standard for Fire and Emergency Services Vehicle Operations Training Program

This standard shall contain the minimum requirements for a fire service vehicle operations training program. This standard shall outline the development of a written fire service vehicle training program, which includes the organizational procedures for training personnel, maintaining vehicles, and identifying equipment deficiencies; design; financing; and other areas. The knowledge and skills required of safety, training, maintenance, and administrative officers charged with developing and implementing the fire service vehicle operations training program shall also be outlined within this standard.

The intent of this document is to provide fire department training officers or other fire service personnel with a guide for the establishment of a community fire safety program for dwellings.

1.1 Scope. 1.1.1 This standard provides the minimum requirements for the design, installation, and system acceptance testing of water spray fixed systems for fire protection service and the minimum requirements for the periodic testing and maintenance of high-speed water spray fixed systems. 1.1.2* Water spray fixed systems shall be specifically designed to provide for effective fire control, extinguishment, prevention, or exposure protection. 1.1.3* This standard shall not apply to water spray protection from portable nozzles, sprinkler systems, monitor nozzles, water mist suppression systems, explosion suppression, or other means of application covered by other standards of NFPA.

This standard establishes life and safety requirements for both humans and animals in all types of animal housing facilities where animals are kept for any purpose, including barns, stables, kennels, animal shelters, veterinary facilities, zoos, laboratories, and racetracks. Provisions encompass design, construction, operation, and maintenance of animal housing facilities and cover performance-based design, subclassification of facilities and categorization of animals, construction and separation requirements, means of egress, and protection from fire and special hazards. Specific chapters for Class 1, 2, and 3 facilities are provided.

ANSI/NFPA 1500-2013, Standard on Fire Department Occupational Safety and Health Program

1.1 Scope. This standard shall contain minimum requirements for a fire service–related occupational safety and health program

ANSI/NFPA 1521-2007, Standard for Fire Department Safety Officer

1.1.1 This standard contains minimum requirements for the assignment, duties, and responsibilities of a health and safety officer and an incident safety officer for a fire department or other fire service organization. 1.1.2 These requirements shall be applicable to organizations providing rescue, fire suppression, emergency medical services, hazardous materials mitigation, special operations, and other emergency services, including public, military, private, and industrial fire departments. 1.1.3 This standard does not apply to industrial fire brigades that also can be known as emergency brigades, emergency response teams, fire teams, plant emergency organizations, or mine emergency response teams.

ANSI/NFPA 1561-2013, Standard on Emergency Services Incident Management System

This standard contains the minimum requirements for an incident management system to be used by emergency services to manage all emergency incidents.

ANSI/NFPA 1581-2014, Standard on Fire Department Infection Control Program

This standard contains minimum requirements for a fire department infection control program.

ANSI/NFPA 1582-2013, Standard on Comprehensive Occupational Medical Program for Fire Departments

1.1 Scope. This standard contains descriptive requirements for a comprehensive occupational medical program for fire departments. 1.1.1* The medical requirements in this standard are applicable to fire department candidates and members whose job descriptions as defined by the authority having jurisdiction (AHJ) are outlined in NFPA1001, Standard for Fire Fighter Professional Qualifications; NFPA 1002, Standard for Fire Apparatus Driver/Operator Professional Qualifications; NFPA 1003, Standard for Airport Fire Fighter Professional Qualifications; NFPA 1006, Standard for Rescue Technician Professional Qualifications; NFPA 1021, Standard for Fire Officer Professional Qualifications; and NFPA 1051, Standard for Wildland Fire Fighter Professional Qualifications. 1.1.2 This standard provides information for physicians and other health care providers responsible for fire department occupational medical programs. 1.1.3 These requirements are applicable to public, governmental, military, private, and industrial fire department organizations providing rescue, fire suppression, emergency medical services, hazardous materials mitigation, special operations, and other emergency services. 1.1.4 This standard shall not apply to industrial fire brigades that also can be known as emergency brigades, emergency response teams, fire teams, plant emergency organizations, or mine emergency response teams.
ANSI/NFPA 1583-2014, Standard on Health-Related Fitness Programs for Fire Department Members
This standard establishes the minimum requirements for the development, implementation, and management of a health-related fitness program (HRFP) for members of the fire department involved in emergency operations. A.1.1 Although this standard is intended primarily for members involved in emergency operations, fire departments are encouraged to apply the components of the health-related fitness program to all employees.

This standard establishes the minimum criteria for developing and implementing a rehabilitation process for fire department members at incident scene operations and training exercises.

This standard contains minimum requirements for the design, installation, and maintenance of foam-water sprinkler and spray systems. These systems shall be designed with the required density for either foam or water application as the controlling factor, depending on the design purpose of the system.

ANSI/NFPA 160-2015, Standard for the Use of Flame Effects Before an Audience
This standard shall provide requirements for the protection of the audience, support personnel, performers, the operator, assistants, and property where flame effects are used.

ANSI/NFPA 1600-2015, Standard on Disaster/Emergency Management and Business Continuity Programs
This standard shall establish a common set of criteria for all hazards disaster/emergency management and business continuity programs, hereinafter referred to as “the program.”

ANSI/NFPA 1620-2014, Standard for Pre-Incident Planning
This document provides criteria for developing pre-incident plans for use by personnel responding to emergencies. Not every portion of this standard is applicable to the development of all pre-incident plans. Annex A, Explanatory Material; Annex B, Case Histories; Annex C, Special or Unique Characteristics of Occupancy Classifications; and Annex D, Sample Pre-Incident Plan Field Collection Card and Facility Data Record forms provide information to the users of this document.

ANSI/NFPA 1670-2013, Standard on Operations and Training for Technical Search and Rescue Incidents
This standard shall identify and establish levels of functional capability for conducting operations at technical search and rescue incidents while minimizing threats to rescuers. This standard was developed to define levels of preparation and operational capability that should be achieved by any authority having jurisdiction (AHJ) that has responsibility for technical rescue operations. These defined levels provide an outline of a system used to manage an incident efficiently and effectively, to maximize personnel safety, and to bring about the successful rescue of victims and the eventual termination of the event. The system should be followed to increase the capabilities of the AHJ to deal successfully with even the most complex incident. The system progresses from the simple basic awareness level to the operations level, and, finally, to the technician level. It should be understood that, as the system expands, the requirements for training, operational skills, management ability, and types and amounts of equipment also expand. * The requirements of this standard shall apply to organizations that provide response to technical search and rescue incidents, including those not regulated by governmental mandates. A. Organizations providing such rescue, fire suppression, and emergency services can include fire departments, law enforcement, emergency medical services, and utility, public works, and rescue organizations. * It is not the intent of this document to be applied to individuals and their associated skills and/or qualifications. A. While organizations can meet the requirements of this standard, individuals and their skills and qualifications are outside of the scope of this standard.

ANSI/NFPA 17-2012, Standard for Dry Chemical Extinguishing Systems
This standard includes minimum requirements for dry chemical fire-extinguishing systems that discharge dry chemical from fixed nozzles or hand hose lines by means of expellant gas.

ANSI/NFPA 170-2014, Standard for Fire Safety and Emergency Symbols
This standard presents symbols used for fire safety, emergency, and associated hazards.

This standard contains minimum requirements relating to the organization and deployment of fire suppression operations, emergency medical operations, and special operations to the public by substantially all career fire departments. The requirements address functions and objectives of fire department emergency service delivery, response capabilities, and resources.

This standard contains minimum requirements relating to the organization and deployment of fire suppression operations, emergency medical operations, and special operations to the public by volunteer and combination fire departments. The requirements address functions and outcomes of fire department emergency service delivery, response capabilities, and resources. This standard also contains minimum requirements for managing resources and systems, such as health and safety, incident management, training, communications, and pre-incident planning. This standard addresses the strategic and system issues involving the organization, operation, and deployment of a fire department and does not address tactical operations at a specific emergency incident. This standard does not address fire prevention, community education, fire investigations, support services, personnel management, and budgeting.

ANSI/NFPA 1730-2015, Standard on the Use of Extinguishing Systems
The provisions of this standard apply to the design, installation, operation, testing, and maintenance of pre-engineered wet chemical fire extinguishing systems that discharge wet chemical from fixed nozzles and piping by means of expellant gas. It contains only the essential requirements and recommendations needed to make the standard workable in the hands of those skilled in this field.

ANSI/NFPA 18-2011, Standard on Wetting Agents
1.1.1 Scope. This standard is limited to qualification tests, methods of evaluation, general rules for application, and limitations for use of wetting agents as related to fire control and extinguishment. 1.1.1.1 The method whereby the wetting agent is added to water is not herein specifically set forth. The solution can be premixed in tanks or can result from bringing the wetting agent into contact with water by any suitable proportioning device, providing, however, said device shall be approved in accordance with applicable standards.
ANSI/NFPA 1801-2012, Standard on Thermal Imagers for the Fire Service

1.1 Scope. 1.1.1 This standard shall specify the design, performance, testing, and certification requirements for thermal imagers used by fire service personnel during emergency incident operations.

1.1.2 This standard shall specify requirements for new thermal imagers used by fire service personnel. 1.1.3 This standard shall not specify requirements for thermal imagers manufactured prior to the effective date of this standard. 1.1.4 This standard shall not specify requirements for thermal imagers manufactured to any other standards or other requirements. 1.1.5 This standard shall not specify requirements for any accessories and enhancements that could be attached to the certified product but that are not necessary for the certified product to meet the requirements of this standard. 1.1.6 This standard shall not be construed as addressing all of the safety concerns associated with the use of compliant thermal imagers. It shall be the responsibility of the persons and organizations that use compliant thermal imagers to establish safety and health practices and to determine the applicability of regulatory limitations prior to use.

1.1.7 This standard shall not be construed as addressing all of the safety concerns, if any, associated with the use of this standard by testing facilities. It shall be the responsibility of the persons and organizations that use this standard to establish safety and health practices and to determine the applicability of regulatory limitations prior to use of this standard for designing, manufacturing, and testing. 1.1.8 Nothing herein shall restrict any jurisdiction or manufacturer from exceeding these minimum requirements.

ANSI/NFPA 1801-2013, Standard on Selection, Care, and Maintenance of Protective Ensembles for Structural Fire Fighting and Proximity Fire Fighting

This standard specifies the minimum selection, care, and maintenance requirements for structural fire fighting protective ensembles and the individual ensemble elements that include garments, helmets, gloves, footwear, and interface components that are compliant with NFPA 1971, Standard on Protective Ensembles for Structural Fire Fighting and Proximity Fire Fighting. This standard also shall specify the minimum selection, care, and maintenance requirements for proximity fire fighting protective ensembles and the individual ensemble elements that include garments, helmets, gloves, footwear, and interface components that are compliant with NFPA 1971, Standard on Protective Ensembles for Structural Fire Fighting and Proximity Fire Fighting. This standard also shall specify requirements for both structural fire fighting and proximity fire fighting protective ensembles, ensemble elements, clothing, and equipment certified as compliant with previous editions of NFPA 1971, Standard on Protective Ensembles for Structural Fire Fighting and Proximity Fire Fighting; NFPA 1972, Standard on Helmets for Structural Fire Fighting; NFPA 1973, Standard on Gloves for Structural Fire Fighting; NFPA 1974, Standard on Protective Footwear for Structural Fire Fighting; or NFPA 1976, Standard on Protective Ensembles for Proximity Fire Fighting. This standard also shall specify the minimum selection, care, and maintenance requirements for structural fire fighting protective ensembles with optional CBRN protection and for proximity fire fighting protective ensembles with optional CBRN protection. This standard shall not specify requirements for other organizational programs such as appropriate use of structural fire apparatus and SCBA/supplied air respirator (SAR) that are used for respiratory protection during emergency operations in environments where the atmosphere is Immediately Dangerous to Life and Health (IDLH), or could become oxygen deficient or IDLH. This standard shall specify the requirements for SCBA models as detailed in Section 1.3 of this chapter. For fire departments, this standard shall specify the requirements for the SCBA selection, care, and maintenance component of the respiratory protection program required in Section 7.9 of NFPA 1500, Standard on Fire Department Occupational Safety and Health Program. This standard shall not specify requirements for any closed-circuit SCBA. This standard shall not specify requirements for other respiratory protection program components of the organization such as SCBA training, appropriate use of SCBA for operations, and breathing air quality as these program components are under the jurisdiction of other NFPA standards. This standard shall not specify requirements for accessories attached to the SCBA unless specifically addressed herein. Nothing herein shall restrict any jurisdiction from exceeding these minimum requirements.

ANSI/NFPA 1852-2012, Standard on Selection, Care, and Maintenance of Open-Circuit Self-Contained Breathing Apparatus (SCBA)

This standard specifies minimum requirements for the selection, care, and maintenance of open-circuit self-contained breathing apparatus (SCBA) and combination SCBA/supplied air respirator (SAR) that are used for respiratory protection during emergency operations in environments where the atmosphere is Immediately Dangerous to Life and Health (IDLH), or could become oxygen deficient or IDLH. This standard shall specify the requirements for SCBA models as detailed in Section 1.3 of this chapter. For fire departments, this standard shall specify the requirements for the SCBA selection, care, and maintenance component of the respiratory protection program required in Section 7.9 of NFPA 1500, Standard on Fire Department Occupational Safety and Health Program. This standard shall not specify requirements for any closed-circuit SCBA. This standard shall not specify requirements for other respiratory protection program components of the organization such as SCBA training, appropriate use of SCBA for operations, and breathing air quality as these program components are under the jurisdiction of other NFPA standards. This standard shall not specify requirements for accessories attached to the SCBA unless specifically addressed herein. Nothing herein shall restrict any jurisdiction from exceeding these minimum requirements.

ANSI/NFPA 1851-2012, Standard for Selection, Care, and Maintenance of Protective Ensembles for Technical Rescue Incidents

This standard specifies the minimum selection, care, and maintenance requirements for utility technical rescue protective, rescue and recovery technical rescue, and chemicals, biological agents, and radiological particulate [also known as chemical, biological, radiological, and nuclear (CBRN) technical rescue] ensembles and the individual ensemble elements that include garments, helmets, gloves, footwear, and interface components that are compliant with NFPA 1951, Standard on Protective Ensembles for Technical Rescue Incidents. This standard shall also specify requirements for USAR operation protective ensembles, ensemble elements, clothing, and equipment certified as compliant with the previous edition of NFPA 1951, Standard on Protective Ensemble for USAR Operations.

ANSI/NFPA 1852A-2011, Standard on Water Additives for Fire Control and Vapor Mitigation

1.1 Scope. This standard provides the minimum requirements for water additives used for the control and/or suppression of fire and mitigation of flammable vapors.

ANSI/NFPA 1901-2015, Standard for Automotive Fire Apparatus

This standard defines the requirements for new automotive fire apparatus and trailers designed to be used under emergency conditions to transport personnel and equipment and to support the suppression of fires and mitigation of other hazardous situations.

ANSI/NFPA 1906-2015, Standard for Wildland Fire Apparatus

This standard defines the minimum requirements for the design, performance, and testing of new automotive fire apparatus that are designed primarily to support wildland fire suppression operations. This standard is designed to cover new automotive fire apparatus primarily used to fight wildland fires at both on-road and off-road locations. To a limited degree, these apparatus can be used to protect exposures or fight structure fires from the exterior.

ANSI/NFPA 1911-2011, Standard for the Inspection, Maintenance, Testing, and Retirement of In-Service Automotive Fire Apparatus

1.1 Scope. 1.1.1 This standard defines the minimum requirements for establishing an inspection, maintenance, and testing program for in-service fire apparatus. 1.1.2 This standard includes guidelines for fire apparatus refurbishment and retirement. 1.1.3 This standard identifies the systems and items on a fire apparatus that are to be inspected and maintained, the frequency of such inspections and maintenance, and the requirements and procedures for conducting performance tests on components. 1.1.4 This standard provides sample forms for collecting inspection and test data.
ANSI/NFPA 1912-2015, Standard for Fire Apparatus Refurbishing
This standard specifies the minimum requirements for the refurbishing of automatic fire apparatus utilized for fire fighting and rescue operations, whether the refurbishing is done at the fire department or municipal maintenance facilities, or at the facilities of private contractors or apparatus manufacturers.

ANSI/NFPA 1917-2015, Standard for Automotive Ambulances
This standard defines the requirements for new automotive ambulances designed to be used under emergency conditions to provide medical treatment and transportation of sick or injured people to appropriate medical facilities.

ANSI/NFPA 1925-2012, Standard on Marine Fire-Fighting Vessels
This standard shall provide minimum requirements for marine fire-fighting vessels. This standard shall also provide minimum maintenance and testing requirements.

ANSI/NFPA 1931-2010, Standard for Manufacturer’s Design of Fire Department Ground Ladders
1.1.1 This standard specifies the requirements for the design of fire department ground ladders and for the design verification tests that are to be conducted by the ground ladder manufacturer. 1.1.2 The tests specified herein are the responsibility of the ladder manufacturer only and are not to be performed by fire departments.

ANSI/NFPA 1932-2010, Standard on Use, Maintenance, and Service Testing of In-Service Fire Department Ground Ladders
This standard specifies requirements for the use, maintenance, inspection, and service testing of fire department ground ladders.

ANSI/NFPA 1936-2014, Standard on Powered Rescue Tools
This standard shall specify the minimum requirements for the design, performance, testing, and product conformance verification of powered rescue tools and components. This standard shall specify the requirements for spreader, ram, cutter, and combination powered rescue tools. This standard shall also specify the requirements for cable assemblies, hose assemblies, and power unit components for powered rescue tools.

1.1 Scope. 1.1.1 This standard shall specify the minimum design, performance, testing, and certification requirements for utility technical rescue, rescue and recovery technical rescue, and chemicals, biological agents, and radiological particulate [also known as chemical, biological, radiological, and nuclear (CBRN) technical rescue] protective ensembles for use by emergency services personnel during technical rescue incidents. 1.1.2 This standard shall also specify the minimum requirements for the various elements of the utility technical rescue ensembles and the rescue and recovery technical rescue protective ensembles, including garments, helmets, gloves, footwear, interface, and eye and face protection devices. 1.1.3* This standard shall also specify the minimum requirements for the respiratory protection for the CBRN technical rescue protective ensembles. 1.1.4 This standard shall not specify requirements for respiratory protection equipment for technical rescue utility and technical rescue and recovery protective ensembles; those requirements are specified by NIOSH in 42 CFR 84, and by OSHA in 29 CFR 1910.134. 1.1.5 This standard shall establish criteria for water or wilderness operations. 1.1.6* This standard shall not specify requirements for any visibility markings. 1.1.7 This standard shall establish criteria for protection from ionizing radiation. 1.1.8 This standard shall not establish criteria for protection for any fire-fighting or hazardous materials emergencies. 1.1.9* This standard shall not specify requirements for accessories that could be attached to any ensemble or ensemble element but are not required for the ensemble or element to meet the performance of this standard. 1.1.10 Certification of Ensembles for Technical Rescue Incidents

Some performance criteria in this standard were based on the U.S. Fire Administration Study, “Protective Clothing and Equipment Needs of Emergency Responders for Urban Search and Rescue Missions.” This report documents the protective clothing and equipment needs for emergency responders engaged in surface water activities. Input was obtained from an emergency responder user requirements committee and resulted in proposed criteria based on a needs and risk analysis. The report contains survey results and test data for a number of materials.

ANSI/NFPA 1953-2015, Standard on Protective Ensembles for Contaminated Water Diving
This standard shall specify the minimum design, performance, testing, and certification requirements for protective clothing and equipment items, including dry suit, dry suit gloves and dry suit footwear designed to provide limited protection from physical, environmental and certain chemical and biological hazards that are listed herein for emergency services personnel during contaminated water dive operations.

ANSI/NFPA 1961-2012, Standard on Fire Hose
1.1 Scope. This standard shall define the design and construction requirements for new fire hose, the testing required to verify the design and construction, and the inspection and testing required of all new fire hose.

This standard shall apply to the inspection, care, and use of fire hose, fire hose couplings, and fire-fighting nozzles; the service testing of fire hose; and the associated record-keeping.

This standard shall apply to the inspection, care, and use of fire hose, fire hose couplings, and fire-fighting nozzles; the service testing of fire hose; and the associated record-keeping.

ANSI/NFPA 1963-2013, Standard for Fire Hose Connections
This standard gives the performance requirements for new fire hose couplings and adapters with nominal sizes from 3/4 in. (19 mm) through 8 in. (200 mm) and the specifications for the mating surfaces. A.1.1 Some fire-fighting organizations use small hose less than 3/4 in. (19 mm) nominal diameter fitted with garden hose couplings. Such couplings should have 0.75-11.5 NH (garden hose thread) threads conforming to ANSI/ASME B1.20.7, Standard on Hose Coupling Screw Threads.

This standard covers the requirements for new adjustable-pattern spray nozzles intended for general fire-fighting use, for marine and offshore platform fire-fighting use, or for use with fire hoses affixed to standpipe systems.

This standard shall cover the requirements for fire hose appliances up to and including 150 mm (6 in.) nominal dimension designed for connection to fire hose, fire apparatus, and fire hydrants and intended for general fire service use in controlling or conveying water.
ANSI/NFPA 1971-2013, Standard on Protective Ensembles for Structural Fire Fighting and Proximity Fire Fighting

1.1 Scope. 1.1.1 This standard shall specify the minimum design, performance, testing, and certification requirements for structural fire fighting protective ensembles and ensemble elements that include coats, trousers, coveralls, helmets, gloves, footwear, and interface components. 1.1.2 This standard shall specify the minimum design, performance, testing, and certification requirements for proximity fire fighting protective ensembles and ensemble elements that include coats, trousers, coveralls, helmets, gloves, footwear, and interface components. 1.1.3* This standard shall also specify additional optional requirements for structural fire fighting protective ensembles and proximity fire fighting protective ensembles that will provide limited protection from specified chemicals, biological agents, and radiological particulates (CBRN) terrorism agents. 1.1.3.1* This standard shall establish requirements for a single exposure wearing of protective ensembles for limited protection from specified CBRN terrorism agents. 1.1.4 This standard shall specify requirements for new structural fire fighting protective ensembles, new proximity fire fighting protective ensembles, or new elements for both ensembles. 1.1.5* This standard shall not specify requirements for any accessories that could be attached to the certified product, but are not necessary for the certification of the product to meet the requirements of this standard. 1.1.6 Other than for the certification of structural or proximity protective ensembles to the optional CBRN requirements, this standard shall not specify the respiratory protection that is necessary for proper protection with both protective ensembles. 1.1.7 Certification of compliant equipment.

ANSI/NFPA 1975-2013, Standard on Station/Work Uniforms for Emergency Services

This standard shall specify requirements for the design, performance, testing, and certification of nonprimary protective station/work uniforms and the individual garments comprising station/work uniforms. This standard shall also specify requirements for the thermal stability of textiles used in the construction of station/work uniforms. This standard shall also specify optional requirements for flame resistant textiles where such textiles are specified or claimed to be used in construction of station/work uniforms. This standard shall not specify requirements for clothing that is intended to provide primary protection from given hazard exposures.

ANSI/NFPA 1981-2012, Standard on Open-Circuit Self-Contained Breathing Apparatus (SCBA) for Emergency Services

This standard shall specify the minimum requirements for the design, performance, testing, and certification of new compressed breathing air open-circuit self-contained breathing apparatus (SCBA) and compressed breathing air combination open-circuit self-contained breathing apparatus and supplied air respirators (SCBA/SARs) for the replacement parts, components, and accessories for these respirators. This standard shall also specify the minimum requirements for the design, performance, testing, and certification of replacement parts, components, and add-on accessories for SCBA and combination SCBA/SAR certified as compliant to specific earlier editions of this standard. This standard shall not specify requirements for other types of SCBA. * This standard shall not specify requirements for any accessories that could be attached to the certified product that are not certified by the National Institute for Occupational Safety and Health (NIOSH). This standard shall not establish criteria for SCBA for water or underwater operations. This standard shall not establish criteria for protection from ionizing radiation. This standard shall not be construed as addressing all of the safety concerns associated with the use of compliant SCBA and combination SCBA/SARs. It shall be the responsibility of the persons and organizations that use compliant SCBA and combination SCBA/SARs to establish safety and health practices and to determine the applicability of regulatory limitations prior to use. This standard shall not be construed as addressing all of the safety concerns, if any, associated with the use of this standard by testing facilities. It shall be the responsibility of the persons and organizations that use compliant SCBA and combination SCBA/SARs to establish safety and health practices and to determine the applicability of regulatory limitations prior to use. 1.1.8 This standard shall not be construed as addressing all of the safety concerns, if any, associated with the use of this standard by testing facilities. It shall be the responsibility of the persons and organizations that use compliant SCBA and combination SCBA/SARs to establish safety and health practices and to determine the applicability of regulatory limitations prior to use.

This standard shall specify minimum requirements for the design, performance, testing, and certification for all Personal Alert Safety Systems (PASS) for emergency services personnel. This standard shall specify the requirements for all new PASS, including but not limited to stand-alone PASS and integrated PASS. This standard shall not specify requirements for any PASS manufactured to previous editions of this standard. * This standard shall not specify requirements for any accessories that could be attached to the certified product but that are not necessary for the certified product to meet the requirements of this standard. This standard shall not be construed as addressing all the safety concerns associated with the use of compliant PASS. It shall be the responsibility of the persons and organizations that use compliant PASS to establish safety and health practices and to determine the applicability of regulatory limitations prior to use. This standard shall not be construed as addressing all the safety concerns, if any, associated with the use of this standard by testing facilities. It shall be the responsibility of the persons and organizations that use this standard to conduct testing of PASS to establish safety and health practices and to determine the applicability of regulatory limitations prior to using this standard for any designing, manufacturing, and testing. Nothing herein is intended to restrict any jurisdiction or manufacturer from exceeding these minimum requirements.

1.1 Scope. 1.1.1 This standard shall specify minimum design, performance, testing, and certifications requirements for life safety rope, escape rope, water rescue throwlines, life safety harnesses, belts, and auxiliary equipment for emergency services personnel. 1.1.2 This standard shall specify requirements for new life safety rope, escape rope, water rescue throwlines, life safety harnesses, belts, and auxiliary equipment. 1.1.3 This standard shall not specify requirements for any accessories that could be attached to the certified product, but are not necessary for the certified product to meet the requirements of this standard. 1.1.4 This standard shall not specify requirements for any utility rope. 1.1.5 This standard shall not specify requirements for any rope or associated equipment designed for mountain rescue, cave rescue, lead climbing operations, or where expected hazards and situations dictate other performance requirements. 1.1.6* This standard shall not specify requirements for any rope or equipment for fall protection pertaining to employees of general industry or the construction and demolition industry. 1.1.7 This standard shall not be construed as addressing all of the safety concerns associated with the use of compliant life safety rope or associated equipment. It shall be the responsibility of the persons and organizations that use compliant life safety rope or associated equipment to establish safety and health practices and determine the applicability of regulatory limitations prior to use. 1.1.8 This standard shall not be construed as addressing all of the safety concerns, if any, associated with the use of this standard by testing facilities. It shall be the responsibility of the persons and organizations that use compliant life safety rope or associated equipment to establish safety and health practices and determine the applicability of regulatory limitations prior to use.

1.1 This standard shall specify the minimum design, performance, testing, and certification requirements for respirators to provide protection from inhalation hazards for personnel conducting wildland fire fighting operations. 1.1.2 This standard shall specify respirator requirements only for use in non-IDLH (Immediate Dangerous to Life and Health) wildland environments during wildland fire fighting operations.

This standard shall specify the minimum requirements for breathing air quality for fire and emergency services organizations that use atmosphere-supplying respirators. This standard shall specify the requirements for the breathing air quality component of the respiratory protection program required by NFPA 1500, Standard on Fire Department Occupational Safety and Health Program. This standard shall not specify requirements for air quality for any other applications. This standard shall not specify requirements for medical-grade oxygen. This standard shall not be construed as addressing all of the safety concerns, if any, associated with its use. It shall be the responsibility of the persons and organizations that use this standard to establish safety and health practices and determine the applicability of regulatory limitations prior to use of this standard. Nothing herein shall restrict any jurisdiction or breathing air provider from exceeding these minimum requirements.

This standard shall specify minimum design, performance, certification, and documentation requirements; and test methods for vapor‐protective ensembles and individual elements for chemical vapor protection; and additional optional criteria for chemical flash fire escape protection and liquefied gas protection.

1.1.1* This standard shall specify minimum design, performance, certification, and documentation requirements; test methods for liquid splash‐protective ensembles and liquid splash‐protective clothing; and additional optional criteria for chemical flash fire protection. 1.1.2 This standard shall apply to the design, manufacturing, and certification of new liquid splash‐protective ensembles or new liquid splash‐protective clothing items. This edition of this standard shall not apply to liquid splash‐protective ensembles or liquid splash‐protective clothing items manufactured to previous editions of NFPA 1992, Standard on Liquid Splash‐Protective Suits for Hazardous Chemical Emergencies (former title). 1.1.3 This standard shall not apply to protection from chemical or biological warfare agents or from chemical or biological terrorism incidents. Such protection shall be provided by vapor‐protective ensembles that are also compliant with the additional optional criteria for chemical and biological terrorism vapor‐protective ensembles as specified in NFPA 1991, Standard on Vapor‐Protective Ensembles for Hazardous Materials Emergencies. 1.1.4* This standard shall not apply to protective ensembles or clothing for hazardous materials emergencies involving known or suspected carcinogens, hazardous materials with known skin toxicity, or hazardous material vapor atmospheres. 1.1.5 This standard shall not apply to protective ensembles or clothing for any fire‐fighting applications and shall not provide criteria for protection from radiological, biological, liquefied gas, or cryogenic liquid hazards, or against explosive vapor atmospheres. 1.1.6 This standard shall not apply to the respiratory protection that is specified by NFPA 1991, Standard on Breathing Air Quality for Emergency Services Respiratory Protection.

ANSI/NFPA 1994-2011, Standard on Protective Ensembles for First Responders to CBRN Terrorism Incidents

1.1 Scope. 1.1.1 This standard shall establish the minimum requirements for the design, performance, testing, documentation, and certification of protective ensembles and ensemble elements for protection from chemicals, biological agents, and radiological particulates (CBRN) terrorism agents. 1.1.2* This standard shall establish requirements for protective ensembles and ensemble elements that are worn for a single exposure at incidents involving CBRN terrorism agents. 1.1.3 This standard shall establish requirements for new CBRN protective ensembles and ensemble elements. 1.1.4* This standard shall not establish requirements for respiratory protection for incidents involving CBRN terrorism agents. Appropriate respiratory protection for the incidents involving specific CBRN terrorism agent exposure is a critical part of overall protection and shall be specified and provided by the authority having jurisdiction. 1.1.5 This standard shall not establish requirements for any fire‐fighting applications. 1.1.6* This standard shall not establish requirements for protection at incidents involving ionizing radiation, liquefied gas, cryogenic liquid hazards, explosives, or explosive atmospheres. 1.1.7* CBRN protective ensembles and ensemble elements that are certified as compliant with NFPA1994 shall be permitted also to be certified to NFPA1991, Standard on Vapor‐Protective Ensembles for Hazardous Materials Emergencies, NFPA1992, Standard on Liquid Splash‐Protective Ensembles and Clothing for Hazardous Materials Emergencies, and the single‐use requirements of NFPA 1999, Standard on Protective Clothing for Emergency Medical Operations. 1.1.8 This standard shall not apply to ionizing radiation.
This standard shall specify the minimum documentation, design, performance, testing, and certification requirements for new single-use and new multiple-use emergency medical protective clothing, including garments, gloves, footwear, and face protection devices, used by fire and emergency services personnel during emergency medical operations. * This standard shall not be interpreted as providing criteria for protection from radiological agents, from hazardous chemicals, from flammable or explosive atmospheres, or from thermal hazards associated with fire fighting. * This standard shall not be interpreted as providing criteria for protection from blood and body fluid-borne pathogens that are airborne. This standard shall not be interpreted as providing criteria for respiratory protection. This standard shall not be interpreted as providing criteria for protection from chemical and biological terrorism agents. Certification of emergency medical garments, emergency medical examination gloves, emergency medical work gloves, emergency medical footwear, emergency medical footwear covers, or emergency medical face protection devices, or cleaning gloves to the requirements of this standard shall not preclude certification to additional appropriate standards where the garments, gloves, footwear, or face protection devices meet all applicable requirements of each standard. This standard shall not be construed as addressing all of the safety concerns, if any, associated with its use. It shall be the responsibility of the persons and organizations that use this standard to establish safety and health practices and determine the applicability of regulatory limitations prior to use of this standard. * Alcoholic beverages shall not be consumed.

ANSI/NFPA 2-2015, Hydrogen Technologies Code
The purpose of this code shall be to provide fundamental safeguards for the generation, installation, storage, piping, use, and handling of hydrogen in compressed gas (GH2) form or cryogenic liquid (LH2) form. This code shall apply to the production, storage, transfer, and use of hydrogen in all occupancies.

This standard deals with the selection and installation of pumps supplying liquid for private fire protection. This document shall include liquid supplies; suction, discharge, and auxiliary equipment; power supplies, including power supply arrangements; electric drive and control; diesel engine drive and control; steam turbine drive and control; and acceptance tests and operation.

ANSI/NFPA 2001-2014, Standard on Clean Agent Fire Extinguishing Systems
This standard contains minimum requirements for total flooding and local application clean agent fire extinguishing systems. It does not cover fire extinguishing systems that use carbon dioxide or water as the primary extinguishing media, which are addressed by other NFPA documents.

This standard contains the requirements for the design, installation, operation, testing, and maintenance of condensed and dispersed aerosol fire-extinguishing systems for total flooding applications. * This standard also covers performance requirements and methods of testing for condensed aerosol systems, dispersed aerosol systems, and associated components.

ANSI/NFPA 204-2014, Standard for Smoke and Heat Venting
This standard shall apply to the design of venting systems for the emergency venting of products of combustion from fires in buildings. The provisions of Chapters 4 through 10 shall apply to the design of venting systems for the emergency venting of products of combustion from fires in nonsprinklered, single-story buildings using both hand calculations and computer-based solution methods as provided in Chapter 9. Chapter 11 shall apply to venting in sprinkered buildings.

This standard applies to the design, installation, maintenance, and inspection of all chimneys, fireplaces, venting systems, and solid fuel-burning appliances.

ANSI/NFPA 2112-2012, Standard on Flame-Resistant Garments for Protection of Industrial Personnel Against Flash Fire
1.1 Scope. The standard shall specify the minimum performance requirements and test methods for flame-resistant fabrics and components and the design and certification requirements for garments for use in areas at risk from flash fires.

ANSI/NFPA 2113-2011, Standard on Selection, Care, Use, and Maintenance of Flame-Resistant Garments for Protection of Industrial Personnel Against Flash Fire
1.1 Scope. * This standard shall specify the minimum selection, care, use, and maintenance requirements for flame-resistant garments for use in areas at risk from flash fires by industrial personnel that are compliant with NFPA 2112, Standard on Flame-Resistant Garments for Protection of Industrial Personnel Against Flash Fire. * This standard shall not apply to protective clothing for wildland fire fighting, technical rescue, structural fire fighting, proximity fire fighting, or any other fire-fighting operations, or hazardous materials emergencies.

ANSI/NFPA 2114-2015, Standard on Water-Cooling Towers
This standard applies to fire protection for field erected and factory-assembled water-cooling towers of combustible construction or those in which the fill is of combustible material.

ANSI/NFPA 22-2012, Standard for Water Tanks for Private Fire Protection
This standard provides the minimum requirements for the design, construction, installation, and maintenance of tanks and accessory equipment that supply water for private fire protection, including the following: (1) Gravity tanks, suction tanks, pressure tanks, and embankment-supported coated fabric suction tanks (2) Towers (3) Foundations (4) Pipe connections and fittings (5) Valve enclosures (6) Tank filling (7) Protection against freezing

ANSI/NFPA 220-2011, Standard on Types of Building Construction
1.1 Scope. This standard defines types of building construction based on the combustibility and the fire resistance rating of a building's structural elements. Fire walls, nonbearing exterior walls, nonbearing interior partitions, fire barrier walls, shaft enclosures, and openings in walls, partitions, floors, and roofs are not related to the types of building construction and are regulated by other standards and codes, where appropriate.

ANSI/NFPA 221-2011, Standard for High Challenge Fire Walls, Fire Walls, and Fire Barrier Walls
1.1 Scope. This standard specifies requirements for the design and construction of high challenge fire walls, fire walls, and fire barrier walls including protection of openings and penetrations.

ANSI/NFPA 225-2012, Model Manufactured Home Installation Standard
This model standard shall cover the installation of manufactured homes wherever sited in the United States and its territories. The manufacturer's installation instructions shall apply under either of the following conditions: (1) To items not covered by this standard (2) Where the manufacturer's approved installation instructions provide a specific method of performing a specific operation or assembly A.1.1 Utilization of this standard by the homeowner and installation crew and use of a registered professional engineer in those unusual circumstances as required by this standard will help ensure the homeowner of a well-built, safe, and affordable home. This standard contains instructions, including specifications and procedures, for installation of utility connections of a manufactured home. It has been written in an objective manner so that it can be understood by those who are trained in the installation of manufactured homes and who are properly licensed. It discusses the installation of the home from preparation of the site through final inspection. It includes many tables and figures giving important data for proper installation.
ANSI/NFPA 232-2012, Standard for the Protection of Records

1.1 Scope. 1.1.1 This standard provides requirements for records protection equipment and facilities and records-handling techniques that provide protection of records in a variety of media forms from the hazards of fire. 1.1.2 This standard does not consider forcible entry. 1.1.3 This standard covers the following categories of records storage environments in ascending order of risk tolerance: (1) Vaults (2) Archives (3) File rooms (4) Compartmented records centers (5) Records centers

ANSI/NFPA 25-2013, Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems

This document establishes the minimum requirements for the periodic inspection, testing, and maintenance of water-based fire protection systems, including land-based and marine applications.

ANSI/NFPA 252-2011, Standard Methods of Fire Tests of Door Assemblies

1.1 Scope. This standard prescribes standardized fire and hose stream test procedures that apply to fire door assemblies intended to be used to retard the spread of fire through door openings in fire-resistant walls.

1.1 Scope. 1.1.1 This test method is intended to provide a means for assessing the lethal toxic potency of combustion products produced from a material or product ignited when exposed to a radiant flux. 1.1.2 This test method has been designed to generate toxic potency data on materials and products (including composites) for use in fire hazard analysis. It is also permitted to be used to assist in the research and development of materials and products. 1.1.3 Lethal toxic potency values associated with 30-minute exposures are predicted using calculations that employ combustion atmospheric analytical data for carbon monoxide, carbon dioxide, oxygen (vitiation), and, if present, hydrogen cyanide, hydrogen chloride, carbon monoxide, carbon dioxide, oxygen (vitiation), and hydrogen bromide. The calculation method is therefore limited to those materials and products whose smoke toxicity can be attributed to those toxicants. 1.1.4 Specimens are exposed to a radiant heating flux with an electric spark ignition. 1.1.5 Specimens tested are representative of finished products, including composite and combination systems. 1.1.6 This standard is not intended to address all safety issues associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and to determine the applicability of regulatory limitations (especially with regard to the institutional care and use of experimental test animals) prior to use. (For specific hazard requirements, see Section 6.1.)

This shall be a fire-test-response standard. This test method shall provide a means of measuring smoke obscuration resulting from subjecting essentially flat materials, products, or assemblies (including surface finishes) not exceeding 25 mm in thickness, to specified levels of thermal irradiance from a conical heater, in a single closed chamber, in the absence or presence of a pilot flame, and when placed in a horizontal orientation. The principal fire-test-response characteristic obtained from this test method shall be the specific optical density of smoke from the specimens tested, which is obtained as a function of time, for a period of 10 minutes. Other fire-test-response characteristics shall also be permitted to be determined. An optional fire-test-response characteristic measurable with this test method shall be the mass optical density, which is the specific optical density of smoke divided by the mass lost by the specimens during the test. This test method shall be based on ISO 5659-2, Determination of Specific Optical Density by a Single-Chamber Test, and shall provide equivalent results to ISO 5659-2. The fire-test-response characteristics obtained from this test shall be specific to the specimen tested, in the form and thickness tested, and shall not be inherent properties of the material, product, or assembly. * This test method shall not provide information on the fire performance of the test specimens under fire conditions other than those conditions specified in this test method. This standard shall measure and describe the response of materials, products, or assemblies to heat and flame under controlled conditions, but shall not by itself incorporate all factors required for fire hazard or fire performance.

1.1.1* This test method measures the response of materials exposed to controlled levels of radiant heating, with or without an external igniter. 1.1.2 This test method determines the ignitibility, heat release rate, mass loss rates, effective heat of combustion, and visible smoke development of materials and products. 1.1.3* This test method tests the specimen in the horizontal orientation.

This standard describes a method for determining the heat release and the smoke generation of pipe insulation assemblies mounted on steel pipes in a full-scale pipe chase.

1.1 Scope. 1.1.1* This method of fire tests for a thermal barrier for foam plastic insulation (herein referred to as thermal barrier) is applicable to building construction materials, products, or assemblies intended to be used to protect foam plastic insulation from direct fire exposure. 1.1.2 The performance of the thermal barrier is evaluated by its ability to limit the temperature rise on its unexposed surface and by the ability of the thermal barrier to remain intact in order to provide protection from ignition of the foam plastic insulation during a standard fire exposure.

ANSI/NFPA 276-2014, Standard Method of Fire Tests for Determining the Heat Release Rate of Roofing Assemblies with Combustible Above-Deck Roofing Components

This standard describes a method for determining the heat release rate from below the deck of roofing assemblies that have combustible above-deck roofing components when the assemblies are exposed to a fire from below the roof deck. 1.1.2 The performance of the above-deck roofing assembly is evaluated by determining the heat release rate below the deck of the roof test specimen.

This test provides a method of determining the flammability characteristics of exterior, non-load-bearing wall assemblies/panels. The test method described is intended to evaluate the inclusion of combustible components within wall assemblies/panels of buildings that are required to be of non-combustible construction. It is intended to simulate the tested wall assemblies’ fire performance.

This standard describes a method for determining the contribution of interior finish materials to room fire growth during specified fire exposure conditions.
ANSI/NFPA 306-2013, Standard for the Control of Gas Hazards on Vessels

This standard applies to the design, location, installation, maintenance, and use of devices and systems that vent the combustion gases and pressures resulting from a deflagration within an enclosure so that structural and mechanical damage is minimized.

This standard shall provide general principles for the construction and fire protection of marine terminals, piers, and wharves. Nothing in this standard shall supersede any of the regulations of governmental or other regulatory authority. The provisions of this standard shall reflect situations and state-of-the-art techniques at the time the standard was issued.

This code is recommended for use as the basis for legal regulations. Its provisions are intended to reduce the hazards of motor fuels to a degree consistent with reasonable public safety, without undue interference with public convenience and necessity. This code shall apply to motor fuel dispensing facilities; marine/motor fuel dispensing facilities; and motor fuel dispensing facilities located inside buildings, at fleet vehicle motor fuel facilities, and at farms and isolated construction sites.

ANSI/NFPA 30B-2014, Code for the Manufacture and Storage of Aerosol Products

This code shall apply to the manufacture, storage, and display of aerosol products. This code shall not apply to post-consumer processing of aerosol containers. This code shall not apply to containers that do not meet the definition of Aerosol Container. Metal containers that contain a product that meets the definitions in 3.3.1 and 3.3.3, but are larger than 1000 ml (33.8 fl oz) shall not be classified as aerosol products, and this code shall not apply to the manufacture, storage, and display of such containers.

ANSI/NFPA 31-2015, Standard for the Installation of Oil-Burning Equipment

This standard shall apply to the installation of stationary liquid fuel–burning appliances, including but not limited to industrial-, commercial-, and residential-type steam, hot water, or warm air heating appliances; domestic-type range burners; space heaters; and portable liquid fuel–burning equipment

This standard shall apply to vessels during the course of construction, conversion, repairs, or while laid up. It shall not apply to situations where it is in conflict with or superseded by requirements of any government regulatory agency.

ANSI/NFPA 318-2011, Standard for the Protection of Semiconductor Fabrication Facilities

1.1 Scope. This standard applies to semiconductor fabrication facilities and comparable fabrication processes, including research and development areas in which hazardous chemicals are used, stored, and handled and containing what is herein defined as a cleanroom or clean zone, or both.

ANSI/NFPA 32-2015, Standard for Drycleaning Plants

This standard shall apply to establishments hereinafter defined as drycleaning plants.

ANSI/NFPA 326-2014, Standard for the Safeguarding of Tanks and Containers for Entry, Cleaning, or Repair

This standard shall apply to the safeguarding of tanks or containers operating at nominal atmospheric pressure that contain or have contained flammable or combustible liquids or other hazardous substances and related vapors or residues.

ANSI/NFPA 329-2014, Recommended Practice for Handling Releases of Flammable and Combustible Liquids and Gases

This recommended practice provides methods for responding to fire and explosion hazards resulting from the release of a flammable or combustible liquid, gas, or vapor that can migrate to a subsurface structure. 1.1.2 Although this recommended practice is intended to address only fire and explosion hazards, other authorities should be consulted regarding the environmental and health impacts and other hazardous conditions of such releases.

ANSI/NFPA 33-2015, Standard for Spray Application Using Flammable or Combustible Materials

This standard shall apply to the spray application of flammable or combustible materials either continuously or intermittently by any of the following methods: Compressed air atomization; Airless or hydraulic atomization, Electrostatic application methods, Other means of atomized application. This standard shall also apply to the application of flammable or combustible materials either continuously or intermittently by any of the following methods: Fluidized bed application methods, Electrostatic fluidized bed application methods Other means of fluidized application

ANSI/NFPA 34-2014, Standard for Dipping, Coating, and Printing Processes Using Flammable or Combustible Liquids

This standard shall apply to dipping, roll coating, flow coating, curtain coating, printing, cleaning, and similar processes, hereinafter referred to as coating processes or processes, in which articles or materials are passed through tanks, vats, or containers, or passed over rollers, drums, or other process equipment that contain flammable or combustible liquids.

ANSI/NFPA 35-2015, Standard on Halon 1301 Fire Extinguishing Systems

This standard shall apply to facilities that use flammable and combustible liquids, as herein defined, to manufacture organic coatings for automotive, industrial, institutional, household, marine, printing, transportation, and other applications.

This guide is intended to protect workers who enter into confined spaces for inspection or testing or to perform associated work from death and from life-threatening and other injuries or illnesses and to protect facilities, equipment, non–confined space personnel, and the public from injuries associated with confined space incidents.

ANSI/NFPA 36-2012, Standard for Solvent Extraction Plants

This standard shall apply to the commercial scale extraction processing of animal and vegetable oils and fats by the use of Class I flammable hydrocarbon liquids, hereinafter referred to as “solvents.” A. Extraction processes that use flammable liquids but are not within the scope of NFPA 36 might be within the scope of NFPA 30, Flammable and Combustible Liquids Code, and the user is referred to that document for guidance. (See Chapter 3 for definitions of terms, including “extraction process” and “solvent.”) This standard shall also apply to any equipment and buildings that are located within 30 m (100 ft) of the extraction process. This standard shall also apply to the unloading, storage, and handling of solvents, regardless of distance from the extraction process. This standard shall also apply to the means by which material to be extracted is conveyed from the preparation process to the extraction process. This standard shall also apply to preparation and meal finishing processes that are connected by conveyor to the extraction process, regardless of intervening distance. * This standard shall not apply to the storage of raw materials or finished products. A. See NFPA 61, Standard for the Prevention of Fires and Dust Explosions in Agricultural and Food Processing Facilities. This standard shall not apply to extraction processes that use liquids that are miscible with water. This standard shall not apply to extraction processes that use flammable gases, liquefied petroleum gases, or nonflammable gases. 0 This standard shall prohibit the use of processes that would produce flammable or nonflammable gases, or liquids, that would be flammable when in intimate mixture with air. This standard shall prohibit the use of processes that would produce flammable or nonflammable gases, or liquids, that would be flammable when in intimate mixture with air.

ANSI/NFPA 37-2014, Standard for the Installation and Use of Stationary Combustion Engines and Gas Turbines

This standard establishes criteria for minimizing the hazards of fire during the installation and operation of stationary combustion engines and gas turbines.
ANSI/NFPA 385-2011, Standard for Tank Vehicles for Flammable and Combustible Liquids

1.1 Scope. 1.1.1* This standard shall apply to tank vehicles used for the transportation of asphalt or normally stable flammable and combustible liquids with flash points below 200°F (93°C). 1.1.2 This standard shall also provide minimum requirements for the design and construction of cargo tanks and their appurtenances and shall set forth certain matters pertaining to tank vehicles. 1.1.3 The provisions of this standard shall not preclude the use of additional safeguards for tank vehicles used for the transportation of flammable and combustible liquids having characteristics that introduce additional factors such as high rates of expansion, instability, corrosiveness, and toxicity. 1.1.4 The provisions of this standard shall also apply to cutback asphalts that have flash points below 100°F (37.8°C) and to liquids transported at temperatures elevated above their flash points. 1.1.5 The requirements for aircraft fuel servicing tank vehicles shall be in accordance with NFPA 407, Standard for Aircraft Fuel Servicing. 1.1.6 A tank vehicle transporting a flammable or combustible liquid in interstate service shall be considered to be in compliance with this standard while it is in interstate service if it meets the requirements of the U.S. Department of Transportation 49 CFR 171–179, “Hazardous Materials Regulations.”

ANSI/NFPA 40-2015, Standard for the Storage and Handling of Cellulose Nitrate Film

This standard shall apply to all facilities that are involved with the storage and handling of cellulose nitrate based film. 1.1.2 This standard shall not apply to the storage and handling of film having a base other than cellulose nitrate.

The Code’s fire and life safety requirements are applicable to a wide range of substances including but not limited to ammonium nitrate solids and liquids, corrosive solids and liquids, flammable solids, organic peroxide formulations, oxidizers, pyrophoric solids and liquids, toxic and highly toxic solids and liquids, unstable (reactive) solids and liquids, water-reactive solids and liquids. Compressed gases and cryogenic fluids are included within the context of NFPA 5.
1.1 The special fire protection required when handling explosive materials (See NFPA 495, Explosive Materials Code.) shall not cover the following: (1) The special fire protection required when handling explosive materials, including scrap, that exhibit combustion characteristics of aluminum, alkali metals, magnesium, tantalum, titanium, or zirconium shall be subject to the requirements of the metal whose combustion characteristics they most closely match.

1.1.2 Operations where metal or metal alloys are subjected to processing or finishing operations that produce combustible powder or dust. 1.1.2.2 Operations where metal or metal alloys are subjected to processing or finishing operations that produce combustible powder or dust shall include, but shall not be limited to, machining, sawing, grinding, buffing, and polishing.

1.1.3 Metals, metal alloy parts, and those materials, including scrap, that exhibit combustion characteristics of alkali metals, aluminum, magnesium, niobium, tantalum, titanium, or zirconium are subject to the requirements of the metal whose combustion characteristics most closely match. 1.1.4 Metals and metal alloy parts and those materials, including scrap, that do not exhibit combustion characteristics of alkali metals, aluminum, magnesium, niobium, tantalum, titanium, or zirconium are subject to the requirements of Chapter 10.

1.1.5 This standard shall not apply to the transportation of metals in any form on public highways and waterways or by air or rail. 1.1.6 This standard shall not apply to the primary production of aluminum, magnesium, and lithium. 1.1.7 This standard shall apply to laboratories that handle, use, or store more than 1/2 lb of alkali metals or 2 lb aggregate of other combustible metals, excluding alkali metals.

1.1.8 This standard does not apply to engines and engine accessories or to engine test facilities where fuels other than hydrocarbon fuels are used.

1.1 Scope. This guide describes the elements of an airport/community emergency plan that require consideration before, during, and after an emergency has occurred. The scope of the airport/community emergency plan should include command, communication, and coordination functions for executing the Plan. Throughout this document, the airport/community emergency plan will be referred to as the “Plan.”

1.1.1 This standard shall apply to laboratory buildings, laboratory units, and laboratory work areas whether located above or below grade in which chemicals, as defined, are handled or stored. This standard contains requirements, but not all-inclusive requirements, for handling and storage of chemicals where laboratory-scale operations are conducted and shall not cover the following: (1) The special fire protection required when handling explosive materials (See NFPA 495, Explosive Materials Code.) (2) The special fire protection required when handling radioactive materials.

ANSI/NFPA 450-2012, Guide for Emergency Medical Services and Systems

1.1 Scope. This document is designed to assist individuals, agencies, organizations, or systems as well as those interested or involved in emergency medical services (EMS) system design.

1.1 Scope. 1.1.1 This standard shall identify the minimum levels of competence required by responders to emergencies involving hazardous materials/weapons of mass destruction (WMD).

1.1.2 This standard shall apply to any individual or member of any organization who responds to hazardous materials/WMD incidents. 1.1.3 This standard shall cover the competencies for awareness level personnel, operations level responders, hazardous materials technicians, incident commanders, hazardous materials officers, hazardous materials safety officers, and other specialist employees. A.1.1.1 Outside the United States, hazardous materials might be called dangerous goods (see Annex H). Weapons of mass destruction (WMD) are known by many different abbreviations and acronyms, including CBRNE (chemical, biological, radiological, nuclear, explosive), B-NICE (biological, nuclear, incendiary, chemical, explosive), COBRA (chemical, ordinance, biological, radiological agents), and NBC (nuclear, biological, chemical).

1.1 Scope. This standard identifies the levels of competence required of emergency medical services (EMS) personnel who respond to incidents involving hazardous materials or weapons of mass destruction (WMD). It specifically covers the requirements for basic life support and advanced life support personnel in the pre-hospital setting. 1.1.1 This standard is based on the premise that all EMS responders are trained to meet at least the core competencies of the operations level responders as defined in Chapter 5 of NFPA 472. Standard for Competence of Responders to Hazardous Materials/Weapons of Mass Destruction Incidents.
This code shall apply to the manufacture, transportation, storage, sale, and use of explosive materials. This code shall not apply to the transportation of explosive materials where under the jurisdiction of the U.S. Department of Transportation (DOT). It shall apply, however, to state and municipal supervision of compliance with “Hazardous Materials Regulations,” U.S. Department of Transportation, Title 49, Code of Federal Regulations, Parts 100-199. This code shall not apply to the transportation and use of military explosives by federal or state military agencies, nor shall it apply to the transportation and use of explosive materials by federal, state, or municipal agencies while engaged in normal or emergency performance of duties. This code shall not apply to the manufacture of explosive materials under the jurisdiction of the U.S. Department of Defense. This code also shall not apply to the distribution of explosive materials to or storage of explosive materials by military agencies of the United States, nor shall it apply to arsenals, navy yards, depots, or other establishments owned by or operated by or on behalf of the United States. This code shall not apply to pyrotechnics such as flares, fuses, and railway torpedoes. It also shall not apply to fireworks and pyrotechnic special effects as defined in NFPA 1123, Code for Fireworks Display; NFPA 1124, Code for the Manufacture, Transportation, and Storage of Fireworks and Pyrotechnic Articles; and NFPA 1126, Standard for the Use of Pyrotechnics before a Proximate Audience. This code shall not apply to model and high power rocketry as defined in NFPA 1122, Code for Model Rocketry; NFPA 1125, Code for the Manufacture of Model Rocket and High Speed Model Solid-propellant Rocket Motor Cases; and NFPA 1137, Standard for the Use of Pyrotechnics before a Proximate Audience.

ANSI/NFPA 496-2012, Standard for Purged and Pressurized Enclosures for Electrical Equipment
This standard applies to purging and pressurizing for the following: (1) Electrical equipment located in areas classified as hazardous by Article 500 or Article 505 of NFPA 70; (2) Electrical equipment containing sources of flammable vapors or gases and located in either classified or unclassified areas; (3) Control rooms or buildings located in areas classified as hazardous by Article 500 or Article 505 of NFPA 70; (4) Analyzer rooms containing sources of flammable vapors or gases and located in areas classified as hazardous by Article 500 or Article 505 of NFPA 70.

ANSI/NFPA 497-2011, Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas
1.1 Scope. 1.1.1 This recommended practice applies to those locations where flammable gases or vapors, flammable liquids, or combustible liquids are processed or handled, and where their release into the atmosphere could result in their ignition by electrical systems or equipment. 1.1.2 This recommended practice provides information on specific flammable gases and vapors, flammable liquids, and combustible liquids whose relevant combustion properties have been sufficiently identified to allow their classification into the groups established by NFPA 70, National Electrical Code (NEC), for proper selection of electrical equipment in hazardous (classified) locations. The tables of selected combustible materials contained in this document are not intended to be all-inclusive. 1.1.3 This recommended practice applies to chemical process areas. As used in this document, a chemical process area could be a large, integrated chemical process plant or it could be a part of such a plant. It could be a part of a manufacturing facility where flammable gases or vapors, flammable liquids, or combustible liquids are produced or used in chemical reactions, or are handled or used in certain unit operations such as mixing, filtration, coating, spraying, and distillation. 1.1.4 This recommended practice does not address situations that could involve catastrophic failure of or catastrophic discharge from process vessels, pipelines, tanks, or systems. 1.1.5 This recommended practice does not address the unique hazards associated with explosives, pyrotechnics, blasting agents, pyrophoric materials, or oxygen-enriched atmospheres that might be present.

ANSI/NFPA 498-2012, Standard for Safe Havens and Interchange Lots for Vehicles Transporting Explosives
This standard shall apply to safe havens that are used for the parking of vehicles transporting explosives and to explosives interchange lots that are safe areas where less-than-truckloads of explosives shall be permitted to be held for transfer from one vehicle to another for continuance in transportation. All vehicles covered by this standard shall be required to be engaged in the transportation of explosives and shall carry shipping papers to show that the explosives being transported are properly described, classified, identified, packaged, and labeled in accordance with regulations of the U.S. Department of Transportation. Additionally, all vehicles shall be required to be marked and placarded in accordance with regulations of the U.S. Department of Transportation. This standard shall apply to the design and operating features of explosives motor vehicle facilities related to the prevention of fire, theft, and explosion. * This standard shall not apply to motor freight terminals for vehicles handling general freight. The requirements of NFPA 513, Standard for Motor Freight Terminals, shall apply to explosives motor vehicle facilities where they are applicable and are not covered by this standard.

ANSI/NFPA 499-2013, Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas
1.1 Scope. 1.1.1 This recommended practice applies to those locations where combustible dusts are produced, processed, or handled, and where dust released into the atmosphere or accumulated on surfaces could be ignited by electrical systems or equipment. 1.1.2 This recommended practice provides information on specific combustible dusts whose relevant combustion properties have been sufficiently identified to allow their classification into the groups established by NFPA 70, National Electrical Code (NEC), for proper selection of electrical equipment in hazardous (classified) locations. The tables of selected combustible materials contained in this document are not intended to be all-inclusive. 1.1.3 This recommended practice also applies to chemical process areas. As used in this document, a chemical process area could be a chemical process plant, or it could be a part of such a plant. A chemical process area could be a part of a manufacturing facility where combustible dusts are produced or used in chemical reactions, or are handled or used in operations such as mixing, coating, extrusion, conveying, drying, and/or grinding. 1.1.4 This recommended practice does not apply to agricultural grain-handling facilities except where powdered grain is used in a chemical reaction or mixture. 1.1.5 This recommended practice does not apply to situations that could involve catastrophic failure of, or catastrophic discharge from, silos, process vessels, pipelines, tanks, hoppers, or conveying or elevating systems. 1.1.6 This recommended practice does not address the unique hazards associated with explosives, pyrotechnics, blasting agents, pyrophoric materials, or oxygen-enriched atmospheres that might be present.

1.1 General. The Code addresses those construction, protection, and occupancy features necessary to minimize danger to life and property. 1.1.2 Code Title. The provisions of this document shall constitute and be known as NFPA 500, Building Construction and Safety Code, hereinafter referred to as “this Code” or “the Code.”

ANSI/NFPA 501-2012, Standard on Manufactured Housing
This standard shall cover all the equipment and installations used in the design, construction, transportation, fire safety, plumbing, heat-producing, and electrical systems of manufactured homes that are designed to be used as dwelling units. This standard shall, to the maximum extent possible, establish performance requirements. In certain instances, however, the use of specific requirements is necessary.

This standard shall cover fire safety requirements for the installation of manufactured homes and manufactured home sites, including accessory buildings, structures, and communities.
ANSI/NFPA 502-2013, Standard for Road Tunnels, Bridges, and Other Limited Access Highways

This edition of NFPA 211 contains provisions for chimneys, fireplaces, venting systems, and solid fuel–burning appliances, including their installation. The standard applies to residential as well as commercial and industrial installations.

ANSI/NFPA 505-2012, Fire Safety Standard for Powered Industrial Trucks Including Type Designations, Areas of Use, Conversions, Maintenance, and Operations

This standard shall apply to fork trucks, tractors, platform lift trucks, motorized hand trucks, and other specialized industrial trucks powered by electric motors or internal combustion engines. This standard shall not apply to compressed air-operated or nonflammable compressed gas-operated industrial trucks, farm vehicles, or automotive vehicles for highway use.

1.1 Scope. 1.1.1 This standard applies to the following: (1) Design and installation of oxygen-fuel gas welding and cutting systems and allied processes (see 3.3.2), except for systems meeting the criteria in 1.1.5. (2) Utilization of gaseous fuels generated from flammable liquids under pressure where such fuels are used with oxygen(3) Storage on the site of a welding and cutting system installation of the following: (a) Gases to be used with such systems where more than one cylinder each of oxygen and fuel gas are stored in any single storage area (includes storage of more than one cylinder in any single storage area even though all such stored cylinders may be intended for use in systems of the kind described in 1.1.5(1)) (b) Calcium carbide 1.1.2 Unless specifically indicated otherwise, the term welding and cutting systems shall be considered to include allied processes in this standard. 1.1.3 Where only a portion of a fuel gas system is to be used for welding, cutting, or allied processes, only that portion of the system need comply with this standard. 1.1.4 Where only a portion of an oxygen system is to be used with fuel gas for welding, cutting, or allied processes, only that portion of the system need comply with this standard. 1.1.5 This standard shall not apply to the following: (1)*Systems consisting of a single cylinder not exceeding 3.4 m3(120 ft3) of oxygen and a single cylinder not exceeding 3.4 m3 (120 ft3) of fuel gas used for welding and cutting (2) Systems in which fuel gases are not to be used with oxygen, as described in NFPA 54, National Fuel Gas Code, and NFPA 58, Liquefied Petroleum Gas Code (3) The manufacture of gases and the filling of cylinders (4) Storage of empty cylinders (5) Compressed air–fueled systems.

ANSI/NFPA 51A-2012, Standard for Acetylene Cylinder Charging Plants

1.1 Scope. This standard shall apply to plants that are engaged in the generation and compression of acetylene and in the charging of acetylene cylinders, either as their sole operation or in conjunction with facilities for charging other compressed gas cylinders.

ANSI/NFPA 51B-2013, Standard for Fire Prevention During Welding, Cutting, and Other Hot Work

This standard shall cover provisions to prevent loss of life and property from fire or explosion as a result of hot work. Installation and operation of arc cutting and welding equipment and operation of gas cutting and welding equipment shall be in accordance with ANSI Z49. 1, Safety in Welding, Cutting, and Allied Processes.

ANSI/NFPA 52-2012, Vehicular Gaseous Fuel Systems Code

This code shall apply to the design, installation, operation, and maintenance of compressed natural gas (CNG) and liquefied natural gas (LNG) engine fuel systems on vehicles of all types and for fueling vehicles (dispensing) systems and associated storage, including the following: (1) Original equipment manufacturers (OEMs) (2) Final-stage vehicle integrator/manufacturer (FSVIM) (3) Vehicle fueling (dispensing) systems This code shall apply to the design, installation, operation, and maintenance of liquefied natural gas (LNG) engine fuel systems on vehicles of all types, to their associated fueling (dispensing) facilities, and to LNG to CNG facilities with LNG storage in ASME containers of 70,000 gal (265 m3) or less. Vehicles and fuel supply containers complying with federal motor vehicle safety standards (FMVSSs) covering the installation of CNG fuel systems on vehicles and certified by the respective manufacturer as meeting these standards shall not be required to comply with Sections 4.4, 4.8, 4.9, and 4.10 and Chapter 6 (except Sections 6.9, 6.11, 6.12, 6.13, and 6.14). This code shall apply to the design, installation, operation, and maintenance of compressed hydrogen (GH2) and liquefied compressed hydrogen (LH2). This code shall include marine, highway, rail, off-road, and industrial vehicles. Vehicles that are required to comply with applicable federal motor vehicle safety standards covering the installation of LNG fuel systems on vehicles and that are certified by the manufacturer as meeting these standards shall not be required to comply with Chapter 11, except 11.12.8. This code shall apply to testing, service, and maintenance of GH2 engine fuel systems. Vehicles that meet FMVSS no hazardous dangers shall be exempt.

ANSI/NFPA 520-2015, Standard on Subterranean Spaces

This standard’s primary focus is to safeguard life and property against fire and related hazards. Other safety concerns such as structural adequacy, plumbing, and mechanical system design, including environmental conditions, are beyond the scope of this standard. These issues are considered important, and additional requirements are expected to be enforced by the authority having jurisdiction. Where no authority having jurisdiction exists, the owner or operator should include due consideration of these items.

NFPA 53 establishes recommended criteria for the safe use of oxygen (liquid/gaseous) and the design of systems for use in oxygen and oxygen-enriched atmospheres (OEA).

ANSI/NFPA 55-2015, Compressed Gases and Cryogenic Fluids Code

NFPA 55 facilitates protection from physiological, over-pressurization, explosive, and flammability hazards associated with compressed gases and cryogenic fluids. Criteria provide fundamental safeguards for the installation, storage, use, and handling of compressed gases and cryogenic fluids in portable and stationary cylinders, containers, and tanks in all occupancy types.

1.1 Scope. This guide describes the structure, application, and limitations of the Fire Safety Concepts Tree.

This guide is intended to provide assistance, primarily to authorities having jurisdiction (AHJs), in evaluating the appropriateness and execution of a fire risk assessment (FRA) for a given fire safety problem. While this guide primarily addresses regulatory officials, it also is intended for others who review FRAs, such as insurance company representatives and building owners.

1.1 Scope. 1.1.1 This guide addresses methods for evaluating the potential for room flashover from fire involving the contents, furnishings, and interior finish of a room. The methods addressed by this guide include prevention of ignition; installation of automatic fire suppression systems; control of ventilation factors; and limitation of the heat release rate of individual and grouped room contents, furnishings, and interior finish. 1.1.2 The accuracy, precision, and relevance of this guide are a function of the accuracy, precision, and relevance of the data from the test methods and calculations used. The principles and concepts presented are among the most reliable available. The use of these techniques can help to minimize the probability of flashover or delay its occurrence, but might not prevent it.

This guide addresses issues associated with the development of hazardous conditions from fire involving passenger road vehicles and the time available for safe egress or rescue. This document provides guidance toward a systematic approach of the determination of the relationship between the properties of passenger road vehicles, including the materials, components and systems, and the development of hazardous conditions in the vehicle.

The scope of this standard is the determination of the fire load and fire load density to be used as the basis for the evaluation and design of the structural fire performance of a building. The determination of a design-basis fire is outside the scope of this standard.
ANSI/NFPA 560-2006, Storage, Handling, and Use of Ethylene Oxide for Sterilization and Fumigation

1.1.1 This standard shall not apply to the following:

(1) Nonflammable mixtures of ethylene oxide with other chemicals
(2) Ethylene oxide manufacturing facilities, and container filling, repacking, or transferring facilities
(3) * The off-site transportation of portable containers of ethylene oxide
(4) Facilities using ethylene oxide as a chemical feedstock
(5) Ethylene oxide in chambers 0.283 m^3 (10 ft^3) or less in volume, or for containers holding 200 g (7.05 oz) of ethylene oxide or less.

ANSI/NFPA 56PS-2013, Standard for Fire and Explosion Prevention During Cleaning and Purging of Flammable Gas Piping Systems

This standard shall apply to fire and explosion prevention during cleaning and purging activities for new and existing flammable gas piping found in electric generating plants and in industrial, institutional, and commercial applications.

1 Coverage of piping systems shall extend from the point of delivery to the gas-consuming equipment isolation valve. 1.1 For other than undiluted liquefied petroleum gas (LP-Gas) systems, the point of delivery is the outlet of the customer meter or at the connection to a customer's piping, whichever is farther downstream, or if there is no meter at the connection to customer piping. 1.2 For undiluted LP-Gas, the point of delivery is the outlet of the final pressure regulator, exclusive of line gas regulators, in the system. 1.3 For facilities that produce flammable gas for consumption on site, the point of delivery is the discharge isolation valve for the gas-consuming equipment.

Nonapplication of Standard. This standard shall not apply to the following items:

(1) Piping systems covered by NFPA 2(2)Piping systems covered by NFPA 54(3)Piping systems covered by NFPA 58(4)LP-Gas systems covered by NFPA 58(5)Refrigerated utility gas systems covered by NFPA 59(6) Nonrefrigerated utility gas systems covered by NFPA 59(7) Nonrefrigerated utility gas systems covered by NFPA 59(8)Fume exhaust lines covered by NFPA 59(9) Oilseed extraction plants covered by NFPA 36

This code applies to the storage, handling, transportation, and use of LP-Gas. A. 1.1 General Properties of LP-Gas. Liquefied petroleum gases (LP-Gases), as defined in this code (see 3.3.6), are gases at normal room temperature and atmospheric pressure. They liquefy under moderate pressure and readily vaporize upon release of the pressure. It is this property that permits the transportation and storage of LP-Gases in concentrated liquid form, although they normally are used in vapor form. For additional information on other properties of LP-Gases, see Annex B. Federal Regulations. Regulations of the U.S. Department of Transportation (DOT) are referenced throughout this code. Prior to April 1, 1967, these regulations were promulgated by the Interstate Commerce Commission (ICC). The Federal Hazardous Substances Act (15 U.S.C. 1261) requires cautionary labeling of refillable cylinders of liquefied petroleum gases distributed for consumer use. They are typically 40 lb (13 kg) and less and are used with outdoor cooking appliances, portable lamps, camping stoves, and heaters. The Federal Hazardous Substances Act is administered by the U.S. Consumer Product Safety Commission under regulations codified at 16 CFR 1500, Commercial Practices, Chapter 11, "Consumer Product Safety Commission."

This code shall apply to the design, construction, location, installation, operation, and maintenance of refrigerated and nonrefrigerated utility gas plants. Coverage of liquefied petroleum gas systems at utility gas plants shall extend to the point where LP-Gas or a mixture of LP-Gas and air is introduced into the utility distribution system.

ANSI/NFPA 59A-2015, Standard for the Production, Storage, and Handling of Liquefied Natural Gas (LNG)

This standard provides minimum fire protection, safety, and related requirements for the location, design, construction, security, operation, and maintenance of liquefied national gas (LNG) plants.

ANSI/NFPA 600-2014, Standard on Industrial Fire Brigades

This standard presents requirements for organizing, operating, training, and equipping industrial fire brigades. It also contains requirements for the occupational safety and health of industrial fire brigade members while performing fire fighting and related activities.

This standard shall apply to the selection, requirements, duties, and training of security personnel who will perform fire loss prevention duties. It shall cover the following three categories of security services:

(1) Protection of the property, including times when management is not present
(2) Access and egress control into and within the confines of the protected property
(3) Carrying out procedures for the orderly conduct of various operations at the property.

ANSI/NFPA 61-2013, Standard for the Prevention of Fires and Dust Explosions in Agricultural and Food Processing Facilities

1.1 Scope. 1.1.1 This standard shall apply to all of the following:

(1) All facilities that receive, handle, process, dry, blend, use, mill, package, store, or ship dry agricultural bulk materials, their by-products, or dusts that include grains, oilseeds, agricultural products, legumes, sugar, flour, spices, feeds, and other related materials.

(2) All facilities designed for manufacturing and handling starch, including drying, grinding, conveying, processing, packaging, and storing dry or modified starch, and dry products and dusts generated from these processes.

(3) All facilities designed for manufacturing and handling starch, including drying, grinding, conveying, processing, packaging, and storing dry or modified starch, and dry products and dusts generated from these processes.

(4) Facilities using ethylene oxide as a chemical feedstock

(5) Ethylene oxide in chambers 0.283 m^3 (10 ft^3) or less in volume, or for containers holding 200 g (7.05 oz) of ethylene oxide or less.

(6) LP delivery is the outlet of the customer meter or at the point of delivery for the gas used with oxygen for gas or a mixture of LP-Gas and air is introduced into the utility distribution system.

(7) Carrying out procedures for the occupational safety and health of industrial fire brigade members while performing fire fighting and related activities.

(8) Facilities using ethylene oxide as a chemical feedstock

(9) Ethylene oxide in chambers 0.283 m^3 (10 ft^3) or less in volume, or for containers holding 200 g (7.05 oz) of ethylene oxide or less.
ANSI/NFPA 654-2012, Standard for the Prevention of Fire and Dust Explosions from the Manufacturing, Processing, and Handling of Combustible Particulate Solids

1.1.1* This standard shall apply to all phases of the manufacture, processing, blending, pneumatic conveying, repackaging, and handling of combustible particulate solids or hybrid mixtures, regardless of concentration or particle size, where the materials present a fire or explosion hazard. 1.1.2 This standard shall apply to systems that convey combustible particulate solids that are produced as a result of a principal or incidental activity, regardless of concentration or particle size, where the materials present a fire or explosion hazard. 1.1.3 This standard shall not apply to materials covered by the following documents, unless specifically referenced by the applicable document: (1) NFPA 30B, Code for the Manufacture and Storage of Aerosol Products (2) NFPA 61, Standard for the Prevention of Fires and Dust Explosions in Agricultural and Food Products Facilities (3) NFPA 120, Standard for Coal Preparation Plants (4) NFPA 432, Code for the Storage of Organic Peroxide Formulations (5) NFPA 480, Standard for the Storage, Handling, and Processing of Magnesium Solids and Powders (6) NFPA 481, Standard for the Production, Processing, Handling, and Storage of Titanium (7) NFPA 482, Standard for the Production, Process, Handling, and Storage of Zirconium (8) NFPA 485, Standard for the Storage, Handling, Processing, and Use of Lithium Metal (9) NFPA 495, Explosive Materials Code (10) NFPA 651, Standard for the Machining and Finishing of Aluminum and the Production and Handling of Aluminum Powders (11) NFPA 655, Standard for Prevention of Sulfur Fires and Explosions (12) NFPA 664, Standard for the Prevention of Fires and Explosions in Wood Processing and Woodworking Facilities

ANSI/NFPA 655-2011, Standard for Prevention of Sulfur Fires and Explosions

1.1 Scope. 1.1.1* This standard shall apply to the crushing, grinding, or pulverizing of sulfur and to the handling of sulfur in any form. 1.1.2 This standard shall not apply to the mining of sulfur, recovery of sulfur from process streams, or transportation of sulfur.

1.1 Scope. This standard shall establish the minimum requirements for fire and explosion prevention and protection of industrial, commercial, or institutional facilities that process wood or manufacture wood products, using wood or other cellulose fiber as a substitute for or additive to wood fiber, and that process wood, creating wood chips, particles, or dust. 1.1.1 Woodworking and wood processing facilities shall include, but are not limited to, wood flour plants, industrial woodworking plants, furniture plants, plywood plants, composite board plants, lumber mills, and production-type woodworking shops and carpentry shops that are incidental to facilities that would not otherwise fall within the purview of this standard. 1.1.2* This standard shall apply to woodworking operations that occupy areas of more than 465 m2 (5000 ft2) or where dust-producing equipment requires an aggregate dust collection flow rate of more than 2549 m3/hr (1500 ft3/min).

ANSI/NFPA 67-2015, Guideline on Explosion Protection for Gaseous Mixtures in Pipe Systems

This guide applies to the design, installation, and operation of piping systems containing flammable gases, where there is a potential for ignition.

ANSI/NFPA 68-2012, Standard on Explosion Protection by Deflagration Venting

This standard applies to the design, location, installation, maintenance, and use of devices and systems that vent the combustion gases and pressures resulting from a deflagration within an enclosure so that structural and mechanical damage is minimized.

ANSI/NFPA 69-2013, Standard on Explosion Prevention Systems

Covers the design, construction, operation, maintenance and testing of systems for the prevention of deflagration explosions by means of the following methods: (a) control of oxidant concentration; (b) control of combustible concentration; (c) explosion suppression; (d) deflagration pressure containment; (e) spark extinguishing systems.

ANSI/NFPA 70-2013, National Electrical Code®

This Code covers the installation of electrical conductors, equipment, and raceways; signaling and communications conductors, equipment, and raceways; and optical fiber cables and raceways for the following: (1) Public and private premises, including buildings, structures, mobile homes, recreational vehicles, and floating buildings (2) Yards, lots, parking lots, carnivals, and industrial substations (3) Installations of conductors and equipment that connect to the supply of electricity (4) Installations used by the electric utility, such as office buildings, warehouses, garages, machine shops, and recreational buildings, that are not an integral part of a generating plant, substation, or control center.

This standard establishes test methods to assess the propagation of flame of various textiles and films under specified fire test condition

This standard provides criteria for defining and identifying fire retardant—treated wood and fire retardant—coated building materials. A.1.1 Fire resistance ratings measured on an hourly basis are not covered in this standard. To establish such ratings, tests should be made in accordance with NFPA 251.

1.1 Scope. This standard shall address the health, flammability, instability, and related hazards that are presented by short-term, acute exposure to a material under conditions of fire, spill, or similar emergencies.

ANSI/NFPA 705-2012, Recommended Practice for a Field Flame Test for Textiles and Films

This recommended practice provides guidance to enforcement officials for the field application of an open flame to textiles and films that have been in use in the field or for which reliable laboratory data are not available. There is no known correlation between this recommended practice and NFPA 701, Standard Methods of Fire Tests for Flame Propagation of Textiles and Films, or full-scale fire behavior

ANSI/NFPA 708-2015, Recommended Practice for Electrical Equipment Maintenance

This recommended practice applies to preventive maintenance for electrical, electronic, and communication systems and equipment and is not intended to duplicate or supersed the instructions that manufacturers normally provide. Systems and equipment covered are typical of those installed in industrial plants, institutional and commercial buildings, and large multifamily residential complexes.

ANSI/NFPA 70E-2014, Standard for Electrical Safety in the Workplace®

This standard addresses electrical safety-related work practices for employee workspaces for the safeguarding of employees relative to the hazards associated with electrical energy during activities such as the installation, inspection, operation, maintenance, and demolition of electric conductors, electric equipment, signaling and communications conductors and equipment, raceways and safe work practices for employees performing other work activities that can expose them to electrical hazards as well as safe work practices.

1.1 Scope. This standard covers the installation and maintenance of carbon monoxide detection and warning equipment, including mobile homes and manufactured homes.

ANSI/NFPA 73-2015, Standard for Electrical Inspections for Existing Dwellings

This standard covers the inspection and testing of electrical equipment and wiring in existing dwellings, including multifamily dwellings.

ANSI/NFPA 730-2013, Guide for Premises Security

This guide describes the selection, application, installation, testing, and maintenance of electronic premises security systems.

This standard covers the application, location, installation, testing, and maintenance of electronic premises security systems.

ANSI/NFPA 75-2009, Standard for the Protection of Information Technology Equipment

This standard applies to the installation and testing of power supplies for information technology equipment.

ANSI/NFPA 750-2014, Standard on Water Mist Fire Protection Systems

This standard applies to the design, installation, maintenance, and testing of water mist fire protection systems.

This standard applies to the design, installation, and testing of fire protection systems for telecommunications facilities.

ANSI/NFPA 77-2013, Recommended Practice on Static Electricity

This recommended practice applies to the identification, assessment, and control of static electricity hazards in buildings and structures.

ANSI/NFPA 780-2013, Standard for the Installation of Lightning Protection Systems

This standard applies to the installation and testing of lightning protection systems in buildings and structures.

ANSI/NFPA 79-2012, Electrical Standard for Industrial Machinery

This standard applies to the design, installation, and testing of machinery.

ANSI/NFPA 790-2013, Standard for Competency of Third-Party Field Evaluation Bodies

This standard applies to the competency of third-party field evaluation bodies.

ANSI/NFPA 791-2013, Recommended Practice and Procedures for Unlabeled Electrical Equipment Evaluation

This standard applies to the evaluation of unlabeled electrical equipment for compliance with recognized standards.

ANSI/NFPA 80-2015, Standard for Fire Doors and Other Opening Protectives

This standard applies to the design, installation, and testing of fire doors and other opening protectives.

This standard applies to the design, installation, and testing of fire protection systems for facilities handling radioactive materials.

This standard applies to the design, installation, and testing of fire protection systems for advanced light water reactors.

This standard applies to the design, installation, and testing of performance-based fire protection systems for light water reactors.

This standard provides minimum requirements for a risk-informed, performance-based change process for the fire protection program for advanced nuclear reactor electric generating plants during construction and all phases of plant operation, including shutdown, degraded conditions, and decommissioning. Fundamental fire protection elements for advanced nuclear reactor electric generating plants can be found in NFPA804, Standard for Fire Protection for Advanced Light Water Reactor Electric Generating Plants.

ANSI/NFPA 80A-2011, Recommended Practice for Protection of Buildings from Exterior Fire Exposures

1.1 Scope. This recommended practice addresses separation distances between buildings to limit exterior fire spread based on exterior openings and other construction features.

ANSI/NFPA 82-2013, Standard on Incinerators and Waste and Linen Handling Systems and Equipment

This standard covers requirements for the installation, maintenance, and use of waste and recyclables storage rooms, containers, handling systems, incinerators, compactors, and linen and laundry handling systems. This standard does not include design criteria for the purpose of reducing air pollution. For such criteria, consult the authorities having jurisdiction. The requirements in this standard shall not apply to one- or two-family residential structures.

ANSI/NFPA 820-2015, Standard for Fire Protection in Wastewater Treatment and Collection Facilities

This standard shall establish minimum requirements for protection against fire and explosion hazards in wastewater treatment plants and associated collection systems, including the hazard classification of specific areas and processes.

This code applies to the following: Technological advances in recent years and, in particular, the pervasiveness of microprocessor-based hardware make it even more important that only highly qualified individuals be employed in applying the requirements of this code to operating systems. Each type of hardware has its own unique features and operational modes. It is vital that the designer of the safety system be completely familiar with the features and weaknesses of the specific hardware and possess a thorough understanding of this code and its intent.

ANSI/NFPA 850-2014, Recommended Practice for Fire Protection for Electric Generating Plants and High Voltage Direct Current Converter Stations

This document provides recommendations for fire prevention and fire protection for electric generating plants and high voltage direct current converter stations, except as follows: Nuclear power plants are addressed in NFPA 805, Performance-Based Standard for Fire Protection for Light Water Reactor Electric Generating Plants; hydroelectric plants are addressed in NFPA851, Recommended Practice for Fire Protection for Hydroelectric Generating Plants; and fuel cells are addressed in NFPA 853, Standard for the Installation of Stationary Fuel Cell Power Systems.

ANSI/NFPA 851-2014, Recommended Practice for Fire Protection for Hydroelectric Generating Plants

This document provides recommendations (not requirements) for fire prevention and fire protection for hydroelectric generating plants. The term “hydroelectric generating plant” also can be referred to as “station,” “project,” “unit(s),” “facility,” or “site.”

This standard shall apply to the design, construction, and installation of stationary fuel cell power systems. The scope of this document shall include the following: (1) A singular prepackaged, self-contained power system unit (2) Any combination of prepackaged, self-contained power system units (3) Power system units comprising two or more factory-matched modular components intended to be assembled in the field (4) Engineered and field-constructed power systems that employ fuel cells.

ANSI/NFPA 86-2011, Standard for Ovens and Furnaces

1.1.1 This standard applies to Class A, Class B, Class C, and Class D ovens, dryers, and furnaces, thermal oxidizers, and any other heated enclosure used for processing of materials. 1.1.2* Within the scope of this standard, a Class A, Class B, or Class C oven is any heated enclosure operating at approximately atmospheric pressure and used for commercial and industrial processing of materials. 1.1.3 A Class A oven can utilize a low-oxygen atmosphere. 1.1.4 This standard applies to bakery ovens and Class A ovens, in all respects, and where reference is made to ANSI Z50.1, Bakery Equipment — Safety Requirements, those requirements shall apply to bakery oven construction and safety. 1.1.5 This standard applies to atmosphere generators and atmosphere supply systems serving Class C furnaces and to furnaces with integral quench tanks or molten salt baths. 1.1.6* This standard applies to Class D ovens and furnaces operating above ambient temperatures to over 5000°F (2760°C) and at pressures normally below atmospheric to 1078 torr (1.33 x 1076 Pa).

ANSI/NFPA 87-2011, Recommended Practice for Fluid Heaters

1.1 Scope 1.1.1 This recommended practice shall apply to fluid heaters including thermal fluid heaters and process fluid heaters. 1.1.2 The fluid shall be flowing, under pressure, and indirectly heated. 1.1.3 This recommended practice shall not apply to water or steam heaters.

ANSI/NFPA 88A-2011, Standard for Parking Structures

1.1 Scope. This standard shall cover the construction and protection of, as well as the control of hazards in, open and enclosed parking structures. This standard shall not apply to one- and two-family dwellings.

These regulations shall control the minimum energy-efficient requirements for the following:(1)The design, construction, reconstruction, alteration, repair, demolition, removal, inspection, issuance, and revocation of permits or licenses, installation of equipment related to energy conservation in all buildings and structures

ANSI/NFPA 901-2015, Standard Classifications for Incident Reporting and Fire Protection Data

This document describes and defines data elements and classifications used by many fire departments in the United States and other countries to describe fire damage potential and experience during incidents. It does not provide guidelines for a reporting system or related forms.

This code describes principles and practices of protection for cultural resource properties (including, but not limited to, museums, libraries, and places of worship), their contents, and collections, against conditions or physical situations with the potential to cause damage or loss. This code covers ongoing operations and rehabilitation and acknowledges the need to preserve culturally significant and character-defining building features and sensitive, often irreplaceable, collections and to provide continuity of operations. * Principles and practices for life safety in cultural resource properties are outside the scope of this code. Where this code includes provisions for maintaining means of egress and controlling occupant load, it is to facilitate the evacuation of items of cultural significance, allow access for damage limitation teams in an emergency, and prevent damage to collections through overcrowding or as an unintended consequence of an emergency evacuation. Library and museum collections that are privately owned and not open to the public shall not be required to meet the requirements of this code.
1.1* Scope. This standard shall cover construction, installation, operation, and maintenance of systems for air conditioning and ventilating, including filters, ducts, and related equipment, to protect life and property from fire, smoke, and gases resulting from fire or from conditions having manifestations similar to fire.

ANSI/NFPA 90B-2011, Standard for the Installation of Warm Air Heating and Air-Conditioning Systems
1.1* Scope. This standard shall cover construction, installation, operation, and maintenance of systems for warm air heating and air conditioning, including filters, ducts, and related equipment to protect life and property from fire, smoke, and gases resulting from fire or from conditions having manifestations similar to fire.

ANSI/NFPA 91-2014, Standard for Exhaust Systems for Air Conveying of Vapors, Gases, Mists, and Noncombustible Particulate Solids
This standard provides technical requirements for exhaust systems that will protect lives and property from fires and explosions and minimize damage in the event that such fires and explosions occur.

This code describes principles and practices of fire safety for historic structures and for those who operate, use, or visit them. 1.1.2* Collections within libraries, museums, and places of worship are not within the scope of this code. A.1.1.2 Collections within libraries, museums and places of worship should be evaluated and protected in accordance with NFPA 909, Code for the Protection of Cultural Resource Properties — Museums, Libraries, and Places of Worship.

ANSI/NFPA 92-2014, Standard for Smoke Control Systems
This standard shall apply to the design, installation, acceptance testing, operation, and ongoing periodic testing of smoke control systems. This standard incorporates methods for applying engineering calculations and reference models to provide a designer with the tools to develop smoke control system designs.

ANSI/NFPA 921-2013, Guide for Fire and Explosion Investigations
This document is designed to assist individuals who are charged with the responsibility of investigating and analyzing fire and explosion incidents and rendering opinions as to the origin, cause, responsibility, or prevention of such incidents.

ANSI/NFPA 950-2014, Standard for Data Development and Exchange for the Fire Service
This standard is designed to standardize data for interoperable information sharing in support of the all-hazards response. 1.1.2 To describe a digital information structure and associated requirements and workflows common to fire and emergency services delivery and management for emergency response and administrative use.

ANSI/NFPA 951-2015, Guide to Building and Utilizing Data Information
The intent of this document is to provide guidance in the development of an “integrated information management system” which facilitates information sharing. The resulting system shall be designed to support a communications pathway for all relevant components of the national preparedness and response framework.

This code shall apply to the design, installation, operation, and maintenance of compressed natural gas (CNG) and liquefied natural gas (LNG) engine fuel systems on vehicles of all types and for fueling vehicle (dispensing) systems and associated storage, including the following: (1) Original equipment manufacturers (OEMs) (2) Final-stage vehicle integrator/manufacturer (FSVIM) (3) Vehicle fueling (dispensing) systems This code shall apply to the design, installation, operation, and maintenance of liquefied natural gas (LNG) engine fuel systems on vehicles of all types, to their associated fueling (dispensing) facilities, and to LNG to CNG facilities with LNG storage in ASME containers of 70,000 gal (265 m3) or less. Vehicles and fuel supply containers complying with federal motor vehicle safety standards (FMVSS) covering the installation of CNG fuel systems on vehicles and certified by the respective manufacturer as meeting these standards shall not be required to comply with Sections 4.4, 4.8, 4.9, and 4.10 and Chapter 6 (except Sections 6.9, 6.11, 6.12, 6.13, and 6.14). This code shall apply to the design, installation, operation, and maintenance of compressed hydrogen (GH2) and liquefied compressed hydrogen (LH2). This code shall include marine, highway, rail, off-road, and industrial vehicles. Vehicles that are required to comply with applicable federal motor vehicle safety standards covering the installation of LNG fuel systems on vehicles and that are certified by the manufacturer as meeting these standards shall not be required to comply with Chapter 11, except 11.12.8. This code shall apply to testing, service, and maintenance of GH2 engine fuel systems. Vehicles that meet FMVSS and other applicable standards shall not be required to meet these standards.

ANSI/NFPA 99-2012, Standard for Health Care Facilities
1.1.1 The scope of this document is to establish criteria to minimize the hazards of fire, explosion, and electricity in health care facilities providing services to human beings. 1.1.2 Annex D covers principles of design and use of electrical and electronic appliances generating high-frequency currents for medical treatment in hospitals, clinics, ambulatory care facilities, and dental offices, whether fixed or mobile. 1.1.2.1 Areas Not Addressed. The following areas are not addressed: (1) Communication equipment, resuscitation equipment (e.g., defibrillators), or physiological stimulators (e.g., used for anesthesia, acupuncture). (2) Experimental or research apparatus built to order, or under development, provided such apparatus is used under qualified supervision and provided the builder demonstrates to the authority having jurisdiction that the apparatus has a degree of safety equivalent to that described in Annex D. 1.1.3 Annex E retains the established requirements that would be necessary for the safe use of flammable inhalation anesthetics should the use of this type of anesthetic be reintroduced. 1.1.4 Chapter 4, Electrical Systems, covers the performance, maintenance, and testing of electrical systems (both normal and essential) used within health care facilities. 1.1.4.1 Areas Not Addressed. The following areas are not addressed in NFPA 99, but are addressed in other NFPA documents: (1) Specific requirements for wiring and installation on equipment are covered in NFPA 70, National Electrical Code®. (2) Requirements for illumination and identification of means of egress in health care facilities are covered in NFPA 101®, Life Safety Code®. (3) Requirements for fire protection signaling systems. 1.1.5 Areas Not Addressed. The following areas are not addressed: (1) Communication equipment, resuscitation equipment (e.g., defibrillators), or physiological stimulators (e.g., used for anesthesia, acupuncture). (2) Experimental or research apparatus built to order, or under development, provided such apparatus is used under qualified supervision and provided the builder demonstrates to the authority having jurisdiction that the apparatus has a degree of safety equivalent to that described in Annex D. 1.1.6 Annex E retains the established requirements that would be necessary for the safe use of flammable inhalation anesthetics should the use of this type of anesthetic be reintroduced.

ANSI/NFPA 99B-2010, Standard for Hypobaric Facilities
1.1.* This standard shall apply to all hypobaric facilities in which humans will be occupants or are intended to be occupants of the hypobaric chamber. 1.1.2 This standard shall not apply to hypobaric facilities used for animal experimentation if the size of the hypobaric chamber does not allow for human occupancy.

NFRC (National Fenestration Rating Council)
ANSI/NFRC 100-2017, Procedure for Determining Fenestration Product U-factors
This standard specifies a method for determining fenestration product U-factor (thermal transmittance).

This standard specifies a method for calculating solar heat gain coefficient (SHGC) and visible transmittance (VT) at normal (perpendicular) incidence for fenestration products containing glazings or glazing with applied films, with specular optical properties calculated in accordance with ISO 15099 (except where noted) or tested in accordance with NFRC 201, NFRC 202, and NFRC 213.
ANSI/NFRC 400-2014 (R2017), Procedure for Determining Fenestration Product Air Leakage
This standard specifies a procedure for determining fenestration product air leakage.

NFSI (National Floor Safety Institute)
This test method specifies the procedures and device used for both laboratory and field testing to measure the wet SCOF of common hard-surface floor materials.

Specifies the procedures and devices used for both laboratory and field testing to measure the wet dynamic coefficient of friction (DCOF) of common hard-surface floor materials.

ANSI/NFSI B101.5-2014, Standard Guide for Uniform Labeling Method for Identifying the Wet Static and Wet Dynamic Coefficient of Friction (Traction) of Floor Coverings, Floor Coverings with Coatings, and Treated Floor Coverings
This guideline sets forth a uniform product labeling method which identifies the wet static and wet dynamic coefficient of friction (DCOF) of floor coverings, floor coverings with coatings, and treated floor coverings.

ANSI/NFSI B101.6-2012, Standard Guide for Commercial Entrance Matting in Reducing Slips, Trips and Falls
Provides the criteria for the selection, installation, inspection, care, and maintenance of entrance mats and runners in commercial facilities in reducing slips, trips, and falls.

NGWA (National Ground Water Association)
ANSI/NGWA 01-2014, NGWA Water Well Construction Standard
Document defines construction for residential, municipal, irrigation, industrial and monitoring water wells. Topics include: site selection; casing and casing installation; screens, filter pack, and formation stabilizer; grouting; plumbness and alignment; development; testing for performance; data recording; disinfection with chlorine; water sampling and analysis; and permanent well and test hole decommissioning. Document is not intended for consideration as an ISO or ISO/IEC JTC 1 standard. All Comments must be submitted on the standard comment form located at http://www.ngwa.org/Professional-Resources/standards/Documents/071013%20Standard%20Comment%20Form.pdf

NIRMA (Nuclear Information and Records Management Association)
ANSI/NIRMA CM 1.0-2007 (R2015), Guidelines for Configuration Management of Nuclear Facilities
This ANSI/NIRMA Standard applies to operating nuclear facilities and is not intended to address CM-related issues for new nuclear facility projects.
NIRMA has surveyed nuclear industry stakeholders to identify required updates to this ANSI/NIRMA CM Standard. No issues have been identified for operating nuclear facilities for which the current revision 2007 requires update. Thus, NIRMA proposes to reaffirm the current 2007 version at this time.

NISO (National Information Standards Organization)
Guidance is presented for authors and editors preparing abstracts that represent the content of texts reporting on the results of experimental work or descriptive or discursive studies. Suggestions for the placement of abstracts within publications or other media are given, along with recommendations for abstracting specific documents. Types of abstracts and their content are described. Also included are suggestions on the style of abstracts and a list of selected readings on the subject of abstracting. Examples of abstracts are appended.

ANSI/NISO Z39.18-2005 (R2010), Scientific and Technical Reports - Preparation, Presentation, and Preservation
This standard outlines the elements, organization and design of scientific and technical reports, including guidance for uniform presentation of front and back matter, text, and visual and tabular matter in print and digital formats, as well as recommendations for multimedia reports.

ANSI/NISO Z39.19-2005 (R2010), Guidelines for the Construction, Format, and Management of Monolingual Controlled Vocabularies
Presents guidelines and conventions for the contents, display, construction, testing, maintenance, and management of monolingual controlled vocabularies. It focuses on controlled vocabularies that are used for the representation of content objects in knowledge organization systems including lists, synonym rings, taxonomies, and thesauri.

ANSI/NISO Z39.2-1994 (R2016), Information Interchange Format
The basis for the MARC (Machine Readable Catalog) record, this standard specifies the requirements for a generalized interchange format that can be used for the communication of records in any media.

Defines a unique numbering system that improves access to the wealth of scientific and technical reports issued by the government and private organizations. The STRN has an alphanumeric code with a maximum length of 34; for international application an optional country code can be added. The standard explains how and where the code should be assigned and used. A central authority to coordinate and monitor assignments of the code is designated.

ANSI/NISO Z39.29-2005 (R2010), Bibliographic References
This standard provides rules, guidelines, and examples for the creation of bibliographic references to numerous types of print, audiovisual, and electronic materials, both published and unpublished, arranged in fifteen broad categories. The bibliographic references should result in the unique identification of most print and non-print materials. This standard is intended for a broad audience, including the creators of bibliographic references, the processors who publish and otherwise display references, and the ultimate users of the references.

ANSI/NISO Z39.32-1996 (R2012), Information on Microfiche Headers
Defines the specific eye-legible information that should appear on the limited space available on microfiche so the fiche can be correctly identified and properly filed. The standard describes where to place the data, the order of the information, and a recommended type size and contrast to maximize readability. Many examples show how to use the standard.

ANSI/NISO Z39.41-1997 (S2015), Placement Guidelines for Information on Spines
Describes and allocates areas on the spines of printed bindings, covers, containers, or other protective enclosures. It describes, at a high level, both the kinds of information to be printed on spines and the order and placement of the information.

ANSI/NISO Z39.43-1993 (R2017), Standard Address Number (SAN) for the Publishing Industry
The Standard Address Number (SAN) is a seven-digit numeric identifier used to identify organizations and businesses interacting with the publishing industry (including book and serial manufacturers, libraries, publishers, etc.). Originally created to expedite paper-based transactions such as purchase orders and returns, the SAN has been designated as the organizational identifier for use in EDI transactions in the publishing industry.
This standard establishes criteria for coated and uncoated paper that will last several hundred years without significant deterioration under normal use and storage conditions in libraries and archives. This standard identifies the specific properties of such paper and specifies the tests required to demonstrate these properties. The standard does not address environmental impact issues of manufacturing.

This standard defines a client/server based service and protocol for Information Retrieval. It specifies procedures and formats for a client to search a database provided by a server, retrieve database records, and perform related information retrieval functions. The protocol addresses communication between information retrieval applications at the client and server; it does not address interaction between the client and the end-user.

This standard identifies categories for basic library statistical data reported at the national level, and provides associated definitions of terms.

ANSI/NISO Z39.71-2006 (R2011), Holdings Statements for Bibliographic Items
This standard specifies display requirements in any physical or electronic medium for holdings statements for bibliographic items to promote consistency in the communication and exchange of holdings information. It identifies and defines the data elements for holdings statements in one or more libraries or institutions.

ANSI/NISO Z39.73-1994 (R2012), Single-Tier Steel Bracket Library Shelving
Reduces the costs of purchases of steel, single-tier, freestanding shelving while ensuring that the shelving meets minimum performance requirements that can be verified by an independent testing laboratory. Since this is a performance standard rather than an engineering specification, Z39.73 allows for advances in materials, technology and engineering. It is based on information collected by the American Library Association from a quarter century of laboratory testing on the performance of single-tier steel library shelving.

ANSI/NISO Z39.74-1996 (R2012), Guides to Accompany Microform Sets
Describes the basic requirements for user guides that accompany microform sets so microform publishers can provide the most useful and comprehensive guides to their publications. The standard gives practical information on all of the details that should be covered, so your guides will be both complete and efficiently arranged. Special instructions are given for archival and manuscript collections and for government documents and newspapers.

This standard defines a protocol that is limited to the exchange of messages between and among computer-based applications to enable them to perform the functions necessary to lend and borrow items, to provide controlled access to electronic resources, and to facilitate co-operative management of these functions.

The purpose of this Protocol Implementation Profile 1 (IMP1) is to specify details of implementation of the NISO Circulation Interchange Part 1: Protocol (NCIP). This IMP1 was developed primarily to support three broad application areas: Direct Consortal Borrowing, Circulation/Interlibrary Loan Interchange, and Self Service Circulation. Secondly, the profile was intended for use with emerging application areas such as the management of electronic resources.

ANSI/NISO Z39.85-2012, The Dublin Core Metadata Element Set
 Defines fifteen metadata elements for resource description in a cross disciplinary information environment. The revision deletes a sentence from the comments of the "subject" element to eliminate a potential ambiguity.

This standard defines the format and content of the electronic file set that comprises a digital talking book (DTB) and establishes a limited set of requirements for DTB playback devices.

This standard defines a set of metadata elements for raster digital images to enable users to develop, exchange, and interpret digital image files. The dictionary has been designed to facilitate interoperability between systems, services, and software as well as to support the long-term management of and continuing access to digital image collections.

ANSI/NISO Z39.88-2004 (R2010), The OpenURL Framework for Context-Sensitive Services
The OpenURL Framework Standard defines an architecture for creating OpenURL Framework Applications. An OpenURL Framework Application is a networked service environment, in which packages of information are transported over a network. This Standard specifies how to construct these packages as Representations of abstract information constructs called ContextObjects.

This standard specifies the use of ANSI/NISO Z39.50-2003 in library applications. It specifies Z39.50 client and Z39.50 server behavior for search and retrieval across online library catalogs. The specifications included in this standard use The Bath Profile: A Z39.50 Specification for Library Applications and Resource Discovery (Release 2) as its foundation. Conformant use of this standard will improve interoperability between Z39.50 implementations.

This standard defines an automated request and response model for the harvesting of electronic resource usage data utilizing a Web services framework that can replace the user-mediated collection of usage data reports. It was designed as a generalized protocol extendible to a variety of usage reports. An extension designed specifically to work with COUNTER reports is provided. This revision extends the filter support to allow multiple optional filters and/or report attributes to be included in the SUSHI Request.

ANSI/NISO Z39.96-2015, JATS: Journal Article Tag Suite
JATS: Journal Article Tag Suite (1.0), achieved through Continuous Maintenance procedure. Includes changes submitted through February, 2015, approved by NISO JATS Standing Committee and NISO Content and Collection Management Topic Committee.

This specification details the nature of the Authoring and Interchange Format profiles and how they are created. These profiles use XML markup languages to represent different kinds of information resources (books, periodicals, etc.), with the intent of producing documents suitable for transformation into different universally accessible formats. It uses a modular, extensible architecture to permit the creation of any number of document models, each custom-tailored for a particular kind of information resource. It is intended primarily for agencies interested in creating conformant profiles for new documents types and for processing agent developers.

The ResourceSync specification describes a synchronization framework for the web consisting of various capabilities that allow third-party systems to remain synchronized with a servers evolving resources. The capabilities may be combined in a modular manner to meet local or community requirements. This specification also describes how a server should advertise the synchronization capabilities it supports and how third-party systems may discover this information. The proposed revised standard includes edits to address problems related to the conflation of a resource and the datetime of notification of a change to the resource.
This standard applies to the binding of books and periodicals using methods and materials that result in volumes that are sturdy, durable, and flexible enough to withstand the rigors of library use.

NIST/ITL (National Institute of Standards and Technology/Information Technology Laboratory)

ANSI B65-1-2011, Graphic technology - Safety requirements for graphic technology equipment and systems - Part 2: Prepress and press equipment and systems

Provides additional safety requirements for the design and construction of new prepress and press equipment, and the auxiliary equipment integrated into the press control system.

ANSI B65-2011, Graphic technology - Safety requirements for graphic technology equipment and systems - Part 3: Binding and finishing equipment and systems

Provides safety requirements specific to binding and finishing equipment and systems. This standard is intended to be used in conjunction with the general requirements given in B65-1. It provides additional safety requirements for the design and construction of new equipment used to convert printed or blank substrates into cut, folded, collated, assembled, bound, or otherwise finished product. It can also be applicable to processes for preparing substrate for the printing process and to a wide range of equipment used in the binding and finishing process.

ANSI B65-5-2011, Graphic technology - Safety requirements for graphic technology equipment and systems - Part 5: Stand-alone platen presses

Provides additional press design safety requirements for the design and construction of new manually fed or automatic stand-alone platen press systems intended for diecutting, creasing, embossing, foil stamping and/or printing of paper, board and other materials processed in a similar manner.

ANSI/NAPIM 177.1-2007 (R2011), Safety standard - Three-roll printing ink mills

Applies to all three-roll mills used in the printing ink manufacturing industry. The purpose of this standard is to establish safety requirements with respect to safety controls, operating procedures, and design of three-roll mills.

ANSI/NAPIM 177.2-2006 (R2011), Safety standard - Printing ink vertical post mixers

The requirements of this standard apply to vertical post mixers designed to be used in the manufacturing of printing inks. The purpose of this standard is to establish safety requirements with respect to the design and operation of vertical post mixers.

NPES (ASC CGATS) (Association for Suppliers of Printing, Publishing and Converting Technologies)

ANSI CGATS 12642-1 (IT8.7/3)-2015, Graphic technology - Input data for characterization of four-colour process printing - Part 1: Initial data set

This part of ISO 12642 defines an input data file, a measurement procedure, and an output data format for use in characterizing any four-colour printing process.

ANSI CGATS 12642-2 (IT8.7/4)-2015, Graphic technology - Input data for characterization of 4-colour process printing -- Part 2: Expanded data set

This part of ISO 12642 defines a data set of ink value combinations that are intended to be used to characterize 4-colour process printing. This data set is not optimized for any printing process or application area but is robust enough for all general applications. The needs of publication, commercial, and package printing with offset, gravure, flexography, and other printing processes have been considered. While it is primarily aimed at process colour printing with CMYK inks, it can also be used with any combination of three chromatic coloured inks and a dark ink. It is an alternate to the ISO 12642-1 data set where more robust data is required.

ANSI CGATS.17-2009 (R2015), Graphic technology - Exchange format for color and process control data using XML or ASCII text

This standard defines an exchange format for color and process control data (and the associated metadata necessary for its proper interpretation) in electronic form using either XML or ASCII formatted data files. It maintains human readability of the data as well as enabling machine readability. It includes a series of predefined tags and keywords and provides extensibility through provision for the dynamic definition of additional tags and keywords as necessary. It is focused primarily on spectral measurement data, colorimetric data, and densitometric data.

ANSI CGATS.20-2002 (R2012), Graphic technology - Variable printing data exchange using PPM and PDF (PPML/VDX)

This standard specifies the methods for the use of the Personalized Print Markup Language (PPML) and the Portable Document Format (PDF) for the exchange or identification of all elements necessary to render a variable data imaging job as intended by the sender. This standard specifies document layout and content data and makes provision for product intent specifications using the Job Definition Format (e.g., paper selection, binding, finishing, etc.).

ANSI CGATS.5-2009, Graphic technology - Spectral measurement and colorimetric computation for graphic arts images

This standard establishes a methodology for reflection and transmission spectral measurement and colorimetric parameter computation for graphic arts images. Graphic arts includes, but is not limited to, the preparation of material for, and volume production by, production printing processes which include offset lithography, letterpress, flexography, gravure and screen printing.

ANSI CGATS.7-2003 (R2013), Graphic technology - Pallet loading for printed materials

This standard specifies the stacking, unitizing, protection and labeling of palletized printed materials. It also specifies the functional design of pallets used to transport printed materials, and gives specifications for their loading onto delivery vehicles.

ANSI CGATS.9-2007 (R2012), Graphic technology - Graphic arts transmission densitometry measurements - Terminology, equations, image elements and procedures

This standard defines terminology, equations, process control elements, and procedures for measurement and communication of transmission densitometry data for graphic arts halftone images.
This standard specifies the CMYK standard colour image data that represents a set of standard colour images to be used for evaluation of changes in image quality during coding, image processing (including transformation, compression and decompression), film recording or printing which can be used for research, development, product evaluation and process control.

This part of ISO 12640 specifies a set of 15 standard colour images (encoded as both 16-bit XYZ and 8-bit RGB digital data provided in electronic data files) that can be used for the evaluation of changes in image quality during coding, image processing (including colour re-rendering and colour space transformations, compression and decompression), displaying on a colour monitor or printing. These can be used for many graphic technology applications such as research, development, product evaluation, and process control.

This part of ISO 12640-2-2007 (R2013), Graphic technology - Prepress digital data exchange - Part 2: X/Y/sRGB encoded standard colour image data (XYZ/SCID)

This part of ISO 12640 specifies a set of three chromatic inks and a dark ink.

This part of ISO 12640 specifies a set of standard colour images (encoded as both 16-bit Adobe RGB [1998] digital data [Adobe RGB(1998)/SCID]) that can be used for the evaluation of changes in image quality during coding, image processing (including colour re-rendering and colour space transformations, compression and decompression), displaying on a colour monitor and printing. These can be used for research, testing and assessing of output systems such as printers, colour management systems and colour profiles. This standard is only available on DVD.

This part of ISO 12640 specifies the methods for the use of the Portable Document Format (PDF) for the dissemination of compound CMYK digital data, in a single exchange, that is complete and ready for final print reproduction.

This part of ISO 12640-3-2004/ISO 15930-3 -2002 (R2013), Graphic technology - Prepress digital data exchange - Use of PDF - Part 3: Complete exchange suitable for color managed workflows (PDF/X-3)

This part of CGATS ISO 15930 specifies the use of the Portable Document Format (PDF) for the dissemination of complete digital data, in a single exchange, that contains all elements necessary for final print reproduction. These exchanges will support both colour-managed workflows and traditional CMYK workflows.

This part of CGATS ISO 15930-6-2004 (R2009), Graphic Technology - Prepress digital exchange using PDF - Part 6: Complete exchange of printing data suitable for colour-managed workflows using PDF 1.4 (PDF/X-3)

This part of CGATS ISO 15930 specifies the use of the Portable Document Format (PDF) Version 1.4 for the dissemination of complete digital data, in a single exchange, that contains all elements ready for final print reproduction. Colour-managed, CMYK, gray, RGB or spot colour data are supported.

ANSI IT8.6-2002 (R2013), Graphic technology - Prepress digital data exchange - Diecutting data (DDES3)

This standard establishes a data exchange format to enable transfer of numerical control information between diecutting systems and between diecutting systems and electronic prepress systems. The information will typically consist of numerical control information used in the manufacture of dies.

ANSI IT8.7/1-1993 (R2013), Graphic technology - Color transmission target for input scanner calibration

This standard defines the layout and colorimetric values of a target which can be manufactured on any positive color transparency film and which is intended for use in the calibration of a photographic film/scanner combination (as used in the preparatory process for printing and publishing).

ANSI IT8.7/2-1993 (R2013), Graphic technology - Color reflection target for input scanner calibration

This standard defines the layout and colorimetric values of a target which can be manufactured on any positive color photographic paper and which is intended for use in the calibration of a photographic paper/scanner combination (as used in the preparatory process for printing and publishing).

ANSI IT8.7/3-2010, Graphic technology - Input data for characterization of 4-color process printing

This standard defines a data set of ink value combinations that may be used to characterize four-color process printing. Such characterization data may be created by rendering as images the ink values specified in this document and by measuring the printed sheet.

ANSI IT8.7/4-2005 (R2010), Graphic technology - Input data for characterization of 4-color process printing - Expanded data set

This standard defines a data set of ink value combinations that may be used to characterize four-color process printing. This data set is not optimized for any printing process or application area, but is robust enough for all general applications. The needs of publication, commercial, and package printing with offset lithography, gravure, flexography, and other printing processes have been considered. While it is primarily aimed at process color printing with CMYK inks, it may also be used with any combination of three chromatic inks and a dark ink.

ANSI/CGATS 21-1-2013, Graphic technology - Printing from digital data across multiple technologies - Part 1: Principles

This part of CGATS 21 establishes principles for the use of color characterization data as the definition of the intended relationship between input data and printed color for copy preparation, job assembly, proofing, and graphic arts production printing. Additional Parts of CGATS 21 specify a limited number of characterized reference printing conditions that span the expected range of color gamuts used for the production of printed material from digital data, regardless of printing process used. The procedure to be used to adjust color characterization data for the normally expected range of substrate color is specified.

ANSI/CGATS ISO 12639-2004 (R2013), Graphic technology - Prepress digital data exchange - Tag image file format for image technology (TIFF/IT)

This standard specifies a media-independent means for prepress electronic data exchange using a tag image file format. This standard defines image file formats for encoding colour continuous-tone picture images, colour line-art images, high-resolution continuous-tone images, monochrome continuous-tone picture images, binary picture images, binary line-art images, screened data, and images of composite final pages.

ANSI/CGATS 4-2011 (R2016), Graphic technology - Graphic arts reflection densitometry measurements - Terminology, equations, image elements and procedures

This standard defines terms, equations and procedures for measurement, use, and communication of data obtained using reflection densitometry in the graphic arts. Graphic arts includes, but is not limited to, the preparation of material for, and volume production by, production printing processes, which include offset lithography, letterpress, flexography, gravure, and screen printing. This standard also applies to measurement of materials produced by systems such as photographic, ink jet, thermal transfer, electrophotographic, and toner technology (including off-press proofs), etc., when used for graphic arts applications.

ANSI/CGATS/ISO 12639 Amd2-2006, Graphic technology - Prepress digital data exchange - Tag image file format for image technology (TIFF/IT) - Amendment 1

The purpose of Amendment 1 is to add an informative annex relating to the incorporation of JBIG2-Amd2 compressed data into TIFF/IT.
This part of ISO 12640 specifies a set of standard large gamut colour images (encoded as 16-bit CIELAB digital data) that can be used for the evaluation of changes in image quality during coding, image processing (including transformation, compression and decompression), displaying on a colour monitor and printing. These images can be used for research, testing and assessment of output systems such as printers, colour management systems and colour profiles.

ANSI/CGATS/ISO 12646-2008, Graphic technology - Displays for colour proofing - Characteristics and viewing conditions
This standard specifies the minimum requirements for the characteristics of displays to be used for soft proofing of colour images. Included are requirements for uniformity, convergence, refresh rate, display diagonal size, spatial resolution and glare of the screen surface. The dependence of colorimetric properties on the electrical drive signals and viewing direction, especially for flat panel displays, is also specified.

ANSI/CGATS/ISO 12646-2017, Graphic technology - Displays for colour proofing - Characteristics
This International Standard specifies requirements for two conformance levels for the characteristics of displays to be used for soft proofing of colour images. Included are requirements for uniformity and variations of electro-optical properties with viewing direction for different driving signals.

ANSI/CGATS/ISO 12646/Amd 1:2008, Graphic technology - Displays for colour proofing - Characteristics and viewing conditions
AMENDMENT 1
This document amends CGATS/ISO 12646:2008 (identical national adoption of ISO 12646:2008)

ANSI/CGATS/ISO 15790-2005 (R2013), Graphic technology and photography - Certified reference materials for reflection and transmission metrology - Documentation and procedures for use, including determination of combined standard uncertainty
This standard specifies the documentation requirements for certified reference materials (CRMs), procedures for the use of CRMs, and procedures for the computation and reporting of the combined standard uncertainty of reflectance and transmittance measurement systems used in graphic arts, photographic and other imaging industries.

ANSI/CGATS/ISO 15930-4-2004 (R2009), Graphic technology - Prepress digital data exchange using PDF - Part 4: Complete exchange of CMYK and spot colour printing data using PDF 1.4 (PDF/X-1a)
This part of ISO 15930 specifies the use of Portable Document Format (PDF) Version 1.4 for the dissemination of complete digital data, in a single exchange, that contains all elements ready for final print reproduction. CMYK and spot-colour data are supported in any combination.

ANSI/CGATS/ISO 15930-7-2010 (R2016), Graphic technology - Prepress digital data exchange using PDF - Part 7: Complete exchange of printing data (PDF/X-4) and partial exchange of printing data with external profile reference (PDF/X-4p) using PDF 1.6
This part of CGATS/ISO 15930 specifies the use of Portable Document Format (PDF) Version 1.6 for the dissemination of digital data intended for print reproduction. When all elements necessary for final print reproduction are contained within the file, it is designated as PDF/X-4. If a required ICC profile is externally supplied and unambiguously identified, it is designated as PDF/X-4p. Colour-managed, CMYK, gray, RGB or spot colour data are supported, as are PDF transparency and optional content. Files can be prepared for use with gray, RGB and CMYK printing characterizations.

ANSI/CGATS/ISO 15930-8-2010 (R2016), Graphic technology - Prepress digital data exchange using PDF - Part 8: Partial exchange of printing data using PDF 1.6 (PDF/X-5)
This part of CGATS/ISO 15930 specifies the use of Portable Document Format (PDF) Version 1.6 for the dissemination of digital data intended for print, whereby all elements necessary for final print reproduction are either included or provision is made for unique identification of externally supplied graphical content or n colorant ICC profiles. Colour-managed, CMYK, gray, RGB or spot colour data are supported in any combination; as are PDF transparency and optional content. Files can be prepared for use with gray, RGB, CMYK and n-colorant printing characterizations.

NPPC (National Pork Producers Council)
ANSI/GELPP 0001-2002 (R2012), Good Environmental Livestock Production Practices - Concentrated Livestock Operations - General Site Conditions
The Good Environmental Livestock Production Practice (GELPP) standard series addresses environmental issues related to livestock production. The GELPPs combine Best Management Practices (BMPs) obtained from various sources including USDA-NRCS publications, university publications, commodity groups, and other livestock industry experts. This GELPP (0001-2002) is applicable to any Animal Feeding Operation's (AFO) production area such as: buildings, sheds, lots and related systems.

The Good Environmental Livestock Production Practice (GELPP) standard series addresses environmental issues related to livestock production. The GELPPs combine Best Management Practices (BMPs) obtained from various sources including USDA-NRCS publications, university publications, commodity groups, and other livestock industry experts. This GELPP (0003-2002) is applicable to any Animal Feeding Operation's (AFO) with outdoor manure and/or storm water storage.

ANSI/GELPP 0004-2002 (R2012), Good Environmental Livestock Production Practices - Concentrated Livestock Operations - Manure Utilization
The Good Environmental Livestock Production Practice (GELPP) standard series addresses environmental issues related to livestock production. The GELPPs combine Best Management Practices (BMPs) obtained from various sources including USDA-NRCS publications, university publications, commodity groups, and other livestock industry experts. This GELPP (0004-2002) is applicable to any Animal Feeding Operation’s (AFO) that engages in manure utilization activities such as: planning and land application aspects, records, etc.

The Good Environmental Livestock Production Practice (GELPP) standard series addresses environmental issues related to livestock production. The GELPPs combine Best Management Practices (BMPs) obtained from various sources including USDA-NRCS publications, university publications, commodity groups, and other livestock industry experts. This GELPP (0005-2002) is applicable to any Animal Feeding Operation’s (AFO) mortality management such as planning, collection, records, etc.
NSAA (ASC B77) (National Ski Areas Assc.)

This document establishes a standard for the design, manufacture, construction, operation, and maintenance of passenger ropeways. For this standard, passenger ropeway categories include: - aerial ropeways (single and double reversible); - aerial lifts (detachable lifts, chair lifts, and similar equipment); - surface lifts (1-bar lifts, 2-bar lifts, platter lifts, and similar equipment); - tows (wire rope and fiber rope tows) - conveyors.

ANSI B77.2-2014, Funiculars - Safety Standard

Revises the standard dealing with Funicular systems, especially such a system operated on a steep incline with simultaneous ascending and descending carriers on (usually very nearly parallel!) guideways counterbalancing on another, are also known as cable railways or inclines. This document establishes a standard for the design, manufacture construction, operation, and maintenance of Funiculars for passenger transport that meet the criteria of the standard.

NSF (NSF International)

ANSI/BIFMA e3-2012 (i7), Furniture Sustainability Standard

Issue 7: The purpose of the ballot is to propose new and clarifying language in section 7.

ANSI/BIFMA e3-2012 (i8), Furniture Sustainability Standard

Issue 8 - Provides updates to section 5 of e3.

ANSI/BIFMA e3-2012 (i9), Furniture Sustainability Standard

Issue 9 - Provide updates to section 6 of e3.

ANSI/BIFMA e3-2013 (i19r1), Furniture Sustainability

This Standard is applicable to all business and institutional furniture; this includes but is not limited to moveable walls, systems furniture, desking systems, casegoods, tables, seating, and accessories. The Standard is also applicable to materials and components manufactured by suppliers to furniture manufacturers.

ANSI/BIFMA e3-2013 (i20r1), Furniture Sustainability

This Standard is applicable to all business and institutional furniture; this includes but is not limited to moveable walls, systems furniture, desking systems, casegoods, tables, seating, and accessories. The Standard is also applicable to materials and components manufactured by suppliers to furniture manufacturers.

ANSI/BIFMA e3-2014 (i17r1), Furniture Sustainability Standard

This Standard is applicable to all business and institutional furniture; this includes but is not limited to moveable walls, systems furniture, desking systems, casegoods, tables, seating, and accessories. The Standard is also applicable to materials and components manufactured by suppliers to furniture manufacturers.

ANSI/BIFMA e3-2014 (i21r1), Furniture Sustainability Standard

This sustainability standard is applicable to all business and institutional furniture; this includes but is not limited to moveable walls, systems furniture, desking systems, casegoods, tables, seating, and accessories. The Standard is also applicable to materials and components manufactured by suppliers to furniture manufacturers.

ANSI/NSF 12-2009 (i6), Automatic Ice Making Equipment

Issue 6 - Boilerplate revisions in the family of food equipment standards including normative references.

ANSI/NSF 12-2012 (i7), Automatic ice making equipment

Issue 7 - The purpose of this ballot is to update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 12-2017 (i11r1), Automatic Ice Making Equipment

This Standard contains requirements for automatic ice making equipment and devices used in the manufacturing, processing, storing, dispensing, packaging, and transportation of ice intended for human consumption.

ANSI/NSF 13-2007 (i3), Refuse processors and processing systems

Issue 3: To update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 13-2009 (i4), Refuse processors and processing systems

Issue 4 - Boilerplate updates in the family of food equipment standards including normative references.

ANSI/NSF 13-2012 (i5), Refuse processors and processing systems

Issue 5 - The purpose of this ballot is to update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 13-2017 (i6r2), Refuse Processors and Processing Systems

Equipment covered by this Standard includes but is not limited to pulpers, disposers, and compactors used for processing refuse generated from facilities that may generate food wastes. These refuse processors are not intended for compaction of hazardous or infectious material. Specifically excluded are refuse collection trucks and refuse processors intended for use at transfer stations and in industrial operations.

ANSI/NSF 14-2007 (i17), Plastic piping system components and related materials

Issue 17: To allow manufacturers to use rework material per the proposed alternative practice provided that the regrind containers are labeled in accordance with a standard protocol developed to address traceability.

ANSI/NSF 14-2007 (i20), Plastic piping system components and related materials

Issue 20: To update the chlorine resistance test requirements for a PEX pipe manufacturer using a PEX material that already has chlorine resistance classification.

ANSI/NSF 14-2008 (i21), Plastics piping system components and related materials

Issue 21-To update Section 2.0 Normative References of NSF/ANSI Standard 14.
Issue 22: To update the QC tables with the addition of new standards that are already referenced in the normative reference section.

Issue 23: To add QC requirements in Table 10 for polyethylene pipe.

Issue 24: To require that each colored pipe made from a classified material be tested to section 5.7.

Issue 27: Update Section 2 Normative References

To update Section 2, Normative References of NSF/ANSI Standard 14.

Issue 29: Add dezincification and resistance to stress corrosion requirements in NSF/ANSI 14 with the addition of a new section, Section 5.8.

Issue 31: Add QC tables for testing of UL and AWWA standards

Issue 32: Add a footnote to Table 10 to perform the burst test on pipe sizes 24-63 once per week.

Issue 33: This would change the burst pressure test for the sulfone family of fittings for PEX tubing in Table 11 from weekly to annually.

Issue 34: This issue would remove the word ‘may’ from sections 3.1, 3.57, 5.2.1, and 6.2 in Standard 14.

Issue 35: This would remove the burst test requirement for DWA pipe and fittings from Tables 12 and 13.

Issue 37: Update Table 3 for MEK test method.

Issue 38: Clarify the intent of the ‘Degree of Crosslinking’ Test, by adding a footnote indicating that the test shall be performed on samples collected from the post-cure process.

Issue 41: This proposal removes the weekly burst pressure requirement for reducer bushings.

Issue 43: Add QC requirements in Table 10 for PVC pressure pipe and fabricated fittings having recycle content.

Issue 44: Add dezincification and resistance to stress corrosion requirements in this Standard apply to thermoplastic and thermoset plastic piping system components, including but not limited to pipes, fittings, valves, joining materials, gaskets, and appurtenances. The established physical, performance, and health effects requirements also apply to materials (resin or blended compounds) and ingredients used to manufacture plastic piping system components. This Standard provides definitions and requirements for materials, ingredients, products, quality assurance, marking, and recordkeeping.

Issue 46: Update normative references under section 2 of NSF/ANSI 14

Issue 47: This issue proposes the addition of QC requirements specific to PEX tubing.

Issue 48: This issue proposes to update Table 33 under NSF/ANSI 14 for PVC pressure pipe and fabricated fitting for water transmission and distribution to reflect QC requirements per AWWA C900 and AWWA C905.

Issue 49: This issue addresses the variable outcomes in Chlorine Resistance - Dependent Transfer Listing requirements for solid wall pipe by updating the current method and adding an additional method for testing.

Issue 50: This issue addresses the updates in the normative references by updating the QC tables in NSF/ANSI 14.
ANSI/NSF 14-2014 (i54r1), Plastics Piping System Components and Related Materials
This Standard establishes minimum physical, performance, and health effects requirements for plastic piping system components and related materials. These criteria were established for the protection of public health and the environment.

ANSI/NSF 14-2014 (i55r1), Plastics piping system components and related materials
This Standard establishes minimum physical, performance, and health effects requirements for plastic piping system components and related materials. These criteria were established for the protection of public health and the environment.

ANSI/NSF 14-2014 (i56r1), Plastics Piping System Components and Related Materials
This Standard establishes minimum physical, performance, and health effects requirements for plastic piping system components and related materials. These criteria were established for the protection of public health and the environment.

ANSI/NSF 14-2014 (i57r2), Plastics Piping System Components and Related Materials
This Standard establishes minimum physical, performance, and health effects requirements for plastic piping system components and related materials. These criteria were established for the protection of public health and the environment.

ANSI/NSF 14-2014 (i58r2), Plastics Piping System Components and Related Materials
This Standard establishes minimum physical, performance, and health effects requirements for plastic piping system components and related materials. These criteria were established for the protection of public health and the environment.

ANSI/NSF 14-2014 (i59r1), Plastics Piping System Components and Related Materials
This Standard establishes minimum physical, performance, and health effects requirements for plastic piping system components and related materials. These criteria were established for the protection of public health and the environment.

ANSI/NSF 14-2014 (i61r1), Plastics Piping System Components and Related Materials
This Standard establishes minimum physical, performance, and health effects requirements for plastic piping system components and related materials. These criteria were established for the protection of public health and the environment.

ANSI/NSF 14-2014 (i64r1), Plastics piping system components and related materials
The physical, performance, and health effects requirements in this Standard apply to thermoplastic and thermoset plastic piping system components including, but not limited to, pipes, fittings, valves, joining materials, gaskets, and appurtenances. The established physical, performance, and health effects requirements also apply to materials (resin or blended compounds) and ingredients used to manufacture plastic piping system components. This Standard provides definitions and requirements for materials, ingredients, products, quality assurance, marking, and recordkeeping.

ANSI/NSF 14-2014 (i68r1), Plastics Piping System Components and Related Materials
This Standard establishes minimum physical, performance, and health effects requirements for plastic piping system components and related materials. These criteria were established for the protection of public health and the environment.

ANSI/NSF 14-2015 (i65r1), Plastics Piping System Components and Related Materials
This Standard establishes minimum physical, performance, and health effects requirements for plastic piping system components and related materials. These criteria were established for the protection of public health and the environment.

ANSI/NSF 14-2015 (i67r1), Plastics piping system components and related materials
The physical, performance, and health effects requirements in this Standard apply to thermoplastic and thermoset plastic piping system components including, but not limited to, pipes, fittings, valves, joining materials, gaskets, and appurtenances. The established physical, performance, and health effects requirements also apply to materials (resin or blended compounds) and ingredients used to manufacture plastic piping system components. This Standard provides definitions and requirements for materials, ingredients, products, quality assurance, marking, and recordkeeping.

ANSI/NSF 14-2015 (i69r1), Plastics piping system components and related materials
This Standard establishes minimum physical, performance, and health effects requirements for plastic piping system components and related materials. These criteria were established for the protection of public health and the environment.

ANSI/NSF 14-2015 (i70r1), Plastics piping system components and related materials
This Standard establishes minimum physical, performance, and health effects requirements for plastic piping system components and related materials. These criteria were established for the protection of public health and the environment.

ANSI/NSF 14-2015 (i71r1), Plastic Piping System Components and Related Materials
This Standard establishes minimum physical, performance, and health effects requirements for plastic piping system components and related materials. These criteria were established for the protection of public health and the environment.

ANSI/NSF 14-2016 (i72r1), NSF/ANSI 14 - Plastics piping system components and related materials
The physical, performance, and health effects requirements in this Standard apply to thermoplastic and thermoset plastic piping system components including, but not limited to, pipes, fittings, valves, joining materials, gaskets, and appurtenances.

ANSI/NSF 14-2016 (i73r1), NSF/ANSI 14 - Plastics piping system components and related materials
The physical, performance, and health effects requirements in this Standard apply to thermoplastic and thermoset plastic piping system components including, but not limited to, pipes, fittings, valves, joining materials, gaskets, and appurtenances.

ANSI/NSF 14-2016 (i74r1), Plastics Piping System Components and Related Materials
This Standard establishes minimum physical, performance, and health effects requirements for plastic piping system components and related materials. These criteria were established for the protection of public health and the environment.

ANSI/NSF 14-2016 (i75r1), Plastics Piping System Components and Related Materials
This Standard establishes minimum physical, performance, and health effects requirements for plastic piping system components and related materials. These criteria were established for the protection of public health and the environment.

ANSI/NSF 14-2016 (i76r1), NSF 14 Plastic Piping System Components and Related Materials
This Standard establishes minimum physical, performance, and health effects requirements for plastic piping system components and related materials. These criteria were established for the protection of public health and the environment.

ANSI/NSF 14-2016 (i77r2), NSF/ANSI 14 - Plastics piping system components and related materials
The physical, performance, and health effects requirements in this Standard apply to thermoplastic and thermoset plastic piping system components including, but not limited to, pipes, fittings, valves, joining materials, gaskets, and appurtenances.

ANSI/NSF 14-2016 (i78r2), NSF/ANSI 14 - Plastics piping system components and related materials
The physical, performance, and health effects requirements in this Standard apply to thermoplastic and thermoset plastic piping system components including, but not limited to, pipes, fittings, valves, joining materials, gaskets, and appurtenances.

ANSI/NSF 14-2016 (i79r1), NSF 14 - Plastics piping system components and related materials
This Standard establishes minimum physical, performance, and health effects requirements for plastic piping system components and related materials. These criteria were established for the protection of public health and the environment.

ANSI/NSF 14-2016 (i80r1), NSF/ANSI 14 - Plastics piping system components and related materials
This Standard establishes minimum physical, performance, and health effects requirements for plastic piping system components and related materials. These criteria were established for the protection of public health and the environment.
ANSI/NSF 14-2016 (i79r2), NSF 14 - 2014
Plastics piping system components and related materials

The physical, performance, and health effects requirements in this Standard apply to thermoplastic and thermoset plastic piping system components including, but not limited to, pipes, fittings, valves, joining materials, gaskets, and appurtenances.

ANSI/NSF 14-2016 (i80r1), Plastics piping system components and related materials
The physical, performance, and health effects requirements in this Standard apply to thermoplastic and thermoset plastic piping system components including, but not limited to, pipes, fittings, valves, joining materials, gaskets, and appurtenances.

ANSI/NSF 14-2016 (i81r1), NSF/ANSI 14: Plastics Piping System Components and Related Materials

The physical, performance, and health effects requirements in this Standard apply to thermoplastic and thermoset plastic piping system components including, but not limited to, pipes, fittings, valves, joining materials, gaskets, and appurtenances.

ANSI/NSF 14-2017 (i78r1), Plastics Piping System components and related materials
The physical, performance, and health effects requirements in this Standard apply to thermoplastic and thermoset plastic piping system components including, but not limited to, pipes, fittings, valves, joining materials, gaskets, and appurtenances.

ANSI/NSF 14-2017 (i82r1), Plastics Piping System Components and Related Materials
The physical, performance, and health effects requirements in this Standard apply to thermoplastic and thermoset plastic piping system components including, but not limited to, pipes, fittings, valves, joining materials, gaskets, and appurtenances.

ANSI/NSF 14-2017 (i83r1), NSF/ANSI 14: Plastics Piping System Components and Related Materials
The physical, performance, and health effects requirements in this Standard apply to thermoplastic and thermoset plastic piping system components including, but not limited to, pipes, fittings, valves, joining materials, gaskets, and appurtenances.

ANSI/NSF 140-2007 (i2), Sustainable Carpet Assessment
Issue 2: To provide a market-based definition for a path to sustainable carpet, establish performance requirements for public health and environment, and address the triple bottom line, economic-environmental-social, throughout the supply chain.

ANSI/NSF 140-2009 (i4), Sustainable Carpet Assessment
Issue 4 - Fluorosurfactants based on a fluorinated chain of 8 or more carbons present significant concerns for toxicity, persistence, and bioaccumulation. The current version of the standard does not address this class of chemicals specifically in section 6 Public Health and Environment.

ANSI/NSF 140-2009 (i7), Sustainable Carpet Assessment
Issue 7: Remove fluorine test requirement from Table 9.2

ANSI/NSF 140-2009 (i8), Sustainable Carpet Assessment
Issue 8: Eliminate the words after ISO 14001 and ‘performance track’ in Section 9.5.

ANSI/NSF 140-2010 (i10), Sustainable Carpet Assessment
Issue 10 - This ballot would add a Table titled 9.2A - Performance Testing for Wool Rich Carpet to the standard.

ANSI/NSF 140-2010 (i11), Sustainability Assessment for Carpet
Issue 11: To allow 24 hours test results from the Carpet and Rug Institutes’ Green Label Plus program for carpet to be used to meet the requirements of section 6.3.5.1 Minimization of Indoor Formaldehyde Emissions.

ANSI/NSF 140-2010 (i14r1), Sustainability Carpet Assessment
Issue 14 - The purpose of this ballot is to include language that was issued via formal interpretation in September 2008. This pertains to section 7.3.2.

ANSI/NSF 140-2010 (9), Sustainable Carpet Assessment
Issue 9 - revise the definition of renewable energy in 3.14

ANSI/NSF 140-2012 (i16), Sustainability Assessment for Carpet
Issue 16 - Addresses PBTs and updates the reference to RoHS in Annex A.

ANSI/NSF 140-2012 (i17), Sustainability Carpet Assessment
Issue 17 - The purpose of this ballot is to change the prerequisites listing in section 4 and one revision in Section 10. Due to an error in the revision 2 ballot document, the corrected text is being reballoted as revision 3.

ANSI/NSF 140-2012 (i18), Sustainability Assessment for Carpet
Issue 18: Revision 2 narrows the scope of the ballot to only revise Table 10.1. The remaining revisions were deferred to a task group.

ANSI/NSF 140-2012 (i19), Sustainability Assessment for Carpet
Issue 19 - The purpose of this ballot is to update section 8 for EPP, bio-based and recycled content.

ANSI/NSF 140-2012 (i21), Sustainability Carpet Assessment
Issue 21: The purpose of this ballot is to add language in several sections to clarify intent.

ANSI/NSF 140-2012 (i22), Sustainability Assessment for Carpet
Issue 22: The purpose of this ballot is to add a column for validity of test data to Table 9.2.

ANSI/NSF 140-2013 (i120), Sustainability Assessment for Carpet
The purpose of this ballot is to update the normative references in the Standard.

ANSI/NSF 140-2013 (i20r2), Sustainability Assessment for Carpet
Issue 20 - This Standard can be used on any carpet product; however, it is intended to be used for evaluation of commercial carpet products by providing a product evaluation methodology that is additive to emerging commercial green building standards.

ANSI/NSF 140-2013 (i23), Sustainability Assessment for Carpet
Issue 23: The purpose of this ballot is to address various motions from the 2012 JC meeting and other outstanding ballots.

ANSI/NSF 140-2013 (i24), Sustainability Assessment for Carpet
Issue 24 - The purpose of this ballot is to update the reference to a specific product type in 8.1. The language addresses coal fly ash in general; therefore it does not need to be specifically stated. Other product types are not listed but fail under this criterion.

ANSI/NSF 140-2013 (i64r4), Sustainability Assessment for Carpet
Issue 6 revision 4: The purpose of this ballot is to revise the social indicator criteria in the Standard.

ANSI/NSF 140-2015 (i26r4), NSF/ANSI 140: Sustainability Assessment for Carpet
This sustainability standard is intended to enable organizations throughout the carpet supply chain to apply performance requirements to achieve sustainable attributes and demonstrate compliance with levels of achievement through quantifiable metrics. While this Standard can be used on any carpet product, it is intended to be used for evaluation of commercial carpet products by providing a product evaluation methodology that is additive to emerging commercial green building standards. This Standard does not apply to the packaging of sustainable carpets or to the adhesive or padding products used in the installation of carpet products.

ANSI/NSF 14159-2-2010 (i2), Hygiene requirements for the design of hand held tools used in meat and poultry processing equipment
Issue 2 - NSF/ANSI 14159-2 is open for revision as part of its prescribed five-year review.

ANSI/NSF 169-2005 (i11), Special purpose food equipment and devices
Issue 1: This Standards establishes minimum food protection & sanitation requirements for the materials, design, construction, & performance of special purpose food handling & processing equipment & devices not fully covered by other individual standards.
ANSI/NSF 169-2007 (i2), Special purpose food equipment and devices
Issue 2 - To update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 169-2009 (i4), Special purpose food equipment and devices
Issue 4 - Boilerplate revisions in the family of food equipment standards including normative references.

ANSI/NSF 169-2012 (i5), Special purpose food equipment and devices
Issue 5 - The purpose of this ballot is to update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 169-2016 (i7r2), NSF 169-12 Special Purpose Food Equipment and Devices
Equipment covered by this Standard includes, but is not limited to, specialty equipment items or devices that have special, complex, or multiple functions such as refrigeration heating equipment, and refrigerated tumblers equipment. These are applicable provisions and additional specific requirements or exceptions as might be needed for proper evaluation of devices or equipment for which individual standards do not exist.

ANSI/NSF 170-2007 (i4), Glossary of food equipment terminology
Issue 4: The purpose of this ballot is to update normative references.

ANSI/NSF 170-2007 (i7), Glossary of food equipment terminology
Issue 7 - The purpose of this ballot is to define the term frost top unit.

ANSI/NSF 170-2008 (i5), Glossary of food equipment terminology
Issue 5: The purpose of this ballot is to update the food shield definition and add definitions for cafeteria counter, carving station, cooking station, elementary school, mobile buffet counter, multiple tier, and self service food shields.

ANSI/NSF 170-2009 (i12), Glossary of Food Equipment Terminology
Issue 12: To update the normative references in the standard.

ANSI/NSF 170-2009 (i10), Glossary of food equipment terminology
Issue 10 - to define the terms - average rotational speed and variable capacity compressor and modify the term - compressor percentage run time.

ANSI/NSF 170-2010 (i9), Glossary of food equipment terminology
Issue 9: The purpose of the ballot is to modify the following definitions: dishwashing machine, final chemical sanitizing rinse, final hot water sanitizing rinse and final rinse. A new definition is proposed for a post-sanitizing rinse.

ANSI/NSF 170-2011 (i12), Glossary of food equipment terminology
Issue 12 - The purpose of this ballot is to modify the term ‘slicers’.

ANSI/NSF 170-2011 (i13), Glossary of food equipment terminology
Issue 13 - The purpose of this ballot is to define the terms ‘drip tray’ and ‘drip trough’.

ANSI/NSF 170-2014 (i15r1), Glossary of Food Equipment Terminology
Definitions covered by this Standard consist of terminology related to food equipment, including terms describing equipment, materials, design, construction, and performance testing. This Standard includes common definitions of terms used throughout NSF Food Equipment and Sanitation Standards.

ANSI/NSF 170-2015 (i16r2), Glossary of Food Equipment Terminology
Definitions covered by this Standard consist of terminology related to food equipment, including terms describing equipment, materials, design, construction, and performance testing. This Standard includes common definitions of terms used throughout NSF Food Equipment and Sanitation Standards.

ANSI/NSF 170-2015 (i17r2), Glossary of Food Equipment Terminology
Definitions covered by this Standard consist of terminology related to food equipment, including terms describing equipment, materials, design, construction, and performance testing. This Standard includes common definitions of terms used throughout NSF Food Equipment and Sanitation Standards.

ANSI/NSF 170-2015 (i18r3), Glossary of food equipment technology
Definitions covered by this Standard consist of terminology related to food equipment, including terms describing equipment, materials, design, construction, and performance testing. This Standard includes common definitions of terms used throughout NSF Food Equipment and Sanitation Standards.

ANSI/NSF 170-2017 (i19r1), Glossary of Food Equipment Terminology
Definitions covered by this Standard consist of terminology related to food equipment, including terms describing equipment, materials, design, construction, and performance testing. This Standard includes common definitions of terms used throughout NSF Food Equipment and Sanitation Standards.

ANSI/NSF 173 2012 (i45), Dietary Supplements
Issue 45: The purpose of this ballot is to modify 5.3.2 Pesticides and 7.2.1 Multi-residue method in NSF/ANSI 173. The proposed changes will allow NSF international increased flexibility in conducting pesticide testing, due to the variations and limitations in manufacturer testing. Additionally, a modification to the requirements specific to Panax ginseng or Panax quinquefolius to only apply the zero tolerance limits to products sold and/or distributed within the United States is proposed.

ANSI/NSF 173-2007 (i14), Dietary Supplements
Issue 14: To revise Section 8 to broaden the testing of raw materials as part of a comprehensive Good Manufacturing Practices raw materials acceptance program.

ANSI/NSF 173-2007 (i22), Dietary Supplements
Issue 22: Incorporate language that requires manufacturers to comply with new federal legislation on the reporting of adverse events from dietary supplements to the US FDA.

ANSI/NSF 173-2007 (i23), Dietary Supplements
Issue 23: Incorporate language on the handling and storage of raw materials in an effort to reduce cross-contamination from allergens.

ANSI/NSF 173-2007 (i25), Dietary Supplements
Issue 25: To incorporate general requirements for formulation submissions to demonstrate product compliance.

ANSI/NSF 173-2008 (i20r2), Dietary Supplements
Issue 20, r2: To incorporate testing requirements for potential contaminants in fish oil.

ANSI/NSF 173-2008 (i27), Dietary Supplements
Issue 27: To replace Section 8 of NSF/ANSI 173 with 21 CFR § 111. Additional requirements, including Recall procedures, compliance with the 2002 Bioterrorism Act, and AER reporting system, which are not covered in 21 CFR § 111, will remain.

ANSI/NSF 173-2009 (i24), Dietary Supplements
Issue 24: add modifications to the define the types of ingredients that are associated with the acceptable limits categories in tables 6A and 6B.

ANSI/NSF 173-2010 (i35), Dietary Supplements
Issue 35: Recently an error was identified in ANSI/NSF 173 related to the disintegration testing for delayed release/enteric coated capsules and tablets. Section 5.4 Disintegration of NSF/ANSI 173 - Dietary Supplements needs to be updated.

ANSI/NSF 173-2010 (i31), Dietary Supplements
Issue 31: Diethylene glycol (DEG) is a suspected contaminant of glycerin. The U.S. Food and Drug Administration (FDA) has recommended that pharmaceutical manufacturers screen for diethylene glycol contamination in glycerin supplies. Glycerin may be used as a humectant, solvent, sweetener, or filler (among other uses) in dietary supplements. Sections 5.3.6 Industrial Contaminants and 7.5 Test Methods for Industrial Contaminants of NSF/ANSI 173 - Dietary Supplements needs to be updated.
ANSI/NSF 173-2010 (i33r2), NSF/ANSI - 173 - Dietary Supplements

Issue 33: The purpose of this ballot is to update Section 7.3 of the current version of NSF/ANSI Standard 173 to allow test methods for microbiological contaminants to be more in sync with the current promulgated version of the United States Pharmacopeia (USP). As well, alternate test methodologies are identified.

ANSI/NSF 173-2010 (i34), NSF/ANSI 173 - Dietary Supplements

Issue 34: The acceptance levels for dioxins and dioxin-like PCBs do not currently allow for a dose-related risk evaluation based on the wording in NSF/ANSI Standard 173, Section 5.3.6 Industrial Contaminants.

ANSI/NSF 173-2011 (i29), Dietary Supplements

Issue 29: The purpose of this ballot is four-fold: (1) to update Section 6, Test methods used by testing laboratories for identification and quantification of ingredients—raw materials and finished products; (2) to update Section 7.4, Test methods for chemical contaminants; (3) to remove Tables 3 and 4; and (4) to update the quality assurance sections related to verification testing performed to evaluate compliance with the Standard.

ANSI/NSF 173-2011 (i30), Dietary Supplements

Issue 30: The purpose of this ballot is to update Sections 5.3.4 Natural toxins and 7.4 Test methods for chemical contaminants of NSF/ANSI 173, and to revise Table A1 - Botanicals known or suspected to contain aristolochic acid.

ANSI/NSF 173-2011 (i36), Dietary Supplements

Issue 36: Reduces the current limit in ANSI/NSF 173 for lead content in finished products to 10 micrograms per day. This change would harmonize the lead limit with current APHA and USP limits.

ANSI/NSF 173-2011 (i38), Dietary Supplements

Issue 38: The purpose of this ballot is to add additional Normative References and a definition for ‘qualified individual’ to NSF/ANSI 173.

ANSI/NSF 173-2011 (i39), Dietary Supplements

Issue 39: The purpose of this ballot is to update the subsection heading for 6.1.1.1 Macroscopic test methods in NSF/ANSI 173.

ANSI/NSF 173-2011 (i40), Dietary Supplements

Issue 40: The purpose of this ballot is three-fold: (1) To eliminate discrepancies with the language in 7.4; (2) To achieve consistency with language in paragraphs related to method selection and development; (3) To ensure that all language meets ANSI requirements.

ANSI/NSF 173-2012 (i37), Dietary Supplements

Issue 37: Reduces the current limit in ANSI/NSF 173 for cadmium content in finished products to 4.1. This change would harmonize the cadmium limit with the current AHPA limit.

ANSI/NSF 173-2012 (i41), Dietary Supplements

Issue 41: Corrects the finished product acceptance level for mercury in ANSI/NSF 173 to 0.002 mg/day (2 ug/day).

ANSI/NSF 173-2012 (i43), Dietary Supplements

Issue 43: The purpose of this ballot is to modify NSF/ANSI 173 to allow NSF International increased flexibility in selecting finished product claims for analysis based on the number of finished product claims and ingredients present on the product label.

ANSI/NSF 173-2012 (i44), Dietary Supplements

Issue 44: The purpose of this ballot is to modify 5.2.2 Finished products in NSF/ANSI 173. The proposed changes will allow NSF International increased flexibility in selecting finished product claims for analysis based on the number of finished product claims and ingredients present on the product label.

ANSI/NSF 173-2012 (i46), Dietary Supplements

Issue 46: The purpose of this ballot is to update NSF/ANSI 173 with a requirement for testing Diethylene Glycol (DEG) in Glycerin ingredients.

ANSI/NSF 173-2013 (i47r2), Dietary Supplements

Issue 47: This ballot proposes updates to several parts of NSF/ANSI 173, Section 5, to clarify product requirements.

ANSI/NSF 173-2013 (i48), Dietary Supplements

Issue 48: The purpose of this ballot is to update and clarify the language in NSF/ANSI 173, Section 5.4.1, to ensure that the requirement is clearly defined.

ANSI/NSF 173-2015 (i50r3), Dietary Supplements

This Standard contains requirements for dietary supplements that contain one or more of the following dietary ingredients: a vitamin, a mineral, an herb or other botanical, an amino acid, a dietary substance for use by humans to supplement the diet by increasing the total dietary intake, or a concentrate, metabolite, constituent, extract, or combinations of these ingredients.

ANSI/NSF 173-2016 (i49r1), Dietary Supplements

This Standard contains requirements for dietary supplements that contain one or more of the following dietary ingredients: a vitamin, a mineral, an herb or other botanical, an amino acid, a dietary substance for use by humans to supplement the diet by increasing the total dietary intake, or a concentrate, metabolite, constituent, extract, or combinations of these ingredients.

ANSI/NSF 173-2016 (i51r2), Dietary Supplements

This Standard contains requirements for dietary supplements that contain one or more of the following dietary ingredients: a vitamin, a mineral, an herb or other botanical, an amino acid, a dietary substance for use by humans to supplement the diet by increasing the total dietary intake, or a concentrate, metabolite, constituent, extract, or combinations of these ingredients.

ANSI/NSF 173-2016 (i54r1), Dietary Supplements

This Standard contains requirements for dietary supplements that contain one or more of the following dietary ingredients: a vitamin, a mineral, an herb or other botanical, an amino acid, a dietary substance for use by humans to supplement the diet by increasing the total dietary intake, or a concentrate, metabolite, constituent, extract, or combinations of these ingredients.

ANSI/NSF 173-2016 (i60r1), Dietary Supplements

The purpose of NSF/ANSI 173 is to serve as an evaluation tool for analyzing dietary supplements. Certification to this Standard serves as a communication tool between manufacturers of ingredients and finished product, retailers, healthcare practitioners, and consumers. This Standard provides test methods and evaluation criteria to allow for the determination that a dietary supplement contains the ingredients claimed on the label, either qualitatively or quantitatively, and that it does not contain specific undeclared contaminants.

ANSI/NSF 177-2014 (i51r1), Shower Filtration Systems - Aesthetic Effects

The point-of-use shower filtration systems addressed by this Standard are designed to be used for the reduction of specific substances that may be present in potable water (public or private). Systems covered under this Standard are intended to reduce substances affecting the aesthetic quality of the water. Only whole systems shall be evaluated under this Standard. Systems with components or functions covered under other NSF or NSF/ANSI standards or criteria shall comply with those applicable requirements.

ANSI/NSF 18-2007 (i9), Manual food and beverage dispensing equipment

Issue 9 - To update the Normative References and boilerplate language in the Food Equipment family of Standards.
ANSI/NSF 18-2009 (i11), Food Equipment - Manual food and beverage
Issue 11 R2 - To update the boilerplate changes in the family of food equipment standards. Additionally, changes to Section 6 and Annex B are proposed.

ANSI/NSF 18-2011 (i13), Manual food and beverage dispensing equipment
Issue 13 - Establishes requirements in NSF 18 for dispensing equipment designed to maintain the safety of potentially hazardous foods held under controlled conditions without refrigeration for dispensers that operate with a mechanical barrier that is also the original hermetic seal.

ANSI/NSF 18-2012 (i12), Manual food and beverage dispensing equipment
Issue 12 - The purpose of this ballot is to update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 18-2016 (i14r1), Manual Food and Beverage Dispensing Equipment
This Standard contains requirements for equipment and devices that manually dispense food or beverages, in bulk or in portions. The materials, design, and construction requirements of this Standard may also be applied to an item that is manufactured as a component of food and beverage dispensing equipment. This Standard does not apply to vending machines, dispensing freezers, or bulk milk dispensing equipment covered by the scope of other NSF Standards.

ANSI/NSF 184-2010 (i4), Residential dishwashers
Issue 4 - NSF/ANSI 184 is open for revision as part of its prescribed five-year review.

ANSI/NSF 184-2014 (i5r1), Residential Dishwashers
Equipment covered by this Standard includes all residential dishwashers. This Standard does not establish equipment installation requirements. While the requirements of this Standard are intended to ensure equipment may be installed in a sanitary manner, proper installation of equipment shall be governed by the applicable codes.

ANSI/NSF 2-2006 (i13), Food equipment
Issue 13 - The purpose is to allow the use of ColiScan; MF and CHROMagarTM as equivalent, alternate, selective media to Chromocult; for the recovery and enumeration of E. coli 11229 for all in Place Cleaning assays.

ANSI/NSF 2-2007 (i11), Food Equipment
Issue 11 - To address electronic thermometers power loss.

ANSI/NSF 2-2007 (i12), Food equipment
Issue 12 - To update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 2-2008 (i4), Food Equipment
Issue 4 - The purpose of this ballot is to update section 5.35 Food shields.

ANSI/NSF 2-2009 (i15), Food Equipment
Issue 15 - Boilerplate modifications to be made throughout the family of food equipment standards including normative references.

ANSI/NSF 2-2009 (i16), Food equipment
Issue 16 - The purpose of this revision is to include an exemption from the material smoothness and cleanability requirements for woven silicone baking mats used for baking bread products only.

ANSI/NSF 2-2010 (i17), Food equipment
Issue 17 - The purpose of this ballot is to eliminate the exemption for bun and baking pans that permits an unsealed seam on a rolled bead and clarify the requirements for attaching handles to lids in 5.30 Pots, pans, and utensils.

ANSI/NSF 2-2012 (i18), Food equipment
Issue 18 - The purpose of this ballot is to update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 2-2012 (i21), Food equipment
Issue 21 - The purpose of this ballot is to update the requirement in 5.4.6 - Beverage (urn) stands, which is outdated, does not reflect advancements and changes in commercial hot and cold beverage equipment.

ANSI/NSF 2-2014 (i20r2), Food Equipment
Equipment covered by this Standard includes, but is not limited to, bakery, cafeteria, kitchen, and pantry units and other food handling and processing equipment such as tables and components, counters, hoods, shelves, and sinks.

ANSI/NSF 2-2014 (i21r2), Food Equipment
This Standard establishes minimum food protection and sanitation requirements for the materials, design, fabrication, construction, and performance of food handling and processing equipment.

ANSI/NSF 2-2015 (i24r2), NSF/ANSI 2: Food Equipment
Equipment covered by this Standard includes, but is not limited to, bakery, cafeteria, kitchen, and pantry units and other food handling and processing equipment such as tables and components, counters, hoods, shelves, and sinks.

ANSI/NSF 2-2016 (i23r2), Food Equipment
This Standard establishes minimum food protection and sanitation requirements for the materials, design, fabrication, construction, and performance of food handling and processing equipment.

ANSI/NSF 2-2016 (i25r2), Food Equipment
This Standard establishes minimum food protection and sanitation requirements for the materials, design, fabrication, construction, and performance of food handling and processing equipment.

ANSI/NSF 20-2012 (i5), Commercial bulk milk dispensing equipment
Issue 5 - The purpose of this ballot is to update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 20-2016 (i6r1), Commercial Bulk Milk Dispensing Equipment
This Standard contains requirements for bulk milk dispensers designed to dispense servings of milk or milk products by manual or machine actuation. This Standard does not apply to dispensing freezers (soft-serve machines), vending machines, or manual food and beverage dispensing equipment covered by the scope of other NSF standards.

ANSI/NSF 20-2016 (i6r1), Commercial Bulk Milk Dispensing Equipment
This Standard contains requirements for bulk milk dispensers designed to dispense servings of milk or milk products by manual or machine actuation. This Standard does not apply to dispensing freezers (soft-serve machines), vending machines, or manual food and beverage dispensing equipment covered by the scope of other NSF standards.

ANSI/NSF 21-2007 (i3), Thermostatic refuse containers
Issue 3 - To update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 21-2009 (i4), Thermostatic refuse containers
Issue 4 - Boilerplate updates in the family of food equipment standards including normative references.

ANSI/NSF 21-2012 (i5), Thermostatic refuse containers
Issue 5 - The purpose of this ballot is to update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 21-2015 (i6r3), Thermoplastic Refuse Containers
This Standard contains sanitation requirements for new thermoplastic refuse containers intended for the indoor and outdoor storage of refuse. Thermoplastic refuse container materials and components covered under other NSF or NSF/ANSI Standards or Criteria shall also comply with the requirements therein. This Standard is not intended to restrict new unit design, provided that such design meets the minimum specifications described herein.

ANSI/NSF 222-2006 (R2011) (i3), Ozone generators
Issue 3: Reaffirms ANSI/NSF 222, Ozone generators, as required every five years by American National Standards Institute (ANSI). This is a reaffirmation ballot, and as such no substantive changes are being recommended to the Standard.

ANSI/NSF 223-2012, Conformity Assessment Requirements for Certification Bodies that Certify Products pursuant to NSF/ANSI Standard 60: Drinking Water Treatment Chemicals - Health Effects
The proposed standard, NSF 223, establishes minimum requirements for certification bodies to be used when certifying products to NSF/ANSI Standard 60.
ANSI/NSF 223-2013 (i2), Conformity Assessment Requirements for Certification Bodies that Certify Products Pursuant to NSF/ANSI 60: Drinking Water Treatment Chemicals - Health Effects

This Standard establishes requirements for activities to be performed when certification bodies certify products to NSF/ANSI 60, including documentation reviews, product testing, and facility audits conducted during surveillance.

ANSI/NSF 223-2013 (i3r1), Conformity Assessment Requirements for Certification Bodies that Certify Products Pursuant to NSF/ANSI 60: Drinking Water Treatment Chemicals - Health Effects

This Standard establishes minimum requirements for certification bodies to be used when certifying products to NSF/ANSI 60 - Drinking Water Treatment Chemicals - Health Effects. These requirements are supplemental to those contained in ISO Guide 65 or ISO 17020 and do not replace the requirements of either ISO standard. By specifying this Standard, users of product certifications can communicate their expectation that certification activities addressed herein are performed in the particular manner described.

ANSI/NSF 223-2013 (i4r1), Conformity Assessment Requirements for Certification Bodies that Certify Products Pursuant to NSF/ANSI 60: Drinking Water Treatment Chemicals - Health Effects

This Standard establishes minimum requirements for certification bodies to be used when certifying products to NSF/ANSI 60 - Drinking Water Treatment Chemicals - Health Effects. These requirements are supplemental to those contained in ISO Guide 65 or ISO 17020 and do not replace the requirements of either ISO standard. By specifying this Standard, users of product certifications can communicate their expectation that certification activities addressed herein are performed in the particular manner described.

ANSI/NSF 223-2015 (i5r1), Conformity Assessment Requirements for Certification Bodies that Certify Products Pursuant to NSF/ANSI 60-Dinking Water Treatment Chemicals - Health Effects

This Standard establishes minimum requirements for certification bodies to be used when certifying products to NSF/ANSI 60 - Drinking Water Treatment Chemicals - Health Effects. These requirements are supplemental to those contained in ISO Guide 65 or ISO 17020 and do not replace the requirements of either ISO standard. By specifying this Standard, users of product certifications can communicate their expectation that certification activities addressed herein are performed in the particular manner described.

ANSI/NSF 24-2008 (i2), Plumbing system components for recreational vehicles, Issue 2

Issue 2 - To clarify that toilets under NSF/ANSI 24 shall comply with only the Function Test of IAPMO TS 12, and not all sections of IAPMO TS 12.

ANSI/NSF 24-2008 (i3), Plumbing system components for recreational vehicles, Issue 3

Issue 3 - To remove the requirement for mechanical seal toilets under NSF/ANSI 24 to comply with the 'structural strength and integrity' and 'wear and cleanability' sections of ANSI Z124.4.

ANSI/NSF 24-2008 (i4), Plumbing system components for recreational vehicles, Issue 4

Issue 4 - To add requirements for mechanical seal toilets and tanks to meet the appropriate sections of IAPMO TS-1.

ANSI/NSF 24-2008 (i6), Plumbing system components for recreational vehicles

Issue 6: Body Waste Inlet - clarification to piping size and harmonization with NFPA 1192.

ANSI/NSF 24-2009 (i5), Plumbing system components for recreational vehicles

Issue 5 - To update Section 21 requirements for flexible dry vent assembly of ANSI/NSF24.

ANSI/NSF 24-2010 (i7), Plumbing System Components for Recreational Vehicles

Issue 7: This issue removes the colorfastness and cigarette tests for plastic mechanical seal toilets.

ANSI/NSF 24-2014 (i8r1), Plumbing System Components for Recreational Vehicles

This Standard covers pipe, fittings, valves, traps, vents, tanks, pumps, connectors, fixtures, appliances, and similar appurtenances used in a plumbing system of a recreational vehicle.

ANSI/NSF 24-2015 (i10r2), Plumbing system components for recreational vehicles

This Standard covers pipe, fittings, valves, traps, vents, tanks, pumps, connectors, fixtures, appliances, and similar appurtenances used in a plumbing system of a recreational vehicle.

ANSI/NSF 240-2011 (R2017) (i2r1), Drainfield Trench Product Sizing for Gravity Dispersal Onsite Wastewater Treatment and Disposal Systems

This Standard provides a methodology to compare, assess and document product sizing criteria for alternative or proprietary products with respect to conventional coarse aggregate used in onsite wastewater dispersal drainfields, based on comparative hydraulic performance. The comparative treatment performance of alternative products compared to performance of conventional systems is not within the scope of this Standard

ANSI/NSF 240-2011, Drainfield Trench Product Sizing for Gravity Dispersal Onsite Wastewater Treatment and Disposal Systems

Issue 1 - Revision 5: The purpose of this ballot is to create an American National Standard that provides laboratory and field evaluation methods for comparing gravity dispersal drainfield products based on hydraulic performance used in place of conventional coarse aggregate within onsite wastewater treatment and disposal systems.

ANSI/NSF 245-2010 (i4), NSF/ANSI 245 wastewater treatment systems-nitrogen reduction

Issue 4 - The purpose of this ballot is to update the table in Section 8.3.3 Analysis which requires treated effluent analysis for TKN, NO2 and NO3. However, this same section requires the raw influent to be analyzed for TKN and not NO2 or NO3, thus not meeting the definition of total nitrogen. The result is a potential discrepancy in calculating the total nitrogen reduction performance.

ANSI/NSF 245-2010 (i5), Wastewater Treatment Systems - Nitrogen reduction

Issue 5: The purpose of this ballot is to update the Normative References in several of the Wastewater Treatment Standards.

ANSI/NSF 245-2012 (i6), Wastewater treatment systems - Nitrogen reduction

Issue 6: The purpose of this ballot is to make the language relating to failure sensing equipment in the wastewater standards consistent as well as update it regarding the testing procedure.

ANSI/NSF 245-2013 (i7), Wastewater treatment systems - Nitrogen reduction

Issue 7: The purpose of this ballot is to update the language in section 8.4.1 for consistency among wastewater standards. The change in section 9 addresses a comment on the ballot 4020 regarding when adjustments to alkalinity are made, they are required to be reported. Issue 7 r3 - This is a boilerplate ballot for wastewater treatment systems standards.

ANSI/NSF 25-2007 (i6), Vending machines for food and beverage

Issue 6: To update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 25-2007 (i7), Vending machines for food and beverages

Issue 7 - To allow the use of ColiScan® and CHROMagarTM as equivalent, alternate, selective media to Chromocult®; for the recovery and enumeration of Escherichia coli 11229 for the In Place Cleaning assay specified in NSF/ANSI 25.

ANSI/NSF 25-2009 (i8), Vending machines for food and beverages

Issue 8 - Boilerplate updates in the family of food equipment standards including normative references.

ANSI/NSF 25-2012 (i9), Vending machines for food and beverages

Issue 9 - The purpose of this ballot is to update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 25-2017 (i11r1), Vending Machines for Food and Beverages

This Standard contains requirements for food and beverage vending machines, including those that vend packaged food and beverages and those that vend food and beverages in bulk.
ANSI/NSF 29-2007 (i2), Detergent and chemical feeders for commercial spray-type dishwashing machines

Issue 2: To update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 29-2009 (i3), Detergent and chemical feeders for commercial spray-type dishwashing machines

Issue 3 - Boilerplate updates in the family of food equipment standards including normative references.

ANSI/NSF 29-2012 (i4), Detergent and chemical feeders for commercial spray-type dishwashing machines

Issue 4 - The purpose of this ballot is to update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 3-2006 (i5), Commercial warewashing equipment

Issue 5 - To A) remove the requirement for either a self-draining pump or a drain plug on the pump, and B) allow the final rinse pressure gauge to read 5 to 30 psi rather than 20 +/- 5 psi.

ANSI/NSF 3-2007 (i4), Commercial warewashing equipment

Issue 6 - To update Normative references, 6.2.2 - Chemical sanitizing dishwashing & glasswashing machines & 6.2.4 - Chemical sanitizing pot, pan, & utensil washing machines test methods.

ANSI/NSF 3-2008 (i7), Commercial warewashing equipment

Issue 7 - To include and modify language to be consistent with the boilerplate language in NSF/ANSI 2 Food equipment.

ANSI/NSF 3-2009 (i8), Commercial warewashing equipment

Issue 8 - Boilerplate updates in the family of food equipment standards including normative references.

ANSI/NSF 3-2010 (i6), Commercial warewashing equipment

Issue 9: The purpose of this ballot is threefold: (1) to modify ANSI/NSF 305 by updating Table 5.1 to show a missing process known as ‘Etherification of glycercin and glycercin making polyglycerols’; (2) to update the naming conventions so that the botano-chemical process names are the same in Table 5.1, Table 6.1 and Annex E; and (3) to incorporate additional language allowing for the use of catalysts meeting the chemical definition of catalyst (3.3) in the botano-chemical processes (5.3.1).

ANSI/NSF 3-2011 (i7), Commercial warewashing equipment

Issue 10: Incorporates a note into ANSI/NSF 305 concerning compliance with the California Organic Products Act (COPA) of 2003 and the proper calculation.

ANSI/NSF 3-2011 (i12), Personal Care Products Containing Organic Ingredients

Issue 11: To add additional wording in ANSI/NSF 3 to allow for bagging and labeling of commercial dishwashing machines with soap bars or pastes, and to include soap bars or pastes in ANSI/NSF 3.

ANSI/NSF 3-2017 (i2r1), Commercial Warewashing Equipment

This Standard applies to commercial dishwashing, glasswashing, and pot, pan, and utensil washing machines that wash their contents by applying sprays of detergent solutions with or without blasting media granules, and sanitize their contents by applying sprays of hot water or chemical sanitizing solutions. Stationary rack and conveyor machines are covered under this Standard.

ANSI/NSF 3-A 14159-1-2014 (i4r1), Hygiene Requirements for the Design of Meat and Poultry Processing Equipment

This NSF/ANSI 3-A Standard applies to equipment intended for use in the slaughter, processing, and packaging of meat and poultry products, excluding hand held tools and mechanical belt conveyors. The requirements are to be applied by designers and manufacturers who in turn are to provide guidance to the users for the intended use of the equipment.

ANSI/NSF 3-A 14159-2-2014 (i5r1), Hygiene Requirements for the Design of Hand Held Tools Used in Meat and Poultry Processing

This NSF/3-A/ANSI Standard applies to hand held tools intended for use in the slaughter, processing, and packaging of meat and poultry products.

ANSI/NSF 3-A 14159-3-2010 (i3), Hygiene requirements for the design of mechanical belt conveyors used in meat and poultry processing equipment

Issue 3 - NSF/ANSI 14159-3 is open for revision as part of its prescribed five-year review.

ANSI/NSF 3-A 14159-3-2014 (i6r1), Hygiene Requirements for the Design of Mechanical Belt Conveyors Used in Meat and Poultry Processing

This American National Standard applies to exposed product mechanical belt conveyors, either singularly or as a component of equipment, intended for use in the slaughter, processing, and packaging of meat and poultry products.

ANSI/NSF 3-A 14159-3-2015 (i3r1), Hygiene Requirements for the Design of Mechanical Belt Conveyors Used in Meat and Poultry Processing

This American National Standard applies to exposed product mechanical belt conveyors, either singularly or as a component of equipment, intended for use in the slaughter, processing, and packaging of meat and poultry products.

ANSI/NSF 305-2011 (i10), Personal Care Products Containing Organic Ingredients

Issue 10: Incorporates a note into ANSI/NSF 305 concerning compliance with the California Organic Products Act (COPA) of 2003 and the proper calculation.

ANSI/NSF 305-2011 (i5), Personal Care Products Containing Organic Ingredients

Issue 5: The purpose of this ballot is threefold: (1) to modify ANSI/NSF 305 by updating Table 5.1 to show a missing process known as ‘Etherification of glycercin and glycercin making polyglycerols’; (2) to update the naming conventions so that the botano-chemical process names are the same in Table 5.1, Table 6.1 and Annex E; and (3) to incorporate additional language allowing for the use of catalysts meeting the chemical definition of catalyst (3.3) in the botano-chemical processes (5.3.1).

ANSI/NSF 305-2011 (i6), Personal Care Products Containing Organic Ingredients

Issue 6: The purpose of this ballot is to provide a means for companies to source ingredients by modifying NSF/ANSI 305 to include language allowing plant-based products certified to EC 834/2007 and EC 889/2008 (European Union organic regulations) to be considered equivalent to USDA NOP standards certification.

ANSI/NSF 305-2011 (i7), Personal Care Products Containing Organic Ingredients

Issue 7: The purpose of this ballot is threefold: (1) to modify ANSI/NSF 305 by updating Table 5.1 to show a missing process known as ‘Etherification of glycercin and glycercin making polyglycerols’; (2) to update the naming conventions so that the botano-chemical process names are the same in Table 5.1, Table 6.1 and Annex E; and (3) to incorporate additional language allowing for the use of catalysts meeting the chemical definition of catalyst (3.3) in the botano-chemical processes (5.3.1).

ANSI/NSF 305-2011 (i8), Personal Care Products Containing Organic Ingredients

Issue 8: The purpose of this ballot is four-fold: (1) to change Annex G from &##8216;Informative’ to &##8216;Normative’; (2) to amend the introductory note in Annex G; (3) to specify in Table G.3 that Glycine betaine extracted from sugar beets is allowed; and (4) to clarify in Table G.3 that in addition to betaines other that Glycine betaine extracted from sugar beets, amphoteretic surfactants are also prohibited under NSF/ANSI 305.

ANSI/NSF 305-2011 (i9), Personal Care Products Containing Organic Ingredients

Issue 9: The purpose of this ballot is to include the California Organic Products Act of 2003 as a normative reference, and also to update sections 2.1 Normative references and 2.2 Informational references in NSF/ANSI 305.

ANSI/NSF 305-2011 (i3), Personal Care Products Containing Organic Ingredients

Modifies ANSI/NSF 305 by incorporating additional language agreed to by the Joint Committee on Organic Personal Care for clarifying Grapefruit Seed Extract in Table 5.2 – Preservative ingredients allowed in “Contains Organic” products.
ANSI/NSF 305-2012 (i13), Personal Care Products Containing Organic Ingredients

Issue 13: This ballot includes proposed updates to section content and titles for the following in ANSI/NSF 305: 5.2 Organic production system plan; 7.1 Use of the term "organic"; 7.4 Packaged products labeled "100 percent organic" or "organic" or "made with organic"; 7.5.1 Personal care packaged products; and 7.5.2 Agricultural packaged products.

ANSI/NSF 305-2012 (i14), Personal Care Products Containing Organic Ingredients

Issue 14: The purpose of this ballot is to provide additional clarification in 6.3 Mined Minerals, water and salt with regards to Aloe and processed Mined Minerals.

ANSI/NSF 305-2014 (i20r1), Personal Care Products Containing Organic Ingredients

This Standard specifies materials, processes, production criteria, and conditions that shall be met in order for personal care products to make organic label and marketing claims under this Standard. This Standard intends to address products with a minimum organic content of 70% (O70). Products intended to be labeled with organic processing claims currently defined under the USDA National Organic Program (NOP), including "100% Organic", "Organic", and "Made with Organic", are not covered by this Standard.

ANSI/NSF 305-2015 (i19r2), NSF/ANSI 305: Personal Care Products Containing Organic Ingredients

This Standard encourages participation in the manufacturing of personal care products using organically grown ingredients within the supply chain. It emphasizes open disclosure of impacts and benefits, and does not compromise proprietary, patented, or trade secret information. Production practices implemented in accordance with this Standard shall maintain or improve the natural resources of the operation, including soil and water quality. This Standard is to be used voluntarily by companies that may not be able to meet the current USDA organic food regulations.

ANSI/NSF 305-2015 (i21r4), Personal Care Products Containing Organic Ingredients

This Standard encourages participation in the manufacturing of personal care products using organically grown ingredients within the supply chain. It emphasizes open disclosure of impacts and benefits, and does not compromise proprietary, patented, or trade secret information. Production practices implemented in accordance with this Standard shall maintain or improve the natural resources of the operation, including soil and water quality. This Standard is to be used voluntarily by companies that may not be able to meet the current USDA organic food regulations.

ANSI/NSF 305-2016 (i26r1), Personal Care Products Containing Organic Ingredients

This Standard specifies materials, processes, production criteria, and conditions that shall be met in order for personal care products to make organic label and marketing claims under this Standard. This Standard intends to address products with a minimum organic content of 70% (O70).

ANSI/NSF 305-2016 (i28r1), Personal Care Products Containing Organic Ingredients

This Standard specifies materials, processes, production criteria, and conditions that shall be met in order for personal care products to make organic label and marketing claims under this Standard. This Standard intends to address products with a minimum organic content of 70% (O70).

ANSI/NSF 321-2010 (R2016), Goldenseal Root (Hydrastis canadensis)

The purpose of this Standard is to serve as an evaluation tool for analyzing the botanical dietary supplement Goldenseal Root (Hydrastis canadensis). NSF/ANSI 321 contains requirements for dietary supplements that contain goldenseal root as an ingredient. It allows for the determination that this botanical ingredient is accurately identified, that the product contains the quantity of dietary ingredients and marker constituents as determined by the American Herbal Pharmacopoeia (AHP), that the ingredient does not contain unacceptable quantities of contaminants, conforms to the compliance criteria of the AHP, and can be used to facilitate GMP compliance.

ANSI/NSF 320-2009 (i1), Glossary of drinking water treatment unit terminology

Issue 1 - The NSF Glossary of drinking water treatment unit terminology was developed as a means of ensuring greater consistency in the terminology used within the various NSF Drinking Water Treatment Unit Standards. The technical terms used in all NSF Drinking Water Treatment Unit Standards have been edited for consistency and compiled into this document. In addition, new definitions have been added as needed.

ANSI/NSF 330-2012 (i4), Glossary of drinking water treatment unit terminology

Multiple revisions are being proposed to NSF/ANSI 330: - a statement is being added to clarify the use of undated references (this statement is being added to all NSF Standards) and referenced standards are being added to Section 2, Normative references; - all definitions specific to NSF/ANSI 222, which is now maintained by the Joint Committee on Recreational Water Facilities, are being removed from this Standard; - all definitions of ‘rated service cycle’ and ‘service cycle’ are being revised; an - the definition of ‘unit void volume’ is being revised per the 2012 DWTU JC meeting to include the procedure used to establish the

ANSI/NSF 330-2013 (i3), Glossary of drinking water treatment unit terminology

Definitions covered by this Standard consist of terminology related to drinking water treatment units including terms describing materials, design, construction, and performance testing. This Standard includes definitions of terms used in NSF Drinking Water Treatment Unit Standards.

ANSI/NSF 330-2013 (i5), Glossary of Drinking Water Treatment Unit Terminology

The purpose of this Glossary is to provide a single resource containing all of the technical terms used in all NSF Drinking Water Treatment Unit Standards.

ANSI/NSF 330-2014 (i6r3), Glossary of Drinking Water Treatment Unit Terminology

Definitions covered by this Standard consist of terminology related to drinking water treatment units including terms describing materials, design, construction, and performance testing. This Standard includes definitions of terms used in NSF Drinking Water Treatment Unit Standards.

ANSI/NSF 330-2015 (i7r4), Glossary of Drinking Water Treatment Unit Terminology

This Standard establishes definitions for drinking water treatment units and related components.

ANSI/NSF 330-2015 (i8), Glossary of Drinking Water Treatment Unit Terminology

This Standard establishes definitions for drinking water treatment units and related components.

ANSI/NSF 332-2010 (i2 rev 3), Sustainability Assessment for Resilient Floor Coverings

Issue 2 revision 3 - changes to the proposed draft standard are included in this revision. As used in this Standard, ‘resilient floor coverings’ includes, but is not limited to, vinyl tile, vinyl composition tile, sheet vinyl, rubber, polymeric, and linoleum flooring products in which the wearing surface is non-textile. Also included are flooring accessories such as wall base, moldings, and stair treads. The Standard is applicable to products manufactured in one facility or multiple facilities, one country or multiple countries.

ANSI/NSF 332-2011 (i3), Sustainability Assessment for Resilient Flooring

Issue 3 - Revises the normative references throughout the standard.
ANSI/NSF 332‐2011 (i4), Sustainability Assessment for Resilient Flooring

Issue 4: The purpose of this ballot is to add a specific reference to the RoHS list in section 5.4.1 and clarify how to achieve points for section 5.4.3.

ANSI/NSF 332‐2011 (i6), Sustainability Assessment for Resilient Flooring

Issue 6 - The purpose of this ballot is to add language in section 6.4.2 Reduced water consumption.

ANSI/NSF 332‐2012 (i7r1), Sustainability Assessment for Resilient Flooring

Issue 7 - Review GHG inventory section 6.6 and update normative references.

ANSI/NSF 332‐2015 (i8r1), NSF/ANSI 332‐2012 Sustainability Assessment for Resilient Floor Coverings

This Standard establishes a consistent approach to the evaluation and determination of environmentally preferable and sustainable resilient floor coverings. The Standard includes relevant criteria across the product(s) life cycle from raw material extraction through manufacturing, use, and end-of-life management. As used in this Standard, “resilient floor coverings” includes, but is not limited to, vinyl tile, vinyl composition tile, sheet vinyl, rubber, polymeric, and linoleum flooring products in which the wearing surface is non‐textile. Also included are flooring accessories such as wall base, moldings, and stair treads. The Standard is applicable to products manufactured in one facility or multiple facilities, one country or multiple countries.

ANSI/NSF 336‐2011 (i1), Commercial Furnishings Fabric Sustainability Assessment

Issue 1: The standard received one negative vote during the ballot of the textiles standard at the CPHC that was not resolved. The purpose of this ballot is to alter 5.4.2.9 on Nylon Fibers to resolve that comment and negative vote. The commenter and response have been included with this ballot as a referenced item. Please see that item for further detail. Only the proposed change to section 5.4.2.9 is within the scope of this ballot.

ANSI/NSF 342‐2010 (i1), Sustainability Assessment for Wallcovering Manufacturing & Distribution

Issue 1 - The purpose of the sustainable assessment for Wallcovering products is to facilitate the thorough communication of information that is verifiable, accurate, and credible associated with the production, distribution, and use of wallcovering products.

ANSI/NSF 342‐2012 (i2r1), Sustainability Assessment for Wallcovering Products

Change the language in Section 7.3.1 and remove Section 7.3.3 from the document.

ANSI/NSF 342‐2012 (i2r2), Sustainability Assessment for Wallcovering Products

Change the language in Section 7.3.1 and remove Section 7.3.3 from the document.

ANSI/NSF 342‐2012 (i3r1), Sustainability Assessment for Wallcovering Products

Change the language in Section 7.3.1 and remove Section 7.3.3 from the document.

ANSI/NSF 342‐2012 (i4), Sustainability Assessment for Wallcovering Products

Change the language in Section 7.3.1 and remove Section 7.3.3 from the document.

ANSI/NSF 342‐2014 (i4), Sustainability Assessment for Wallcovering Products

The overall purpose of this Standard is to facilitate the thorough communication of information that is verifiable, accurate, and credible associated with the production, distribution, and use of wallcovering products. Such communication is expected to encourage the demand for and supply of products that cause less impact on the environment and society, thereby stimulating the potential for market‐driven continuous improvement. The standard is voluntary and encourages inclusive participation in the production and distribution of sustainable wallcovering products within the supply chain.

ANSI/NSF 342‐2014 (i5), Sustainability Assessment for Wallcovering Products

Issue 2: The purpose of this ballot is to revise language in Sections 7.2.2 and 8.2.2.2.

ANSI/NSF 342‐2014 (i6r1), Sustainability Assessment for Wallcovering Products

The overall purpose of this Standard is to facilitate the thorough communication of information that is verifiable, accurate, and credible associated with the production, distribution, and use of wallcovering products. Such communication is expected to encourage the demand for and supply of products that cause less impact on the environment and society, thereby stimulating the potential for market‐driven continuous improvement. The standard is voluntary and encourages inclusive participation in the production and distribution of sustainable wallcovering products within the supply chain.

ANSI/NSF 342‐2014 (i7r1), Sustainability Assessment for Wallcovering Products

The overall purpose of this Standard is to facilitate the thorough communication of information that is verifiable, accurate, and credible associated with the production, distribution, and use of wallcovering products. Such communication is expected to encourage the demand for and supply of products that cause less impact on the environment and society, thereby stimulating the potential for market‐driven continuous improvement. The standard is voluntary and encourages inclusive participation in the production and distribution of sustainable wallcovering products within the supply chain.

ANSI/NSF 342‐2012 (i2), Sustainability Assessment for Single Ply Roofing Membranes

Issue 2: The purpose of this ballot is to revise language in the following sections: 2.1 Normative References 2.2 Informative References 5.7 Post‐Consumer Single Ply Roofing Membrane Reclamation 5.8 Pre‐Consumer Single Ply Roofing Membrane Reclamation 6.5 Optimization of Material Resources 7.3 Durability 7.4 Membrane Surface Contribution 7.5.2 Quality Management System (QMS)

ANSI/NSF 35‐2007 (i3), High pressure decorative laminates (HPDL) for surfacing food equipment

Issue 3: To update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 35‐2009 (i5), High pressure decorative laminates for surfacing food service equipment

Issue 5: Normative references update

ANSI/NSF 35‐2012 (i6), High pressure decorative laminates (HPDL) for surfacing food service equipment

Issue 6 - The purpose of this ballot is to update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 350‐1‐2011 (i1), Onsite residential and commercial graywater treatment systems for subsurface discharge

Issue 1 - Revision 2: The overall purpose of this Standard is to establish minimum materials, design and construction, and performance requirements for onsite residential and commercial graywater treatment systems. It includes graywater only as the influent source, and treated effluent criteria suitable for outdoor restricted urban water use, such as subsurface irrigation.

ANSI/NSF 350‐1‐2013 (i4r2), Wastewater treatment systems - Onsite residential and commercial graywater treatment systems for subsurface discharge

Issue 4: The purpose of this ballot is to update the language in section 8.4.1 for consistency among wastewater standards. The change in section 9 addresses a comment on the ballot 40i20 regarding when adjustments to alkalinity are made, they are required to be reported.

ANSI/NSF 350‐1‐2013 (i4r3), Wastewater treatment systems - Onsite residential and commercial graywater treatment systems for subsurface discharge

Issue 4 revision 3: This is boilerplate for the wastewater treatment systems standards.
ANSI/NSF 350-1-2013 (i5), Onsite residential and commercial graywater treatment systems for subsurface discharge

This Standard contains minimum requirements for onsite residential and commercial graywater treatment systems. Graywater reuse treatment systems having a rated treatment capacity up to 5,678 L/day (1,500 gal/d). This applies to onsite residential and commercial reuse treatment systems that treat combined graywater, laundry water only from residential laundry facilities, and bathing water only.

Commercial graywater reuse treatment systems: This applies to onsite commercial reuse treatment systems that treat combined commercial facility graywater with capacities exceeding 5,678 L/day (1,500 gal/day) and commercial facility laundry water only of any capacity.

ANSI/NSF 350-2011 (i2), Onsite residential and commercial water reuse treatment systems

Issue 2 - Adds in the language that is included in 350-1 relating to concentration values for the challenge water after parameters are added. In addition, a correction to section 5 was made such that water tightness testing applies to all systems claiming conformance to the standard.

ANSI/NSF 350-2012 (i3), Wastewater treatment systems - Onsite residential and commercial water reuse treatment systems

Issue 3: The purpose of this ballot is to make the language relating to failure sensing equipment in the wastewater standards consistent as well as update it regarding the testing procedure.

ANSI/NSF 350-2013 (i4), Wastewater treatment systems - Onsite residential and commercial water reuse treatment systems

Issue 4: The purpose of this ballot is to update the language in section 8.4.1 for consistency among wastewater standards. The change in section 9 addresses a comment on the ballot 4020 regarding when adjustments to alkalinity are made, they are required to be reported.

ANSI/NSF 350-2013 (i4r3), Wastewater treatment systems - Onsite residential and commercial water reuse treatment systems

Issue 4 revision 3: This is boilerplate for the wastewater treatment systems standards.

ANSI/NSF 350-2013 (i5), Onsite residential and commercial reuse treatment systems

This Standard contains minimum requirements for onsite residential and commercial water treatment systems. Systems may include: Graywater treatment systems having a rated treatment capacity up to 5,678 L/day (1,500 gal/day). Residential wastewater treatment systems having a rated treatment capacity up to 5,678 L/day (1,500 gal/day). Commercial treatment systems that treat combined commercial facility wastewater and commercial facility laundry water of any capacity, and those treatment systems that treat graywater from commercial facilities with capacities exceeding 5,678 L/day (1,500 gal/day).

ANSI/NSF 350-2015 (i6r1), Wastewater treatment systems - Onsite residential and commercial water reuse treatment systems

This Standard contains minimum requirements for onsite residential and commercial water treatment systems.

ANSI/NSF 350-2016 (i11r1), Onsite residential and commercial water reuse treatment systems

This Standard contains minimum requirements for onsite residential and commercial water treatment systems.

ANSI/NSF 350-2017 (i15r1), Onsite Residential and Commercial Water Reuse Treatment Systems

This Standard contains minimum requirements for onsite residential and commercial water treatment systems.

ANSI/NSF 350-2017 (i9r1), Onsite Residential and Commercial Reuse Treatment Systems

This Standard contains minimum requirements for onsite residential and commercial water treatment systems.

ANSI/NSF 358-1-2014 (i2r1), Polyethylene Pipe and Fittings for Water-Based Ground-Source Geothermal Heat Pump Systems

This Standard establishes the minimum physical and performance requirements for plastic piping system components. These criteria were established for the protection of property, public health and the environment.

ANSI/NSF 358-1-2017 (i3), Polyethylene Pipe and Fittings for Water-Based Ground-Source Geothermal Heat Pump Systems

ANSI/NSF 358-2-2012, Polypropylene Pipe and Fittings for Water-Based Ground-Source Geothermal Heat Pump Systems

This proposed standard will be separated into four separate ballot documents based on material types. NSF 358-2 addresses products in polypropylene systems.

ANSI/NSF 358-3-2016 (i12r), Cross-Linked Polyethylene (PEX) Pipe and Fittings for Water-Based Ground-source (Geothermal) Heat Pump Systems

The physical and performance requirements in this Standard apply to plastic piping system components as well as non-plastic components of the ground loop heat exchanger including but not limited to cross-linked polyethylene (PEX) pipes and fittings used in water-based ground-source heat pump systems.

ANSI/NSF 358-3-2016 (i2r1), NSF/ANSI 358-3 Cross-linked Polyethylene (PEX) Pipe and Fittings for Water-Based Ground-Source (Geothermal) Heat Pump Systems

The physical and performance requirements in this Standard apply to plastic piping system components as well as non-plastic components of the ground loop heat exchanger including but not limited to cross-linked polyethylene (PEX) pipes and fittings used in water-based ground-source heat pump systems.

ANSI/NSF 358-111-2011 (i1), Valves for Crosslinked Polyethylene (PEX) Water Distribution Tubing Systems

Issue 1: To establish a standard for testing inline valves.

ANSI/NSF 358-116 , Valves for crosslinked polyethylene (PEX) water distribution tubing systems

This Standard covers components intended for use in residential and commercial, hot and cold, potable water distribution systems; and sealed central heating, including under-floor heating systems. This Standard excludes supply stops and fixture fittings (faucets).

ANSI/NSF 36-2007 (i4), Dinnerware

Issue 4: To update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 36-2009 (i5), Dinnerware

Issue 5 - Boilerplate revisions in the family of food equipment standards including normative references.

ANSI/NSF 36-2012 (i6), Dinnerware

Issue 6 - The purpose of this ballot is to update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 360-2010, NSF 360 Field Performance Evaluation

NSF 360 - Field Performance Verification was developed as a means to properly evaluate the performance of residential wastewater treatment systems under field conditions. Establishment of a national standard ensures a single, comprehensive method for properly conducting independent field performance studies, and enables broad acceptance of data to minimize redundant efforts.
ANSI/NSF 360-2014 (i2r1), Field Performance Verification

This wastewater standard provides site selection, field sampling, analytical, and statistical methods for evaluating the field performance of residential wastewater treatment systems capable of providing at least secondary treatment.

ANSI/NSF 363-2016 (i2r1), Good Manufacturing Practices (GMP) for Pharmaceutical Excipients

The purpose of NSF/IPEC/ANSI 363 is to serve as an evaluation tool for analyzing pharmaceutical excipients. Certification to this Standard serves as a communication tool between manufacturers of excipients and finished product, pharmaceutical regulators, pharmacy organizations, and consumers. This Standard provides guidance to allow for the determination that a pharmaceutical excipient is within the specifications stated by the manufacturer, either qualitatively or quantitatively, and that it does not contain specific undeclared contaminants. In some instances, validated laboratory methods are not yet available for analyzing certain ingredients.

ANSI/NSF 363-2016 (i3r1), Good Manufacturing Practices (GMP) for Pharmaceutical Excipients

The purpose of NSF/IPEC/ANSI 363 is to serve as an evaluation tool for analyzing pharmaceutical excipients. Certification to this Standard serves as a communication tool between manufacturers of excipients and finished product, pharmaceutical regulators, pharmacy organizations, and consumers. This Standard provides guidance to allow for the determination that a pharmaceutical excipient is within the specifications stated by the manufacturer, either qualitatively or quantitatively, and that it does not contain specific undeclared contaminants. In some instances, validated laboratory methods are not yet available for analyzing certain ingredients.

ANSI/NSF 363-2016 (i4r2), NSF 363-2014 Good Manufacturing Practices(GMP) for Pharmaceutical Excipients

The purpose of NSF/IPEC/ANSI 363 is to serve as an evaluation tool for analyzing pharmaceutical excipients. Certification to this Standard serves as a communication tool between manufacturers of excipients and finished product, pharmaceutical regulators, pharmacy organizations, and consumers. This Standard provides guidance to allow for the determination that a pharmaceutical excipient is within the specifications stated by the manufacturer, either qualitatively or quantitatively, and that it does not contain specific undeclared contaminants. In some instances, validated laboratory methods are not yet available for analyzing certain ingredients.

ANSI/NSF 363-2016 (i5r1), Good Manufacturing Practices (GMP) for Pharmaceutical Excipients

The purpose of NSF/IPEC/ANSI 363 is to serve as an evaluation tool for analyzing pharmaceutical excipients. Certification to this Standard serves as a communication tool between manufacturers of excipients and finished product, pharmaceutical regulators, pharmacy organizations, and consumers. This Standard provides guidance to allow for the determination that a pharmaceutical excipient is within the specifications stated by the manufacturer, either qualitatively or quantitatively, and that it does not contain specific undeclared contaminants. In some instances, validated laboratory methods are not yet available for analyzing certain ingredients.

ANSI/NSF 363-2016 (i6r1), NSF 363-2014 Good Manufacturing Practices(GMP) for Pharmaceutical Excipients

The purpose of NSF/IPEC/ANSI 363 is to serve as an evaluation tool for analyzing pharmaceutical excipients. Certification to this Standard serves as a communication tool between manufacturers of excipients and finished product, pharmaceutical regulators, pharmacy organizations, and consumers. This Standard provides guidance to allow for the determination that a pharmaceutical excipient is within the specifications stated by the manufacturer, either qualitatively or quantitatively, and that it does not contain specific undeclared contaminants. In some instances, validated laboratory methods are not yet available for analyzing certain ingredients.

ANSI/NSF 363-2016 (i7r1), Good Manufacturing Practices (GMP) for Pharmaceutical Excipients

The purpose of NSF/IPEC/ANSI 363 is to serve as an evaluation tool for analyzing pharmaceutical excipients. Certification to this Standard serves as a communication tool between manufacturers of excipients and finished product, pharmaceutical regulators, pharmacy organizations, and consumers. This Standard provides guidance to allow for the determination that a pharmaceutical excipient is within the specifications stated by the manufacturer, either qualitatively or quantitatively, and that it does not contain specific undeclared contaminants. In some instances, validated laboratory methods are not yet available for analyzing certain ingredients.

ANSI/NSF 363-2016 (i8r1), Good Manufacturing Practices (GMP) for Pharmaceutical Excipients

The purpose of NSF/IPEC/ANSI 363 is to serve as an evaluation tool for analyzing pharmaceutical excipients. Certification to this Standard serves as a communication tool between manufacturers of excipients and finished product, pharmaceutical regulators, pharmacy organizations, and consumers. This Standard provides guidance to allow for the determination that a pharmaceutical excipient is within the specifications stated by the manufacturer, either qualitatively or quantitatively, and that it does not contain specific undeclared contaminants. In some instances, validated laboratory methods are not yet available for analyzing certain ingredients.

ANSI/NSF 363-2016 (i9r1), NSF 363-2014 Good Manufacturing Practices(GMP) for Pharmaceutical Excipients

The purpose of NSF/IPEC/ANSI 363 is to serve as an evaluation tool for analyzing pharmaceutical excipients. Certification to this Standard serves as a communication tool between manufacturers of excipients and finished product, pharmaceutical regulators, pharmacy organizations, and consumers. This Standard provides guidance to allow for the determination that a pharmaceutical excipient is within the specifications stated by the manufacturer, either qualitatively or quantitatively, and that it does not contain specific undeclared contaminants. In some instances, validated laboratory methods are not yet available for analyzing certain ingredients.

ANSI/NSF 363-2017 (i10r1), Good Manufacturing Practices (GMP) for Pharmaceutical Excipients

The purpose of NSF/IPEC/ANSI 363 is to serve as an evaluation tool for analyzing pharmaceutical excipients. Certification to this Standard serves as a communication tool between manufacturers of excipients and finished product, pharmaceutical regulators, pharmacy organizations, and consumers. This Standard provides guidance to allow for the determination that a pharmaceutical excipient is within the specifications stated by the manufacturer, either qualitatively or quantitatively, and that it does not contain specific undeclared contaminants. In some instances, validated laboratory methods are not yet available for analyzing certain ingredients.

ANSI/NSF 37-2007 (i3), Air curtains for entranceways in food and food service establishments

Issue 3: To update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 37-2009 (i4), Air curtains for entranceways in food and food service establishments

Issue 4 - Boilerplate revisions in the family of food equipment standards including normative references.

ANSI/NSF 37-2012 (i5), Air curtains for entranceways in food and food service establishments

Issue 5 - The purpose of this ballot is to update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 37-2017 (i6r6), Air Curtain for Entranceways for Food and Food Service Establishments

Equipment covered by this Standard includes, but is not limited to, air curtains for entranceways in food and food service establishments (e.g., service and customer entries, service windows, cooler and cold storage entries). Housing, air moving equipment, air directional regulating devices, and other appurtenances to the air curtain are included.

ANSI/NSF 372-2010 (i1r2), Drinking Water System Components - Lead Content
Issue 1: To establish a new standard to house the lead content evaluation procedures currently located in NSF/ANSI 61, Annex G.

ANSI/NSF 372-2011 (i2), Drinking Water System Components Lead Contents
This proposed revision to NSF/ANSI 372 clarifies the intent and application of the criterion for the percentage of internal threads that are to be evaluated as wetted (25%) under section 4.

ANSI/NSF 372-2016 (i4r1), Drinking Water System Components - Lead Content
This standard establishes procedures for the determination of lead content based on the wetted surface areas of products.

ANSI/NSF 375-2015 (i1r2), Sustainability Assessment for Water Contact Products
This sustainability standard covers products that contact drinking water, wastewater, and recreational water and their packaging. The document includes relevant criteria across the product(s) life cycle from raw material extraction through manufacturing, use, and end-of-life management. The Standard may be primarily used by water contact product(s) manufacturers interested in understanding the sustainability performance of their product(s).

ANSI/NSF 4-2007 (i12), Commercial cooking, rethermalization, and powered hot food holding and transport equipment
Issue 12 - To update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 4-2009 (i16), Commercial cooking, rethermalization, and powered hot food holding and transport equipment
Issue 16 - Boilerplate updates in the family of food equipment including normative references.

ANSI/NSF 4-2011 (i17), Commercial cooking, rethermalization, and powered hot food holding and transport equipment
Issue 17 - The purpose of this ballot is clarify the requirements in section 5.43 drains in steam tables and bains-marie units and to modified the error in 1999.

ANSI/NSF 4-2014 (i18r3), Commercial Cooking, Rethermalization, and Powered Hot Food Holding and Transportation Equipment
Equipment covered by this Standard includes, but is not limited to, ranges, ovens, fat/oil fryers, fat/oil filters, griddles, tilting griddle skillets, broilers, steam and pressure cookers, kettles, rotissieres, toasters, coffee makers and other hot beverage makers, component water heating equipment, proofing boxes and cabinets, hot food holding equipment, rethermalization equipment, and hot food transport cabinets.

ANSI/NSF 4-2016 (i18r4), Commercial Cooking, Rethermalization, and Powered Hot Food Holding and Transportation Equipment
Equipment covered by this Standard includes, but is not limited to, ranges, ovens, fat/oil fryers, fat/oil filters, griddles, tilting griddle skillets, broilers, steam and pressure cookers, kettles, rotissieres, toasters, coffee makers and other hot beverage makers, component water heating equipment, proofing boxes and cabinets, hot food holding equipment, rethermalization equipment, and hot food transport cabinets.

ANSI/NSF 4-2016 (i23r1), Commercial Cooking, Rethermalization, and Powered Hot Food Holding and Transportation Equipment
Equipment covered by this Standard includes, but is not limited to, ranges, ovens, fat/oil fryers, fat/oil filters, griddles, tilting griddle skillets, broilers, steam and pressure cookers, kettles, rotissieres, toasters, coffee makers and other hot beverage makers, component water heating equipment, proofing boxes and cabinets, hot food holding equipment, rethermalization equipment, and hot food transport cabinets.

ANSI/NSF 4-2016 (i24r4), Commercial Cooking, Rethermalization, and Powered Hot Food Holding and Transportation Equipment
Equipment covered by this Standard includes, but is not limited to, ranges, ovens, fat/oil fryers, fat/oil filters, griddles, tilting griddle skillets, broilers, steam and pressure cookers, kettles, rotissieres, toasters, coffee makers and other hot beverage makers, component water heating equipment, proofing boxes and cabinets, hot food holding equipment, rethermalization equipment, and hot food transport cabinets.

ANSI/NSF 40-2009 (i19), Residential wastewater treatment systems
Issue 19: To clarify in 8.5.1.5, which spells out the details for performance testing, that samples are to be taken during the stress recovery period, not the stress loading period.

ANSI/NSF 40-2010 (i22), Residential wastewater treatment systems
Issue 22: The purpose of this ballot is to update the Normative References in several of the Wastewater Treatment Standards.

ANSI/NSF 40-2012 (i20), Residential wastewater treatment systems
Issue 20 - The purpose of this ballot is to harmonize the alkalinity parameters in NSF/ANSI 40 to that of NSF/ANSI 245 - Nitrogen Reduction.

ANSI/NSF 40-2012 (i25r2), Residential wastewater treatment systems
Issue 25 revision 2: The purpose of this ballot is to make the language relating to failure sensing equipment in the wastewater standards consistent as well as update it regarding the testing procedure. This revision incorporates comments received on revision 1.

ANSI/NSF 40-2013 (i26r3), Residential Wastewater Treatment Systems
The purpose of this ballot is to update the language in section 8.4.1 for consistency among wastewater standards. The change in section 9 addresses a comment on the ballot 40i20 regarding when adjustments to alkalinity are made, they are required to be reported.

ANSI/NSF 401-2016 (i3r1), Drinking water treatment units - Emerging compounds/incidental contaminants
The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of drinking water treatment systems that are designed to reduce emerging compounds in public or private water supplies, such as pharmaceutical, personal care products (PPCPs), and endocrine disrupting compounds (EDCs).

ANSI/NSF 401-2016 (i6r1), NSF 401-2016 - Drinking water treatment units - Emerging compounds/incidental contaminants
The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of drinking water treatment systems that are designed to reduce emerging compounds in public or private water supplies, such as pharmaceutical, personal care products (PPCPs), and endocrine disrupting compounds (EDCs).

ANSI/NSF 401-2016 (i7r1), Drinking water treatment units - Emerging compounds/incidental contaminants
The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of drinking water treatment systems that are designed to reduce emerging compounds in public or private water supplies, such as pharmaceutical, personal care products (PPCPs), and endocrine disrupting compounds (EDCs).

ANSI/NSF 401-2016 (i5r1), Drinking water treatment units - Emerging compounds/incidental contaminants
The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of drinking water treatment systems that are designed to reduce emerging compounds in public or private water supplies, such as pharmaceutical, personal care products (PPCPs), and endocrine disrupting compounds (EDCs).

ANSI/NSF 401-2017 (i5r1), Drinking water treatment units - Emerging compounds/incidental contaminants
The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of drinking water treatment systems that are designed to reduce emerging compounds in public or private water supplies, such as pharmaceutical, personal care products (PPCPs), and endocrine disrupting compounds (EDCs).
ANSI/NSF 401-2017 (i8r1), Drinking water treatment units - Emerging compounds/incidental contaminants

The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of drinking water treatment systems that are designed to reduce emerging compounds in public or private water supplies, such as pharmaceutical, personal care products (PPCPs), and endocrine disrupting compounds (EDCs).

ANSI/NSF 41-2011 (i5), Non-liquid saturated treatment systems

Issue 41 - Revision 2: This revision is only to update the normative references.

ANSI/NSF 41-2016 (i7r1), Non-liquid Saturated Treatment Systems

This Standard contains minimum requirements for treatment systems that do not utilize a liquid saturated media as a primary means of storing or treating human excreta or human excreta mixed with other organic household materials. It addresses treatment systems that treat both solid and liquid waste, as well as those that only treat solid waste. Management methods for the end products of these systems are not addressed by this Standard.

ANSI/NSF 416-2014 (i1r4), Sustainability Assessment for Water Treatment Chemical Products

This sustainability standard establishes a consistent approach to the evaluation and determination of environmentally preferable and sustainable chemical processes for water treatment chemical products. Many of these water treatment chemicals are used for public health protection. The document includes relevant criteria across the product(s) life cycle from raw material extraction through manufacturing, use, and end-of-life management.

ANSI/NSF 416-2014 (i2r1), Sustainability Assessment for Water Treatment chemical products

This sustainability standard establishes a consistent approach to the evaluation and determination of environmentally preferable and sustainable chemical processes for water treatment chemical products. Many of these water treatment chemicals are used for public health protection. The document includes relevant criteria across the product(s) life cycle from raw material extraction through manufacturing, use, and end-of-life management.

ANSI/NSF 418-2014 (i1r1), Effluent Filters Field Longevity Testing

The purpose of this standard is to establish consistent site selection and data evaluation methods for obtaining field longevity results for septic tank effluent filters.

ANSI/NSF 419-2015 (i1r3), Public Drinking Water Equipment Performance - Filtration

This standard is designed to describe the performance evaluation test procedure for the product specific challenge testing of full scale UF and MF membrane modules, bag filters, and cartridge filters for the removal of microbial contaminants.

ANSI/NSF 42-2007 (i50), Drinking water treatment units – Aesthetic Effects

Issue 50: To enable point-of-entry (POE) drinking water treatment systems to be covered by NSF/ANSI 61 & to use this universal materials safety standard for POE drinking water treatment units.

ANSI/NSF 42-2007 (i51), Drinking water treatment units - Aesthetic Effects

Issue 51 - To revise requirements for filter media.

ANSI/NSF 42-2007 (i52), Drinking water treatment units - Aesthetic Effects

Issue 52: To establish sample sizes for mechanical reduction tests other than cyst reduction.

ANSI/NSF 42-2007 (i56), Drinking water treatment units - Aesthetic effects

Issue 56 - To clarify that the active agent levels from two units will be evaluated against levels of toxicological significance in 6.12 - Active agents and additives, and will not be evaluated during extraction testing.

ANSI/NSF 42-2007 (i57), Drinking water treatment units - Aesthetic effects

Issue 57 - to set the influent organism limits in the Bacteriostatic test to values that are achievable without unusual means to control bacterial growth, but that still allow the proper evaluation of the bacteriostatic properties of products.

ANSI/NSF 42-2007 (i59), Drinking water treatment Units - Aesthetic effects

Issue 59 - to include USEPA methods 524.2 and 525.2 in Tables 1 and 2 and include language to ensure when using the GC/MS (method 625) an adequate analytical library has been developed.

ANSI/NSF 42-2007 (i60), Drinking water treatment Units - Aesthetic effects

Issue 60 - The proposed revision recommends not testing for CLASS III along with CLASSES I and II and to test CLASS III using only ISO coarse test dust, changing the flow reduction from 75% to 50%; and clarifying the language in 7.4.8.1 for sampling.

ANSI/NSF 42-2007 (i61), Drinking water treatment units - aesthetic effects

Issue 61: The proposed revision is to lower the maximum contaminant concentration (MCC) for lead for material extraction testing from 0.015 mg/L to 0.010 mg/L in Table 1 of the Drinking Water Treatment Unit Standards.

ANSI/NSF 42-2008 (i55), Drinking water treatment units - Aesthetic effects

Issue 55: The proposed revision is to allow the chloramines reduction test water to contain &math#8805; 0.2 mg/L organic nitrogen, if the analytical validation is conducted in such water.

ANSI/NSF 42-2008 (i62), Drinking water treatment units - Aesthetic effects

Issue 62 - To clarify the formulation review requirements and provide consistency between the Drinking Water treatment Unit Standards and NSF/ANSI 60 and NSF/ANSI 61.

ANSI/NSF 42-2009 (i64), Drinking Water Treatment Units - Aesthetic effects

Issue 64 - The proposed revision is to revise the criteria for laboratory evaluation of filter media.

ANSI/NSF 42-2009 (i66), Drinking Water Treatment Units - Aesthetic effects

Issue 66 - The proposed revision is to revise the procedure for collection of effluent samples when conducting mechanical reduction tests.

ANSI/NSF 42-2010 (i67), Drinking Water Treatment Units - Aesthetic effects

Issue 67 - The proposed revision is to correct an error that occurred during the reformatting of NSF/ANSI Standard 42 chlorine, chloride, sulfate, TDS, foaming agent, hydrogen sulfide, phenol, and pH test methods.

ANSI/NSF 42-2011 (i68), Drinking Water Treatment Units - Aesthetic effects

Issue 68 - The proposed revision is to clarify the rated service flow requirement by not allowing a rated service flow to be less than the required minimum service flow.

ANSI/NSF 42-2011 (i69), Drinking Water Treatment Units - Aesthetic Effects

Issue 69 - The proposed revision is to remove the filter media test from the minimum performance requirements (section 6).

ANSI/NSF 42-2012 (i71), Drinking Water Treatment Units - Aesthetic Effects

Issue 71: The proposed revision is to remove the component burst pressure test requirement from section 5 of the family of DWTU Standards.

ANSI/NSF 42-2012 (i72), Drinking Water Treatment Units - Aesthetic Effects

The proposed revision will remove the retesting requirement for contaminants that exceed the non-health based advisory concentration under section 4.2.3.6.

ANSI/NSF 42-2012 (i76), Drinking water treatment units - aesthetic effects

The proposed revision is to clarify under section 8 of NSF/ANSI 42 and NSF/ANSI 53, and section 7.1.1 of NSF/ANSI 58 (VOC reduction claims) that each certified system may only make a single capacity claim based on the lowest reduction capacity in any standard to which the model is certified.

ANSI/NSF 42-2013 (i74), Drinking Water Treatment Units - Aesthetic Effects

The point-of-use and point-of-entry systems addressed by this Standard are designed to be used for the reduction of specific substances that may be present in drinking water (public or private) that affect the aesthetic quality of water.
ANSI/NSF 42-2013 (i78), Drinking Water Treatment Units - Aesthetic Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of point-of-use and point-of-entry drinking water treatment systems that are designed to reduce specific aesthetic contaminants in public or private water supplies.

ANSI/NSF 42-2014 (i79r2), Drinking Water Treatment Units - Aesthetic Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of drinking water treatment systems that are designed to reduce specific aesthetic-related (non-health effects) contaminants in public or private water supplies. This Standard also specifies the minimum service-related obligations that the manufacturer shall extend to system owners.

ANSI/NSF 42-2014 (i80r1), Drinking Water Treatment Units - Aesthetic Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of drinking water treatment systems that are designed to reduce specific aesthetic-related (non-health effects) contaminants in public or private water supplies. This Standard also specifies the minimum product literature and labeling information that a manufacturer shall supply to authorized representatives and system owners as well as the minimum service-related obligations that the manufacturer shall extend to system owners.

ANSI/NSF 42-2015 (i73r5), Drinking Water Treatment Units - Aesthetic Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of drinking water treatment systems that are designed to reduce specific aesthetic-related (non-health effects) contaminants in public or private water supplies. This Standard also specifies the minimum product literature and labeling information that a manufacturer shall supply to authorized representatives and system owners as well as the minimum service-related obligations that the manufacturer shall extend to system owners.

ANSI/NSF 42-2015 (i82r1), Drinking Water Treatment Units - Aesthetic Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of drinking water treatment systems that are designed to reduce specific aesthetic-related (non-health effects) contaminants in public or private water supplies. This Standard also specifies the minimum product literature and labeling information that a manufacturer shall supply to authorized representatives and system owners as well as the minimum service-related obligations that the manufacturer shall extend to system owners.

ANSI/NSF 42-2015 (i83r2), Drinking Water Treatment Units - Aesthetic Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of drinking water treatment systems that are designed to reduce specific aesthetic-related (non-health effects) contaminants in public or private water supplies. This Standard also specifies the minimum product literature and labeling information that a manufacturer shall supply to authorized representatives and system owners as well as the minimum service-related obligations that the manufacturer shall extend to system owners.

ANSI/NSF 42-2015 (i84), Drinking Water Treatment Systems - Aesthetic Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of drinking water treatment systems that are designed to reduce specific aesthetic-related (non-health effects) contaminants in public or private water supplies. This Standard also specifies the minimum product literature and labeling information that a manufacturer shall supply to authorized representatives and system owners as well as the minimum service-related obligations that the manufacturer shall extend to system owners.

ANSI/NSF 42-2015 (i85), Drinking Water Treatment Systems - Aesthetic Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of drinking water treatment systems that are designed to reduce specific aesthetic-related (non-health effects) contaminants in public or private water supplies. This Standard also specifies the minimum product literature and labeling information that a manufacturer shall supply to authorized representatives and system owners as well as the minimum service-related obligations that the manufacturer shall extend to system owners.

ANSI/NSF 42-2016 (i75r1), Drinking Water Treatment Units - Aesthetic Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of drinking water treatment systems that are designed to reduce specific aesthetic-related (non-health effects) contaminants in public or private water supplies. This Standard also specifies the minimum product literature and labeling information that a manufacturer shall supply to authorized representatives and system owners as well as the minimum service-related obligations that the manufacturer shall extend to system owners.

ANSI/NSF 42-2016 (i92r1), NSF 42-2016 - Drinking Water Treatment Units - Aesthetic Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of drinking water treatment systems that are designed to reduce specific aesthetic-related (non-health effects) contaminants in public or private water supplies. This Standard also specifies the minimum product literature and labeling information that a manufacturer shall supply to authorized representatives and system owners as well as the minimum service-related obligations that the manufacturer shall extend to system owners.

ANSI/NSF 42-2017 (i91r1), Drinking Water Treatment Units - Aesthetic Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of drinking water treatment systems that are designed to reduce specific aesthetic-related (non-health effects) contaminants in public or private water supplies. This Standard also specifies the minimum product literature and labeling information that a manufacturer shall supply to authorized representatives and system owners as well as the minimum service-related obligations that the manufacturer shall extend to system owners.

ANSI/NSF 44-2007 (i24), Residential cation exchange water softeners

Issue 24 - To enable point-of-entry (POE) drinking water treatment systems to be covered by NSF/ANSI 61 and to use this universal materials safety standard for POE drinking water treatment units.

ANSI/NSF 44-2007 (i26), Residential cation exchange water softeners

Issue 26 - The purpose of this proposal is to update the pass/fail criteria levels in Tables 1 and 2 for cyclohexanone, methyl ethyl ketone, carbon disulfide, diethylene glycol, di-n-butyl phthalate, butyl benzyl phthalate, naphthalene, acetonitrile, and 1,4-dioxane to match the levels in NSF/ANSI 61.

ANSI/NSF 44-2007 (i27), Residential cation exchange water softeners

Issue 27 - to include USEPA methods 524.2 and 525.2 in Tables 1 and 2 and include language to ensure when using the GC/MS (method 625) an adequate analytical library has been developed.

ANSI/NSF 44-2007 (i28), Residential cation exchange water softeners

Issue 28: The proposed revision is to lower the maximum contaminant concentration (MCC) for lead for material extraction testing from 0.015 mg/L to 0.010 mg/L in Table 1 of the Drinking Water Treatment Unit Standards.

ANSI/NSF 44-2007 (i29), Residential cation exchange water softeners

Issue 29 - To clarify the formulation review requirements and provide consistency between the Drinking Water treatment Unit Standards and NSF/ANSI 60 and NSF/ANSI 61.
ANSI/NSF 44-2012 (i33), Residential Cation Exchange Water Softeners

Issue 33: The proposed revision is to remove the component burst pressure test requirement from section 5 of the family of DWTU Standards.

ANSI/NSF 44-2012 (i34), Residential Cation Exchange Water Softeners

The proposed revision will remove the retesting requirement for contaminants that exceed the non-health based advisory concentration under section 4.2.3.6.

ANSI/NSF 44-2014 (i35), Residential Cation Exchange Water Softeners

The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of residential cation exchange water softeners.

ANSI/NSF 44-2014 (i36r1), Residential Cation Exchange Water Softeners

The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of residential cation exchange water softeners. This Standard also specifies the minimum product literature that manufacturers shall supply to authorized representatives and owners, as well as the minimum service-related obligations that manufacturers shall extend to owners.

ANSI/NSF 44-2015 (i37r1), Residential Cation Exchange Water Softeners

The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of residential cation exchange water softeners. This Standard also specifies the minimum product literature that manufacturers shall supply to authorized representatives and owners, as well as the minimum service-related obligations that manufacturers shall extend to owners.

ANSI/NSF 44-2015 (i38r2), Residential Cation Exchange Water Softeners

The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of residential cation exchange water softeners. This Standard also specifies the minimum product literature that manufacturers shall supply to authorized representatives and owners, as well as the minimum service-related obligations that manufacturers shall extend to owners.

ANSI/NSF 44-2015 (i39), Residential Cation Exchange Water Softeners

The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of residential cation exchange water softeners. This Standard also specifies the minimum product literature that manufacturers shall supply to authorized representatives and owners, as well as the minimum service-related obligations that manufacturers shall extend to owners.

ANSI/NSF 44-2016 (i41r1), NSF 44-2016 - Residential Cation Exchange Water Softeners

The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of residential cation exchange water softeners. This Standard also specifies the minimum product literature that manufacturers shall supply to authorized representatives and owners, as well as the minimum service-related obligations that manufacturers shall extend to owners.

ANSI/NSF 44-2017 (i42r1), Residential Cation Exchange Water Softeners

The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of residential cation exchange water softeners. This Standard also specifies the minimum product literature that manufacturers shall supply to authorized representatives and owners, as well as the minimum service-related obligations that manufacturers shall extend to owners.

ANSI/NSF 46-2007 (i14), Evaluation of components and devices used in wastewater treatment systems

Issue 14: To incorporate a buoyancy test method into section 10.4.5, Bypass Protection Test, and to include two particle size specifications for effluent filters; 1/8th inch and 1/16th inch.

ANSI/NSF 46-2007, Addendum 1 (i16), Evaluation of components and devices used in wastewater treatment systems

Issue 16: To modify the language to require the use of the geometric mean rather than the arithmetic average for fecal coliform analysis.

ANSI/NSF 46-2009 (i17), Evaluation of components and devices used in wastewater treatment systems

Issue 17: To update the temperature specifications for influent wastewater characteristics for testing according to Section 11.6.2.2.2.

ANSI/NSF 46-2009 (i18), Evaluation of components and devices used in wastewater treatment systems

Issue 18: To remove section 11.4.1 relating to noise levels of chlorinators.

ANSI/NSF 46-2010 (i20), Evaluation of components and devices used in wastewater treatment systems

Issue 20: The purpose of this ballot is to update the Normative References in several of the Wastewater Treatment Standards.

ANSI/NSF 46-2012 (i21), Evaluation of components and devices used in wastewater treatment systems

Issue 21: The purpose of this ballot is to make the language relating to failure sensing equipment in the wastewater standards consistent as well as update it regarding the testing procedure.

ANSI/NSF 46-2013 (i22r2), Evaluation of components and devices used in wastewater treatment systems

This Standard is intended for use with components and devices not covered by other NSF wastewater standards. Components and devices covered by this Standard are intended for use with greywater or blackwater or both. Management methods for the end-products of these components and devices are not addressed in this Standard. This Standard shall in no way restrict new system designs, provided that such designs meet the minimum specifications described herein.

ANSI/NSF 46-2014 (i24r1), Plumbing System Components for Recreational Vehicles

This Standard covers pipe, fittings, valves, traps, vents, tanks, pumps, connectors, fixtures, appliances, and similar appurtenances used in a plumbing system of a recreational vehicle.

ANSI/NSF 46-2014 (i25r1), Evaluation of Components Used in Wastewater Treatment Systems

This Standard is intended for use with components and devices not covered by other NSF wastewater standards. Components and devices covered by this Standard are intended for use with greywater or blackwater or both. Management methods for the end-products of these components and devices are not addressed in this Standard. This Standard shall in no way restrict new system designs, provided that such designs meet the minimum specifications described herein.

ANSI/NSF 46-2014 (i26r1), Evaluation of Components Used in Wastewater Treatment Systems

This Standard is intended for use with components and devices not covered by other NSF wastewater standards. Components and devices covered by this Standard are intended for use with greywater or blackwater or both. Management methods for the end-products of these components and devices are not addressed in this Standard. This Standard shall in no way restrict new system designs, provided that such designs meet the minimum specifications described herein.

ANSI/NSF 46-2015 (i28r1), Evaluation of Components and Devices Used in Wastewater Treatment Systems

This Standard is intended for use with components and devices not covered by other NSF wastewater standards. Components and devices covered by this Standard are intended for use with greywater or blackwater or both. Management methods for the end-products of these components and devices are not addressed in this Standard. This Standard shall in no way restrict new system designs, provided that such designs meet the minimum specifications described herein.
such designs meet the minimum specifications no way restrict new system designs, provided that Revision 2 has clarification to the location of the process for aerosol introduction point information.

class II biosafety cabinets.

consistency throughout the standard.

to be consistent with background noise levels.

ANSI/NSF 49

paragraph of F.1.

and to correct the referenced year in the first

Issue 35

ANSI/NSF 49

updated for consistency with Annex A.

Issue 28

ANSI/NSF 49

standard.

Issue 27

ANSI/NSF 49

language in Annex F, section F.1.1 in NSF/ANSI 49.

Issue 26

ANSI/NSF 49

same language is already part of Annex F (F.7.3.3):.

‐ Issue 19

Revise Noise Level Test acceptance criteria to be consistent with background noise levels.

‐ Issue 20

To add language in the Section F.7.3.2 for consistency throughout the standard.

‐ Issue 12

To add in Section 3.13 specification for use in class II biosafety cabinets.

‐ Issue 13

To add in Section 3.4.2.2 clarification language.

‐ Issue 14

Concurrent Balance Definition This revision added the reference to ASHRAE Standard 111-1988.

‐ Issue 15

Biosafety Cabinetry: Design, Construction, Performance, and Field Certification

Issue 15- To add in the standard a listing process for aerosol introduction point information.

‐ Issue 12r2

Biosafety Cabinetry: Design, Construction, Performance, and Field Certification

Issue 15- revision 2 To add in the standard a listing process for aerosol introduction point information. Revision 2 has clarification to the location of the engineering schematic.

‐ Issue 16

Biosafety cabinetry

Issue 17- To add in section F.7.3.2 interlock requirements for both type B cabinets.

‐ Issue 18

To add language in F.1 regarding downflow velocity readings.

‐ Issue 26

To update the reported values in Annex A and F and throughout the standard where necessary.

‐ Issue 30

Class II (laminar flow) biosafety cabinetry

‐ Issue 34

Biosafety Cabinetry: Design, Construction, Performance, and Field Certification

Issue 34- Acceptance Statements in Annex F will be updated for consistency with Annex A.

‐ Issue 35

Biosafety Cabinetry: Design, Construction, Performance, and Field Certification

Issue 35-The purpose of this ballot is to add the definition of w.g. to the standard; to update the UL reference throughout the standard where necessary; and to correct the referenced year in the first paragraph of F.1.

‐ Issue 36

Biosafety Cabinetry: Design, Construction, Performance, And Field Certification

Issue 36 - The purpose of this ballot is to update section 5.4 with the definition of A1 cabinets.

‐ Issue 23

Biosafety Cabinetry: Design, Construction, Performance, and Field Certification

Issue 23 - to disallow certification of direct connected Type A biosafety cabinets

‐ Issue 29

Biosafety Cabinetry: Design, Construction, Performance, and Field Certification

Issue 29 - The purpose of this ballot is to revise sections relating to uniform and zoned downflow.

‐ Issue 37

Biosafety Cabinetry: Design, Construction, Performance, and Field Certification

Issue 37 - The purpose of this ballot is to update illustrations, references and additional material on decontamination as well as organization of the informational annexes in the standard.

‐ Issue 41

The purpose of this ballot is to modify NSF/ANSI 49 to be more inclusive of markets outside North America by modifying Section 6 - Performance of the Standard.

‐ Issue 27

The purpose of this ballot is to update the Class I and III definitions in the NSF/ANSI 49 Standard.

‐ Issue 42

Biosafety Cabinetry: Design, Construction, Performance and Field Certification

Issue 42: The purpose of this ballot is to update language in Annex F, section F.1.1 in NSF/ANSI 49.

‐ Issue 43

Biosafety Cabinetry: Design, Construction, Performance and Field Certification

Issue 43: The purpose of this ballot is to provide language in the body of NSF/ANSI 49 (5.2, Canopy Connect exhaust and 5.2.3.4, Type A1 or A2 exhaust alarm) to allow canopy testing for class II, type A1 & A2 cabinets. This same language is already part of Annex F (F.7.3.3):.

‐ Issue 44

Biosafety Cabinetry: Design, Construction, Performance and Field Certification

Issue 44: The purpose of this ballot is to include a test method for biosafety cabinets with an interior sidewall dimension of three feet or less in NSF/ANSI 49.

‐ Issue 46

Biosafety Cabinetry: Design, Construction, Performance and Field Certification

Issue 46: The purpose of this ballot is to add a reference to non-back-pressure compensated readings used in a Direct Inflow Measurement (DIM) in Annex A, Annex B, and Annex F of NSF/ANSI 49, as well as to include language in Annex A, Annex E, and Annex F of NSF/ANSI 49 for the 12 inch clearance requirement used for measuring an exhaust HEPA filter.

‐ Issue 48r7

Biosafety Cabinetry: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinetry designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanliness; limitations on noise level; illumination; vibration; and motor/blower performance.
ANSI/NSF 49-2014 (i49r1), Biosafety Cabinet: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinets designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanability; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2014 (i50r2), Biosafety Cabinet: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinets designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanability; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2014 (i51r1), Biosafety Cabinet: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinets designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanability; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2014 (i52r1), Biosafety Cabinet: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinets designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanability; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2014 (i53r1), Biosafety Cabinet: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinets designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanability; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2014 (i54r1), Biosafety Cabinet: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinets designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanability; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2014 (i55r1), Biosafety Cabinet: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinets designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanability; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2014 (i56r1), Biosafety Cabinet: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinets designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanability; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2014 (i57r1), Biosafety Cabinet: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinets designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanability; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2014 (i58r1), Biosafety Cabinet: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinets designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanability; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2014 (i59r1), Biosafety Cabinet: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinets designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanability; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2014 (i60r1), Biosafety Cabinet: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinets designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanability; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2014 (i61r2), Biosafety Cabinet: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinets designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanability; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2014 (i62r1), Biosafety Cabinet: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinets designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanability; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2014 (i63r1), Biosafety Cabinet: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinets designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanability; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2014 (i64r1), Biosafety Cabinet: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinets designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanability; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2014 (i65r1), Biosafety Cabinet: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinets designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanability; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2014 (i66r1), Biosafety Cabinet: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinets designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanability; limitations on noise level; illumination; vibration; and motor/blower performance.
This Standard applies to Class II (laminar flow) biosafety cabinetry designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanliness; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2016 (i7sr3), Biosafety Cabinetry: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinetry designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanliness; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2016 (i7sr2), NSF 49 - Biosafety Cabinetry: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinetry designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanliness; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2016 (i90r1), NSF 49 - Biosafety Cabinetry: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinetry designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanliness; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2016 (i96r1), NSF 49 - 2016 - Biosafety Cabinetry: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinetry designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanliness; limitations on noise level; illumination; vibration; and motor/blower performance.

ANSI/NSF 49-2017 (i73Br5), Biosafety Cabinetry: Design, Construction, Performance, and Field Certification

This Standard applies to Class II (laminar flow) biosafety cabinetry designed to minimize hazards inherent in work with agents assigned to biosafety levels 1, 2, 3, or 4. It also defines the tests that shall be passed by such cabinetry to meet this Standard. This Standard includes basic requirements for the design, construction, and performance of biosafety cabinets that are intended to provide personnel, product, and environmental protection; reliable operation; durability and structural stability; cleanliness; limitations on noise level; illumination; vibration; and motor/blower performance.
ANSI/NSF 50-2008 (i16), Circulation system components and related materials for swimming pools, spas/hot tubs
Issue 16: To incorporate requirements for the evaluation and testing of automated controllers (revision 2).

ANSI/NSF 50-2008 (i36), Circulation system components and related materials for swimming pools, spas/hot tubs
Issue 36: To allow manufacturers to set their own vertical lift claims for self-priming pumps.

ANSI/NSF 50-2008 (i37), Circulation system components and related materials for swimming pools, spa/hot tubs
Issue 37: To update Standard 50 with references to the appropriate standard(s) for evaluation of anti-entrapment safety vacuum release systems (SVRs).

ANSI/NSF 50-2008 (i43), Circulation system components and related materials for swimming pools, spa/hot tubs
Issue 43 - Life Testing revision 4: To eliminate the 80% pressure requirement from Section 13.4, Life Test.

ANSI/NSF 50-2008 (i44), Circulation system components and related materials for swimming pools, spa/hot tubs
Issue 44 - Skimmer performance To incorporate requirements for skimmer testing, including UV exposure, point load and deflection testing for skimmer lids; and requirements for water levels and flow rates.

ANSI/NSF 50-2008 (i46), Circulation system components and related materials for swimming pools, spa/hot tubs
Issue 46 - Pool Covers To include requirements for thorough evaluation of covers used on recreational water structures such as swimming pools, hot tubs, and spas.

ANSI/NSF 50-2008 (i48), Circulation system components and related materials for swimming pools, spa/hot tubs
Issue 48 - Pool Alarms. To include alarm requirements for pools and reference ASTM F2208.

ANSI/NSF 50-2008 (i50), Circulation system components and related materials for swimming pools, spa/hot tubs
Issue 50 - To address the evaluation of water quality testing devices.

ANSI/NSF 50-2008 (i51), Circulation system components and related materials for swimming pools, spa/hot tubs
Issue 51- To update the normative references in standard 50.

ANSI/NSF 50-2008 (i52), Circulation system components and related materials for swimming pools, spa/hot tubs
Issue 52- To update the name and scope of this standard.
ANSI/NSF 50-2011 (i71), Equipment for swimming pools, spas, hot tubs, and other recreational water facilities
Issue 71 - Revises the operating condition specifications in 15.2 for batch chlorination systems as discussed at the Joint Committee meeting in 2009.

ANSI/NSF 50-2011 (i73), Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
Issue 73: The purpose of this issue is to include labeling requirements for filtration media.

ANSI/NSF 50-2012 (i72), Equipment for swimming pools, spas, hot tubs, and other recreational water facilities
Issue 72 - The purpose of this ballot is to include the test method for determination of the permeability and cake density of precoat filter media.

ANSI/NSF 50-2012 (i79), Equipment for swimming pools, spas, hot tubs, and other recreational water facilities
Issue 79 - The purpose of this ballot is to update the life testing requirements for process equipment.

ANSI/NSF 50-2012 (i81), Equipment for swimming pools, spas, hot tubs, and other recreational water facilities
Issue 81 - The purpose of this ballot is to address several issues that were motioned to ballot as written from the 2010 and 2011 Joint Committee on Recreational Water Facilities annual meetings. The following modifications are included in the ballot: &amp;#8226; The addition of requirements for fences and barriers (RWF-2010-11) &amp;#8226; Clarification with valve handles (RWF-2011-5) &amp;#8226; Spa temperature requirements (RWF-2010-4) &amp;#8226; Hardware interlock (RWF-2010-26) &amp;#8226; Sensor output signal requirements (RWF-2011-19)

ANSI/NSF 50-2012 (i82), Equipment for swimming pools, spas, hot tubs, and other recreational water facilities
Issue 82 - The purpose of this ballot is to delete the requirements for copper test kits for copper/silver ion generators in 16.1 and 16.16 of NSF 50.

ANSI/NSF 50-2012 (i83), Equipment for swimming pools, spas, hot tubs, and other recreational water facilities
Issue 83 - The purpose of this ballot is to rewrite and move the electrical requirements of NSF/ANSI 50. Section 4.2 of NSF 50 requires electrical components to comply with the applicable requirements of the National Electrical Code. This is a very broad statement that could be misinterpreted to mean that products that have been certified to NSF 50 are certified or otherwise compliant to all electrical standards referenced in the National Electric Code. There are over 80 UL standards specifically for electrical Pool equipment and hundreds of other electrical component standards worldwide.

ANSI/NSF 50-2012 (i84), Equipment for swimming pools, spas, hot tubs, and other recreational water facilities
Issue 84 - The purpose of this ballot is to address issues that were motioned to ballot from the 2009 and 2010 Joint Committee on Recreational Water Facilities annual meetings, and to modify incorrect references.

ANSI/NSF 50-2012 (i85), Equipment for swimming pools, spas, hot tubs, and other recreational water facilities
Issue 85 - The purpose of this ballot is to address several issues that were motioned to ballot as written from the 2011 Joint Committee on Recreational Water Facilities annual meetings. The following modifications are included in the ballot: Modification to Annex G (RWF-2011-3); modification to Electrolytic ClBr (RWF-2011-17); Non-integral strainers section (RWF-2011-22); and Feeder output flow control (RWF-2011-24)

ANSI/NSF 50-2012 (i86), Equipment for swimming pools, spas, hot tubs, and other recreational water facilities
Issue 86 - The purpose of this ballot is to replace withdrawn Standard ANSI/ASME A112.19.8a with ANSI/APSP 16.

ANSI/NSF 50-2013 (i87r1,2,and r3), Equipment for swimming pools, spas, hot tubs, and other recreational water facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2013 (i47r3), Equipment for Swimming Pools, Spas, Hot Tubs and other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2013 (i88r1), Equipment for Swimming Pools, Spas, Hot Tubs and other Recreational Water Facilities
Issue 88: This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2014 (i49r5), Equipment for Swimming Pools, Spas, Hot Tubs and other Recreational Water Facilities
Issue 49: This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2014 (i75r1), Equipment for Swimming Pools, Spas, Hot Tubs and other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2014 (i78r5), Equipment for Swimming pools, spas, hot tubs, and other recreational water facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2014 (i86r1), Equipment for Swimming pools, spas, hot tubs, and other recreational water facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2014 (i94r1), Equipment for Swimming pools, spas, hot tubs, and other recreational water facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2014 (i95r1)), Equipment for Swimming pools, spas, hot tubs, and other recreational water facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2014 (i97r1), Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2015 (i100r1), Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2015 (i107r1), Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2015 (i74r5), Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.
ANSI/NSF 50-2015 (i91r1), Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2015 (i92r1), Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2016 (i99r1), Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2016 (i102r1), Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2016 (i109r1), NSF/ANSI 50-2015: Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2016 (i112), NSF/ANSI 50: Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2016 (i113r2), Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2016 (i114r1), NSF/ANSI 50-2015: Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2016 (i118r1), Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2016 (i89r1), Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2016 (i119r1), Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2016 (i112), NSF/ANSI 50: Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2017 (i110), Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2017 (i111), Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2017 (i119r1), Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2017 (i123r1), Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2017 (i125r1), Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2017 (i125r2), Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 50-2017 (i125r1), Equipment for Swimming Pools, Spas, Hot Tubs and Other Recreational Water Facilities
This Standard covers materials, components, products, equipment and systems, related to public and residential recreational water facility operation.

ANSI/NSF 51-2009 (i8r2), Food Equipment Materials
Issue 8 - To update the boilerplate changes in the family of food equipment standards. Additionally, changes to organic coatings were made relating to direct and non-direct food contact surfaces and an editorial correction. Revision 1 had comments on the organic coating issue presented. A task group meeting was held where the comments on the ballot were discussed. Those changes include adding a category for non-direct food contact surfaces and changing the test requirements for splash zones. A rationale statement was added to the ballot supporting these changes.

ANSI/NSF 51-2012 (i10), Food equipment materials
Issue 10: Updates boilerplate and normative references; clarifies the requirements for brass and bronze, glass and glass-like materials, and storage shelving intended for wet environments; relocates the lead requirement and test method from ANSI/NSF 4 and the glass materials requirement in the food equipment standards to ANSI/NSF 51; and expands the Fluoropolymer coatings requirements.

ANSI/NSF 51-2014 (i11r1), Food Equipment Materials
This Standard establishes minimum public health and sanitation requirements for materials used in the construction of commercial food equipment. The requirements of this Standard are intended to ensure that the composition and surface finish of food equipment materials are such that a material will not adulterate food nor render food equipment difficult to clean and sanitize.

ANSI/NSF 52-2007 (i3), Supplemental flooring
Issue 3 - To update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 52-2009 (i5), Supplemental Flooring
Issue 5 - Revise the normative references in NSF/ANSI 52.

ANSI/NSF 52-2012 (i6), Supplemental flooring
Issue 6 - The purpose of this ballot is to update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 52-2017 (i7r1), Supplemental Flooring
Supplemental flooring covered by this Standard includes, but is not limited to, supplemental flooring for use in food preparation, dry storage, and warewashing areas.

ANSI/NSF 53-2007 (i59), Drinking water treatment units - Health effects
Issue 59: To establish sample sizes for mechanical reduction tests other than cyst reduction.

ANSI/NSF 53-2007 (i62), Drinking Water Treatment Units - Health Effects
Issue 62 - To resolve the testing differences observed between laboratories by developing and validating a test method that includes the ability to produce particulate lead consistently between laboratories.
ANSI/NSF 53-2007 (i68), Drinking water treatment units - Health effects

Issue 68: The proposed revision is to lower the maximum contaminant concentration (MCC) for lead for material extraction testing from 0.015 mg/L to 0.010 mg/L in Table 1 of the Drinking Water Treatment Unit Standards.

ANSI/NSF 53-2007a (i61), Drinking Water Treatment Units - Health Effects

Issue 61 - The purpose of this proposal is to update the pass/fail criteria levels in Tables 1 and 2 for cyclohexane, methyl ethyl ketone, carbon disulfide, diethyl phthalate, di-n-butyl phthalate, butyl benzyl phthalate, naphthalene, acetone, and 1,4-dioxane to match the levels in NSF/ANSI 61.

ANSI/NSF 53-2007a (i57), Drinking water treatment units – Health Effects

Issue 57 - To enable point-of-entry (POE) drinking water treatment systems to be covered by NSF/ANSI 61 and to use this universal materials safety standard for POE drinking water treatment units

ANSI/NSF 53-2007a (i58), Drinking water treatment units - Health Effects

Issue 58 - To revise requirements for filter media.

ANSI/NSF 53-2007a (i64), Drinking Water Treatment Units - Health Effects

Issue 64 - To clarify that the active agent levels from two units will be evaluated against levels of toxicological significance in 6.12 - Active agents and additives, and will not be evaluated during extraction testing.

ANSI/NSF 53-2007a (i67), Drinking water treatment units - Health effects

Issue 67 - To include USEPA methods 524.2 & 52S.2 in Tables 1 and 2 and include language to ensure when using the GC/MS (method 625) an adequate analytical library has been developed.

ANSI/NSF 53-2008 (i66), Drinking water treatment units - Health effects

Issue 66 - The purpose of this ballot is to add language to clarify the usage of the word “#8216; removes’ along with the percentage of removal is acceptable when describing the cyst reduction claim (DWTU-2004-29), the inclusion of a variance for the inlet pressure in the rated service flow test, a clarification in 6.13.1 - Media test and to correct a publishing error for heptachlor to maintain consistency between the tables for VOC surrogate testing in NSF DWTU Standards.

ANSI/NSF 53-2008 (i69), Drinking water treatment units - Health effects

Issue 69 - To clarify the formulation review requirements and provide consistency between the Drinking Water Treatment Unit Standards and NSF/ANSI 60 and NSF/ANSI 61.

ANSI/NSF 53-2009 (i72), Drinking Water Treatment Units - Health effects

Issue 72 - The proposed revision is to revise the criteria for laboratory evaluation of filter media.

ANSI/NSF 53-2009 (i74), Drinking Water Treatment Units - Health effects

Issue 74 - The proposed revision is to revise the procedure for collection of effluent samples when conducting mechanical reduction tests.

ANSI/NSF 53-2009 (i75), Drinking Water Treatment Units - Health effects

Issue 75 - The proposed revision is to clarify the PID requirements.

ANSI/NSF 53-2010 (i76), NSF/ANSI 53 - Drinking water treatment units - Health effects

Issue 76: The purpose of this ballot is to include the results of an inactivation method study for live cyst, the use of a surfactant in cyst test challenge preparation and the specification of cycling valves for the mechanical reduction tests.

ANSI/NSF 53-2011 (i78), Drinking Water Treatment Units - Health effects

Issue 78 - The purpose of this ballot is to include EPA methods 524.2 & 524.3 for VOC analysis to Table 7.

ANSI/NSF 53-2011 (i80), Drinking water treatment units - Health effects

The proposed revision is to remove the filter media test from the minimum performance requirements (section 6).

ANSI/NSF 53-2012 (i83), Drinking water treatment units - Health effects

Issue 83: The proposed revision is to remove the component burst pressure test requirement from section 5 of the family of DWTU Standards.

ANSI/NSF 53-2012 (i84), Drinking water treatment units - Health effects

The proposed revision will remove the retesting requirement for contaminants that exceed the non-health based advisory concentration under section 4.2.3.6.

ANSI/NSF 53-2012 (i86), Drinking water treatment units - Health effects

The proposed revision is to clarify the syringe filtration method used in the determination of particulate lead in pH 8.5 testing, and to add a corrosion warning note under the test equipment cleaning and conditioning instructions for that analysis.

ANSI/NSF 53-2012 (i88), Drinking water treatment units - health effects

The proposed revision is to clarify the syringe filtration method used in the determination of particulate lead in pH 8.5 testing, and to add a corrosion warning note under the test equipment cleaning and conditioning instructions for that analysis.

ANSI/NSF 53-2013 (i79), Drinking Water Treatment Units - Health Effects

The point-of-use and point-of-entry systems addressed by this Standard are designed to be used for the reduction of specific substances that may be present in drinking water (public or private). These substances are considered potential or established health hazards.

ANSI/NSF 53-2013 (i90r2), Drinking Water Treatment Units - Health Effects

Issue 90: The point-of-use and point-of-entry systems addressed by this Standard are designed to be used for the reduction of specific substances that may be present in drinking water (public or private). These substances are considered potential or established health hazards. They may be microbiological, chemical, or particulate (including filterable cysts) in nature.

ANSI/NSF 53-2013 (i91), Drinking Water Treatment Units - Health Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of point-of-use and point-of-entry drinking water treatment systems that are designed to reduce specific health-related contaminants in public or private water supplies.

ANSI/NSF 53-2013 (i93r1), Drinking Water Treatment Units - Health Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of point-of-use and point-of-entry drinking water treatment systems that are designed to reduce specific health-related contaminants in public or private water supplies. Such systems include point-of-entry drinking water treatment systems used to treat all or part of the water at the inlet to a residential facility or a bottled water production facility, and includes the material and components used in these systems.

ANSI/NSF 53-2014 (i51r16), Drinking Water Treatment Units - Health Effects

The point-of-use and point-of-entry systems addressed by this Standard are designed to be used for the reduction of specific substances that may be present in drinking water (public or private). These substances are considered potential or established health hazards. They may be microbiological, chemical, or particulate [including filterable cysts] in nature. It is recognized that a system may be effective in controlling one or more of these contaminants, but systems are not required to control all.

ANSI/NSF 53-2014 (i92), Drinking Water Treatment Units - Health Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of point-of-use and point-of-entry drinking water treatment systems that are designed to reduce specific health-related contaminants in public or private water supplies. Such systems include point-of-entry drinking water treatment systems used to treat all or part of the water at the inlet to a residential facility or a bottled water production facility, and includes the material and components used in these systems.

ANSI/NSF 53-2014 (i94r1), Drinking Water Treatment Units - Health Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of point-of-use and point-of-entry drinking water treatment systems that are designed to reduce specific health-related contaminants in public or private water supplies. Such systems include point-of-entry drinking water treatment systems used to treat all or part of the water at the inlet to a residential facility or a bottled water production facility, and includes the material and components used in these systems.

ANSI/NSF 53-2014 (i95r1), Drinking Water Treatment Units - Health Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of point-of-use and point-of-entry drinking water treatment systems that are designed to reduce specific health-related contaminants in public or private water supplies. Such systems include point-of-entry drinking water treatment systems used to treat all or part of the water at the inlet to a residential facility or a bottled water production facility, and includes the material and components used in these systems.

ANSI/NSF 53-2014 (i96r1), Drinking Water Treatment Units - Health Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of point-of-use and point-of-entry drinking water treatment systems that are designed to reduce specific health-related contaminants in public or private water supplies. Such systems include point-of-entry drinking water treatment systems used to treat all or part of the water at the inlet to a residential facility or a bottled water production facility, and includes the material and components used in these systems.

ANSI/NSF 53-2014 (i97), Drinking Water Treatment Units - Health Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of point-of-use and point-of-entry drinking water treatment systems that are designed to reduce specific health-related contaminants in public or private water supplies. Such systems include point-of-entry drinking water treatment systems used to treat all or part of the water at the inlet to a residential facility or a bottled water production facility, and includes the material and components used in these systems.

ANSI/NSF 53-2015 (i100), Drinking Water Treatment Systems - Health Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of point-of-use and point-of-entry drinking water treatment systems that are designed to reduce specific health-related contaminants in public or private water supplies. Such systems include point-of-entry drinking water treatment systems used to treat all or part of the water at the inlet to a residential facility or a bottled water production facility, and includes the material and components used in these systems.

ANSI/NSF 53-2015 (i101), Drinking Water Treatment Systems - Health Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of point-of-use and point-of-entry drinking water treatment systems that are designed to reduce specific health-related contaminants in public or private water supplies. Such systems include point-of-entry drinking water treatment systems used to treat all or part of the water at the inlet to a residential facility or a bottled water production facility, and includes the material and components used in these systems.

ANSI/NSF 53-2015 (i85r5), Drinking Water Treatment Units - Health Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of point-of-use and point-of-entry drinking water treatment systems that are designed to reduce specific health-related contaminants in public or private water supplies. Such systems include point-of-entry drinking water treatment systems used to treat all or part of the water at the inlet to a residential facility or a bottled water production facility, and includes the material and components used in these systems.

ANSI/NSF 53-2015 (i98r1), Drinking water treatment units - Health effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of point-of-use and point-of-entry drinking water treatment systems that are designed to reduce specific health-related contaminants in public or private water supplies. Such systems include point-of-entry drinking water treatment systems used to treat all or part of the water at the inlet to a residential facility or a bottled water production facility, and includes the material and components used in these systems.

ANSI/NSF 53-2015 (i99r2), Drinking water treatment units - Health effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of point-of-use and point-of-entry drinking water treatment systems that are designed to reduce specific health-related contaminants in public or private water supplies. Such systems include point-of-entry drinking water treatment systems used to treat all or part of the water at the inlet to a residential facility or a bottled water production facility, and includes the material and components used in these systems.

ANSI/NSF 53-2016 (i104r1), NSF 53-2016 - Drinking Water Treatment Units - Health Effects

It is the purpose of this Standard to establish minimum requirements for materials, design and construction, and performance of point-of-use and point-of-entry drinking water treatment systems that are designed to reduce specific health-related contaminants in public or private water supplies. Such systems include point-of-entry drinking water treatment systems used to treat all or part of the water at the inlet to a residential facility or a bottled water production facility, and includes the material and components used in these systems.
The purpose of this Standard is to establish minimum requirements for the reduction of microorganisms using ultraviolet radiation (UV). UV water treatment systems covered by this Standard are intended for water that may be either microbiologically safe or microbiologically unsafe. This Standard also specifies the minimum product literature and labeling information that a manufacturer shall supply to authorized representatives and system owners, as well as the minimum service-related obligations that the manufacturer shall extend to system owners.

ANSI/NSF 55-2016 (i4r2), Ultraviolet Microbiological Water Treatment Systems

The purpose of this Standard is to establish minimum requirements for the reduction of microorganisms using ultraviolet radiation (UV). UV water treatment systems covered by this Standard are intended for water that may be either microbiologically safe or microbiologically unsafe. This Standard also specifies the minimum product literature and labeling information that a manufacturer shall supply to authorized representatives and system owners, as well as the minimum service-related obligations that the manufacturer shall extend to system owners.

ANSI/NSF 55-2015 (i40r2), Ultraviolet Microbiological Water Treatment System

The purpose of this Standard is to establish minimum requirements for the reduction of microorganisms using ultraviolet radiation (UV). UV water treatment systems covered by this Standard are intended for water that may be either microbiologically safe or microbiologically unsafe. This Standard also specifies the minimum product literature and labeling information that a manufacturer shall supply to authorized representatives and system owners, as well as the minimum service-related obligations that the manufacturer shall extend to system owners.

ANSI/NSF 55-2007 (i52), Reverse osmosis drinking water treatment systems

Issue 52: The proposed revision is to lower the maximum contaminant concentration (MCC) for lead for material extraction testing from 0.015 mg/L to 0.010 mg/L in Table 1 of the Drinking Water Treatment Unit Standards.

ANSI/NSF 55-2007 (i53), Reverse osmosis drinking water treatment systems

Issue 53 - To clarify the formulation review requirements and provide consistency between the Drinking Water treatment Unit Standards and NSF/ANSI 60 and NSF/ANSI 61.

ANSI/NSF 58-2008 (i50), Reverse osmosis drinking water treatment systems

Issue 50 - To add language to clarify the usage of the word “&” in Table 1 to reflect that the words “along with” are acceptable when describing the cyst reduction claim and to correct an error that occurred during the reformatting for the sampling - systems without storage tanks sections of 7.1.2.7, 7.1.3.5.3, 7.2.1.6, 7.2.2.6, & 7.2.3.6.

ANSI/NSF 58-2011 (i56), Reverse osmosis drinking water treatment systems

Issue 56 - Perchlorate levels in Section 7, Table 8 have been updated to correct an error published in NSF/ANSI 58-2009.

ANSI/NSF 58-2012 (i58), Reverse osmosis drinking water treatment systems

Issue 58: The proposed revision is to remove the component burst pressure test requirement from section 5 of the family of DWTU Standards.

ANSI/NSF 58-2012 (i59), Reverse osmosis drinking water treatment systems

The proposed revision will remove the retesting requirement for contaminants that exceed the non-health based advisory concentration under section 4.2.3.6.

ANSI/NSF 58-2012 (i61), Reverse osmosis drinking water treatment systems

The proposed revision is to clarify under section 8 of NSF/ANSI 42 and NSF/ANSI 53, and section 7.1.1 of NSF/ANSI 58 (VOC reduction claims) that each certified system may only make a single capacity claim based on the lowest reduction capacity in any standard to which the model is certified.

ANSI/NSF 58-2013 (i62), Reverse osmosis drinking water treatment systems

This proposed revision addresses the number of samples taken on Days 2 - 4 of testing under NSF/ANSI 58.
ANSI/NSF 58-2013 (i63), Reverse Osmosis Drinking Water Treatment Systems
The point-of-use reverse osmosis drinking water treatment systems addressed by this Standard are designed to be used for the reduction of specific substances that may be present in drinking water supplies (public or private) considered to be microbiologically safe and of known quality (except that claims for the reduction of filterable cysts may be permitted). Systems covered by this Standard are intended for reduction of total dissolved solids (TDS) and other contaminants specified herein.

ANSI/NSF 58-2013 (i64), Reverse Osmosis Drinking Water Treatment Systems
The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of reverse osmosis drinking water treatment systems. This Standard also specifies the minimum product literature that manufacturers shall supply to authorized representatives and owners, as well as the minimum service-related obligations that manufacturers shall extend to system owners.

ANSI/NSF 58-2014 (i65), Reverse Osmosis Drinking Water Treatment Systems
The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of reverse osmosis drinking water treatment systems. This Standard also specifies the minimum product literature that manufacturers shall supply to authorized representatives and owners, as well as the minimum service-related obligations that manufacturers shall extend to system owners.

ANSI/NSF 58-2014 (i66r1), Reverse Osmosis Drinking Water Treatment Systems
The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of reverse osmosis drinking water treatment systems. This Standard also specifies the minimum product literature that manufacturers shall supply to authorized representatives and owners, as well as the minimum service-related obligations that manufacturers shall extend to system owners.

ANSI/NSF 58-2014 (i67r2), Reverse Osmosis Drinking Water Treatment Systems
The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of reverse osmosis drinking water treatment systems. This Standard also specifies the minimum product literature that manufacturers shall supply to authorized representatives and owners, as well as the minimum service-related obligations that manufacturers shall extend to system owners.

ANSI/NSF 58-2015 (i68r2), Reverse Osmosis Drinking Water Treatment Systems
The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of reverse osmosis drinking water treatment systems. This Standard also specifies the minimum product literature that manufacturers shall supply to authorized representatives and owners, as well as the minimum service-related obligations that manufacturers shall extend to system owners.

ANSI/NSF 58-2015 (i69r1), Reverse Osmosis Drinking Water Treatment Systems
The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of reverse osmosis drinking water treatment systems. This Standard also specifies the minimum product literature that manufacturers shall supply to authorized representatives and owners, as well as the minimum service-related obligations that manufacturers shall extend to system owners.

ANSI/NSF 58-2015 (i70), Reverse Osmosis Drinking Water Treatment Systems
The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of reverse osmosis drinking water treatment systems. This Standard also specifies the minimum product literature that manufacturers shall supply to authorized representatives and owners, as well as the minimum service-related obligations that manufacturers shall extend to system owners.

ANSI/NSF 58-2015 (i71), Reverse Osmosis Drinking Water Treatment Systems
The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of reverse osmosis drinking water treatment systems. This Standard also specifies the minimum product literature that manufacturers shall supply to authorized representatives and owners, as well as the minimum service-related obligations that manufacturers shall extend to system owners.

ANSI/NSF 58-2016 (i72r2), Reverse Osmosis Drinking Water Treatment Systems
The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of reverse osmosis drinking water treatment systems. This Standard also specifies the minimum product literature that manufacturers shall supply to authorized representatives and owners, as well as the minimum service-related obligations that manufacturers shall extend to system owners.

ANSI/NSF 58-2016 (i76r1), NSF 58-2016 - Reverse Osmosis Drinking Water Treatment Systems
The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of reverse osmosis drinking water treatment systems. This Standard also specifies the minimum product literature that manufacturers shall supply to authorized representatives and owners, as well as the minimum service-related obligations that manufacturers shall extend to system owners.

ANSI/NSF 58-2016 (i77r1), Reverse Osmosis Drinking Water Treatment Systems
The purpose of this Standard is to establish minimum requirements for materials, design and construction, and performance of reverse osmosis drinking water treatment systems. This Standard also specifies the minimum product literature that manufacturers shall supply to authorized representatives and owners, as well as the minimum service-related obligations that manufacturers shall extend to system owners.

ANSI/NSF 59-2012 (i6), Mobile Food Carts
Issue 6 - The purpose of this ballot is to update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 59-2017 (i7r1), NSF 59-2012 Mobile Food Carts
This Standard contains requirements for mobile food carts and their related components and materials. This Standard applies to mobile food carts intended for the preparation and service of food, as well those intended for service of prepackaged food only.

ANSI/NSF 6-2006 (i4), Dispensing Freezers
Issue 4 - To update normative references, incorporate revised boilerplate language from NSF/ANSI 2, and correct an error in 6.1 - Cleaning and sanitization procedures.

ANSI/NSF 6-2007 (i5), Dispensing freezers
Issue 5: Update 5.2 to specify that its requirements apply only to food zones.

ANSI/NSF 6-2007 (i6), Dispensing freezers
Issue 6 - To update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 6-2008 (i7), Dispensing freezers
Issue 7 - To include and modify language to be consistent with the boilerplate language in NSF/ANSI 2 Food equipment. The test method on Heat treatment cycle - product heating is being modified to reflect the format used in NSF/ANSI 7 - Dispensing freezers - 6.10 Performance - storage refrigerators and refrigerated food transport cabinets.

ANSI/NSF 6-2009 (i8), Dispensing Freezers
Issue 8 - Boilerplate updates in the family of food equipment standards including normative references.

ANSI/NSF 6-2012 (i9), Dispensing freezers
Issue 9 - The purpose of this ballot is to update the Normative References and boilerplate language in the Food Equipment family of Standards.
ANSI/NSF 6-2014 (i10r1), Dispensing Freezers
This Standard contains requirements for the following equipment: dispensing freezers that process and freeze previously pasteurized product (e.g., soft ice cream, ice milk, yogurt, malts, custards) and dispense it directly into the consumer's container; dispensing freezers that dispense premanufactured frozen product (e.g., ice cream) directly into the consumer's container; and batch dispensing freezers. The materials, design, and construction requirements of this Standard may also apply to items that are manufactured as a component of a dispensing freezer.

ANSI/NSF 6-2014 (i10r2), Dispensing Freezers
This Standard contains requirements for the following equipment: dispensing freezers that process and freeze previously pasteurized product (e.g., soft ice cream, ice milk, yogurt, malts, custards) and dispense it directly into the consumer's container; dispensing freezers that dispense premanufactured frozen product (e.g., ice cream) directly into the consumer's container; and batch dispensing freezers. The materials, design, and construction requirements of this Standard may also apply to items that are manufactured as a component of a dispensing freezer.

ANSI/NSF 6-2016 (i11r3), Dispensing Freezers
This Standard contains requirements for the following equipment: dispensing freezers that process and freeze previously pasteurized product (e.g., soft ice cream, ice milk, yogurt, malts, custards) and dispense it directly into the consumer's container; dispensing freezers that dispense premanufactured frozen product (e.g., ice cream) directly into the consumer's container; and batch dispensing freezers. The materials, design, and construction requirements of this Standard may also apply to items that are manufactured as a component of a dispensing freezer.

ANSI/NSF 60-2005 Addendum 1 (i35), Drinking Water Treatment Chemicals - Health Effects
Issue 35: To provide guidance regarding the rounding method that should be used when evaluating analytical results.

ANSI/NSF 60-2005 Addendum 1 (i41), Drinking Water Treatment Chemicals - Health Effects
Issue 41: To incorporate recent additions of Organics/Pesticides considered contaminants by the U.S. Environmental Protection Agency and Health Canada.

ANSI/NSF 60-2006 (i40), Drinking water treatment chemicals - Health effects
Issue 40: The purpose of this revision is to streamline the sampling procedures in Annex B.

ANSI/NSF 60-2008 (i42), Drinking water treatment chemicals - Health effects
Issue 42: To modify the minimum recorded weight in the method for Preparation K (B.3.12) to provide practical limitations for weights recorded during the estimation of chemical tested on a dry weight basis.

ANSI/NSF 60-2009 (i45), Drinking Water Treatment Chemicals - Health Effects
Issue 45: The Task Group on Annual Recertification Requirements for NSF 60 is submitting a ballot to add annual certification requirements to NSF/ANSI Standard 60.

ANSI/NSF 60-2011 (i39), Drinking water treatment chemicals - Health effects
Issue 39 - 1. Establishes that the Single Product Allowable Concentration (SPAC) for bromate will be lowered from 0.005 mg/L to 0.003 mg/L on 1/1/2013. 2. Creation of Annex G to hold that requirement until 1/1/2013. 3. Immediately raises the bromate acceptance criteria for low-bromate hypochlorites from 0.001 mg/L to 0.003 mg/L.

ANSI/NSF 60-2011 (i46), Drinking Water Treatment Chemicals - Health Effects
Issue 46: This proposed revision to NSF/ANSI Standard 60 contains requirements for the evaluation of perchlorate in hypochlorites. This includes establishment of SPACs, criteria for analytical methods, sample requirements, and requirements to inform the user of production date and provide references to recommended handling and storage requirements.

ANSI/NSF 60-2011 (i47), NSF/ANSI 60 - Drinking Water Treatment Chemicals - Health Effects
Issue 47: This issue will amend Standard 60 to require tamper resistant/tamper evident seals on all containers of water treatment chemicals sold to water suppliers.

ANSI/NSF 60-2011 (i49), Drinking Water Treatment Chemicals: Health Effects
Issue 49: Covers the: (1) Proposal to update sections of ANSI/NSF 60, Annex B (B.3.6 and B.4.2.3), which refer to sampling and preparation of elemental chlorine and other gaseous products; (2) Proposal to revise ANSI/NSF 60, Section 3.2.1. Current requirement in NSF 60, Section 3.2.1 can be interpreted to require submittal of toxicology studies for each product submission. However, this is not required if SPACs are established for each chemical contaminant of concern (Annex A); and (3) Proposal to revise ANSI/NSF 60, Section 2.19 to clarify the definitions of Typical Use Level and Maximum Use Level.

ANSI/NSF 60-2012 (i48), Drinking Water Treatment Chemicals - Health Effects
The proposed ballot revises ANSI/NSF 60, Table 6.2, Maximum Use Level (MUL) of hydrogen peroxide from 3 mg/L to 23 mg/L, and removes the chlorination footnote.

ANSI/NSF 60-2012 (i50), Drinking Water Treatment Chemicals: Health Effects
Contains requirements for the evaluation of chlorate in hypochlorites, as well as some editorial changes to the previous perchlorate requirements that were successfully balloted in issue 46, revision 2. This includes establishment of a SPAC based on the Health Canada MAC, criteria for analytical methods, sample requirements.

ANSI/NSF 60-2012 (i51), Drinking Water Treatment Chemicals - Health Effects
Issue 51: This revision specifies an exemption for mineral oils from the microbial growth potential test.

ANSI/NSF 60-2012 (i52), Drinking Water Treatment Chemicals: Health Effects
Updates the normative drinking water criteria listed under Tables D1-D4 of ANSI/NSF 60.

ANSI/NSF 60-2012 (i54), Drinking Water Treatment Chemicals - Health Effects
Includes the following proposed revisions to section 3 of NSF/ANSI 60: 1)Section 3.5 - Product labeling The product labeling requirements will be revised to contain the maximum use level on a product container or literature that it is shipped with the product, such as product technical data sheets. Any applicable certification markings shall also be required. 2)Section 3.9 - Product Security Tamper-evident packaging requirements will be revised to clarify that they apply for drinking water applications in 3.9, and to specify the requirements for bulk shipments in railcars in 3.9.3.

ANSI/NSF 60-2012 (i55), Drinking Water Treatment Chemicals - Health Effects
The proposed revision adds a precipitation step to Method C under Annex B.3.4 of NSF/ANSI 60, which addresses the preparation of calcium carbonate, calcium hydroxide, calcium oxide, magnesium carbonate hydroxide and magnesium oxide. The method has been revised to better reflect actual use conditions of these chemicals in the field.

ANSI/NSF 60-2012 (i58), Drinking water treatment chemicals - Health effects
Issue 58: The proposed revision adds language to exclude the intentional use of microorganisms under the scope of NSF/ANSI 60.

ANSI/NSF 60-2013 (i53), Drinking Water Treatment Chemicals - Health Effects
The proposed revision will specify requirements regarding the use of non-potable water in the production of drinking water treatment chemicals in NSF/ANSI 60.

ANSI/NSF 60-2013 (i58), Drinking Water Treatment Chemicals- Health Effects
This Standard establishes minimum health effects requirements for the chemicals, the chemical contaminants, and the impurities that are directly added to drinking water from drinking water treatment chemicals. This Standard does not establish performance or taste and odor requirements for drinking water treatment chemicals.

ANSI/NSF 60-2013 (i59r1), Drinking Water Treatment Chemicals - Health Effects
This Standard establishes minimum health effects requirements for the chemicals, the chemical contaminants, and the impurities that are directly added to drinking water from drinking water treatment chemicals. This Standard does not establish performance or taste and odor requirements for drinking water treatment chemicals.
ANSI/NSF 60-2014 (i60r1), Drinking Water Treatment Chemicals - Health Effects
This Standard establishes minimum health effects requirements for the chemicals, the chemical contaminants, and the impurities that are directly added to drinking water from drinking water treatment chemicals. This Standard does not establish performance or taste and odor requirements for drinking water treatment chemicals.

ANSI/NSF 60-2014 (i61r2), NSF/ANSI 60: Drinking Water Treatment Chemicals - Health Effects
This Standard establishes minimum health effects requirements for the chemicals, the chemical contaminants, and the impurities that are directly added to drinking water from drinking water treatment chemicals. This Standard does not establish performance or taste and odor requirements for drinking water treatment chemicals.

ANSI/NSF 60-2014 (i63), Drinking Water Treatment Chemicals - Health Effects
This Standard establishes minimum health effects requirements for the chemicals, the chemical contaminants, and the impurities that are directly added to drinking water from drinking water treatment chemicals. This Standard does not establish performance or taste and odor requirements for drinking water treatment chemicals.

ANSI/NSF 60-2014 (i64r1), Drinking Water Treatment Chemicals - Health Effects
This Standard establishes minimum health effects requirements for the chemicals, the chemical contaminants, and the impurities that are directly added to drinking water from drinking water treatment chemicals. This Standard does not establish performance or taste and odor requirements for drinking water treatment chemicals.

ANSI/NSF 60-2014 (i65r1), Drinking Water Treatment Chemicals - Health Effects
This Standard establishes minimum health effects requirements for the chemicals, the chemical contaminants, and the impurities that are directly added to drinking water from drinking water treatment chemicals. This Standard does not establish performance or taste and odor requirements for drinking water treatment chemicals.

ANSI/NSF 60-2015 (i68r1), Drinking Water Treatment Chemicals - Health Effects
This Standard establishes minimum health effects requirements for the chemicals, the chemical contaminants, and the impurities that are directly added to drinking water from drinking water treatment chemicals. This Standard does not establish performance or taste and odor requirements for drinking water treatment chemicals.

ANSI/NSF 60-2015 (i69), Drinking Water Treatment Chemicals: Health Effects
This Standard establishes minimum health effects requirements for the chemicals, the chemical contaminants, and the impurities that are directly added to drinking water from drinking water treatment chemicals. This Standard does not establish performance or taste and odor requirements for drinking water treatment chemicals.

ANSI/NSF 60-2016 (i66r1), Drinking Water Treatment Chemicals
This Standard establishes minimum health effects requirements for the chemicals, the chemical contaminants, and the impurities that are directly added to drinking water from drinking water treatment chemicals. This Standard does not establish performance or taste and odor requirements for drinking water treatment chemicals.

ANSI/NSF 60-2016 (i70r1), Drinking Water Treatment Chemicals
This Standard establishes minimum health effects requirements for the chemicals, the chemical contaminants, and the impurities that are directly added to drinking water from drinking water treatment chemicals. This Standard does not establish performance or taste and odor requirements for drinking water treatment chemicals.

ANSI/NSF 60-2016 (i71r1), Drinking Water Treatment Chemicals
This Standard establishes minimum health effects requirements for the chemicals, the chemical contaminants, and the impurities that are directly added to drinking water from drinking water treatment chemicals. This Standard does not establish performance or taste and odor requirements for drinking water treatment chemicals.

ANSI/NSF 60-2016 (i72r1), Drinking Water Treatment Chemicals
This Standard establishes minimum health effects requirements for the chemicals, the chemical contaminants, and the impurities that are directly added to drinking water from drinking water treatment chemicals. This Standard does not establish performance or taste and odor requirements for drinking water treatment chemicals.

ANSI/NSF 60-2016 (i73r1), Drinking Water Treatment Chemicals
This Standard establishes minimum health effects requirements for the chemicals, the chemical contaminants, and the impurities that are directly added to drinking water from drinking water treatment chemicals. This Standard does not establish performance or taste and odor requirements for drinking water treatment chemicals.

ANSI/NSF 60-2016 (i74r1), Drinking Water Treatment Chemicals
This Standard establishes minimum health effects requirements for the chemicals, the chemical contaminants, and the impurities that are directly added to drinking water from drinking water treatment chemicals. This Standard does not establish performance or taste and odor requirements for drinking water treatment chemicals.

ANSI/NSF 60-2016 (i75r1), NSF 60-2015 - Drinking Water Treatment Chemicals
This Standard establishes minimum health effects requirements for the chemicals, the chemical contaminants, and the impurities that are directly added to drinking water from drinking water treatment chemicals. This Standard does not establish performance or taste and odor requirements for drinking water treatment chemicals.

ANSI/NSF 61-2007 (i55), Drinking Water System Components - Health Effects
Issue 55: To incorporate POE drinking water treatment unit systems into Standard 61.

ANSI/NSF 61-2007 (i56), Drinking Water System Components - Health Effects
Issue 56: Add a required labeling distinction for POE systems only that NSF/ANSI 61 does not cover performance and structural integrity certifications.

ANSI/NSF 61-2007 (i57), Drinking Water System Components - Health Effects
Issue 57: Allow a toxicology assessment to determine the most appropriate exposure water for “all other process media” to be consistent with the other test procedures throughout Standard 61.

ANSI/NSF 61-2007 (i59), Drinking Water System Components - Health Effects
Issue 59: To provide guidance regarding the rounding method that should be used when evaluating analytical results.

ANSI/NSF 61-2007 (i68), Drinking Water System Components - Health Effects
Issue 68: To incorporate recent additions of Organics/Pesticides considered contaminants by the U.S. Environmental Protection Agency and Health Canada.

ANSI/NSF 61-2007 (i69), Drinking water system components - Health effects
Issue 69: To amend Section 3.2 clarifying the need to examine process performance and the necessary controls required to provide continued compliance of products.

ANSI/NSF 61-2007 (i70r2), Drinking water system components - Health effects
Issue 70r2: To increase the level of protection provided by Standard 61 by lowering the drinking water acceptance criteria for lead.

ANSI/NSF 61-2007 (i72r2), Drinking water system components - Health effects
Issue 72, r2: To include explicit and uniform guidance for overtime testing protocols into sections 4 (4.5.4.3), 5 (5.5.5.5), 6 (B.3.7), 8 (B.4.5) and 9 (B.5.6) on Multiple Time Point Protocols.

ANSI/NSF 61-2007 (i75), Drinking water system components - Health effects
Issue 75: Update to Section 5, adding immediate return to service paint/coating systems to the definition section, and adding language providing transparency regarding product testing and certification.
ANSI/NSF 61-2007, Addendum 1 (i74), Drinking water system components - Health effects

Issue 74: To specifically identify flexible plumbing connectors in the scope of section 9 and transfer the evaluation of riser tubing to section 9, rather than section 4.

ANSI/NSF 61-2008 (i76), Drinking water system components - Health effects

Issue 76: Update to standardize the testing of metallic products and components for Section 4 and Section 8.

ANSI/NSF 61-2008 (i77), Drinking water system components - Health effects

Issue 77: To clarify the minimum requirements for information and formulation (Section 3).

ANSI/NSF 61-2008 (i79), Drinking water system components - Health effects

Issue 79, r2: To establish an evaluation procedure for use when a lead content requirement needs to be met in addition to current chemical extraction requirements of the standard.

ANSI/NSF 61-2008 (i80), Drinking water system components - Health effects

Issue 80: 1) To revise the tolerance for percent relative humidity during mortar cube preparation. 2) To provide definitions of different manifold types and clarification on the testing of different manifold types.

ANSI/NSF 61-2009 (i81), Drinking water system components - Health effects

Issue 81 - To clarify the minimum requirements for information and formulation (Section 3) by specifying for which products a formulation review is not necessary and setting a de minimus level below which products do not require the same review.

ANSI/NSF 61-2009 (i82), Drinking Water System Components - Health Effects

Issue 82 - To revert the exposure water used on non-adsorptive, non-POE process media back to reagent water.

ANSI/NSF 61-2009 (i83), Drinking Water System Components - Health Effects

Issue 83 - Sample storage temperatures do not specify an acceptable temperature range. Currently in Table B10 in NSF 61, the sample storage column specifies 4°C (39°F) for those samples required to be kept cool.

ANSI/NSF 61-2009 (i84), Drinking Water System Components - Health Effects

Issue 84 - Add remote chillers and electronically activated faucets to sections 9.1.1 and 9.1.2 so they will be properly evaluated as end point devices. Also, a few minor formatting issues will be addressed.

ANSI/NSF 61-2009 (i85), Drinking Water System Components - Health Effects

Issue 85 - Currently there are various temperature tolerances within the standard. This ballot is being proposed to make all tolerances on temperature a consistent ± 4°F.

ANSI/NSF 61-2010 (i90), NSF/ANSI 61 - Drinking Water System Components - Health Effects

Issue 90: The purpose of this ballot is to alter Annex G of Standard 61 to reference the new standard 372. The new standard 372 is currently out for ballot at the Joint Committee (372i1r1). These two ballots are hinged and must proceed in the process together.

ANSI/NSF 61-2011 (i91), Drinking Water System Components - Health Effects

Issue 91: The NSF 61 Joint Committee considered a proposal that solid chemical feeders be evaluated with manufacturer’s recommended use chemicals that also comply with the requirements of NSF/ANSI 60: Drinking Water Treatment Chemicals - Health Effects (DWA JC annual meeting, December 2009). Draft 2 of this ballot addresses comments received by Joint Committee members that requiring specific warning language in Std. 61 is not appropriate. Therefore, the language has been revised to specify that the manufacturer shall include this type of information, but will allow the manufacturer to determine the specific language used for warning and warranty disclaimers of its products.

ANSI/NSF 61-2011 (i92), NSF/ANSI 61 - Drinking Water System Components - Health Effects

Issue 92 - Clarify evaluation requirements for coatings covered under Section 5 of NSF 61 for pipes, tanks and other products.

ANSI/NSF 61-2011 (i95), Drinking Water System Components - Health Effects

Issue 95 - The following revisions are being proposed to section 7, process media: 1. clarification of 7.3.1 to state that only media requiring conditioning, dosing, use of filtration aids or specific recommended use concentrations, shall be required to contain manufacturer use instructions; 2. clarification that ‘reagent’ water is to be used in 7.5.2, and 3. the inclusion of an additional normalization calculation in section 7.7 for process media with a manufacturer’s recommended use concentration.

ANSI/NSF 61-2011 (i96), Drinking Water System Components - Health Effects

Issue 96: The following revisions are being proposed to NSF/ANSI 61: 1. The definition of ‘unit void volume’ was added to section 2, Definitions; 2. Section 7.5.4.2 was revised to clarify exposure water requirements of adsorptive and non-adsorptive media; and 3. Section 7.5.5.4.2 was updated to reference collecting the unit void volume of the vessel rather than the 2 L or more referenced in 7.5.5.4.3. Section 7.5.5.4.2 was also revised to eliminate the collection of the first two exposure water samples.

ANSI/NSF 61-2012 (i100), Drinking Water System Components - Health Effects

Clarifying language is proposed for describing the coating manufacturer’s instructions for lab testing, and the relationship to manufacturer’s published use instructions for field and factory use. A tolerance of +/- 48°C ± 1°C for cure temperature is established. Require airless plural component systems to be operated at the midpoint of the coating manufacturer’s recommended pressure and temperature range.

ANSI/NSF 61-2012 (i101), Drinking Water System Components - Health Effects

The proposed revision shall remove the exclusion of fire hydrants under NSF/ANSI 61.

ANSI/NSF 61-2012 (i102), Drinking Water System Components - Health Effects

The proposed revision will update Table 3.1 to require nitrosamine analysis.

ANSI/NSF 61-2012 (i103), Drinking water system components - Health effects

The proposed revision is to provide a normalization example of a 1/2’ ball valve following exposure in a 1-L test assembly under Annex B of NSF/ANSI 61.

ANSI/NSF 61-2012 (i94), NSF/ANSI 61 - Drinking Water System Components: Health Effects

The following modifications are being proposed to NSF/ANSI 61: 1. the inclusion of additional materials to Table 3.1 - Material-specific analyses; 2. the inclusion of additional language to clarify what defines a piping system as flexible or rigid in Section 4, Pipes and Related Products; and 3. the removal of the option of exposing in-line devices for 16 hours and normalizing to 12 hours, in Section 8.4 - Mechanical Devices, and Table B8 - In-line device exposure sequence.

ANSI/NSF 61-2012 (i97), Drinking Water System Components: Health Effects

The proposed ballot reduces the formulation information required for components of mechanical devices and mechanical plumbing devices that are composed from materials that are less than or equal to 2.0 sq inches per liter and listed in Table 3.1 Material-specific analyses.

ANSI/NSF 61-2012 (i98), Drinking Water System Components: Health Effects

Updates the normative drinking water criteria listed under Tables D1-D4 of ANSI/NSF 61.

ANSI/NSF 61-2012 (i99), Drinking Water System Components: Health Effects

The proposed revision is to specify the evaluation criterion for fire sprinklers and associated fittings that are used in piping systems intended to serve both drinking water and fire protection needs under section 4 of NSF/ANSI 61.

ANSI/NSF 61-2013 (i104), Drinking water system components - Health effects

The proposed revision will remove the limitation of 1, 2-dibromo-3-chloropropane (DBCP) in activated carbon under the additional requirements for reactivated/regenerated media under NSF/ANSI 61.

ANSI/NSF 61-2013 (i105), Drinking Water System Components - Health Effects

Issue 105: This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.
ANSI/NSF 61-2013 (i106r1), Drinking Water System Components - Health Effects
This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.

ANSI/NSF 61-2014 (i109r2), Drinking Water System Components - Health Effects
This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.

ANSI/NSF 61-2014 (i111r1), Drinking Water System Components - Health Effects
This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.

ANSI/NSF 61-2014 (i113r1), NSF/ANSI 61: Drinking Water System Components - Health Effects
This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.

ANSI/NSF 61-2014 (i114r1), Drinking Water System Components - Health Effects
This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.

ANSI/NSF 61-2014 (i115r1), Drinking Water System Components - Health Effects
This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.

ANSI/NSF 61-2014a (i119r1), Drinking Water System Components - Health Effects
This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.

ANSI/NSF 61-2015 (i118), Drinking Water System Components: Health Effects
This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.

ANSI/NSF 61-2015 (i120r1), Drinking Water System Components - Health Effects
This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.

ANSI/NSF 61-2015 (i121), Drinking Water System Components: Health Effects
This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.

ANSI/NSF 61-2015 (i123r1), Drinking Water System Components - Health Effects
This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.

ANSI/NSF 61-2016 (i124), Drinking Water System Components: Health Effects
This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.

ANSI/NSF 61-2016 (i126), Drinking Water System Components: Health Effects
This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.

ANSI/NSF 61-2016 (i128), Drinking Water System Components: Health Effects
This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.

ANSI/NSF 61-2015 (i125), Drinking Water System Components: Health Effects
This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.
ANSI/ NSF 61-2016 (i129), Drinking Water System Components - Health Effects
This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.

ANSI/ NSF 61-2016 (i130), Drinking Water System Components - Health Effects
This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.

ANSI/ NSF 61-2016 (i131r1), Drinking Water System Components - Health Effects
This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.

ANSI/ NSF 61-2016 (i132r1), Drinking Water System Components - Health Effects
This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.

ANSI/ NSF 61-2016 (i133r1), NSF 61-2015 - Drinking Water System Components - Health effects
This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.

ANSI/ NSF 61-2017 (i134r1), Drinking Water System Components - Health Effects
This Standard establishes minimum health effects requirements for the chemical contaminants and impurities that are indirectly imparted to drinking water from products, components, and materials used in drinking water systems. This Standard does not establish performance, taste and odor, or microbial growth support requirements for drinking water system products, components, or materials.

ANSI/ NSF 62-2009 (i1), Drinking water distillation systems
Issue 1 - The proposed revision updates the scope, normative references, structural integrity requirements, performance indication devices (PID), test waters and instruction and information. Requirements not pertaining to distillers are being removed. The document has also been restructured to be consistent with the Drinking Water Treatment Unit family of Standards.

ANSI/ NSF 62-2009 (i15), Drinking water distillation systems
Issue 15 - To include a perchlorate claim and update maximum product water concentration for arsenic.

ANSI/ NSF 62-2012 (i22), Drinking water distillation systems
Issue 22: The proposed revision is to remove the component burst pressure test requirement from section 5 of the family of DWTU Standards.

ANSI/ NSF 62-2012 (i23), Drinking water distillation systems
The proposed revision will remove the retesting requirement for contaminants that exceed the non-health based advisory concentration under section 4.2.3.6.

ANSI/ NSF 62-2014 (i24), Drinking Water Distillation Systems
This standard establishes minimum materials, design and construction, and performance requirements for point-of-use and point-of-entry drinking water distillation systems and the components used in these systems. Distillation systems covered by this standard are designed to reduce specific chemical contaminants from potable drinking water supplies. Systems covered under this standard may also be designed to reduce microbiological contaminants, including bacteria, viruses, and cysts, from potable drinking water supplies. It is recognized that a system may be effective in controlling one or more of these contaminants, but systems are not required to control all.

ANSI/ NSF 62-2015 (i26r2), Drinking Water Distillation Systems
This standard establishes minimum materials, design and construction, and performance requirements for point-of-use and point-of-entry drinking water distillation systems and the components used in these systems. Distillation systems covered by this standard are designed to reduce specific chemical contaminants from potable drinking water supplies. Systems covered under this standard may also be designed to reduce microbiological contaminants, including bacteria, viruses, and cysts, from potable drinking water supplies. It is recognized that a system may be effective in controlling one or more of these contaminants, but systems are not required to control all.

ANSI/ NSF 62-2015 (i27), Drinking Water Distillation Systems
This standard establishes minimum materials, design and construction, and performance requirements for point-of-use and point-of-entry drinking water distillation systems and the components used in these systems. Distillation systems covered by this standard are designed to reduce specific chemical contaminants from potable drinking water supplies. Systems covered under this standard may also be designed to reduce microbiological contaminants, including bacteria, viruses, and cysts, from potable drinking water supplies. It is recognized that a system may be effective in controlling one or more of these contaminants, but systems are not required to control all.

ANSI/ NSF 62-2016 (i28r1), Drinking Water Distillation Systems
This standard establishes minimum materials, design and construction, and performance requirements for point-of-use and point-of-entry drinking water distillation systems and the components used in these systems. Distillation systems covered by this standard are designed to reduce specific chemical contaminants from potable drinking water supplies. Systems covered under this standard may also be designed to reduce microbiological contaminants, including bacteria, viruses, and cysts, from potable drinking water supplies. It is recognized that a system may be effective in controlling one or more of these contaminants, but systems are not required to control all.
ANSI/NSF 62-2016 (i30r1), NSF 62-2016 - Drinking Water Distillation Systems

This standard establishes minimum materials, design and construction, and performance requirements for point-of-use and point-of-entry drinking water distillation systems and the components used in these systems. Distillation systems covered by this standard are designed to reduce specific chemical contaminants from potable drinking water supplies. Systems covered under this standard may also be designed to reduce microbiological contaminants, including bacteria, viruses, and cysts, from potable drinking water supplies. It is recognized that a system may be effective in controlling one or more of these contaminants, but systems are not required to control all.

ANSI/NSF 62-2016 (i31r1), Drinking Water Distillation Systems

This standard establishes minimum materials, design and construction, and performance requirements for point-of-use and point-of-entry drinking water distillation systems and the components used in these systems. Distillation systems covered by this standard are designed to reduce specific chemical contaminants from potable drinking water supplies. Systems covered under this standard may also be designed to reduce microbiological contaminants, including bacteria, viruses, and cysts, from potable drinking water supplies. It is recognized that a system may be effective in controlling one or more of these contaminants, but systems are not required to control all.

ANSI/NSF 62-2017 (i32r1), Drinking Water Distillation Systems

This standard establishes minimum materials, design and construction, and performance requirements for point-of-use and point-of-entry drinking water distillation systems and the components used in these systems. Distillation systems covered by this standard are designed to reduce specific chemical contaminants from potable drinking water supplies. Systems covered under this standard may also be designed to reduce microbiological contaminants, including bacteria, viruses, and cysts, from potable drinking water supplies. It is recognized that a system may be effective in controlling one or more of these contaminants, but systems are not required to control all.

ANSI/NSF 7-2009 (i7), Commercial Refrigerators and freezers

Issue 7 - boilerplate updates in the family of food equipment standards; reference to NSF/ANSI 51 update; and addition of thermometer language in section 9.

ANSI/NSF 7-2009 (i7r2), Commercial Refrigerators and Freezers

Issue 7 - Boilerplate modifications and thermometer language update. Revision 2 includes changes proposed in 215r2 boilerplate modifications to the family of food equipment standards.

ANSI/NSF 7-2014 (i11r1), Commercial Refrigerators and Freezers

This Standard contains requirements for refrigerators and freezers used to store and/or display cold food. The types of refrigerators and freezers covered by this Standard include, but are not limited to: storage refrigerators (e.g., reach-in, under counter, walk-in, roll-in); storage freezers (e.g., reach-in, under counter, walk-in, roll-in); rapid pull-down refrigerators and freezers; refrigerated food transport cabinets; refrigerated buffet units; refrigerated food preparation units; display refrigerators; beverage coolers; and ice cream cabinets.

ANSI/NSF 7-2016 (i13r1), Commercial Refrigerators and Freezers

This Standard contains requirements for refrigerators and freezers used to store and/or display cold food. The types of refrigerators and freezers covered by this Standard include, but are not limited to: storage refrigerators (e.g., reach-in, under counter, walk-in, roll-in); storage freezers (e.g., reach-in, under counter, walk-in, roll-in); rapid pull-down refrigerators and freezers; refrigerated food transport cabinets; refrigerated buffet units; refrigerated food preparation units; display refrigerators; beverage coolers; and ice cream cabinets.

ANSI/NSF 7-2016 (i9r1), Commercial Refrigerators and Freezers

This Standard contains requirements for refrigerators and freezers used to store and/or display cold food. The types of refrigerators and freezers covered by this Standard include, but are not limited to: storage refrigerators (e.g., reach-in, under counter, walk-in, roll-in); storage freezers (e.g., reach-in, under counter, walk-in, roll-in); rapid pull-down refrigerators and freezers; refrigerated food transport cabinets; refrigerated buffet units; refrigerated food preparation units; display refrigerators; beverage coolers; and ice cream cabinets.

ANSI/NSF 8-2007 (i6), Commercial powered food preparation equipment

Issue 6 - To update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 8-2009 (i8), Commercial powered food preparation equipment

Issue 8 - Boilerplate revisions in the family of food equipment standards including normative references.

ANSI/NSF 8-2010 (i9), Commercial powered food preparation equipment

Issue 9 - The purpose of this ballot is to update the design and construction requirements for food slicers.

ANSI/NSF 8-2012 (i10), Commercial powered food preparation equipment

Issue 10 - The purpose of this ballot is to update the Normative References and boilerplate language in the Food Equipment family of Standards.

ANSI/NSF 8-2017 (i12r1), Commercial Powered Food Preparation Equipment

Equipment covered by this Standard includes, but is not limited to, coffee grinders, grinders, mixers, pasta makers, peelers, saws, slicers, tenders, and similar equipment.

ANSI/NSF BIFMA e3-2014 (i16r2), Sustainable Furniture

This sustainability standard is applicable to all business and institutional furniture; this includes but is not limited to moveable walls, systems furniture, desking systems, casegoods, tables, seating, and accessories. The Standard is also applicable to materials and components manufactured by suppliers to furniture manufacturers.

ANSI/NSF e3-2014 (i15r2), ANSI/BIFMA e3 Furniture Sustainability

This sustainability standard is applicable to all business and institutional furniture; this includes but is not limited to moveable walls, systems furniture, desking systems, casegoods, tables, seating, and accessories. The Standard is also applicable to materials and components manufactured by suppliers to furniture manufacturers.

Issue 2 - This ballot is proposed to reaffirm the Water Systems Council PST-2000 Pressurized Water Storage Tank Standard as required every five years by American National Standards Institute (ANSI). At this time, no revisions are being recommended to the Standard.

ANSI/NSF/BIFMA e3-2013 (i18r2), Furniture Sustainability

This sustainability standard is applicable to all business and institutional furniture; this includes but is not limited to moveable walls, systems furniture, desking systems, casegoods, tables, seating, and accessories. The Standard is also applicable to materials and components manufactured by suppliers to furniture manufacturers.

ANSI/NSF/GCI 355-2011, Greener Chemicals and Processes Information Standard

Issue 1 - Revision 2: The purpose of this ballot is to create a new standard to provide the chemical enterprise with a voluntary and standardized way to define and report the primary categories of information, their respective data elements, and data quality objectives. This information will be provided by suppliers to communicate clearly, with transparency and consistency, to help customers evaluate the relative greenness of a chemical product and process over its life cycle.

ANSI/NSF/IPEC 363-2014 (i1), Good Manufacturing Practices (GMP) for Pharmaceutical Excipients

This Standard is intended to define Good Manufacturing Practices (GMP) for excipient manufacture and distribution for use in drug products. It sets minimum requirements for GMP applicable to all commercially available excipients.

Establishes guiding principles for the development and use of environmental labels and declarations.

ANSI/NSF/ISO 14021-2001, Environmental Labels and Declarations - Self-Declared Environmental Claims (Type II Environmental Labelling)

Specifies requirements for self-declared environmental claims, including statements, symbols and graphics, regarding products. It further describes selected terms commonly used in environmental claims and gives qualifications for their use. This standard also describes a general evaluation and verification methodology for self-declared environmental claims and specific evaluation and verification methods for the selected claims in this standard.

ANSI/NSF/ISO 14024-2001, Environmental Labels and Declarations - Type I Environmental Labelling - Principles and Procedures

Establishes the principles and procedures for developing Type I environmental labelling programmes, including the selection of product categories, product environmental criteria and product function characteristics; and for assessing and demonstrating compliance. This standard also establishes the certification procedures for awarding the label. A Type I environmental labelling programme is a voluntary, multiple-criteria-based third party programme that awards a license which authorizes the use of environmental labels on products indicating overall environmental preferablety of a product within a particular product category based on life cycle considerations.

ANSI/WSC PST 2000-2016 , WSC Standard for Pressurized Water Storage Tank

This standard prescribes minimum performance and construction requirements for pressurized storage tanks for service in water well systems with a maximum factory pre-charge pressure of 40 psig (280 kPa), to be operated in ambient air temperatures up to 120 °F (49 °C), with maximum working pressures not less than 75 psig (520 kPa) and not greater than 150 psig (1000 kPa) and tank volumes not exceeding 120 gallons (450 L).

BSR/NSF 40-201X (i29r1), NSF/ANSI 40

Residential Wastewater Treatment Systems

This Standard contains minimum requirements for residential wastewater treatment systems having rated treatment capacities between 1514 L/day (400 gal/day) and 5678 L/day (1500 gal/day). Management methods for the treated effluent discharged from residential wastewater treatment systems are not addressed by this Standard.

NW&RA (ASC Z245) (National Waste & Recycling Association)

The scope of this revision is to clarify some aspects related to the stand up drive position.

ANSI Z245.2-2013, Stationary Compactors - Safety Requirements for Installation, Maintenance, Operation, Modification and Repair

Standard revises ANSI Z245.2-2008 safety requirements for the installation, operation, maintenance, service, repair, modification and reconstruction of stationary compacting equipment. The requirements of this standard apply to stationary compactors rated at 600 volts or less, for outdoor or indoor use, and are employed in accordance with the manufacturer's written installation, operation, and maintenance instructions and procedures. This standard does not apply to compactors intended for use in private homes. This standard does not apply to mobile landfill compactors and compactor-type equipment that is operational when permanently mounted on trucks or other vehicles.

ANSI Z245.21-2013, Equipment Technology and Operations for Wastes and Recyclable Materials - Stationary Compactors -- Safety Requirements for Installation, Maintenance and Operation

Provides safety requirements with respect to the design and construction of stationary compacting equipment. Provides requirements to minimize the risk of fire, electrical shock and injury to persons during operation and maintenance of stationary compacting equipment for use with wastes and recyclable materials by commercial businesses, apartment buildings, industrial plants, waste processing facilities, waste disposal and transfer industries, and recycling facilities.

Establishes safety requirements with respect to the manufacture, reconstruction, use, modification, maintenance, service, operation, and installation (where applicable) of containers, two-wheeled carts, and two-wheeled cart lifters use for the collection, transportation and recycling of solid wastes.

Establishes safety requirements with respect to the design, manufacture, installation, reconstruction, modification, maintenance, and operation of facilities for the processing of commingled recyclable materials. It does not cover other types of facilities such as, waste-to-energy plants, scrap processing facilities, transfer stations, or mixed waste processing facilities, unless there is a commingled processing operation as part of these facilities.

Establishes safety requirements for the design, manufacture, construction, modification, maintenance and operation of waste transfer stations used in the collection, storage, and the eventual transportation of commingled wastes and recyclable materials.

ANSI Z245.5-2013, Equipment Technology and Operations for Wastes and Recyclable Materials - Baling Equipment -- Safety Requirements for Installation, Maintenance and Operation

Provides safety requirements with respect to the installation, operation, maintenance, service, repair, modification, and reconstruction (where applicable) of baling equipment. Applies to baling equipment rated at 600 volts or less, for outdoor or indoor use, and are employed in accordance with the manufacturer’s installation, operation, and maintenance instructions and procedures.

Provides safety requirements with respect to the design and construction of baling equipment. Provides requirements to minimize the risk of fire, electrical shock and injury to persons during operation and maintenance of baling equipment for use with wastes and recyclable materials by commercial businesses, apartment buildings, industrial plants, waste processing facilities, waste disposal and transfer industries, and recycling facilities. Requirements apply to balers rated at 600 volts or less, for outdoor or indoor use, and are employed in accordance with the manufacturer’s installation, operation, and maintenance instructions and procedures.

Establishes dimensional requirements for all waste containers commonly used in the collection, compaction and transportation of solid waste and recyclables in residential, commercial and industrial applications. Specified labeling will assist the users of such equipment in identifying that a container so marked is compatible with a lifting device designed to accommodate containers of the same type. The revision includes dimensions for Type L (hook-lift) and Type S (front loader) containers.

NWRA (National Windshield Repair Association)

ANSI/NWRA/ROLAGS 001-2013, Repair of Laminated Automotive Glass Standard

Updates the Standard for Repair of Auto Glass (previously known as ANSI NGA R.1 - 2007) and redesignates it. Adds product performance specifications.

OEOSC (ASC OP) (Optics and Electro-Optics Standards Council)

ANSI OEOSC OP1.002-2017, for Optics and Electro-Optical Instruments - Optical Elements and Assemblies - Surface Imperfections

(30-Day Public Comment Period: Announcement of Limited Substantive Changes to an Approved American National Standard) This page replaces Page 4 in ANSI/OEOSC OP1.002-2016. The standard establishes uniform practices for stating and interpreting tolerances and for conducting inspections of transmissive and reflective optical elements and cemented components for scratch, dig, edge, coating, and optical cement imperfections. Default specifications for bubbles and inclusions are also included.

ANSI/OEOSC OP1.0110-1-2011, Optics and Electro-Optical Instruments - Preparation of drawings for optical elements and systems - Part 1: General

ISO&160:10110 specifies the presentation of design and functional requirements for optical elements and systems in technical drawings used for manufacturing and inspection. This part of ISO&160:10110 specifies the presentation in drawings of the characteristics, especially the tolerances, of optical elements and systems. Rules for preparation of technical drawings as well as for dimensioning and tolerancing are given in various International Standards. These general standards apply to optical elements and systems only if the necessary rules are not given in the various parts of ISO&160:10110.

ANSI/OEOSC OP1.0110-10-2014, Standard for Optics and Electro-Optical Instruments - Preparation of drawings for optical elements and systems - Part:10 Table representing data of optical elements and cemented assemblies

OP1.0110-10 is a national standard which establishes uniform practices for drawing notations in tabular form for optical elements and assemblies. It is based entirely on ISO 10110-10, but modified to accommodate standard practice in the United States.

ANSI/OEOSC OP1.0110-12-2014, Optics and Electro-Optical Instruments - Preparation of Drawings for Optical Elements and Systems - Part 12: Aspheric Surfaces

This national standard establishes uniform practices for indications on drawings of aspheric optical surfaces. It is based entirely on ISO 10110-12, with the addition of a notation to allow the specification of Forbes aspheres, commonly called Qcon and Qbfs.

ANSI/OEOSC OP1.0110-5:2015, Standard for Optics and Photonics - Preparation of Drawings for Optical Elements and Systems - Part 5: Surface Form Tolerances

This Standard specifies terms, definitions, and methods necessary to specify the properties of optical surface and wavefront errors by statistical methods. This standard applies to surfaces that are intrinsically very smooth, that have few isolated asperities with amplitudes beyond several standard deviations from the average that can be excluded from the analysis. It departs from previous surface texture specifications in that it describes surface properties primarily in Fourier frequency space rather than in coordinate space.

ANSI/OEOSC OP1.0110-8:2014, American National Standard for Optics and Electro-Optical Instruments - Preparation of Drawings for Optical Elements and Systems - Part 8: Surface Texture; Roughness and Waviness

The ISO 10110 series specifies the presentation of design and functional requirements for optical elements in technical drawings used for manufacturing and inspection. This part of ISO 10110 specifies rules for specifying and tolerancing surface roughness and waviness on optical elements. This part of ISO 10110 does not specify the method by which compliance with the specifications is to be tested.

ANSI/OEOSC OP1.0110-9:2015, Standard For Optics and Photonics - Preparation of Drawings for Optical Elements and Systems - Part 9: Surface treatment and coatings

OP1.0110 specifies the presentation of design and functional requirements for optical elements and systems in technical drawings used for manufacturing and inspection. This part of OP1.0110 specifies rules for indicating the treatments and coatings applied to optical surfaces for functional and/or protective purposes.

ANSI/OEOSC OP1.9211-4-2014, Standard For Optics and Photonics - Optical Coatings - Part 4: Specific Test Methods

ISO 9211 identifies surface treatments of components and substrates excluding ophthalmic optics (spectacles) by the application of optical coatings and gives a standard form for their specification. It defines the general characteristics and the test and measurement methods whenever necessary, but is not intended to define the process method. This part of ISO 9211 provides specific test methods for optical coatings.

ANSI/OEOSC OP3.001-2001 (R2014), Standard For Optics and Electro-Optical Instruments - Optical Glass

This Standard establishes uniform practices for stating and interpreting specifications, tolerances, and functional requirements for optical glass that is used to fabricate lenses and other optical elements, such as prisms, windows, light pipes, etc., used in optical assemblies, systems, instruments, or other related uses.
OPEI (Outdoor Power Equipment Institute)

ANSI/OPEI B175.1-2012, Outdoor Power Equipment - Internal Combustion Engine-Powered Hand-Held Chain Saws - Safety and Environmental Requirements

To establish safety and environmental requirements for internal combustion engine-powered chain saws and replacement saw chains for use primarily in cutting wood.

ANSI/OPEI B175.1-2012/A1-2014, Internal Combustion Engine-Powered Handheld Chain Saws - Safety and Environmental Requirements - Amendment 1

Addenda to address revisions to implementation terms in Scope, clarify section 3.31 Table 1 regarding guide bars definition, clarify section 5.11.2.5 regarding guide bars for kickback testing and clarifying sections 8.8.4.1 and D.2.2 intent.

ANSI/OPEI B175.2-2012, Outdoor Power Equipment - Internal Combustion Engine-Powered Hand-Held and Backpack Blowers and Blower-Vacuums - Safety Requirements and Performance Testing Procedures

To establish manufacturer requirements to reduce the risk of injury associated with the use of hand-held and backpack internal combustion engine-powered blowers and blower-vacuums and to measure bystander sound pressure levels at 15 meters (50 feet). This standard does not apply to ride-on, towed, walk-behind units, or electrically powered units.

ANSI/OPEI B175.2-2012/A1-2013, Internal Combustion Engine-Powered Handled and Backpack Blowers and Blower-Vacuums - Safety Requirements and Performance Testing Procedures - Amendment 1

Addenda to address revisions to Implementation Terms and Standard identification in Scope. Probe Test for Power Driven Components, Probe Test for Hot Surfaces, UV Resistance, Equivalent Vibration Equation and Performance Testing Procedures of ANSI/OPEI B175.2-2012

ANSI/OPEI B175.3-2013, Outdoor Power Equipment - Internal Combustion Engine-Powered Hand-Held Grass Trimmers and Brushcutters - Safety and Environmental Requirements

Re-balloting of standard to accommodate changes made after the initial round of comments and balloting.

ANSI/OPEI B175.4-2013, Outdoor Power Equipment - Portable, Hand-Held, Internal Combustion Engine-Powered Cut-Off Machines - Safety and Environmental Requirements

Re-balloting of standard to accommodate changes made after the initial round of comments and balloting.

The safety specifications given in this standard are for powered a) reel and rotary pedestrian-controlled lawn mowers, b) reel and rotary ride-on lawn mowers, c) ride-on lawn tractors with mower attachments, d) ride-on lawn and garden tractors with mower attachments, e) lever-steer and zero-turn ride-on mowers.

ANSI/OPEI B175.10-2013, Off-Road Ground-Supported Outdoor Power Equipment - Gasoline Fuel Systems - Performance Specifications and Test Procedures

Re-balloting of standard to accommodate changes made after the initial round of comments and balloting.

ANSI/OPEI B175.3-2014, Snow Throwers - Safety Specifications

The specifications in this standard apply to (a) walk-behind power snow throwers, (b) ride-on power snow throwers, (c) lawn ride-on tractors with snow thrower attachments, (d) lawn and garden tractors with snow thrower attachments, and (e) lever-steer ride-on machines with snow thrower attachments. These specifications are not intended to apply to hand-held snow throwers nor to airport, highway, and agricultural types of snow removal machines and equipment. This standard does not cover all of the specifications that apply to electrically-powered snow throwers.

ANSI/OPEI B175.4-2017, Commercial Turf Care Equipment - Safety Specifications

The safety specifications given in this standard are for powered (a) pedestrian-controlled machines, (b) ride-on machines and (c) implements for use with pedestrian and ride-on machines intended for marketing as commercial turf care equipment and that are customarily used by hired operators.

ANSI/OPEI B71.8-2016, Powered Walk-Behind Rotary Tillers and Hand-Supported Cultivators - Safety Specifications

The requirements provided in this standard are for powered walk-behind rotary tillers and hand-supported cultivators. This standard is intended to provide safety and design requirements to help ensure uniform operator environments, exclusive of the power source. This standard shall apply to machines specifically marketed for consumer / personal use.

ANSI/OPEI B71.9-2016, Multipurpose Off-Highway Utility Vehicles

This standard establishes requirements for equipment, configuration, and performance of Multipurpose Off-Highway Utility Vehicles (MOHUVs). MOHUVs are vehicles having features specifically intended for utility use and having the following characteristics: (a) intended to transport a person(s) and/or cargo, with a top speed in excess of 25 mph (40.2 km/h); (b) 2030 mm (80 in) or less in overall width; (c) designed to travel on four or more wheels; (d) using a steering wheel for steering control; (e) with a non-straddle seat; (f) with a Gross Vehicle Weight Rating of no more than 1814 kg (4000 lb), and (g) a minimum cargo capacity of 159 kg (350 lb).

PGMA (Portable Generator Manufacturers Association)

ANSI/PGMA G300-2015, Safety and Performance of Portable Generators

This standard applies to 15 kW or smaller; single phase; 300 V or lower; 60 hertz; gasoline, liquefied petroleum gas (LPG) and diesel engine driven portable generators intended for multiple use and intended to be moved, though not necessarily with wheels. Permanent stationary generators, 50 hertz generators, marine generators, trailer mounted generators, generators in motor homes, generators intended to be pulled by vehicles, engine driven welding power sources and portable generators with AC output circuits that are not compatible with NEMA receptacles are not covered.

PLASTICS (Plastics Industry Association)

ANSI/PLASTICS B151.1-2017, Safety Requirements for Plastics Injection Molding Machines

The requirements of this standard apply to Horizontal and Vertical Clamp Injection Molding Machines (HCIMMs and VCIMMs) that process plastic materials and inject said material into a mold(s) held closed by the acting clamp.

ANSI/SPi B151.20-2013, Safety Requirements for Plastic Sheet Production Machinery

The requirements of this standard shall apply to plastic sheet production machinery. This standard also specifies safety requirements relating to the design and construction of multi-roll calenders intended for the processing of plastics and concerns the calender including all components fixed to its frame. Safety requirements of ancillary equipment used with plastic sheet production machinery are not covered by this standard.

ANSI/SPi B151.27-2013, Safety Requirements for the Integration of Robots with Injection Molding Machines

The requirements of this standard apply to all robots used on or in conjunction with horizontal and vertical injection molding machines (IMMs). The purpose of this standard is to establish recommended safe practices and procedures for the integration, care, and use of robots entering the mold area of horizontal and vertical IMM(s). Procedures for automatic mold changers and other ancillary equipment are not included in this standard.
ANSI/SPI B151.31-2014, Safety Requirements for the Manufacture and Use of Blow Molding Machines

The requirements of this standard shall apply to the manufacture and use of all Blow Molding Machines (BMMs) that process plastic materials to: - blow a parison; - blow a preform (including injection blow, injection stretch blow, and reheat & blow) into the shape of a mold cavity held together by a vertically or horizontally acting clamp(s), and includes: - Extrusion Blow Molding Machines; - Injection Stretch Blow Molding Machines; - Injection Blow Molding Machines; - Reheat & Blow Molding Machines. Safety requirements for the manufacture or use of ancillary equipment for Blow Molding Machines is not covered by this standard.

ANSI/SPI B151.7-2013, Safety Requirements for Extrusion Machines

The requirements of this standard shall apply to extrusion machines that are used in the plastics industry. Extrusion machinery suppliers and users shall use the risk assessment process in the manufacture, care, and use of the machinery. Deviations from the requirements of this standard shall be based on a documented risk assessment. Safety requirements of ancillary equipment used with extrusion machines are not covered by this standard.

PLATO (Portable Lights American Trade Organization)

ANSI/PLATO FL 1-2016, Flashlight Basic Performance Standard

This Standards Publication covers basic performance characteristics of hand-held/portable flashlights, spotlights, and headlamps providing directional lighting.

PMMI (Organization) (Project Management Institute)

ANSI/PMMI B155.1-2016, Safety Requirements for Packaging and Processing Machinery

The standard specifies basic principles and methodology for achieving safety in the design and the use of machinery based on risk assessment. The requirements of this standard apply to new, modified or rebuilt industrial and commercial: - processing machinery used to produce food, beverage and pharmaceutical products; - packaging machinery that performs packaging functions for primary, secondary, and tertiary (transport / distribution) packaging; - coordination of the packaging functions that take place on the production line; and - packaging-related converting machinery.

PRCA (Professional Ropes Course Association)

ANSI/PRCA 1.1-3-2014, Ropes Challenge Course Installation, Operation & Training Standards

Establishes safety requirements for the design, manufacture, performance, construction, inspection, maintenance, removal from service, qualification, instruction, training, use and operation of components, subsystems, systems and courses utilized by the ropes challenge course industry including permanent temporary or mobile portable and fixed low-ropes challenge course elements, high ropes challenge course elements, standalone challenge elements, zip lines, canopy tours, adventure courses and any climbing walls, and climbing structures that are components of a ropes challenge course.

PSAI (Portable Sanitation Association)

Updated and included relevant industry information for consumers, operators and suppliers in the portable sanitation industry. Ready to be reviewed and start canvass surveys.

The Standard for Portfolio Management - Third Edition provides guidelines for managing programs within an organization. It defines program management and related concepts, describes the program management life cycle and outlines related processes.

This new standard replaces the former ANSI Z4.3-2005. Following prior public comment and vote of the consensus body it was determined that a few changes to language pertaining to hand wash station requirements and disposal of wastewater were needed. Other wording changes were made for clarity in the language.

ANSI/PSAI AE-1-2016, Sanitation in Fields and Temporary Labor Camps: Minimum Requirements

This new standard replaces the former ANSI Z4.4-2005. Following prior public comment and vote of the consensus body it was determined that a few changes to language pertaining to hand wash station requirements were needed.

RESNA (Rehabilitation Engineering and Assistive Technology Society of North America)

This standard includes requirements and test methods for adaptive winter sports equipment (sit-skis, mono-skis, and bi-skis). Additional sections pertaining to other types of winter adaptive sports equipment will be developed and incorporated with future revisions.

NGCMA Z130.1-2004 provides Safety and Performance Specifications for Golf Carts. Adaptive golf cars are similar to standard golf cars in many respects but have hand controls, a swivel seat and the golfer swings the golf club while sitting in the adaptive golf car. This creates numerous safety issues not addressed by NGCMA Z130.1-2004 that need to be resolved.

This standard addresses the accessibility of technologies identified as priorities for people with cognitive impairments, which includes cell phones, microwave ovens, and fire extinguishers. The initial focus will be on the accessibility of devices, generally excluding software products, services, or web-page design. This standard is intended to increase access to a variety of products for people with cognitive impairments. This standard reports measureable and functional characteristics of products to assist users in determining if the product will meet their specific needs. Using this standard does not preclude meeting other applicable standards and test methods.

This standard applies to powered wheelchairs, including scooters, and accessories for wheelchairs and scooters. It specifies test methods and requirements for: dynamic stability; brake effectiveness; energy consumption; maximum speed, acceleration and deceleration; obstacle climbing ability; climatic testing; power and control system; and electromagnetic compatibility.

ANSI/RESNA WC-3-2013, RESNA American National Standard for Wheelchairs - Volume 3: Wheelchair Seating

Wheelchair seating as a sub-specialty of rehabilitation services involves the selection and provision of wheelchair seating products to provide improved body support to the wheelchair user. This standard applies to all wheelchair seating and postural devices. It specifies test methods or methods of measurement for: vocabulary; the physical and mechanical characteristics; and static, impact and load strength testing.

RESNET (Residential Energy Services Network, Inc.)

ANSI/RESNET 1201-2016, Standard Method of Test for the Evaluation of Building Energy Analysis Model Calibration Methods

This standard test procedure applies to calibration methods used with computer programs that predict the energy performance of buildings.

The proposed addenda to standard ANSI/RESNET 301-2014 will modify the calculation of domestic hot water heating energy as it affects the Home Energy Rating System Index score of a home.

The proposed addendum to standard ANSI/RESNET 301-2014 will modify section 5.2 on Innovative Design Requests. Editorial changes are made to replace HERS with Energy Rating in the title and throughout the standard.

For residential buildings, the proposed standard will identify the metrics, tolerances, procedures, calculations and the required documentation to: (1) Calculate the standard energy use of a home, (2) Determine the HERS Index score of a home, (3) Define the minimum rated features of a home, (4) Calculate the retrofit savings for existing homes, (5) Calculate the cost effectiveness of energy improvements to a home (6) Label the certified energy performance of a home.

This proposed standard is applicable to all single family dwelling units and all multifamily dwelling units in buildings three stories or less in height above ground. The standard defines procedures for measuring the air leakage of building enclosures, the air leakage of heating and cooling air distribution systems, and the airflow of mechanical ventilation systems and is to be used when evaluating the energy performance of residential buildings. The proposed standard complements and references other American National Standards.

RIA (Robotics Industries Association)

ANSI/RIA R15.06-2012, Industrial Robots and Robot Systems - Safety Requirements

Requirements for the safety of personnel using industrial robots and robot systems. Safety requirements for the manufacture, integration, installation and use of industrial robots and robot systems. Identifies hazards and provides guidance on mitigating them using protective measures and design principles.

RIC (Remanufacturing Industries Council)

ANSI/RIC 001.1-2016, Specifications for the Process of Remanufacturing

This standard defines and provides a benchmark for the process of remanufacturing, and establishes specifications that characterize the remanufacturing process and differentiate remanufacturing from other practices. The specifications in this standard will promote continual improvement in the remanufacturing process and ensure that the products provided to customers by the remanufacturing industry are dependable and of a consistent high quality. This standard is intended to serve as a baseline for additional standards for specific remanufactured products and product groups to be developed in the future.
ROHVA (Recreational Off-Highway Vehicle Association)

ANSI/ROHVA 1-2016, Standard for Recreational Off-Highway Vehicles

This standard establishes minimum requirements for recreational off-highway vehicles (ROVs). These vehicles are intended by the manufacturer for recreational use by one or more persons and may have secondary general utility applications. This standard addresses design, configuration and performance aspects of ROVs, including, among other items, requirements for accelerator, clutch and gearshift controls; engine controls; lighting; tires; service and parking brake/parking mechanism performance; lateral and pitch stability; occupant handholds; Roll Over Protective Structure (ROPS); Occupant Retention System (ORS); and requirements for safety labels and owner’s manual.

RVIA (Recreational Vehicle Industry Association)

ANSI A119.5-2015, Standard for Park Model Recreational Vehicles

This standard covers the fire and life safety criteria and plumbing for Recreational Park Trailers considered necessary to provide a reasonable level of protection from loss of life from fire and explosion. It reflects situations and the state of the art prevalent at the time the Standard was issued.

RVIA EGS-1-2013, Engine Generator Sets for Recreational Vehicle Requirements

This standard sets forth safety requirements and standards for engine generators having a continuous rating of 20 kilowatts or less, intended for installation and operation in recreational vehicles and similar mobile applications. It is not intended to apply to emergency or standby generators (i.e., standby generators, generators with integral fuel tanks), welding generators, farm lighting plants, variable speed generators for railroad car installations, military specification engine generators, marine use, or similar specialized equipment. Included in this standard are recommended safety measures for installations, use and care.

RVIA LV-2017, Standard for Low Voltage Systems in Conversion and Recreational Vehicles

This standard covers the installation of low voltage electrical systems and devices within conversion and recreational vehicles. In the absence of specific instructions from the automotive OEM, this standard also covers any additions, deletions, or modifications to any part of the original equipment chassis manufacturer’s electrical system.

RVIA TSIC-1-2008 (R2013), Recommended Practice Process Controls for Assembly of Wheels on Trailers

This Recommended Practice identifies and defines the significant factors required for trailer wheel assembly process and systematic control. The proper assembly of wheels on trailers is of critical importance to consumer safety. The improper attachment of a wheel to an axle may lead to the loss of the wheel in service. This document provides information on the recommended design and assembly of trailer wheel components and control processes intended to improve trailer reliability and enhance consumer safety.

RVIA UPA-1-2014, Uniform Plan Approval for Recreational Vehicles

This standard covers minimum plan approval requirements to ensure a reasonable degree of safety and health for occupants using recreational vehicles.

SAAMI (Sporting Arms and Ammunition Manufacturers Institute)

ANSI/SAAMI Z299.1-2015, Voluntary Industry Performance Standards for Pressure and Velocity of Centerfire Rifle Sporting Ammunition for Use by Commercial Manufacturers

This standard for Centerfire Rifle Ammunition was first published in 1981. Subsequently it was revised on five year intervals, in keeping with ANSI policy, through 1992. In accordance with ANSI Essential Requirements and to capture the changes in technology, the addition of new load offerings, amendments to process and protocol and recommended equipment sources since the last revision, a new ANSI is being created. The material presented provides the commercial manufacturer of factory loaded ammunition with Pressure and velocity performance and dimensional characteristics. Included are procedures and equipment requirements for determining these criteria.

ANSI/SAAMI Z299.2-2015, Voluntary Industry Performance Standards for Pressure and Velocity of Shotshell Ammunition for Use by Commercial Manufacturers

This standard for Shotshell Ammunition was first published in 1977. Subsequently it was revised on five year intervals, in keeping with ANSI policy, through 1992. In accordance with ANSI Essential Requirements and to capture the changes in technology, the addition of new load offerings, amendments to process and protocol and recommended equipment sources since the last revision, a new ANSI is being created. The material presented provides the commercial manufacturer of factory loaded ammunition with Pressure and velocity performance and dimensional characteristics. Included are procedures and equipment requirements for determining these criteria.

ANSI/SAAMI Z299.3-2015, Voluntary Industry Performance Standards for Pressure and Velocity of Centerfire Pistol and Revolver Ammunition for Use by Commercial Manufacturers

This standard for Centerfire Pistol and Revolver Ammunition was first published in 1979. Subsequently it was revised on five year intervals, in keeping with ANSI policy, through 1993. In accordance with ANSI Essential Requirements and to capture the changes in technology, the addition of new load offerings, amendments to process and protocol and recommended equipment sources since the last revision, a new ANSI is being created. The material presented provides the commercial manufacturer of factory loaded ammunition with Pressure and velocity performance and dimensional characteristics. Included are procedures and equipment requirements for determining these criteria.

ANSI/SAAMI Z299.4-2015, Voluntary Industry Performance Standards for Pressure and Velocity of Centerfire Rifle Sporting Ammunition for Use by Commercial Manufacturers

This standard for Centerfire Rifle Ammunition was first published in 1981. Subsequently it was revised on five year intervals, in keeping with ANSI policy, through 1992. In accordance with ANSI Essential Requirements and to capture the changes in technology, the addition of new load offerings, amendments to process and protocol and recommended equipment sources since the last revision, a new ANSI is being created. The material presented provides the commercial manufacturer of factory loaded ammunition with Pressure and velocity performance and dimensional characteristics. Included are procedures and equipment requirements for determining these criteria.

This Voluntary Industry Performance Standard provides procedures for evaluating new sporting firearms designs and applies to rifle, shotguns, pistols and revolvers. In the interest of safety these tests are structured to demonstrate to the designer of new firearms that the product will be resistant to abusive mishandling. These procedures are specifically understood not to apply to muzzle loading and black powder firearms of any type.

SAE (SAE International)

ANSI/GEIA 859-2009, Data Management

Standard addresses data management, and is principles-based. Includes several annexes of associated information. Since the standard was developed, significant new developments have occurred in DM, advancing it to the information technology realm. Purpose of standard revision is to update the current standard with new information, and to include updated methods and processes.
ANSI/SAE J1388-2009, Personnel Protection - Skid Steer Loaders

Intended to provide personnel protection guidelines for skid steer loaders. This document is intended as a guide towards standards practice, but may be subject to frequent change to keep pace with experience and technical advances. This should be kept in mind when considering its use. This document provides performance criteria for newly manufactured loaders and it is not intended for in-service machines.

ANSI/SAE/ISO 9244-2009, Earth Moving Machinery - Safety Signs - General Principles

This International Standard establishes general principles for the design and application of safety signs permanently affixed to earth-moving machinery as defined in ISO 6165. This International Standard outlines safety sign objectives, describes the basic safety sign formats, specifies colours for safety signs, and provides guidance on developing the various panels that together constitute a safety sign.

ANSI/SAE/ISO 9244-2010, Earth Moving Machinery - Product Safety Labels - General Principles

This International Standard establishes general principles and gives requirements for the design and application of machine safety labels to be permanently affixed to earth-moving machinery as defined in ISO 6165. It outlines the objectives of signage, describes basic formats, specifies colours and provides guidance on developing the various panels that together constitute a label.

SAIA (ASC A92) (Scaffold & Access Industry Association)

ANSI A92.7-2014, Standard for Airline Ground Support Vehicle-Mounted Vertical Lift Devices

This standard applies to airline ground support vehicle mounted vertical lift devices specifically designed for servicing aircraft while outdoors on a paved airport ramp surface. The chassis may be either a commercial type vehicle or one custom designed to accommodate the vertical lift structures.

ANSI/SAIA A92.9-2011 (R2017), Standard for Mast-Climbing Work Platforms

This standard applies to Mast Climbing Work Platforms that are primarily used to position personnel, along with their necessary tools and materials, to perform their work. Platforms may be adjustable by manual or powered means.

ANSI/SAIA A92.10-2009 (R2014), Standard for Transport Platforms

This standard applies to Transport Platforms that are primarily used as a tool of the trade to vertically transport authorized persons, along with materials and necessary tools, to various access levels on a building or structure for construction, renovation, maintenance or other types of work.

ANSI/SIA A92.2-2015, Standard for Vehicle-Mounted Elevating and Rotating Aerial Devices

This standard applies to the establishment of criteria for design, manufacture, testing, inspection, installation, maintenance, use, training, and operation of vehicle-mounted aerial devices, primarily used to position personnel, installed on a chassis to achieve the following objectives: (1) Prevention of personal injuries and accidents. (2) Uniformity in ratings. (3) Understanding by manufacturers, dealers, brokers, installers, lessees, lessors, maintenance personnel, operators, owners, and users of their respective responsibilities.

ANSI/SIA A92.3-2006 (R2014), Standard for Manually Propelled Elevating Aerial Platforms

This standard applies to manually propelled, integral chassis aerial platforms having a platform that cannot be positioned completely beyond the base and are used to position personnel, along with their necessary tools and materials, at work locations. Platforms are adjustable by manual or powered means and shall not be occupied when moved horizontally.

ANSI/SIA A92.5-2006 (R2014), Standard for Boom-Supported Elevating Work Platforms

This standard applies to self-propelled integral chassis aerial platforms having a platform that can be positioned completely beyond the base and are used to position personnel, along with their necessary tools and materials, at work locations. Aerial platforms are power operated with primary functions, including drive, controlled from the platform. Such aerial platforms are intended to be occupied when driven.

ANSI/SIA A92.6-2006 (R2014), Standard for Self-Propelled Elevating Work Platforms

This standard applies to self-propelled integral chassis aerial platforms having a platform that cannot be positioned completely beyond the base and are used to position personnel, along with their necessary tools and materials, at work locations. Aerial platforms are power operated with primary functions including drive controlled from the platform.

ANSI/SIA A92.8-2006 (R2011), Vehicle-Mounted Bridge Inspection and Maintenance Devices

This Standard applies to mobile units capable of positioning a platform alongside or beneath a bridge deck or equivalent structure while being supported from such structure and are used to position personnel, along with their necessary tools and materials, at work locations.

ANSLI/SBCA FS 100-2012, Standard Requirements for Wind Pressure Resistance of Foam Plastic Insulating Sheathing Used in Exterior Wall Covering Assemblies

This standard establishes wind pressure resistance requirements for Foam Plastic Insulating Sheathing (FPIS) products used as exterior wall sheathing, including use as continuous insulation in exterior wall covering assemblies for the purpose of demonstrating wind pressure performance. This includes performance testing, analysis and quality control procedures.

SCITE (Society of Cable Telecommunications Engineers)

ANSI/SCITE 01-2016, Specification for "F" Port, Female, Outdoor

1. Scope The purpose of this document is to specify requirements for female outdoor 'F'&#8221; ports that are used in the 75-ohm RF broadband communications industry and that interface with 'F'&#8221; Male connectors as defined by ANSI/SCITE 123 2011 and ANSI/SCITE 124 2011.

ANSI/SCITE 02-2016, Specification for "F" Port, Female, Indoor

The purpose of this document is to specify requirements for female indoor 'F'&#8221; ports that are used in the 75-ohm RF broadband communications industry and that interface with 'F'&#8221; Male connectors as defined by ANSI/SCITE 123 and ANSI/SCITE 124.

ANSI/SCITE 03-2008, Test Method for Coaxial Cable Structural Return Loss

The purpose of this procedure is to provide instructions to measure cable structural return loss (SRL). There are two test methods presented, as the accuracy, ease-of-use, and required test equipment differs for each test method.

ANSI/SCITE 04-2014, Test Method for "F" Connector Return Loss

The purpose of this standard is to provide a test method for measuring return loss of "F" Male Connectors with Cable in the frequency range of 5 MHz to 1002 MHz by utilizing the time domain-gating feature of the network analyzer.

ANSI/SCITE 05-2014, Test Method for "F" Connector Return Loss In-Line Pair

The purpose of this procedure is to provide instructions to measure the Return Loss characteristics of a pair of type 'F' connectors and the cable interface, inserted in the middle of a cable, from 5 MHz to 1002 MHz. This test method makes use of the time domain gating feature of the network analyzer to remove the near end and far end test set connector effects from a type 'F' pair in the middle of the cable, joined by a type F (female) - type F (female) adapter.
ANSI/SCTE 06-2015, Composite Distortion Measurements (CSO & CTB)
This document describes a test procedure for the laboratory and production measurement of composite distortion products. There are two types of composite distortions considered: Composite Second Order and Composite Triple Beat. In order to obtain a stable, repeatable measurement, this test procedure describes testing performed with continuous wave (CW) carriers.

ANSI/SCTE 07-2013, Digital Transmission Standard for Cable Television
This standard describes the framing structure, channel coding, and channel modulation for a digital multi-service television distribution system that is specific to a cable channel. The system can be used transparently with the distribution from a satellite channel, as many cable systems are fed directly from satellite links.

ANSI/SCTE 09-2016, Test Method for Cold Bend
The purpose of this procedure is to provide instructions on testing the cold bend properties of flexible outdoor polyvinyl chloride (PVC) or polyethylene (PE) cable.

ANSI/SCTE 10-2014, Test Method for Flexible Coaxial Cable Impact
This test is to establish that specified outdoor flexible RF coaxial drop cable jackets are capable of low temperature characteristics.

ANSI/SCTE 100-2010, Specification for 75 Ohm Smooth Aluminum Subscriber Access Cable
This specification applies to the material, electrical and mechanical properties of seventy-five ohm smooth aluminum outer conductor coaxial cables as defined herein. Seventy-five ohm smooth aluminum outer conductor coaxial cables are used to distribute radio frequency (R.F.) signals and power for voice, data, and video applications as applicable.

ANSI/SCTE 101-2011, Hard Line Splice Connector Return Loss
This document describes a procedure to measure the Return Loss characteristics of a single Mainline Splice Connector interfaced between (2) mainline cables. It implements the time domain-gating features of the network analyzers, which removes the interfaces, and far end termination from the DUT (device under test) measurement.

ANSI/SCTE 102-2016, Cable Retention Force Testing of Trunk & Distribution Connectors
The purpose of this document is to define a standard test procedure to prepare, test and document the retention forces of a given connector/cable assembly, as whole or separate components.

ANSI/SCTE 103-2012, Test Method for DC Contact Resistance, Drop cable to “F” connectors and F 81 Barrels
The purpose of this test procedure is to measure the contact resistance or intimacy of contact between an F connector and the drop cable shield (outer conductor contact resistance) or the cable center conductor and the F81 barrel (inner conductor contact resistance.)

ANSI/SCTE 104-2015, Automation System to Compression System Communications Applications Program Interface (API)
This standard defines the Communications API between an Automation System and the associated Compression System that will insert SCTE 35 private sections into the outgoing Transport Stream. This standard serves as a companion to both SCTE 35 and SCTE 30.

ANSI/SCTE 106-2010, DOCSIS Set-Top Gateway (DSG) Specification
The intent of this document is to specify open protocols, with a preference for existing, well-known, and well-accepted standards. This interface specification is written to provide the minimal set of requirements for satisfactory communication between the Set-top Controller and the Set-top Device over the DOCSIS transport.

ANSI/SCTE 107-2009, Embedded Cable Modem Devices
This specification defines additional features that must be added to a DOCSIS Cable Modem for implementations that embed the Cable Modem with another application, such as an IP Cablecom MTA.

ANSI/SCTE 108-2012, Test Method for Dielectric Withstand of Coaxial Cable
The purpose of this document is to provide a test standard for detecting flaws in the insulation (sometimes referred to as the dielectric) of a completed coaxial cable.

ANSI/SCTE 109-2010, Test Procedure for Common Path Distortion (CPD)
The purpose of this document is to establish the standard methodology used to measure Common Path Distortion (CPD) in Cable Telecommunications Systems.

ANSI/SCTE 11-2012, Test Method for Aerial Cable Corrosion Protection Flow
This test is to determine that moisture blocking material used in cables intended for indoor and aerial applications, does not flow or drip out of the cable.

ANSI/SCTE 110-2011, Hybrid Fiber Coax Outside Plant Status Monitoring: Alternative Power Supply to Transponder Interface Bus (PSTIB) For HMs Transponders
Hybrid Fiber Coax Outside Plant Status Monitoring: Alternative Power Supply to Transponder Interface Bus (PSTIB) For HMs Transponders

ANSI/SCTE 111-2010, Specification for 5/8-24 Plug, Male Adapters
The purpose of this specification is to serve as a recommended guideline for the physical dimensions of 5/8 - 24 plug (male) hard-line adapters that are used as interconnects in the 75 ohm RF broadband communications industry. It is not the purpose of this standard to specify the details of manufacturing.

ANSI/SCTE 112-2011, HMS/DOCSIS® Transponder for Open Plant Power Supply
This document contains the requirements for a ‘HMS / DOCSIS’ & #174; Transponder for Outside Plant Power Supply. ‘ The HMS / DOCSIS & #174; transponder is defined to be a device where the DOCSIS component has been developed or modified specifically for the HMS / DOCSIS & #174; application. This requirement leverages various HMS specifications and MIBS, as well as the DOCSIS & #174; 1.1 specifications and MIBS.

ANSI/SCTE 113-2006, HMS Digital Transport Management Information Base SCTE-HMS-HE-DIG-TRANSPORT-MIB
This document provides MIB definitions for HMS Digital Transport equipments present in the headend (or indoor) and is supported by a SNMP agent.

ANSI/SCTE 115-2011, Test Method for Reverse Path (Upstream) Intermodulation Using Two Carriers
This test procedure defines a method of measurement of intermodulation distortion in the reverse ‘upstream’ path of Cable Telecommunications equipment.

The purpose of this specification is to serve as a recommended guideline for the physical dimensions of female 5/8 - 24 port that is used on hard-line adapters for interconnection in the 75 ohm RF broadband communications industry. It is not the purpose of this standard to specify the details of manufacturing.

ANSI/SCTE 117-2010, Specification for Braided 75 ohm, Mini-Series Broadband Coaxial Cable
This specification defines the required performance with regards to electrical and mechanical properties of 75-ohm, Braided, Mini-Series Coaxial Cable for Broadband applications.

ANSI/SCTE 118-1-2012, Program-Specific Ad Insertion - Data Field Definitions, Functional Overview and Application Guidelines
This standard defines the functionality associated with Program-Specific Ad Insertion. Program-Specific Ad Insertion is the scheduling and insertion of a spot into a digital broadcast program based on the program identifier passed in the SCTE 35 cue message.

ANSI/SCTE 118-2-2012, Program-Specific Ad Insertion - Content Provider to Traffic Communication Applications Data Model
This standard describes the information that is required to communicate the program and associated structure from a Network to an Affiliate’s SCTE 35 compliant Traffic System.
ANSI/SCTE 118-3-2012, Program-Specific Ad Insertion - Traffic System to Ad Insertion System File Format Specification

This standard defines the information that shall be passed from an Affiliate’s Traffic System to an Affiliate’s Ad Insertion System for communications of ad insertion schedules, including Unique Program Identifiers where specified. It specifies the required data for Multi-Tiered, Program Specific Insertion, as well as the file format for the data communications.

This procedure defines a method of measurement for Noise Power Ratio (NPR) of active Cable Telecommunications equipment. It is intended for measurement of 75-ohm devices having type “F” or 5/8-24 KS connectors. See the Cable Telecommunications Testing Guidelines document, SCTE 96 2003 (formerly IPS TP 200), for a discussion of proper testing techniques.

ANSI/SCTE 12-2011, Test Method for Center Conductor Bond to Dielectric for Trunk, Feeder and Distribution Coaxial Cables

Provides a test to determine the bond strength between the center conductor and dielectric for specified semi-flexible coaxial cables.

ANSI/SCTE 121-2011, Test Method for Downstream Bit Error Rate

The purpose of this test is to measure Bit Error Rate (BER) of downstream (forward path) broadband telecommunications QAM signals. This procedure will address mainly pre-Forward Error Correction BER results for 64 and 256 QAM.

ANSI/SCTE 122-2012, SCTE Recommended Optical Fiber Cable Types for Outside Plant Drop Applications

The purpose of this document is to provide guidance in selection of a suitable outside plant (OSP) optical drop cable with respect to different application environments.

ANSI/SCTE 123-2011, Specification for “F” Connector, Male, Feed-Through

The purpose of this document is to specify requirements for male “F” feed-through connectors that are used in the 75 ohm RF broadband communications industry. This specification applies to SCTE drop cable specifications ANSI/SCTE 74 2003, ANSI/SCTE 71 2003, ANSI/SCTE 100 2004, IPS SP 005 and IPS SP 006.

ANSI/SCTE 124-2011, Specification for “F” Connector, Male, Pin Type

The purpose of this document is to specify requirements for male “F” pin type connectors that are used in the 75 ohm RF broadband communications industry. This specification applies to SCTE drop cable specifications ANSI/SCTE 74 2003, ANSI/SCTE 71 2003, ANSI/SCTE 100 2004, IPS SP 005 and IPS SP 006.

ANSI/SCTE 125-2011, Hard Line Pin (plug) Connector Return Loss

This standard describes a procedure to measure the Return Loss characteristics of a single Mainline Pin Connector interfaced between (1) mainline cable and a precision airline. It implements the time domain-gating features of the network analyzers, which removes the interfaces, and far end termination from the DUT (device under test) measurement.

ANSI/SCTE 126-2013, Test Method for Distortion of 2-way Amplifier Caused by Insufficient Isolation of Built in Diplex Filter

The purpose of this document is to establish the standard methodology to measure an amplifier’s distortion caused by an upstream signal leaking through the diplex filter that is built inside of the amplifier of a Cable Telecommunications System.

ANSI/SCTE 127-2007, Carriage of VPI Data in North American DTV Bitstreams

A design of the carriage of existing analog Standard Definition (SD) video Vertical Blanking Interval signals that is to be used for carriage of VPI data (the transport path) in North American digital television (DTV) bitstreams.

ANSI/SCTE 128-1-2010, AVC Video Constraints for Cable Television - Part 1: Coding

This standard defines the video coding constraints on ITU-T Rec. H.264 | ISO/IEC 14496-10 [2] video compression (hereafter called “AVC”) for Cable Television. In particular, this document describes the constraints on AVC coded video elementary streams in an MPEG-2 service multiplex (single or multi-program Transport Stream).

ANSI/SCTE 128-2-2010, AVC Video Constraints for Cable Television Part 2: Transport

This standard defines the transport constraints on ITU-T Rec. H.264 | ISO/IEC 14496-10 [5] video compression (hereafter called “AVC”) for Cable Television. In particular, this document describes the transmission of AVC coded video elementary streams constrained per SCTE 128 Part 1 in an MPEG-2 service multiplex (single or multi-program Transport Stream).

ANSI/SCTE 129-2007, Drop Passives: Bonding Blocks (Without Surge Protection)

The purpose of this document is to recommend mechanical and electrical standards for broadband radio frequency (RF) devices whose primary purpose is to provide a transition point.

ANSI/SCTE 13-2011, Dielectric Air Leakage Test Method For Trunk, Feeder and Distribution Coaxial Cable

The purpose of this test is to detect voids in the dielectric and the bond between the dielectric and the center conductor.

This standard presents concepts applicable to all other SCTE 130 parts, leaving most of the normative details to the individual documents.

ANSI/SCTE 130-10-2013, Digital Program Insertion - Advertising Systems Interfaces - Part 10: Stream Restriction Data Model (SRDM)

This standard in conjunction with the SCTE 130 Part 10 Extensible Markup Language (XML) schema document defines the XML data model expressing stream restrictions.

ANSI/SCTE 130-2 2014, Digital Program Insertion-Advertising Systems Interfaces Part 2 Core Data Elements

ANSI/SCTE 130-3-2013, Digital Program Insertion - Advertising Systems Interfaces - Part 3: Ad Management Service (ADM) Interface

This document in conjunction with the SCTE 130 Part 3 Extensible Markup Language (XML) schema document defines the XML messages expressing placement opportunities, placement decisions, and placement related event data typically exchanged between an Ad Management Service (ADM) and an Ad Decision Service (ADS). Additionally, this document and the accompanying schema document describe the auxiliary XML messages, elements, and attributes supporting the primary message exchanges.

ANSI/SCTE 130-4-2015, Digital Program Insertion-Advertising Systems Interfaces - Part 4: Content Information Service (CIS)

ANSI/SCTE 130-5-2016, Digital Program Insertion-Advertising Systems Interfaces Part 5-Placement Opportunity Information Service

This document defines the messaging protocol for the Placement Opportunity Information Service (POIS) consistent with other parts of the SCTE 130 standard. A POIS holds, maintains, and retains descriptions of content Placement Opportunities (typically for advertisements) and the interface supports query and notification operations for those opportunities.

ANSI/SCTE 130-6-2013, Digital Program Insertion-Advertising Systems Interfaces - Part 6: Subscriber Information Service (SIS)

This document, SCTE 130 Part 6, describes the Digital Program Insertion Advertising Systems Interfaces’ SIS (Subscriber Information Service) messaging and data type specification using XML, XML Namespaces, and XML Schema. The 2013 version adds two new appendices, Appendix C - Mutable SIS Interface (Normative) and Appendix D - Mutable SIS Examples (Informative), are added. This new text adds the mutability capability to the SCTE 130 Part 6 standard. This capability is optional; though if chosen to be supported shall be normatively implemented as described herein.
ANSI/SCTE 130-7-2016, Digital Program Insertion-Advertising Systems Interfaces - Part 7: Message Transport
This document describes the Digital Program Insertion Advertising Systems Interfaces’ transport protocols required for the exchange of messages defined in the individual parts of the SCTE 130 specification.

ANSI/SCTE 130-8-2013, Digital Program Insertion-Advertising Systems Interfaces - Part 8: General Information Service (GIS)

The purpose of this procedure is to provide instructions to measure the Return Loss characteristics of a pair of type 'F' connectors and the cable interface, inserted in the middle of a cable, from 5 MHz to 1002 MHz. This test method makes use of the time domain gating feature of the network analyzer to remove the near end and far end test set connector effects from a type 'F' pair in the middle of the cable, joined by a type F (female) - type F (female) adapter.

ANSI/SCTE 131-2007, HMS VoIP Test Management Information Base (MIB)
Definition SCTE-HMS-VOIP-MIB
This document provides MIB definitions for VoIP testing between two endpoints. It allows an HMS/DOCSIS transponder or any other device that implements it to be used as a test point to validate VoIP service in the network and to report a common basic set of measurements.

ANSI/SCTE 132-2012, Test Method for Reverse Path (Upstream) Bit Error Rate
This procedure defines a method of measurement for Bit Error Rate (BER) in the return path of active Cable Telecommunications equipment. It is intended for measurement of 75-ohm devices having type "F" or 5/8-24 KS connectors.

ANSI/SCTE 133-2010, Downstream RF Interface for Cable Modem Termination Systems
This document describes the downstream radio-frequency interface [DRFI] specifications for: an edgeQAM (EQAM) modular device, an integrated Cable Modem Termination System [CMTS] with multiple downstream channels per RF port, or an integrated CMTS beyond DOCSIS 2.0.

ANSI/SCTE 134-2012, Fusion Splicing Equipment and Applications for the Cable/Broadband Industry
This standard defines the equipment, methods, and practices used within the cable/broadband industry to obtain consistent low loss fusion splice connections between optical fibers.

This specification is part of the DOCSIS&®174; family of specifications. In particular, this specification is part of a series of specifications that defines the third generation of high-speed data-over-cable systems. This specification was developed for the benefit of the cable industry, and includes contributions by operators and vendors from North America, Europe, and other regions.

ANSI/SCTE 135-2-2013, DOCSIS 3.0 Part 2: MAC and Upper Layer Protocols
This specification is part of the DOCSIS&®174; family of specifications. In particular, this specification is part of a series of specifications that define the third generation of high-speed data-over-cable systems. This specification was developed for the benefit of the cable industry, and includes contributions by operators and vendors from North America, Europe, and other regions.

ANSI/SCTE 135-3-2013, DOCSIS 3.0 Part 3: Security Services
This specification is part of the DOCSIS&®174; family of specifications. In particular, this specification is part of a series of specifications that define the third generation of high-speed data-over-cable systems. This specification was developed for the benefit of the cable industry, and includes contributions by operators and vendors from North America, Europe, and other regions.

ANSI/SCTE 135-4-2013, DOCSIS 3.0 Part 4: Operations Support Systems Interface
This standard is part of the DOCSIS&®174; family of specifications. In particular, this specification is part of a series of specifications that define the third generation of high-speed data-over-cable systems. This specification was developed for the benefit of the cable industry, and includes contributions by operators and vendors from North America, Europe, and other regions.

ANSI/SCTE 135-5-2009, DOCSIS 3.0 Part 5: Cable Modem to Customer Premise Equipment Interface
This specification defines the interface requirements for data over cable services between a cable modem and the customer premise equipment (CPE). The CPE may include PCs, Macintoshes, workstations, network computers, and other electronic equipment. This specification defines the applicable communications standards and protocols as needed to implement a cable modem interface to the CPE.

ANSI/SCTE 136-1-2013, Layer 2 Virtual Private Networks for IP Cable Modem Systems
This standard describes requirements on both CMTSs and CMs in order to implement a DOCSIS Layer-2 Virtual Private Network (DOCSIS L2VPN) feature.

ANSI/SCTE 136-2-2013, Cable Modem TDM Emulation Interface Standard
TDM Emulation service (TDM-E) is a method for cable operators to deliver T1, E1 and NxDSO emulation services that meet or exceed the quality requirement of applications that use such services. This standard is part of the Cable Modem family of standards and in particular, defines the TDM-E architecture and components.

ANSI/SCTE 137-1-2010, Modular Headend Architecture Part 1: DOCSIS Timing Interface
The DOCSIS Timing Protocol (DTI) defined in this document supports the accurate and robust transport of the DTI server 10.24 MHz master clock, 32-bit DOCSIS timestamp, and Time of Day, to the DTI client within the DOCSIS M-CMTS cable network. The DTI protocol is structured to minimize the complexity and cost of the DTI client clocks, and the per port cost of the shared server function while supporting all S-CDMA and TDMA timing requirements.

ANSI/SCTE 137-2-2017, Modular Head End Architecture Part 2: M-CMTS Downstream External PHY Interface
This specification is part of the DOCSIS® family of specifications, and in particular, is part of a series of specifications that define a Modular Cable Modem Termination System (M-CMTS®) architecture for head-end components that comply with DOCSIS. This specification was developed for the benefit of the cable industry, and includes contributions by operators and vendors from North America, Europe, and other regions.

ANSI/SCTE 137-3-2017, Modular Head End Architecture Part 3: Operations Support System Interface
This specification defines the Network Management requirements to support a Modular Cable Modem Termination System (M-CMTS®) for headend components compliant to DOCSIS®. The purpose of this document is to define the management requirements for the M-CMTS architecture that enables an effective operation of the M-CMTS components.

ANSI/SCTE 137-4-2017, Modular Head End Architecture Part 4: Edge Resource Manager Interface
This document specifies interfaces that are used by Edge QAM devices (EQAMs), Edge Resource Managers (ERMs) and M-CMTS Cores within the context of a Modular Cable Modem Termination System (M CMTS).

ANSI/SCTE 137-5-2017, Modular Head End Architecture Part 5: Edge QAM Provisioning and Management Interface
This specification is a component of the Modular Headend Architecture; in particular it defines the Provisioning and Management requirements for the EQAM device.
ANSI/SCTE 137-6-2017, Modular Head End Architecture Part 6: Edge QAM Video Stream Interface
This specification is a component of the Modular Headend Architecture. In particular, it defines the data plane requirements for receiving, processing, and transmitting MPEG transport streams in EQAMs, compliant with the Video EQAM or Universal EQAM profiles described in the Architectural Overview of the Modular Headend Architecture.

ANSI/SCTE 137-7-2017, Modular Head End Architecture Part 7: EQAM Architectural Overview Technical Report
This Architectural Overview Technical Report is intended to provide an introduction to the Modular Headend Architecture, with particular emphasis on the EQAM as a key component. This document describes the various architectural entities and the interfaces that connect them, provides an overview of the various profiles of EQAM devices and their operations, and discusses the various specifications that contain normative requirements pertaining to the Modular Headend Architecture.

ANSI/SCTE 138-2013, Stream Conditioning for Switching of Addressable Content in Digital Television Receivers
This document describes the stream Conditioning required to enable Client-DPI Receivers to implement switching in a both non-seamless fashion ('Level 0', or 'L0'), and in a seamless fashion ('Level 1', or 'L1').

ANSI/SCTE 140-2016, Test Method for Hex Crimp Tool Verification/Calibration
To determine and verify the actual crimp dimension of hex crimp tools. Provide a calibration technique for adjusting hex crimp tools.

ANSI/SCTE 140-2013, Cable Modem IPv4 and IPv6 eRouter Specification
This standard defines a core set of features that enable multiple subscriber devices to gain access to operator provided high speed data service using DOCSIS. This core set of features allow for both IPv4 and IPv6 enabled devices to gain connectivity to the Internet.

ANSI/SCTE 142-2009, Recommended Practice for Transport Stream Verification
This Recommended Practice provides a common methodology for describing Transport Stream conformance criteria. This document explicitly describes the elements and parameters of SCTE 54 [2], along with ATSC A/53-3 [5] and A/65 [6] that should be verified in an SCTE Transport Stream for it to be considered a proper emission. It does not cover RF, captioning or elementary streams.

ANSI/SCTE 143-2013, Test Method for Salt Spray
This test method provides guidelines for salt spray testing of broadband communications equipment.

ANSI/SCTE 144-2012, Test Procedure for Measuring Transmission and Reflection
The purpose of this test procedure is to determine the reflection at any port, or the transmission between any two ports of a properly terminated device, as measured across a frequency range of interest.

The purpose of this document is to establish the standard methodology to measure second harmonic distortion in a Cable Telecommunication System passive at high signal level conditions (50 - 60 dBmV). Due to the difficulty in acquiring multi-carrier signal generators with both 55 dBmV output and intermod beats at -120 dBc, the test procedure will use a single carrier source test method.

ANSI/SCTE 146-2008, Outdoor "F" Female to "F" Female Inline Splice
The purpose of this document is to recommend mechanical and electrical standards for 75 ohm broadband radio frequency (RF) devices.

ANSI/SCTE 147-2010, Specification for 75 ohm Inline Attenuators
The purpose of this standard is to provide the mechanical, electrical and environmental requirements for 75-ohm "F" type inline attenuators generally used for indoor applications.

ANSI/SCTE 148-2016, Specifications for Male "F" Terminator, 75 ohm
The purpose of this specification is to specify requirements of the Male 'F'&#8221; Terminators that are used on 'F'&#8221; ports as specified in ANSI/SCTE 01 2015 and ANSI/SCTE 02 2015. This specification is not intended to limit or restrict any manufacturers from innovative designs and product improvements.

ANSI/SCTE 149-2013, Test Method for Withstanding Tightening Torque- "F" Female
To measure the 'F' Female interface torque and/or to determine the amount of torque that will cause one or more of the following conditions to occur; stripping of the external threads, or damage to the female interface.

ANSI/SCTE 150-2016, Specification for Trunk, Feeder and Distribution Coaxial Cable
This specification applies to material, electrical and mechanical properties of seventy-five ohm coaxial cables as defined herein. Seventy-five ohm coaxial cables are used to distribute radio frequency (RF), digital signals and power as applicable.

ANSI/SCTE 150-2010, Preparing a Line Extender Specification
This standard provides guidance for preparing a Line Extender requirement specification independent of manufacturer and type.

ANSI/SCTE 151-2015, Mechanical, Electrical, and Environmental Requirements for RF Traps and Filters
The purpose of this specification is to provide the mechanical, electrical and environmental requirements for broadband radio frequency (RF) Trap and Filter devices whose primary purpose is to provide a fixed attenuation of RF signal(s) at user defined frequencies while preserving adjacent topology.

ANSI/SCTE 152-2014, Test Method for Contact Resistance Measurement of Mainline Plug Interface
The purpose of this test procedure is to measure the resistance between the contact of the connector and cable interfaces. High resistance contacts may cause excessive energy losses, overheating and possibly common path distortions. It is most desirable to have contact resistance as low as possible.

ANSI/SCTE 153-2016, Drop Passives: Splitters, Couplers and Power Inserters
The purpose of this document is to recommend mechanical, environmental and electrical standards for broadband radio frequency (RF) devices whose primary purpose is to divide signals presented to an input port among two or more output ports with a fixed division ratio that is nominally independent of frequency within the specified bandwidth limits of the device. Alternately, such devices can be used to combine signals from several input ports into a common output port. Its scope is limited to 75-ohm devices whose ports are provided with type F connectors. The most common use for such devices is on-premises RF signal distribution.

ANSI/SCTE 154-1-2008, Digital Video Common MIB
This document provides the branch object identifiers for each of the MIBs within the SCTE HMS DIGITAL VIDEO COMMON MIB tree. The HMS DIGITAL COMMON MIB provides standard common MIB definitions for all HMS inside plant digital devices.

ANSI/SCTE 154-2-2008, SCTE-HMS-QAM-MIB
This document provides the definition for MIB objects within the SCTE-HMS-QAMMIB Tree.

ANSI/SCTE 154-3-2008, Encoder MIB
This document provides the branch object identifiers for each of the MIBs within the SCTE HMS HEADENDIDENT Tree.

ANSI/SCTE 154-4-2008, MPEG Management Information Base SCTE-HMS-MPEG MIB
This document provides the definition for MIB objects within the SCTE HMS MPEG MIB Tree.

ANSI/SCTE 154-5-2008, SCTE-HMS-HEADENDIDENT Textual Conventions MIB
This document provides the branch object identifiers for each of the MIBs within the SCTE HMS DIGITAL VIDEO MIB’s (DVM) in the heDigital branch of the SCTE mibs. The SCTE HMS HEADENDIDENT-T MIB provides standard common mib text syntax for all HMS devices.
ANSI/SCTE 155-2008, Indoor “F” Female to “F” Female Inline Splice
The purpose of this document is to recommend mechanical and electrical standards for 75 Ohm broadband radio frequency (RF) devices. Whose purpose is to provide an indoor inline connection between two type “F” male connectors that conform to ANSI/SCTE 123 2006; Specification for “F” Connector, Male, Feed- Through or ANSI/SCTE 124 2006; Specification for “F” Connector, Male, Pin Type. The mechanical configuration is designed to accommodate wall plate and bulkhead applications.

ANSI/SCTE 156-2016, Specification for Mainline Plug (Male) to Cable Interface
The primary purpose of this specification is to assure acceptable electrical, mechanical and environmental performance of the cable and connector interface. The scope of this standard will be directed to acceptable performance of impedance, galvanic action, loop resistance, cable retention, intermodulation distortion, signal response, RF shielding, and watertight seals. This specification in no way should limit or restrict any manufacturers from innovative designs and product improvements.

ANSI/SCTE 158-2016, Recommended Environmental Condition Ranges for Broadband Communications Equipment
This document specifies the recommended environmental conditions (temperature, humidity, altitude and vibration) for the operation, storage and shipment of broadband communications equipment.

ANSI/SCTE 159-1-2010, IPCablecom Multimedia - Part 1: Multimedia Application and Service
The intent of this specification is to support the deployment of general Multimedia services by providing a technical definition of several IP-based signaling interfaces that leverage core QoS and policy management capabilities native to DOCSIS Versions 1.1 and greater.

ANSI/SCTE 159-2-2017, Multimedia Application and Service Part 2: IPCablecom Multimedia Web Services
This specification provides a simple, open interface between a generic Application Server (AS) and an IPCablecom Multimedia Application Manager (AM)

ANSI/SCTE 16-2012, Test Procedure for Hum Modulation
The purpose of this standard is to define and measure hum modulation in active and passive broadband RF telecommunications equipment and sub-assemblies. This procedure presents two methods for measuring hum modulation in the time domain, with a sensitivity exceeding -80 dB.

ANSI/SCTE 160-2010, Specification for Mini “F” Connector, Male, Pin Type
The purpose of this document is to specify requirements for indoor male “F” pin type connectors that are used on ANSI/SCTE 117 2006 and SCTE IPS SP 009 mini coaxial cable in the 75 ohm RF broadband communications industry.

ANSI/SCTE 161-2016, Drop Amplifiers
The purpose of this specification is to recommend mechanical and electrical standards for broadband radio frequency (RF) devices whose primary purpose is to amplify signals presented to an input port and deliver the amplified signals to one or more output ports. The devices are also required to pass signals in a different range of frequencies in the return direction and, optionally, may provide amplification of such return signals. The specification’s scope is limited to 75 ohm devices whose ports are provided with F connectors. The most common use for such devices is on-premises RF signal distribution.

ANSI/SCTE 163-2009, SCTE HMS Switched Digital Video MIB
This document provides the definition for MIB objects within the SCTE HMS SDV MIB Tree.

ANSI/SCTE 164-2010, Emergency Alert Metadata Descriptor
This document defines a container usable by cable system operators for the delivery of Emergency Alert (EA) metadata into the consumer domain. This metadata is designed to support cable set-top terminals which function as servers of commercial video services (CVS) into the home network, by providing preformatted XML-based EA data required by such Digital Media Servers (DMS) in the home.

The IPCablecom project defines interface specifications that can be used to develop interoperable equipment capable of providing packet-based voice, video and other high-speed multimedia services over hybrid fiber coax (HFC) cable systems utilizing the DOCSIS#174; protocol. Any reference to DOCSIS in this document is understood to be DOCSIS version 1.1 or later.

ANSI/SCTE 165-10-2009, IPCablecom 1.5 Part 10: Security
The scope of this document is to define the IPCablecom Security architecture, protocols, algorithms, associated functional requirements and any technological requirements that can provide for the security of the system for the IPCablecom network. Authentication, access control, signaling and media content integrity, confidentiality, and nonrepudiation security services must be provided as defined herein for each of the network element interfaces.

ANSI/SCTE 165-11-2009, IPCablecom 1.5 Part 11: Analog Trunking for PBX Specification
This specification defines extensions to the IPCablecom Network-based Call Signaling (NCS) protocol to support the following analog trunking for PBX interfaces on an embedded Voice-Over-Pt client device in an IPCablecom environment: Ground-start lines; PBX one-way and two-way OTMF trunks.

ANSI/SCTE 165-12-2016, IPCablecom 1.5 Part 12: PSTN Gateway Call Signaling Protocol
This document is part of the IPCablecom suite of specifications. The document is based on MGCP 1.0 [1], an IETF informational RFC.

ANSI/SCTE 165-13-2009, IPCablecom 1.5 Part 13; Electronic Surveillance Standard
This specification defines the interface between a telecommunications carrier that provides telecommunications services to the public for hire using IPCablecom capabilities (a ‘PC/TSP’) and a Law Enforcement Agency (LEA) to assist the LEA in conducting lawfully authorized electronic surveillance. Companies using IPCablecom capabilities will not in the normal case be ‘telecommunications carriers.’ Instead they will be providers of information services.

ANSI/SCTE 165-14-2009, IPCablecom 1.5 Part 14; Embedded MTA Analog Interface and Powering
This standard defines the embedded MTA (E-MTA) requirements for the analog interface and powering of the E-MTA. An embedded MTA is a DOCSIS cable modem (CM) integrated with an IPCablecom multimedia terminal adapter (MTA). The purpose of this specification is to define a set of requirements that will enable a service that is sufficiently reliable to meet an assumed consumer expectation of essentially constant availability, including, specifically, availability during power failure at the customer’s premises, and (assuming the service is used to connect to the PSTN), access to emergency services (911, etc.).

This document describes an SNMP MIB in SMv2, to support the management event mechanism as described in [1]. It is intended to be implemented in the MTA and management devices.

ANSI/SCTE 165-16-2016, IPCablecom 1.5 Part 16; Management Event Mechanism
This standard is one of two documents that together define a framework for reporting Management Events in the IPCablecom architecture. This document defines the general event reporting mechanism and framework. The mechanism consists of a set of protocols and interfaces that can be used by individual elements and components in the IPCablecom architecture. This document defines how the SNMPv3 transport protocol, SYSLOG, local log, and the IPCablecom Management Event MIB are used to carry management event information to an event management system.

ANSI/SCTE 165-17-2009, IPCablecom 1.5 Part 17: Audio Server Protocol
This specification describes the architecture and protocols that are required for playing announcements in voiceover-IP (VoIP) IPCablecom networks, and is issued to facilitate design and field-testing leading to the manufacture and interoperability of conforming hardware and software by multiple vendors. The will be referred to as the IPCablecom Audio Server Specification. This specification defines a set of signaling protocols that are used to provide announcement services within a cable network. For one of these protocols, this specification defines two new event packages: A Base Audio Package; An Advanced Audio Package
This specification describes the IPCablecom Call Management Server (CMS) to CMS Signaling protocol intended for use by a CMS to communicate with another CMS in order to support packet-based voice and other real-time multimedia applications.

This document describes a methodology for a client device to request a specific set of resources. In particular, it specifies a comprehensive Device Provisioning Specification (DPS). The DPS defines the interface used between the CMS and Provisioning Server for the exchange of service provisioning information. It is intended to facilitate interoperability of conforming hardware and software from multiple vendors.

ANSI/SCTE 165-2-2016, IPCablecom 1.5 Part 2: Audio/Video Codecs

This document addresses interfaces between IPCablecom client devices for audio and video communication. Specifically, it identifies the audio and video codecs necessary to provide the highest quality and the most resource-efficient service delivery to the customer. This document also specifies the performance required in client devices to support future IPCablecom codecs. Additionally, this document describes a suggested methodology for optimal network support for codecs.

ANSI/SCTE 165-20-2009, IPCablecom 1.5 Part 20: MTA Extension MIB

New objects that are being introduced beyond IPCablecom 1.0 for MTA MIBS are being grouped in this document so that the additional changes made can be tracked easily.

ANSI/SCTE 165-21-2016, IPCablecom 1.5 Part 21: Signaling Extension MIB

New objects that are being introduced beyond IPCablecom 1.0 for Signaling MIBS are being grouped in this document so that the additional changes made can be tracked easily.

ANSI/SCTE 165-3-2016, IPCablecom 1.5 Part 3: Network-Based Call Signaling Protocol

This document is considered part of the IPCablecom standard. The document is based on MGCP 1.0 [1], which is an IETF Informational RFC.

ANSI/SCTE 165-4-2009, IPCablecom 1.5 Part 4: Dynamic Quality-of-Service

This document describes requirements for a client device to obtain access to IPCablecom network resources. In particular, it specifies a comprehensive mechanism for a client device to request a specific Quality of Service from the DOCSIS® network. Extensive examples illustrate the use of the specification.

ANSI/SCTE 165-5-2009, IPCablecom 1.5 Part 5: Media Terminal Adapter (MTA) Device Provisioning

This scope of this document is limited to the provisioning of an IPCablecom 1.5 embedded-MTA device by a single provisioning and network management provider. An attempt has been made to provide enough detail to enable vendors to build an embedded-MTA device that is interoperable in an IPCablecom 1.5 network configuration. This document defines the provisioning of MTA components of the embedded MTA device (unless stated otherwise).

ANSI/SCTE 165-6-2009, IPCablecom 1.5 Part 6: MIBS Framework

This specification describes the framework in which IPCablecom 1.5 MIB (Management Information Base) modules are described. It provides information on the management requirements of IPCablecom-compliant devices and functions and how these requirements are supported in the MIB modules. It is intended to support and complement the actual MIB module documents, which are issued separately.

ANSI/SCTE 165-7-2009, IPCablecom 1.5 Part 7: MTA MIB

This standard describes the IPCablecom 1.5 MTA MIB requirement.

ANSI/SCTE 165-8-2009, IPCablecom 1.5 Part 8: Signaling MIB

This specification describes the IPCablecom Signaling (SIG) MIB requirements.

ANSI/SCTE 165-9-2009, IPCablecom 1.5 Part 9: Event Messaging

This standard describes the concept of Event Messages used to collect usage for the purposes of billing within the IPCablecom architecture. It details a transport protocol independent Event Message attribute TLV format, an Event Message file format, mandatory and optional transport protocols, the various Event Messages, lists the attributes each Event Message contains, and lists the required and optional Event Messages associated with each type of enduser service supported. In order to support vendor interoperability, implementations must minimally support RADIUS as a transport protocol.

ANSI/SCTE 166-2010, Flexure Method for Drop Cable Conditioning

This test procedure provides a method of flex fatigue for accelerating the degradation of coaxial drop cable in the laboratory environment. The degradation observed, as measured by various performance criteria (shield effectiveness, DC resistance, etc.), is not intended to predict life expectancy of the cable under test (CUT). The test data obtained is for relative comparison purposes only.

ANSI/SCTE 167-2010, Recommended Practice for Headend Cable Color Coding

The purpose of this Recommended Practice is to provide a guideline for the color of cables used in headend cabling.

ANSI/SCTE 168-4-2010, Recommended Practice for Transport Stream Verification Metrics

This Recommended Practice provides a common methodology for defining the measurement points and metrics of interest in digital cable networks that impair the compressed multimedia (video/audio/data) quality end to end. Uncompressed content and those metrics not related to 'quality' are not included in this Recommended Practice.

ANSI/SCTE 168-6-2010, Recommended Practice for Monitoring Multimedia

The scope of this Recommended Practice document is to provide background and discussion on Multimedia Management (MMM) system requirements to assist the cable operator with MMM deployment design tradeoffs as well as provide guidance and recommendations on several topics related to the deployment of Multimedia Management systems based on the experiences to date of both the participating committee operators and vendor companies and the directions of ongoing work in the HMS.

ANSI/SCTE 168-7-2010, Recommended Practice for Transport Stream Verification in an IP Transport Network

This document describes the protocols within the IP network and the possible IP layer causes of media impairments but does not provide metrics that correlate specific IP failures to media impairments. Industry accepted metrics have been provided for IP packet loss, delay and jitter.

ANSI/SCTE 17-2007, Test Procedure for Carrier to Noise (C/N, CCN, CIN, CTN)

This procedure defines the measurement procedure for determining the ratio of carrier to thermal noise and 'noise-like' interference for broadband telecommunications system components. The test involves measuring the noise levels, or the combined noise plus 'noise-like' intermodulation product levels, relative to the carrier level of a CW signal. The noise contribution of the test equipment is also measured to allow for correction of readings near the test equipment noise floor. ANSI/SCTE 96 2003, Cable Telecommunications Testing Guidelines, has additional definitions common to this and other SCTE test procedures.

ANSI/SCTE 170-2010, Preparing an MDU Amplifier Extender Specification

This document provides guidance for preparing an MDU Amplifier requirements specification, independent of manufacturer and type.

ANSI/SCTE 171-2016, Passive Network Device (NID) Enclosure Specification

This specification applies to recommended mechanical, electrical and environmental performance of Network Interface Device enclosures for use in broadband deployment. The intended location for this device is on the outside of the customer premise. This specification focuses on non-metallic enclosures.
This document defines the video coding and transport constraints on ITU-T H.264/ISO/IEC 14496-10 ("AVC") video compression for Digital Program Insertion applications using SCTE 35 and SCTE 30 messaging.

The ANSI/SCTE 173-1-2017, Requirements for Preferential Telecommunications over IPCablecom Networks

The objective of this standard is to provide an initial set of requirements for preferential telecommunications within IPCablecom networks. Aspects of preferential telecommunications include provisions for Authentication and Priority (Special Handling).

The objective of this Standard is to provide a framework for the implementation of preferential telecommunications services within cable networks as described in [ANSI/SCTE 24-1] and [ITU-T J.360].

The ANSI/SCTE 173-3-2017, Specification for Authentication in Preferential Telecommunications over IPCablecom2 Networks

This standard is one of a series of standards to enable support for preferential telecommunication services over IPCablecom networks.

The ANSI/SCTE 173-4-2017, Specification for Priority in Preferential Telecommunications over IPCablecom2 Networks

This Standard is one of a series of Standards to enable support for preferential telecommunication services over IPCablecom networks.

This document defines a fiber-to-the-home system optimized for compatibility with hybrid fiber-coax (HFC) plant, using the same end equipment at both the home and at the headend or hub. The RfOG system is defined to begin where the plant becomes passive, extending from that point to the home. This interface is referred to as the Optical Hub. There are many possible variations on the structure of the optical hub, depending on the needs of the system. The RfOG system is defined to terminate at the subscriber-side interface of an RfOG Optical Network Unit (R-ONU) at the home.

The ANSI/SCTE 175-2011, Multimedia Management (MMS) Recommended Practice for Qualifying Network Devices (HMS 168)

The ANSI/SCTE 176 series of Recommended Practices describe IP video networks at MSO Headend, Core, and Hub networks. The recommended baseline tests in this document are intended to represent the operation of network devices in these three applications. These baseline tests provide a common set of reference results that can be used to preliminarily screen equipment and configurations during the selection, configuration, and deployment process.

The ANSI/SCTE 177-2012, Specification for 75 ohm, Mini-Series Quad Shield Coaxial Cable for CMTS and SDI Cables

This specification defines the required performance with regards to electrical and mechanical properties of 75-ohm, braided, mini-series quad shield coaxial cable for CMTS and SDI applications.

The ANSI/SCTE 178-2011, Test Method for Cable Weld Integrity

This test procedure provides methods for evaluating and determining defects along the welded seam of coaxial cables whose outer conductor shield is constructed of a welded, aluminum or copper strip. This procedure may be used to inspect finished coaxial cable's outer conductor; either smooth or corrugated.

The ANSI/SCTE 185-2012, Test Method for Cantilever Force, Female Port

This test procedure is used to evaluate the mechanical strength of female "F" ports when a cantilever force is applied.

The ANSI/SCTE 186-2016, Product Environmental Requirements for Cable Telecommunications

The specification purpose is to define product environmental and sustainability requirements 1) by referencing existing international standards; 2) by using requirements from cable operator specifications; and 3) by adding cable system specific requirements as needed. It is not the intent of this document to replace existing standards or cable operator requirements.

The ANSI/SCTE 187-1-2012, Stereoscopic 3D Formatting and Coding for Cable

This document defines the video-related formatting, and encoding parameters for high-definition frame-compatible stereoscopic 3D content for distribution on cable television systems. Encoding parameters and constraints defined by this specification can be applied to different content types, including broadcast programming, switched digital video (SDV), VOD content, and advertising content to be inserted into broadcast or VOD content.

The ANSI/SCTE 187-2-2012, Stereoscopic 3D PSI Signaling

This document defines the transport and signaling for high-definition frame-compatible stereoscopic 3D content for distribution on cable television systems. Transport parameters and constraints defined by this specification can be applied to different content types, including broadcast programming, switched digital video (SDV), VOD content, and advertising content to be inserted into broadcast or VOD content.

The ANSI/SCTE 187-3-2012, Informative Guidance for Stereoscopic Video

This document provides informative guidance for the construction or production of stereoscopic 3D programming material intended for transmission or distribution using the frame-compatible stereoscopic 3D format defined in part 1 [SCTE 187-1] and part 2 SCTE 187-2] of this standard.

The ANSI/SCTE 19-2013, Methods for Isochronous Data Service Transport

This standard defines transmission format for the carriage of isochronous data services compatible with digital multiplex bitstreams constructed in accordance with ISO/IEC 13818-1 (MPEG-2 Systems). Bit rates for the data services extend from 19.2 kbps to 9.0 Mbps.

The ANSI/SCTE 191-2010, Test Method for Axial Pull Force, Female Port

This test procedure is used to evaluate the mechanical strength of female "F" ports when an axial pull force is applied.

The ANSI/SCTE 193-1-2014, MPEG-4 AAC Family Audio System - Part 1 Coding Constraints for Cable Television

This document defines the coding constraints on MPEG-4 AAC, HE AAC, and HE AAC v2 (referred to collectively in this document as the 'AAC family') profile audio for cable television.

The ANSI/SCTE 193-2-2014, MPEG-4 AAC Family Audio System - Part 2 Constraints for Carriage over MPEG-2 Transport

This document describes the carriage of MPEG-4 AAC, MPEG-4 HE AAC and MPEG-4 HE AAC v2 (referred to collectively in this document as the 'AAC family') profile audio in MPEG-2 transport systems.

The ANSI/SCTE 194-1-2010, DTS-HD Audio System - Coding Constraints for Cable Television

This standard describes the coding constraints of the DTS-HD audio system and identifies the normative references that apply.

This document describes the carriage of DTS-HD audio in MPEG-2 systems. The descriptor necessary to signal DTS-HD audio is defined in this document. Multiplexing and transport for cable using MPEG-2 systems are defined in SCTE 54 [5]. Coding constraints for DTS-HD audio elementary streams are defined in SCTE 194-1 [4].

The ANSI/SCTE 195-2013, XFP-RF: Interface Specifications for an RF-Modulated Small Form Factor Pluggable Optical Module

This specification will focus on the communications, electrical, and mechanical interfaces for the XFP RF optical transmitter module. Requirements held within this specification apply both to the transmitter module and its host.
ANSI/SCTE 196-2013, SFP-RF: Interface Specifications for an RF-Modulated Small Form Factor Pluggable Optical Module
This standard will focus on the communications, electrical, and mechanical interfaces for the SFP RF optical transmitter module. Requirements held within this standard apply both to the transmitter module and its host.

ANSI/SCTE 197-2013, Recommendations for Spot Check Loudness Measurements
This document provides recommendations for measuring content carried in a single programming channel of a program network for 24-hours as part of managing audio loudness.

ANSI/SCTE 199-2010, RF-Modulated Small Form Factor Pluggable Optical Receiver Interface Specification
This standard focuses on the communication, electrical, and mechanical interfaces for the optical receiver module. Requirements held within this standard apply both to the receiver module and its host.

ANSI/SCTE 20-2012, Methods for Carriage of CEA-608 Closed Captions and Non-Real Time Sampled Video
This document defines a standard for the carriage of CEA-608 Closed Captions and certain other Vertical Blanking Interval (VBI) services in MPEG-2 compliant bitstreams constructed in accordance with ISO/IEC 13818-2.

ANSI/SCTE 200-2016, Specification for a 75 ohm ‘MMCX’ Connector (MMCX-75), Male & Female Interface
The purpose of this document is to specify requirements for the male/female interface of a 75 ohm, 3 GHz rated connector series generically known as MMCX-75. This is an indoor connector with applications in controlled environments such as headends and hubsites where high density platform chassis are used. MMCX-75 connectors are not intended to be mated with 50 ohm MMCX design counterparts.

ANSI/SCTE 201-2013, Open Media Security (OMS) Root Key Derivation Profiles and Test Vectors
This cryptographic key ladder standard defines a set of key ladder profiles, additional requirements and test vectors for a key ladder implementation. This standard is an extension of the ETSI TS 103 162 [1] standard for a key ladder, by further defining certain aspects and providing test vectors to enable implementers to verify certain aspects of an implementation.

ANSI/SCTE 203-2014, Product Environmental Requirements for Cable Telecommunications Facilities - Test Methods
This document specifies physical, environmental, electrical, and sustainability test procedures to evaluate equipment compliance with requirements defined in ANSI/SCTE 186 2012.

ANSI/SCTE 21-2012, Standard for Carriage of VBI Data in Cable Digital Transport Streams
This document defines a standard for the carriage of Vertical Blanking Interval (VBI) services in MPEG-2 compliant bitstreams constructed in accordance with ISO/IEC 13818-2. The approach builds upon a data structure defined in ATSC A/53 Part 4 (Digital Television Standard: Part 4 - MPEG-2 Video System Characteristics), and is designed to be backwards-compatible with that method.

Cable operator networks are large expansive networks that involve hundreds if not thousands of miles of coaxial or fiber cable powered by power supplies in the plant and connecting customers to critical infrastructure facilities such as hubs, headends, data centers, regional and national distribution datacenters. In these facilities is a vast array of equipment responsible for the production and support of the cable products - voice, video and data as well as newer products such as home automation and security, and Wi-Fi to name a few.

ANSI/SCTE 211-2015, Energy Metrics for Cable Operator Access Networks
This document contains metrics for measuring the energy efficiency of access networks (ANs) that are utilized to transport information between a service provider and a plurality of users. For the purposes of this document, the AN includes all active and passive equipment between the headend or hub, referred herein as the ‘hub’, &#8221; and the demarcation point at the user premises. This document does not include any equipment inside the hub, nor does it include any customer premises equipment (CPE).

ANSI/SCTE 212-2015, Cable Operator Energy Audit Framework and Establishment of Energy Baseline
Defines how cable operators should audit power consumption and accurately establish an energy baseline for inside and outside plant excluding any customer powered equipment.

ANSI/SCTE 213-2015, Edge and Core Facilities Energy Metrics
This document provides a metric to help operators measure how effective changes in the service impact energy consumption from both a high level and functional work perspective.

ANSI/SCTE 214-1-2016, MPEG DASH for IP-Based Cable Services Part 1: MPD Constraints and Extensions
This standard is part of a suite documenting use of MPEG DASH in cable networks. This part of the standard defines a profile of MPEG DASH which is based on the ISO BMFF Common Profile. It also defines inband carriage of information typically present in cable systems - such as closed captioning and cue messages - in DASH ISO-BMFF media segments. This profile is a combination of generic restrictions in SCTE 214-1 and restrictions specific to ISO-BMFF specified in this standard.

ANSI/SCTE 214-3-2015, MPEG DASH for IP-Based Cable Services Part 3: DASH/FF Profile
This standard is part of a suite documenting use of MPEG DASH in cable networks. This part of the standard defines a profile of MPEG DASH which is based on the ISO BMFF Common Profile. It also defines inband carriage of information typically present in cable systems - such as closed captioning and cue messages - in DASH ISO-BMFF media segments. This profile is a combination of generic restrictions in SCTE 214-1 and restrictions specific to ISO-BMFF specified in this standard.

ANSI/SCTE 215-1-2015, HEVC Video Constraints for Cable Television Part 1: Coding

This document is part of the work being done in SCTE’s Standards Energy Management Subcommittee (EMS). The Adaptive Power System Interface Specification (APSIS) working group under the EMS is responsible for the creation and updates of this document. The document was developed for the benefit of the cable industry and includes contributions by cable operators, vendors and industry support organizations. While the initial intent of this document is to support the cable industry, the process, methodology and results of this effort may be applicable to other telecommunications networks.
ANSI/SCTE 217-2017, MPEG DASH Reference Architecture for IP-based Cable Services
This MPEG DASH Reference Architecture document is to serve as informational background to a suite of specifications that define the usage of MPEG DASH in cable networks. It introduces adaptive bit rate streaming as a general service and defines reference architecture in which content processing components, flows of process, use cases and scope definition of each part of other relevant documents are described.

This generation of the DOCSIS specifications builds upon the previous generations of DOCSIS specifications (commonly referred to as the DOCSIS 3.0 and earlier specifications), leveraging the existing Media Access Control (MAC) and Physical (PHY) layers, but with the addition of a new PHY layer designed to improve spectral efficiency and provide better scaling for larger bandwidths (and appropriate updates to the MAC and management layers to support the new PHY layer). It includes backward compatibility for the existing PHY layers in order to enable a seamless migration to the new technology.

ANSI/SCTE 220-2-2016, DOCSIS 3.1 Part 2: Media Access Control (MAC) and Upper Layer Protocols Interface Specification
This generation of the DOCSIS specifications builds upon the previous generations of DOCSIS specifications (commonly referred to as the DOCSIS 3.0 and earlier specifications), leveraging the existing Media Access Control (MAC) and Physical (PHY) layers, but with the addition of a new PHY layer designed to improve spectral efficiency and provide better scaling for larger bandwidths (and appropriate updates to the MAC and management layers to support the new PHY layer). It includes backward compatibility for the existing PHY layers in order to enable a seamless migration to the new technology.

This standard is part of the DOCSIS® family of specifications. In particular, this standard is part of a series of standards that define the fifth generation of high-speed data-over-cable systems, DOCSIS 3.1. This standard was developed for the benefit of the cable industry, and includes contributions by operators and vendors from North America, Europe, and other regions.

This document defines the requirements necessary for the Configuration, Fault Management, and Performance Management of the Cable Modem Termination System (CMTS) and the Converged Cable Access Platform (CCAP) system. The intent of this standard is to define a common, cross-vendor set of functionality for the configuration and management of CMTSs and CCAPs.

This standard is part of the DOCSIS® family of specifications. In particular, this standard is part of a series of standards that define the fifth generation of high-speed data-over-cable systems. This standard was developed for the benefit of the cable industry, and includes contributions by operators and vendors from North America, Europe, and other regions.

This standard describes the requirements and constraints on a single program transport stream (SPTS) that allow it to be used as an Adaptive Transport Stream, including stream conditioning and signaling of segment boundary points. Typically, multiple ATISs will be generated from a single input and sent to a packager, recorder or other device. The EBP structure can be inserted at the time of encoding or added during the transcoding process.

ANSI/SCTE 224-2016, Event Scheduling and Notification Interface
This document defines the Event Scheduling and Notification Interface (ESNI), which is a web interface facilitating the transmission of event and policy information. ESNI provides a functional method for providers to communicate upcoming schedule or signal-based events and corresponding policy to distributors. This interface allows existing content distribution controls traditionally performed via manual control in IRD’s by providers to be replaced with a programmatic interface (this standard). ESNI policy enables control of content distributed to audiences based on attributes of that audience including (but not limited) geographic location and device type.

ANSI/SCTE 226-2015, Cable Facility Classification Definitions and Requirements
This SCTE standard defines classes of critical facilities along with expected performance availability across five classes of structures thus creating a common nomenclature for critical facilities.

ANSI/SCTE 23-1-2010, DOCSIS 1.1 Part 1: Radio Frequency Interface
This document defines the radio-frequency interface specifications for high-speed data-over-cable systems. They were developed for the benefit of the cable industry, including contributions by operators and vendors from North America, Europe, and other regions.

ANSI/SCTE 23-2-2012, DOCSIS 1.1 Part 2: Baseline Privacy Plus Interface
The intent of this BPI+ specification is to describe MAC layer security services for DOCSIS&174; CMTS - CM communications.

ANSI/SCTE 23-3-2010, DOCSIS 1.1 Part 3: Operations Support System Interface
This standard defines the Network Management requirements for support a DOCSIS® and environment. More specifically, the specification details the SNMP v3 protocol and how it coexists with SNMP v1/v2. The RFCs and Management Information Base (MIB) requirements are detailed as well as interface numbering, filtering, event notifications, etc.

ANSI/SCTE 230-2016, Recommended Practice for Proper Handling of Audio-Video Synchronization in Cable Systems
This Recommended Practice specifies proper procedures for the measurement of and maintenance of Audio-Video Synchronization (commonly known as ‘Lip Sync’&174;) through various aspects of a cable system - including the headend and distribution architecture and devices.

ANSI/SCTE 230-2016, Recommended Practice for Proper Handling of Audio-Video Synchronization in Cable Systems
This Recommended Practice specifies proper procedures for the measurement of and maintenance of Audio-Video Synchronization (commonly known as ‘Lip Sync’&174;) through various aspects of a cable system - including the headend and distribution architecture and devices.

This document covers the general test procedures that are common to all equipment types and specifies the environmental conditions for evaluating cable equipment energy efficiency metrics. Expectations of measurement equipment as well as guidelines on the recording of results are also covered. This standard will be included as a normative reference in each supplemental standard in the series covering metrics and specific test procedures for the various equipment types.

This document defines how to use a standard methodology to measure the density of hardware to meet the needs of optimizing critical space, as well as measuring energy consumption for the various network element classes. This part of the series focuses on the CMTS, CCAP, and other related cable operator critical facility equipment.

ANSI/SCTE 233-2016, Wavelength-Division Multiplex Small Form Factor Pluggable (PXFP-WDM) Optical Transmitter Module Interface Specification
A PON Extender architecture utilizing WDM optics enables 10GEPON to be deployed over limited fibers and distances over 20 km. Figure 1 shows a typical system use case for a PON Extender architecture.
ISO 50001:2011 specifies requirements for establishing, implementing, maintaining and improving an energy management system, whose purpose is to enable an organization to follow a systematic approach in achieving continual improvement of energy performance, including energy efficiency, energy use and consumption.

ANSI/SCTE 24-1-2016, IPCablecom 1.0 Part 1: Architecture Framework for the Delivery of Time-Critical Services over Cable Television Networks Using Cable Modems
This document provides the architectural framework that will enable cable television operators to provide time critical services over their networks that have been enhanced to support cable modems.

ANSI/SCTE 24-10-2016, IPCablecom 1.0 Part 10: Security Specification
The scope of this document is to define the IPCablecom Security architecture, protocols, algorithms, associated functional requirements and any technological requirements that can provide for the security of the system for the IPCablecom network. Authentication, access control, signaling and media content integrity, confidentiality, and non-repudiation security services must be provided as defined herein for each of the network element interfaces.

ANSI/SCTE 24-11-2016, IPCablecom 1.0 Part 11: Internet Signaling Transport Protocol (ISTP)
This document addresses the protocol to implement SS7 signaling interconnection in a distributed IPCablecom PSTN Gateway architecture. Specifically, it defines the messages and procedures for transporting SS7 ISUP, TCAP, and TUP messages between the IPCablecom control functions (Media Gateway Controller and Call Management Server) and the SS7 Signaling Gateway.

ANSI/SCTE 24-12-2016, IPCablecom 1.0 Part 12: Trunking Gateway Control Protocol (TGCP)
This document describes the TGCP profile of an application programming interface (MGCI) and a corresponding protocol (MGCP) for controlling trunking gateways from external call control elements. A trunking gateway is a network element that provides analog, emulated analog, or digital bearer and channel-associated signaling trunk circuit access to a voice-over-IP (VoIP) network.

ANSI/SCTE 24-2-2016, IPCablecom 1.0 Part 2: Audio Codec Requirements for the Provision of Bi-directional Audio Service over Cable Television Networks Using Cable Modems
The quality of audio delivered over the IPCablecom architecture will depend on multiple factors: the end device performance, the network’s inherent quality, and the intelligence of the system resource allocation policy. This document defines mandated codecs and capabilities supporting audio and video applications, with a particular emphasis on the stringent requirements of IP-based voice communications.

ANSI/SCTE 24-21-2012, BV16 Speech Codec Specification for Voice over IP Applications in Cable Telephony
This document contains the description of the BV16 speech codec. BV16 compresses 8 kHz sampled narrowband speech to a bit rate of 16 kb/s by employing a speech coding algorithm called Two-Stage Noise Feedback Coding (TSNFC), developed by Broadcom.

ANSI/SCTE 24-22-2013, iLBCv2.0 Speech Codec Specification for Voice over IP Applications in Cable Telephony
This document contains the description of an algorithm for coding of speech signals sampled at 8 kHz. Some of the applications for which this coder is suitable are real time communications such as telephony and videoconferencing, streaming audio, archival, and messaging.

ANSI/SCTE 24-23-2012, BV32 Speech Codec Specification for Voice over IP Applications in Cable Telephony
This document contains the description of the BV32 speech codec. BV32 compresses 16 kHz sampled wideband speech to a bit rate of 32 kb/s (kilobits per second) by employing a speech coding algorithm called Two-Stage Noise Feedback Coding (TSNFC), developed by Broadcom.

ANSI/SCTE 24-3-2016, IPCablecom 1.0 Part 3: Network Call Signaling Protocol for the Delivery of Time-Critical Services over Cable Television Using Data Modems
This specification describes a profile of the Media Gateway Control Protocol (MGCP) for IPCablecom embedded clients, which we will refer to as the IPCablecom Network-based Call Signaling (NCS) protocol. MGCP is a call signaling protocol for use in a centralized call control architecture, and assumes relatively simple client devices.

ANSI/SCTE 24-4-2016, IPCablecom 1.0 Part 4: Dynamic Quality of Service for the Provision of Real-Time Services over Cable Television Networks Using Data Modems
This document addresses requirements for a client device to obtain access to IPCablecom network resources. In particular, it specifies a comprehensive mechanism for a client device to request a specific Quality of Service from the DOCSIS® network. Extensive examples illustrate the use of the specification.

ANSI/SCTE 24-5-2016, IPCablecom 1.0 Part 5: Media Terminal Adapter (MTA) Device Provisioning Requirements for the Delivery of Real-Time Services over Cable Television Using Cable Modems
The scope of this document is limited to the provisioning of an IPCablecom 1.0 embedded-MTA device by a single provisioning and network management provider. An attempt has been made to provide enough detail to enable vendors to build an embedded-MTA device that is interoperable in an IPCablecom 1.0 network configuration. This document defines the provisioning of MTA components of the embedded MTA device (unless stated otherwise).

ANSI/SCTE 24-6-2016, IPCablecom 1.0 Part 6: Management Information Base (MIB) Framework
This standard describes the framework in which IPCablecom MIB (Management Information Base) modules are described. It provides information on the management requirements of IPCablecom compliant devices and functions and how these requirements are supported in the MIB modules. It is intended to support and complement the actual MIB module documents, which are issued separately.

ANSI/SCTE 24-7-2016, IPCablecom 1.0 Part 7: Media Terminal Adapter (MTA) Management Information Base (MIB) Requirements
This standard describes the IPCablecom MTA MIB requirement.

ANSI/SCTE 24-8-2016, IPCablecom 1.0 Part 8: Signaling Management Information Base (MIB) Requirements
This specification describes the IPCablecom Signaling (SIG) MIB requirements.

ANSI/SCTE 24-9-2016, IPCablecom 1.0 Part 9: Event Message Requirements
IPCablecom identifies and defines specifications for delivery of enhanced communications services using packetized data transmission technology over the cable television hybrid fiber coax (HFC) data network running the DOCSIS® protocol. IPCablecom specifies a network superstructure that overlays the two-way data-ready broadband cable access network.

This specification describes the PHY layer requirements that must be implemented by all Type 2 and Type 3 compliant OSP HMS transponders on the HFC plant and the controlling equipment in the headend. Any exceptions to compliance with this specification will be specifically noted in this document as necessary.

This specification describes the MAC layer protocols that must be implemented between all Type 2 and Type 3 compliant OSP HMS transponders on the HFC plant and the controlling equipment in the headend to support bandwidth management and reliable communications. Any exceptions to compliance with this specification will be specifically noted in this document as necessary.

ANSI/SCTE 25-3-2011, Hybrid Fiber Coax Outside Plant Status Monitoring - Power Supply to Transponder Interface Bus (PSTIB) Specification v1.1
This specification describes the PSTIB PHY and DLL layer requirements and protocols that must be implemented to support reliable communications between all Type 2 and Type 3 compliant OSP HMS transponders on the HFC plant and managed OSP power supplies and related hardware.
ANSI/SCTE 26-2010, Home Digital Network Interface Specification with Copy Protection
The need for interfaces between cable set top boxes and digital television (DTV) receivers is one element of a general movement to interconnect multiple audio/visual (A/V) devices on a common bus or network. The IEEE 1394 interface has emerged as the preferred tool to accomplish this goal. This specification contains requirements and options for an IEEE 1394 digital interface between a cable TV set top box (called a Host Device in this standard because it “hosts” a removable security module), and a DTV receiver.

ANSI/SCTE 27-2016, Subtitling Methods for Broadcast Cable
This document defines a standard for a transmission protocol supporting multilingual subtitling services to augment video and audio within MPEG-2 multiplexes.

ANSI/SCTE 28-2012, HOST-POD Interface Standard
This standard defines the characteristics and normative specifications for the interface between Point of Deployment (POD) security modules owned and distributed by cable operators, and commercially available consumer receivers and set-top terminals ('Host devices') that are used to access multi-channel television programming carried on North American cable systems

ANSI/SCTE 29-2012, Torque Requirements for Bond Wire Penetration of Bonding Set Screw
The purpose of this test procedure is to determine the mechanical force needed to penetrate bonding wire to the appropriate depth. Bonding wire penetration should be 25 +/-1% of wire O.D.

ANSI/SCTE 30-2015, Digital Program Insertion Splicing API
This Application Program Interface (API) creates a standardized method of communication between Servers and Splicers for the insertion of content into any MPEG-2 Output Multiplex in the Splicer. This API is flexible enough to support one or more Servers attached to one or more Splicers. Digital Program Insertion includes content such as spot advertisements of various lengths, program substitution, public service announcements or program material created by splicing portions of the program from a Server.

ANSI/SCTE 31-2016, Test Method for Measuring Diameter Over Core
To document sample preparation, sample testing and test procedure for measurement of min, max, average core diameter of finished goods coaxial cable.

ANSI/SCTE 32-2016, Ampacity of Coaxial Telecommunications Cables
This document provides the current carrying capacity or AMPCAPITY of coaxial cables used in the Telecommunications industry. The method used to calculate the tabulated ampacities is a thermodynamic model of a cable installed indoors in air and considers the heat flow from the inner and outer conductor through the dielectric and jacket materials. It assumes that the conductors carrying current reach an operating temperature of 65°C based on the cables ability to dissipate heat.

ANSI/SCTE 33-2016, Test Method for Diameter of Drop Cable
To determine one or more of the following characteristics relating to flexible coaxial drop cables. This method is intended to make use of relatively inexpensive equipment. For more precise methods using laser micrometers and the like see ANSI/SCTE 31 2007.

ANSI/SCTE 34-2016, Test Method for Cored Depth Verification
The purpose of this test method is to determine the cored depth of Trunk, Feeder and Distribution Coaxial cable. The core depth is the internal measured distance between the dielectric foam and the square-cut end of the outer sheath. This test method will define the suggested method for core depth measurement.

ANSI/SCTE 35-2016, Digital Program Insertion Cueing Message for Cable
This standard supports delivery of events, frame accurate or non-frame accurate, and associated descriptive data in MPEG-2 transport streams, MPEG-DASH and HLS. This standard supports the splicing of content (MPEG-2 transport streams, MPEG-DASH, etc.) for the purpose of Digital Program insertion, which includes advertisement insertion and insertion of other content types. An in-stream messaging mechanism is defined to signal splicing and insertion opportunities and it is not intended to ensure seamless insertion (splicing, playlist, etc.).

ANSI/SCTE 36-2012, SCTE-ROOT Management Information Base (MIB) Definitions
This MIB provides the root object identifier for the Society of Telecommunications Engineers (SCTE) as an enterprise, as assigned by the Internet Assigned Numbers Authority (IANA). Any Management Information Base (MIB) that falls under the auspices of the SCTE must be assigned object identifiers underneath this enterprise object-id.

ANSI/SCTE 37-2010, Hybrid Fiber/Coax Outside Plant Status Monitoring SCTE-HMS-ROOTS Management Information Base (MIB) Definition
This document provides the branch object identifiers for each of the MIBs within the SCTE HMS Tree. This document has been revised; see the Description in the syntax.

ANSI/SCTE 38-1-2009, Hybrid Fiber/Coax Outside Plant Status Monitoring SCTE-HMS-PROPERTY-MIB Management Information Base (MIB) Definition
This document defines the “properties” that may be associated with each parameter in HMS MIBs.

This document defines information about HFC RF Amplifiers.

ANSI/SCTE 38-11-2008, HMS Headend Management Information Base (MIB) SCTE-HMS-HEADENDIDENT-MIB
This document provides the branch object identifiers for each of the MIBs within the SCTE HMS HEADENDIDENT Tree.

ANSI/SCTE 38-2-2011, Hybrid Fiber/Coax Outside Plant Status Monitoring SCTE-HMS-ALARMS-MIB Management Information Base (MIB) Definition
This document defines the historical list of alarms detected by the transponder, as well as the SNMP trap generated for these alarms.

ANSI/SCTE 38-3-2012, Hybrid Fiber/Coax Outside Plant Status Monitoring SCTE-HMS-COMMON-MIB Management Information Base (MIB) Definition
This document defines common information about NEs. This includes administrative information such as name, ID, model number, serial numbers vendor, and location; health indicators such as status and service state; and functional information such as power level and frequency range.

ANSI/SCTE 38-4-2012, Hybrid Fiber/Coax Outside Plant Status Monitoring SCTE-HMS-PS-MIB Management Information Base (MIB) Definition
This document defines information commonly available from HFC power supplies. Its structure permits multiple power supplies to be monitored by a single transponder.

ANSI/SCTE 38-5-2008, Hybrid Fiber/Coax Outside Plant Status Monitoring SCTE-HMS-FIBERNODE-MIB Management Information Base (MIB) Definition
This document defines information about HFC optical fiber nodes. This includes information about the functional parts of a standard HFC optical fiber node, such as optical receivers, optical transmitters, ports, and power supplies.

ANSI/SCTE 38-6-2012, Hybrid Fiber/Coax Outside Plant Status Monitoring - SCTE-HMS-GEN-MIB Management Information Base (MIB) Definition
This document provides the branch object identifiers for each of the MIBs within the SCTE HMS Tree.
ANSI/SCTE 38-7-2008, Hybrid Fiber/Coax Outside Plant Status Monitoring SCTE-HMS-Transponder Interface Bus (TIB)-MIB Management Information Base (MIB) Definition
This document contains information about the communications state of devices connected to the transponder, as well as indicating what device-specific MIB each device supports. These devices are typically connected to the transponder via a serial communications link (bus).

ANSI/SCTE 38-8-2009, Hybrid Fiber/Coax Outside Plant Status Monitoring SCTE-HMS-DOWNLOAD-MIB Management Information Base (MIB) Definition
This document contains the definitions used to maintain one or more loadable firmware images on an HMS transponder.

ANSI/SCTE 39-2013, Test Method for Static Minimum Bending Radius for Coaxial Trunk, Feeder, and Distribution Cables
This test procedure is to be used for initially establishing or alternatively verifying the minimum static bend radius for coaxial distribution cable products. This procedure establishes the methodology to be used in the determination of a minimum bend radius as well as establishing acceptance criteria by which products can be tested or compared.

ANSI/SCTE 40-2016, Digital Cable Network Interface Standard
This standard defines the characteristics and normative specifications for the digital network interface between a cable television system and commercially available digital cable products that are used to access multi-channel television programming.

ANSI/SCTE 41-2016, POD Copy Protection System
This standard defines the characteristics and normative specifications for the system that prevents unrestricted copying of such high value content as it crosses the POD-Host interface.

ANSI/SCTE 42-2008, IP Multicast for Digital MPEG Networks
The document describes two methods to transmit multicast IP datagrams over MPEG 2 digital transport streams. It describes the use of Digital Video Broadcasting (DVB) Multi-Protocol Encapsulation (MPE) Datagram Sections and the Advanced Television Systems

ANSI/SCTE 43-2016, Digital Video Systems Characteristics Standard for Cable Television
This standard contains the constraints and extensions for the use of MPEG-2 video coding in cable television systems.

ANSI/SCTE 44-2010, Test Method for DC Loop Resistance
This method is intended for use in determining the DC Loop Resistance of coaxial cables. Due to low resistances a four-wire test method is used.

ANSI/SCTE 45-2012, Test Method for Group Delay
The purpose of this test is to measure the group delay and group delay variation of a properly terminated device. This procedure is applicable to testing of 75 Ohm components.

ANSI/SCTE 46-2014, Test Method for AC to DC Outdoor Power Supplies
The purpose of this standard is to characterize, document and define test methods for AC to DC outdoor plant power supplies. These tests involve the measurement of AC input parameters and DC output parameters. The application of uniform test methods for power supplies will allow fair performance comparisons to be made between different power supplies.

ANSI/SCTE 47-2007, Test Method for Coaxial Cable Attenuation
Measurement technique for determining attenuation of coaxial cable at various selected frequencies.

The purpose of this test is to determine the shielding effectiveness against Electromagnetic Interference (EMI) of components. This method subjects the component to an electric field of known strength.

This document outlines the procedures for determining the relative Shielding Effectiveness of cable telecommunication system devices employing a combination of Close Field probes and various Scalar Test equipment packages, through the use of defined, repeatable test practices.

ANSI/SCTE 48-3-2011, Test Procedure for Measuring Shielding Effectiveness of Braided Coaxial Drop Cable Using the GTEM Cell
Details the procedure for measuring the Shielding Effectiveness (S.E.) of coaxial cable using the Gigahertz Transverse ElectroMagnetic (GTEM) cell. More particularly, this standard applies to measuring the S.E. of 75 Ohm braided coaxial drop cables presently used within the broadband communications industry. S.E. measurements can be performed with or without the coaxial connectors removed from the measurement.

ANSI/SCTE 49-2011, Test Method for Velocity of Propagation
Provides a means to measure the velocity of propagation (Vp), in coaxial cables. This standard is for use with cables having low-loss dielectrics, as noted in ANSI/SCTE 15 and ANSI/SCTE 74, that have relative permittivity nearly constant with frequency.

ANSI/SCTE 51-2012, Test Method for Determining Drop Cable Braid Coverage
The purpose of this document is to provide instruction on the calculation of braid coverage for braided coaxial drop cables. Braid coverage is expressed as a percentage of optical coverage of the underlying core by the braid wires.

ANSI/SCTE 52-2013, Data Encryption Standard - Cipher Block Chaining Packet Encryption Specification
This document defines a method for encrypting MPEG-2 transport stream packets using the Data Encryption Standard (DES) Cipher Block Chaining (CBC) encryption standard.

ANSI/SCTE 53-2008, Methods for Asynchronous Data Transport
This proposal represents transmission format for the carriage of asynchronous data services, compatible with digital multiplex bitstream constructed in accordance with ISO/IEC 13818-1 (MPEG-2 Systems). Bit rates for the data services extend from 300 bps to 288 kbps including some common high speed modem rates of 115200 bps and 230400 bps. The proposal also covers the entire set of rates specified by the ITU-T Series-V Recommendations (V.22, V.23, V.26, V.27 ter, V.29, V.32, V.32 bis, V.32 ter and V.34).

ANSI/SCTE 54-2015, Digital Video Service Multiplex and Transport System Standard for Cable Television
This document describes the transport subsystem characteristics and normative specifications of the in-band Service Multiplex and Transport Subsystem Standard for Cable Television.

Specifies the physical layer and the data link layer (including the MAC layer) of the Out-Of-Band cable system transport.

Describes the complete physical layer structure, i.e., framing structure, channel coding and modulation (QPSK), for each direction - Downstream and Upstream.

ANSI/SCTE 56-2016, Digital Multiservice Distribution by Satellite
This document analyses the common elements among existing systems, defines and describes the functions of a generic system model and identifies the processes and the minimum set of parameters of the various sub-systems of the universal elements of a Satellite IRD.
ANSI/SCTE 57-2016, System Information for Satellite Distribution of Digital Television for Cable and MMDS

This document defines a Standard for System Information (SI) compatible with MPEG-2 compliant digital multiplex bitstreams constructed in accordance with ISO/IEC 13818-1 (MPEG-2) and transmitted over satellite for distribution on cable and MMDS. The document defines the standard protocol that carries relevant System Information (SI) tables contained within packets carried in the transport multiplex. The term SI will be used to refer to system-wide information in the Network Packet Identifier (PID).

ANSI/SCTE 58-2012, AM Cross Modulation Measurements

This standard describes a test procedure for the laboratory and production measurement of Amplitude Modulation Cross Modulation (or AM-XMOD) that is present in Broadband Systems which carry Frequency Division Multiplexed (FDM), amplitude modulated, analog video channels.

ANSI/SCTE 59-2012, Test Method for Center Conductor Bond to Dielectric

This test is to determine the amount of bond between the center conductor wire to the dielectric (by measuring the force in pounds required to break the bond) for specified flexible RF coaxial drop cables at room temperature.

ANSI/SCTE 60-2016, Test Method for Interface Moisture Migration Double Ended

The purpose of this document is to provide a test method for detecting moisture penetration into the coaxial connector/cable and or the connector/port interface.

The purpose of this test procedure is to provide a test method for measuring the force required to separate webbed or ‘figure-eight’ coaxial cable constructions. These designs are commonly referred to as messenger, dual, or Siamese cables for the two members that are joined by a web and common overall outer jacket.

ANSI/SCTE 62-2012, Measurement Procedure for Noise Figure

This standard defines a method of measurement for Noise Figure of active Cable Telecommunications equipment. It is intended for measurement of 75-ohm devices having type ‘F’ or 5/8-24 KS connectors, and for the measurement of true broadband noise as opposed to broadband disturbances.

This procedure specifies the spark test method to be used in determining if the outer jacket of a coaxial cable will withstand a specified voltage.

ANSI/SCTE 65-2016, Service Information Delivered Out-Of-Band for Digital Cable Television

This document defines a standard for Service Information (SI) delivered out-of-band on cable. This standard is designed to support ‘navigation devices’ and on-cable. The current specification defines the syntax and semantics for a standard set of tables providing the data necessary for such a device to discover and access digital and analog services offered on cable.

ANSI/SCTE 66-2016, Test Method For Coaxial Cable Impedance

The purpose of this procedure is to provide instructions for measuring coaxial cable impedance. The cable impedance as a function of frequency is calculated from a vector (magnitude and phase) return loss. The average of this impedance across the desired frequency range is the cable impedance. This may be automated, but requires a vector network analyzer, and may be subject to errors due to the cable connection.

ANSI/SCTE 67-2014, Recommended Practice for SCTE 35 Digital Program Insertion Cueing Message for Cable

The purpose of this document is to aid splicing equipment designers, ad insertion equipment designers as well as the purchasers and users of such equipment, such as the networks that will originate SCTE 35 Cue Messages from their uplink sites. This document is also expected to aid in the system integration of advertising related equipment, both at the Message origination end and at the Message reception end.

ANSI/SCTE 68-2013, Drop Passives: Matching Transformers 75 Ohm to 300 Ohm

The purpose of this document is to specify recommended mechanical and electrical standards for broadband radio frequency (RF) devices whose primary purpose is to provide impedance and connector match between 75Ω and 300Ω; twin-lead open screw connectorized devices.

This test is designed to measure the corrosion resistance of flooded coaxial drop cables, trunk, feeder, and distribution cables.

ANSI/SCTE 70-2003 (R2007), Insulation Resistance Megohmmeter Method

This method is intended for use in determining the Insulation Resistance of insulated dielectric for coaxial cables by the megohmmeter method.

ANSI/SCTE 71-2008, Specification for Braided, 75 ohm, Coaxial, Multi-Purpose Cable

This specification defines the materials, electrical and mechanical properties of 75 ohm Braided, Low Loss Subscriber Access Cable (Series 15) as defined herein. These cables are used in the transmission of RF signals and power for voice, data and video applications.

ANSI/SCTE 72-2002 (R2007), Test Method for Axial Load Temperature

This test procedure is intended to evaluate the connection between the connector and the coaxial drop cable when it is subjected to a continuously varying environmental cycle. The cable/connector assembly has an axial load of 15 pounds applied to them during the environmental cycling.

ANSI/SCTE 73-2012, Test Method for Insertion Force of Connector to Drop Cable Interface

This test procedure is designed to measure the amount of linear force required to install a drop (‘F’) connector onto a drop cable of the proper size.

ANSI/SCTE 74-2011, Specification for Braided 75 Ohm Flexible RF Coaxial Drop Cable

This specification defines the materials, electrical and mechanical properties of flexible braided 75 ohm coaxial drop cables.

ANSI/SCTE 75-2012, Test Point Accuracy

This document describes a procedure for evaluating the accuracy of internal and external RF test points as used to monitor input and output ports of Cable Telecommunications equipment.

ANSI/SCTE 77-2013, Specification for Underground Enclosure Integrity

This standard covers conformance tests and requirements for the integrity of grade-level enclosures containing telecommunication or other low voltage apparatus that may be exposed to the public.

ANSI/SCTE 78-2012, Test Method for Transfer Impedance

This procedure is for the measurement of transfer impedance of coaxial drop cables from 5 MHz to 1,002 MHz.

ANSI/SCTE 79-1-2016, DOCSIS 2.0 Part 1: Radio Frequency Interface

This document defines the second generation of radio-frequency interface specifications for high-speed data-over-cable systems. They were developed for the benefit of the cable industry, including contributions by operators and vendors from North America, Europe, and other regions.

ANSI/SCTE 79-2-2016, DOCSIS 2.0 Part 2: Operations Support System Interface

This specification defines the Network Management requirements to support a DOCSIS 2.0 environment. More specifically, the specification details the SNMPv3 protocol and how it coexists with SNMP v1/v2. The RFCs and Management Information Base (MIB) requirements are detailed as well as interface numbering, filtering, event notifications, etc. Basic network-management principles such as account, configuration, fault, and performance management are incorporated in this specification for better understanding of managing a high-speed cable modem environment.
ANSI/SCTE 79-3-2011, DOCSIS 2.0 + IPv6 Cable Modem Standard
This standard is an extension to the DOCSIS 2.0 family of specifications, which define high-speed data-over-cable systems. For an overview of DOCSIS 2.0, refer to ANSI/SCTE 79-1. That standard requires the CM to support IP version 4 for provisioning and management. This standard provides IPv6 provisioning and management functionality for DOCSIS 2.0 CMs, connected IPv6 eSAFEs, and external CPE devices. The term DOCSIS 2.0+IPv6 CM is used to represent such Cable Modems.

ANSI/SCTE 81-2012, Surge Withstand Test Procedure
This document describes a procedure for subjecting a broadband device to surge conditions as specified in IEEE C62.41. Ports shall be tested in compliance with IEEE C62.41 Category B3 Combination Waveform or IEEE C62.41 Category A3 Ring Waveform as specified for the Device Under Test.

ANSI/SCTE 82-2012, Test Method for Low Frequency and Spurious Disturbances
The purpose of this standard is to define and measure low frequency and spurious disturbances caused by switched mode power supplies or other active devices in broadband Cable Telecommunications equipment.

The MIB module provides the branch object identifiers for the headend optics MIBs within the SCTE HMS Headend subtree.

ANSI/SCTE 83-3-2009, Hybrid Fiber/Coax Inside Plant Status Monitoring SCTE-HMS-HMTS-MIB Management Information Base (MIB) Definition
This document provides the MIB definitions for management of an HMTS system and defines how to address the HMS transponders connected to the HTMS system.

ANSI/SCTE 83-4-2009, HMS Common Inside Plant Management Information Base (MIB) SCTE-HMS-HE-RF-MIB
This document provides MIB definitions for HMS RF equipments present in the headend (or indoor) and is supported by a SNMP agent.

The MIB module is for representing general information about optical equipment present in the headend (or indoor) and is supported by an SNMP agent.

ANSI/SCTE 84-2-2009, HMS Inside Plant Management Information Base (MIB) SCTE-HMS-HE-POWER-SUPPLY-MIB
This document provides MIB definitions for HMS Indoor Power Supplies present in the headend (or indoor) and supported by a SNMP agent.

ANSI/SCTE 84-3-2009, HMS Inside Plant Management Information Base (MIB) SCTE-HMS-HE-FAN-MIB
This document provides the branch object identifiers for each of the Fan MIBs within the SCTE HMS Tree.

The MIB module is for representing general information about optical equipment present in the headend (or indoor) and is supported by an SNMP agent.

The MIB module is for representing general information about optical equipment present in the headend (or indoor) and is supported by an SNMP agent.

ANSI/SCTE 85-3-2009, HMS Inside Plant Management Information Base (MIB) SCTE-HMS-HE-OPTICAL-AMPLIFIER-MIB
This document provides MIB definitions for HMS optical amplifiers present in the headend (or indoor) and supported by a SNMP agent.

ANSI/SCTE 85-4-2009, HMS Common Inside Plant Management Information Base(MIB) SCTE-HMS-HE-OPTICAL-SWITCH-MIB
This document provides MIB definitions for HMS optical switch equipment present in the headend (or indoor) and is supported by a SNMP agent.

ANSI/SCTE 86-2010, SCTE Recommended Optical Fiber Cable Types for Outside Plant Trunk and Distribution Applications
The purpose of this document is to provide guidance in selection of a suitable outside plant (OSP) optical cable with respect to different application environments.

ANSI/SCTE 87-1-2008, Graphic Symbols for Cable Systems - Part 1: HFC Symbols
The symbols for devices do not indicate types or model numbers of any manufacturer. They represent the function of the device operated within a cable system. The symbols permit easy addition of model or type numbers within or near their outline.

ANSI/SCTE 88-2012, Test Method for Polyethylene Jacket Longitudinal Shrinkage
The purpose of this test is to determine the amount of shrinkage of the jacketing material used on coaxial drop and distribution cables. This test procedure is applicable for use on either drop or distribution coaxial cables employing polyethylene (PE) jacketing material.

ANSI/SCTE 91-2015, Specification for 5/8-24 RF & AC Equipment Port, Female
The purpose of this specification is to serve as a recommended guideline for the physical dimensions of all female 5/8 - 24 plug (male) trunk and distribution connectors that are typically used in the 75 ohm RF broadband communications industry. It is not the purpose of this standard to specify the details of manufacturing.

ANSI/SCTE 92-2012, Specification for 5/8-24 Plug (Male), Trunk & Distribution Connectors
The purpose of this specification is to serve as a recommended guideline for the physical dimensions of all male 5/8 - 24 plug (male) trunk and distribution connectors that are typically used in the 75 ohm RF broadband communications industry. It is not the purpose of this standard to specify the details of manufacturing.

ANSI/SCTE 93-2013, Test Method for Connector/Cable Twist
This standard details the equipment and procedures required to measure the relative degree of twisting imparted to coaxial cables when installed into mainline plug connectors specifically.

This document provides MIB definitions for HMS RF amplifier equipment present in the headend (or indoor) and is supported by a SNMP agent.

This document provides MIB definitions for HMS RF switch equipment present in the headend (or indoor) and is supported by a SNMP agent.

ANSI/SCTE 95-2009, HMS Inside Plant HMTS Theory of Operation
This document contains information about the background of the Hybrid Management Termination System (HMTS). This document is a companion document for the HMTS MIB, and does not replace the MIB. Although this document has been written to be consistent with the HMTS MIB, in case there would be any conflicts between these two documents, the MIB is the reference.

ANSI/SCTE 96-2013, Cable Telecommunications Testing Guidelines
The test procedures that reference this document are intended to allow a competent technician or engineer to perform the tasks of determining, to a reasonable degree of certainty, the level of performance for the various parameters detailed. The procedures are general in nature and with sufficient forethought and preparation, can be adapted to individual devices, cascades or complete systems. The primary focus for these procedures is for bench or laboratory testing, but the principles discussed are equally applicable to field testing.
ANSI A250.6-2015, Recommended Practice for Hardware Reinforcing on Standard Steel Doors and Frames

It is the intention of this publication to furnish users and prospective users of standard steel doors and frames with practical information regarding accepted design methods for reinforcing and recommended practices for proper field preparation for builders' hardware.

ANSI A250.8-2014, Recommended Specifications for Standard Steel Doors and Frames

This specification for standard swinging steel doors and frames offers a variety of choices suitable for any commercial application. Specific performance levels of doors and frames are defined herein. SDI-108, 'Selection and Usage Guide for Standard Steel Doors' shall be used as a guide. This Standard shall not act as an obstruction to the development of new, modified or improved products that meet the intent of this specification.

SDI (Canvas) (Steel Door Institute)

ANSI A250.1-2011, Test Procedure and Acceptance Criteria for Prime Painted Steel Surfaces for Steel Doors and Frames

Prescribes the procedures to be followed in the selection of material, chemical preparation, painting, testing, and evaluation of prime painted steel surfaces for steel doors and frames.

ANSI A250.11-2012, Recommended Erection Instructions for Steel Frames

Covers recommended methods for the installation of steel frames for swinging doors in a variety of wall conditions, commonly used in commercial buildings.

ANSI A250.13-2014, Testing & Rating of Severe Windstorm Resistant Components for Swinging Door Assemblies for Protection of Building Envelopes (Not Applicable for FEMA 320/361 of ICC-500 Shelters)

This standard provides procedure for testing & establishing load ratings for components of exterior swinging door assemblies for purposes of protection of openings in building envelopes during severe windstorm conditions, such as a hurricane that produces sustained wind speeds or gusts in a range of 110 to 15 mph as defined by ASCE 7.

ANSI A250.3-2007 (R2011), Test Procedure and Acceptance Criteria for Factory-Applied Finish Painted Steel Surfaces for Steel Doors and Frames

These methods prescribe the procedures to be followed in the selection of material, chemical preparation, coating application, testing, and evaluation of factory applied finish coatings for steel doors and frames. Coatings covered by this standard include paints, stains, clear coats, and powder coats.

ANSI A250.4-2011, Test Procedure & Acceptance Criteria for - Physical Endurance for Steel Doors, Frames and Frame Anchors

The primary purpose is to establish a std. method of testing the performance of a steel door mounted in a hollow metal or channel iron frame installed with the appropriate anchors, under conditions that might reasonably be considered an accelerated field operating condition.

ANSI A250.6-2015, Recommended Practice for Hardware Reinforcing on Standard Steel Doors and Frames

It is the intention of this publication to furnish users and prospective users of standard steel doors and frames with practical information regarding accepted design methods for reinforcing and recommended practices for proper field preparation for builders' hardware.

ANSI A250.8-2014, Recommended Specifications for Standard Steel Doors and Frames

This specification for standard swinging steel doors and frames offers a variety of choices suitable for any commercial application. Specific performance levels of doors and frames are defined herein. SDI-108, 'Selection and Usage Guide for Standard Steel Doors' shall be used as a guide. This Standard shall not act as an obstruction to the development of new, modified or improved products that meet the intent of this specification.

ANSI/SIA OSIPS-01-2008, Open, Systems Integration and Performance Standards - The OSIPS Framework defines how security components may interoperate with other security components. It is used to communicate over any transport mechanism. The transmission of messages across various transport mechanisms permit common messaging with co-operating devices to interoperate. The Framework is six interfaces and additional fundamental elements that define the elements that are shared among all OSIPS interface models. They are Component Connection, Capabilities Exchange, Event Reporting, Authentication and Authorization, IP Point and Schedule Exchange.

ANSI/SIA OSIPS-DVI-01-2008, Open, Systems Integration and Performance Standards - Digital Video Interface Data Model
This document describes an interface for a component. It provides message sets for the information exchange necessary to provision and command the component, as well as request and receive event and status information. This data model does not prescribe what the physical component is, as it abstracts it to a "black box". The Digital Video Interface data model defines an interface for the control of live and recorded video as well as the control of cameras. It also provides for the reporting of video analytic events.

SJI (Steel Joist Institute)
ANSI/SJI CJ-2010, Standard Specifications for Composite Steel Joists, CJ-Series General Revision
This new standard covers the design and use of open web steel joists in composite construction utilizing field applied shear connectors between the top chord and the overlying concrete slab to allow the steel joist and slab to act together as an integral unit after concrete has adequately cured.

This consolidation effort will take three existing standards and make them one. This effort is being made to eliminate contradictions between the series and provide a simplified approach for the specifying professional.

SLAS (Society for Laboratory Automation and Screening)
ANSI/SLAS 1-2004 (R2012), Microplates - Footprint Dimensions (formerly recognized as ANSI/SBS 1-2004)
This standard defines the dimensional requirements of the footprint of a microplate as specified in American National Standards covering these microplates.

ANSI/SLAS 2-2004 (R2012), Microplates - Height Dimensions, (formerly recognized as ANSI/SBS 2-2004)
This standard defines the dimensional requirements of the height of a microplate as specified in American National Standards covering these microplates.

ANSI/SLAS 3-2004 (R2012), Microplates - Bottom Outside Flange Dimensions (formerly recognized as ANSI/SBS 3-2004)
This standard defines the dimensional requirements of the bottom outside flange of a microplate as specified in American National Standards covering these microplates.

ANSI/SLAS 4-2004 (R2012), Microplates - Well Positions (formerly recognized as ANSI/SBS 4 -2004)
This standard defines the well center positional requirements of a microplate as specified in American National Standards covering these microplates.

ANSI/SLAS 6-2012, Standard #6 for Well Bottom Elevation
Defines well bottom elevation of a microplate as specified in American National Standards (ANS) covering microplates with flat well bottoms.

SMACNA (Sheet Metal and Air-Conditioning Contractors' National Association)
This is an updated set of flexible guidelines that shows designers and contractors how to determine the correct restraints for sheet metal ducts, piping, and conduit, so that they are more likely to remain attached to the building during an earthquake. The manual shows how very low- and very high-risk areas of the country can be accommodated. Meets California Building Code, Title 24, Part 2 and International Building Code, 2006 for bracing ductwork, piping and conduit.

ANSI/SMACNA 002-2011, Rectangular Industrial Duct Construction Standards
Covers moderate to high temperature and pressure indoor and more complex outdoor duct systems that are subject to higher and more complex external loading or where anything other than ambient air is conveyed.

ANSI/SMACNA 005-2013, Round Industrial Duct Construction Standards
SMACNA’s Round Industrial Duct Construction Standards offers a standardized, engineered basis for the design and construction of industrial duct of Classes 1 through 5. The standard covers design pressures through negative 30 to positive 50 inch w.g., nominal diameter ranging from 4 to 96 inches and materials including; carbon, galvanized and coated steels, stainless steels, and aluminum alloys. The main revision in the third edition is the incorporation of temperature reduction factors for carbon steel in the design tables.

ANSI/SMACNA 007-2016, Residential Comfort System Installation Standards
The document will provide installation standards for residential heating, ventilating and air conditioning (HVAC) systems. It will include the most current mechanical and control technology so contractors and designers can design, construct, and install from the simplest to state-of-the-art HVAC systems. Forced-air heating, heat pumps, automatic controls and thermostats, flues, vents, sound and vibration, air cleaning, and others subjects and technologies appropriate for this new century will be included.

ANSI/SMACNA 008-2008, IAQ Guidelines for Occupied Buildings Under Construction
The IAQ Guideline provides project management in maintaining satisfactory indoor air quality (IAQ) of occupied buildings undergoing renovation or construction. The Guideline covers how to manage the source of air pollutants, control measures, quality control and documentation, communication with occupants. It includes example projects, tables, references, resources, and checklists.

The Thermostat FRP Duct Construction Manual is an authoritative manual that design engineers, industrial engineering departments, pollution control authorities, FRP manufacturers and installation contractors can rely upon for the proper selection, manufacture, and installation of FRP duct systems.

ANSI/SMACNA 014-2013, HVAC Systems Commissioning Manual
This manual will detail the commissioning process which ensures that a HVAC system meets the owner’s operational requirements. It will be a practical how-to guide for contractors, owners and engineers interested in commissioning new or existing buildings. Different levels of commissioning will be covered including basic, comprehensive and critical systems. Sample HVAC Systems Commissioning Specification from planning to the final execution and sample reports and checklists will be included.

This manual contains duct leakage classification guidance, test procedures, recommendations on test apparatus and test setup and sample leakage analysis.

ANSI/SMACNA 022-2015, Phenolic Duct Construction Standards
The Phenolic Duct Construction Standard is intended to provide basic phenolic duct fabrication and installation standards to the industry. The standard includes model project specifications, duct performance characteristics, specifications and closures, fittings and connections, reinforcement, hangers and support, accessories and an inspection checklist.
ANSI/SPRI (Single Ply Roofing Institute)

This test standard examines the ability of a root protection barrier to prevent root penetration through the waterproofing layer on low-slope (slope \#8804:70) single-ply membrane and coated roofs. This procedure includes testing of penetration barriers including all seams edges and methods of attachment. This test standard excludes any lamination, i.e., a separate layer installed over the penetration barrier. The penetration barrier may be, but is not limited to, the waterproofing layer itself. The findings for any membrane or coating which has been tested shall not apply to plants with strong rhizome growth (e.g., bamboo or Chinese reeds varieties).

**ANSI/SPRI FX-1-2016, Standard Field Test Procedure for Determining the Withdrawal Resistance of Roofing Fasteners**

This standard provides procedures used in the field to test the pullout resistance of all types of fasteners. The data developed from these tests provide the roof system manufacturer, design professional, and other practitioners with pullout resistance values for the specific fastener installed into the load resisting material of the deck.

**ANSI/SPRI GT-1-2016, Test Standard for Gutter Systems**

This standard provides methodology for the testing of Gutters. This standard is applicable to roof Gutters of all material types and installation methods. This standard specifies a laboratory method for static testing external Gutters. Testing of gutters with a circular cross-section is not addressed in this standard. This standard does not address water removal or the water-carrying capability of the Gutter, and does not consider downspouts or leaders.

**ANSI/SPRI IA-1-2015, Standard Field Test Procedure for Determining the Uplift Resistance of Insulation and Insulation Adhesive Combinations over Various Substrates**

This standard specifies a field-testing procedure to determine the uplift resistance of a specific roof insulation/adhesive combination. This testing procedure encompasses various types of insulation adhesives, substrates and insulations.

**ANSI/SPRI RD-1-2014, Performance Standard for Retrofit Drains**

This standard is a reference on retrofit roof drains which are designated for installation in existing drain plumbing on existing roofs. This standard does not address roof design criteria.

The Wind Design Standard for Vegetative Roofing Systems provides design guidelines associated with wind uplift and stone scour defining items such as set backs from the edges of roofs in areas with high winds, use of wind erosion mats as well as edging details. There is a discussion of the various types of materials and their behavior under varying wind conditions.

The standard being revised is a reference for the design, specification and installation of ballasted single-ply roofing systems. This revision will update the standard to include current ASCE 7 requirements and wind maps. It also updates the design requirements consistent with current technical data.

This design standard provides a method for designing external fire resistance for vegetative roofing systems. It is intended to provide a minimum design and installation reference for those individuals who design, specify, and install vegetative roofing systems. It shall be used in conjunction with the installation specifications and requirements of the manufacturer of the specific products used in the vegetative roofing system.

**ANSI/SPRI WD-1-2014, Wind Design Standard Practice for Roofing Assemblies**

This Wind Design Standard Practice provides general building design considerations as well as a methodology for determining rooftop design wind uplift pressures, then selecting an appropriate roofing system assembly to meet those pressures. This Standard Practice is appropriate for non-ballasted Built-Up, Modified Bitumen, and Single-Ply roofing system assemblies installed over any type of roof deck.

The following standard is a reference for those who design, specify, manufacture, test or install edge materials used with low slope roofing systems. This Standard prescribes methodology for testing roof edge assemblies, excluding gutters, to evaluate their resistance to wind loads.

This Standard provides the basic requirements for wind load resistance testing and design for roof edge securement, edge systems and nailers. It also provides minimum material thicknesses that lead to satisfactory flatness, and designs to minimize corrosion. This Standard is intended for use by those that design, specify, and manufacturer roofing materials and edge systems used in the roofing industry. The membrane manufacturer shall be consulted for specific recommendations for making the roof watertight at the edge.

**ANSI/SPRI/RCI NT-1-2012, Detection and Location of Latent Moisture in Building Roofing Systems by Nuclear Radioisotopic Thermalization**

This standard provides a minimum set of procedures for conducting surveys of moisture in membrane roofing systems, and for analyses of the data obtained in such surveys. Included are operating procedures, operator qualifications, verification, and reporting procedures. It addresses the effect of roof construction, material differences and roof conditions on the numerical data output provided by the nuclear equipment; the limitations in the use of radioisotopic thermalization; and the governmental control of the equipment used to conduct nuclear moisture surveys.

**SVIA (Specialty Vehicle Institute of America)**

**ANSI/SVIA 1-2017, Four Wheel All-Terrain Vehicles**

This voluntary standard addresses design, configuration and performance aspects of ATVs, including, among other items, requirements for mechanical suspension; throttle, clutch and gearshift controls; engine and fuel cutoff devices; lighting; tires; operator foot environment; service and parking brake/parking mechanism performance; and pitch stability. Other areas covered in this standard include: defining Type I and Type II ATVs; Youth and T category ATVs; requirements for Type II ATVs; requirements for labels, owner’s manuals, and hang tags; and a compliance certification label.

**TAPPI (Technical Association of the Pulp and Paper Industry)**

**ANSI/TAPPI T 1009 om-2010, Testing of fiber glass mats: use of modified TAPPI procedures for sampling and lot acceptance, stiffness, tear resistance, air permeability, and thickness**

The purpose of this standard practice is to list existing TAPPI test methods which provide procedures for sampling and lot acceptance, stiffness, tear resistance, air permeability, and thickness.

This method covers the determination of the tensile strength of fiber glass mats, and provides methods for testing and reporting procedures. It addresses the effect of root construction, material differences and roof conditions on the numerical data output provided by the nuclear equipment; the limitations in the use of radioisotopic thermalization; and the governmental control of the equipment used to conduct nuclear moisture surveys.

**ANSI/TAPPI T 1007 sp-2015, Sample location for fiber glass mat sheets**

This practice covers the location from which samples are taken from a sheet of fiber glass mat used as a sample test unit for physical property determination.

**ANSI/TAPPI T 1008 sp-2015, Test conditions for fiber glass mat test methods**

This practice defines the preconditioning and test conditions for testing fiber glass mats.

**ANSI/TAPPI T 1009 om-2010, Tensile strength and elongation at break for fiber glass mats**

This method covers the determination of the tensile strength and elongation at break of fiber glass mats.

**ANSI/TAPPI T 1012 om-2015, Moisture content of fiber glass mats**

This method covers the determination of the moisture content of fiber glass mat on a dry basis.
This standard practice provides a general introduction to the use of color differences and a list of the most widely used equations to obtain them. Color differences can be used (1) as a guide to establishing color tolerances in the production of pulp, paper, and paperboard, (2) for the determination of buying and selling tolerances of color, (3) to provide a method of determining the adequacy of color matches.

This Standard Practice deals only with simplified color indices applicable specifically to white colors. There are approximately 5000 distinguishable white colors. As with any other color, three numbers are necessary for the complete identification of any white. All the color and color difference scales regularly used for color specification are applicable to white colors.

This Standard Practice provides a procedure for judging whether suspect test determinations should be investigated further for possible rejection. A suspect determination (apparent outlier) is one that appears to deviate markedly from other determinations on the same sample of material. An outlying determination (outlier) is a suspect determination for which the deviation has, in fact, been found to be significant using an appropriate statistical test.

This Standard Practice establishes acceptance procedures for the listing of organizations as calibration laboratories or providers of standardized materials in the TAPPI Standards. Such organizations are involved with the maintenance of master instruments, calibration of test instruments and the issuance of calibration materials or transfer standards.

This standard practice covers the significance and application of both instrumental and visual light sources for evaluating papers and related materials including those containing fluorescent whitening agents.

This standard practice lists several practices that have been found to be helpful in preserving samples. Measurements may be made on pulp with up to 4% lignin, as defined by TAPPI T 222 'Acid-Insoluble Lignin in Wood and Pulp,' for their strength and other physical properties as well as their light-scattering coefficient. Information derived from handsheet testing is a measure of the potential contribution of the pulp to the strength of the finished paper product.

This procedure describes the testing of pulp handsheets, prepared in accordance with TAPPI T 205 'Forming Handsheets for Physical Tests of Pulp,' for their strength and other physical properties as well as their light-scattering coefficient. Information derived from handsheet testing is a measure of the potential contribution of the pulp to the strength of the finished paper product.

This method is used to define the papermaking quality of pulp, by subjecting it to a controlled mechanical treatment in a laboratory beater; see also TAPPI T 248 ‘Laboratory Beating of Pulp (PFI Mill Method).’

This method for determination of ash can be applied to all types and grades of wood pulp, paper, and paperboard: combustion at 525 degrees C.

This method for determination of 1% sodium hydroxide solubility of wood and pulp can be applied to wood and to unbleached and bleached pulp.

This method is adapted to the numerical estimation of dirt in pulp and recycled pulp in terms of equivalent black area.

This procedure describes the testing of pulp handsheets, prepared in accordance with TAPPI T 205 'Forming Handsheets for Physical Tests of Pulp,' for their strength and other physical properties as well as their light-scattering coefficient. Information derived from handsheet testing is a measure of the potential contribution of the pulp to the strength of the finished paper product.

This method describes a procedure for determining the viscosity of 0.5% cellulose solutions, using 0.5M cupriethylenediamine (CED) as a solvent and a capillary viscometer. Measurements may be made on bleached cotton and wood pulps. Conventional kraft pulps with up to 4% lignin, as defined by TAPPI T 222 'Acid-Insoluble Lignin in Wood and Pulp,' can also be analyzed.

This standard practice provides a procedure for determining the level of lignin remaining in a sample of finished or in-process pulp. It is thus a measure of the completeness of the pulping process for many kinds of chemical and semi-chemical pulps, both bleached and semi-bleached.
ANSI/TAPPI T 240 om-2012, Consistency (concentration) of pulp suspensions

This method describes the measurement of pulp consistency (concentration) of aqueous fiber suspensions. The method applies to most pulps sampled from different process points in a pulp or paper mill. The method is applicable to pulps with up to 25% consistency.

ANSI/TAPPI T 248 sp-2015, Laboratory beating of pulp (PFI mill method)

This standard practice describes the processing of pulp by means of the PFI mill to evaluate pulp quality for papermaking.

ANSI/TAPPI T 252 om-2012, pH and electrical conductivity of hot water extracts of pulp, paper, and paperboard

This procedure provides for the extraction of pulp, paper, and paperboard samples using boiling reagent water followed by determination of the pH and conductivity of the extract.

ANSI/TAPPI T 257 sp-2014, Sampling and preparing wood for analysis

This practice is applicable to the sampling of wood for all chemical tests. The procedures describe the sampling of wood in all forms, i.e., logs, chips, or sawdust. Two sampling plans are described: A probability sampling plan which provides test units from which some property of the wood may be determined within known and controlled limits at a minimum total cost; an economic or engineered sampling plan which minimizes errors due to variations in the raw material or the quality of the lot.

ANSI/TAPPI T 259 om-2015, Species identification of nonwood plant fibers

The fibrous elements of the nonwood plant species, which are commonly encountered in papermaking or that are expected to have the potential of being used for this purpose, may be identified on the basis of their morphology as revealed by the microscope. The purpose of this method is to provide some of the details, which are useful in making an identification of an unknown nonwood plant specimen. This method can be used whether a coarse undefibered specimen is present or samples of pulp, paper or other paper products are provided.

ANSI/TAPPI T 262 sp-2012, Preparation of mechanical pulps for testing

This practice describes a procedure for the preparation of mechanical pulps prior to physical testing.

ANSI/TAPPI T 268 om-2013, Weight-volume measurement of pulpwod

A method is described for determining the weight of pulpwod per unit of volume (a standard-racked cord).

ANSI/TAPPI T 271 om-2012, Fiber length of pulp and paper by automated optical analyzer using polarized light

This is an automated method by which the numerical and weighted average fiber lengths and fiber length distributions of pulp and paper can be measured using light polarizing optics in the range of 0.1 mm to 7.2 mm.

ANSI/TAPPI T 272 sp-2012, Forming handsheets for reflectance testing of pulp (sheet machine procedure)

This practice describes the procedure using the TAPPI sheet machine for preparing reflectance-testing specimen sheets of bleached or unbleached pulp whose fibers are readily dispersed in water. This practice permits the preparation of sheets having a smooth and reproducible surface for reflectance measurements with a minimum of washing or contamination of the sample.

ANSI/TAPPI T 274 sp-2013, Laboratory screening of pulp (MasterScreen-type instrument)

A general purpose practice for screening pulp using a specific screening device is described, which separates from a slurry of pulp fibers a contaminant fraction with size dimensions which are significantly greater than the diameter of a pulp fiber.

ANSI/TAPPI T 277 sp-2014, Macro stickies content in pulp: the "pick-up" method

This standard practice describes removing and preparation of a test specimen that can be analyzed for determining heat-set area and number of macro stickies in a specified amount of pulp screened. The method applies to a wide range of pulps, typically, recycled pulp. The standard practice does not quantify content of micro stickies.

ANSI/TAPPI T 281 sp-2012, Open drum washer mat sampling technique

Provides a means to collect pulp mat and liquor samples from open drum washers.

ANSI/TAPPI T 282 om-2013, Hexeneuronic acid content of chemical pulp

This method describes a procedure to determine hexeneuronic acid groups (HexA) in chemical pulps. HexA affects the kappa number determination by reaction with permanganate, and can react with certain bleaching chemicals, e.g. chlorine dioxide and ozone, but not with some others such as oxygen and peroxide.

ANSI/TAPPI T 400 sp-2011, Sampling and accepting a single lot of paper, paperboard, containerboard, or related product

This method describes procedures for obtaining a representative sample for testing. It should be recognized that in an ideal situation the samples selected should represent a lot of paper or paperboard, container board, or related product, including converted paper products. However, in some situations the sample may be as small as a single sheet of paper that has been provided to the laboratory for testing and may not represent the lot from which it is obtained.

ANSI/TAPPI T 401 om-2015, Fiber analysis of paper and paperboard

This method provides a procedure for the identification of the kinds of fibers present in a sample of paper or paperboard and their quantitative estimation. This method requires the analyst to be skillful and experienced in the field of pulp and paper microscopy.

ANSI/TAPPI T 402 sp-2013, Standard conditioning and testing atmospheres for paper, board, pulp handsheets, and related products

This standard practice defines the standard atmospheres for normal preconditioning, conditioning, and testing of paper and paper products, paperboard, fiberboard, and containers made from them. It also specifies procedures for handling these materials in order that they may reach equilibrium with the respective atmosphere.

ANSI/TAPPI T 403 om-2015, Bursting Strength of Paper

This test method describes the measurement of the bursting strength of paper. This method applies to paper products having a bursting strength of 50 kPa up to 1200 kPa (7 psi up to 175 psi) and in the form of flat sheets with a maximum thickness of 0.6 mm (0.025 in.). Materials that can be tested using this method include newsprint, bag paper, fine paper, packaging paper, and printing papers. It is not intended for use in testing corrugated, fiberboard, linerboard, or hardboards that tend to cut the thin rubber diaphragm of the bursting tester.

ANSI/TAPPI T 406 om-2013, Reducible sulfur in paper and paperboard

This method describes two procedures for the determination of reducible sulfur in paper and paperboard within the context of the given definitions.

ANSI/TAPPI T 409 sp-2015, Machine direction of paper and paperboard

This Standard Practice describes several procedures for determining the machine direction of most grades of paper and paperboard. Most of the procedures embody the principle that fibers tend to be aligned in the machine direction of the sheet; and this alignment produces observable effects. However, the extent of restraint used in drying can be very important in determining machine direction.

ANSI/TAPPI T 410 om-2013, Grammage of paper and paperboard (weight per unit area)

The area of several sheets of the paper or paperboard is determined from linear measurements and the mass (commonly called 'weight') is determined by weighing. The grammage is calculated from the ratio of the mass to the area after conversion to metric units when necessary.

ANSI/TAPPI T 411 om-2015, Thickness (caliper) of paper, paperboard, and combined board

This method describes the procedure for measuring single-sheet thickness and variations in single sheet thickness of paper, paperboard, and combined board. The term 'combined board'& #8221; encompasses both corrugated and solid fiberboard.
Reducible sulfur activity is a common cause of silver. The appearance of the tarnish or stain of silver under standardized conditions.

This method describes a procedure for determining the quantity of water absorbed by nonbibulous paper, and corrugated fiberboard in a specified time.

This method describes the procedure for identifying the wire side of paper.

This method describes procedures for identifying the wire side of paper made on a fourdrinier paper machine with a single wire or forming fabric. The term 'wire side' will be used throughout this method and relates to the side of the sheet made in contact to either the machine wire or forming fabric.

This method describes the procedure for the determination of the tensile strength of paper and paperboard after saturation with water.

This method, applicable to uncoated and coated papers, is designed to measure the surface strength of paper or its resistance to picking. It is not applicable to loosely felted papers such as blotters or roofing felts, nor to papers containing materials that soften with heat such as waxes or latex type additives. Light weight papers that lack stiffness may slip under the block during the wax removal step are not suitable for testing by this procedure.

This method is used to measure the air resistance of approximately 6.45 sq. cm. (4 sq. in.) circular area of paper using a pressure differential of 1.22 kPa. The recommended range of the liquid column instrument is from 5 to 1800 seconds per 100 mL cylinder displacement. For more impermeable papers the time requirements become so excessive that other techniques are preferable.
ANSI/TAPPI T 494 om-2013, Tensile properties of paper and paperboard (using constant rate of elongation apparatus)

This test method describes the procedure, using constant-rate-of-elongation equipment, for determining four tensile breaking properties of paper and paperboard: tensile strength, stretch, tensile energy absorption, and tensile stiffness.

ANSI/TAPPI T 496 sp-2013, Specimen preparation for cross directional internal tearing resistance for paper, paperboard and related materials

This practice is used for the preparation of test specimens for the internal tearing resistance of paper, board, and related materials when a force is applied perpendicular to the machine direction.

ANSI/TAPPI T 511 om-2013, Folding endurance of paper (MIT tester)

This method describes the use of the MIT-type apparatus for the determination of the folding endurance of paper. An exhaust fan arrangement maintains the folding head at room temperature. The MIT tester is suitable for papers of any thickness; however, if the outer fibrous layers of paper thicker than about 0.25 mm (0.01 in.) rupture during the first few folds, the test loses its significance.

ANSI/TAPPI T 512 sp-2012, Creasing of flexible packaging material paper specimens for testing

This standard practice describes a creasing procedure for tests requiring creased specimens of flexible packaging materials made of paper or paper-based materials. In most instances, it is advantageous to compare the results of the creased specimens with those of uncreased specimens. This standard practice is not applicable to board grades (those exceeding 0.25 mm [0.01 in.] in thickness).

ANSI/TAPPI T 515 om-2014, Visual grading and color matching of paper

This method describes the spectral, photometric, and geometric characteristics of a light source, the illuminating and viewing conditions, and the procedures to be used for the visual evaluation of color differences of paper, including those containing fluorescent whitening agents.

ANSI/TAPPI T 519 om-2011, Diffuse opacity of paper (d/0 paper backing)

Provides a measure of diffuse opacity (paper backing) of white and near-white papers, previously known as ‘printing opacity.’ The method may be employed for colored papers on condition that their reflectance (paper backing) is greater than 20% and their diffuse opacity (paper backing) is greater than 45%. The method is not suitable for highly transparent papers such as glassine.

ANSI/TAPPI T 524 om-2013, Color of paper and paperboard (45/0, C/2)

This method specifies a procedure for measuring the color of paper or paperboard with tristimulus filter colorimeters or spectrophotometers incorporating directional (45/0) geometry and CIE (International Commission on Illumination) illuminant C.

ANSI/TAPPI T 525 om-2012, Diffuse brightness of paper, paperboard and pulp (d/0) -- Ultraviolet level C

This method is for the determination of the brightness of white, near-white, and naturally colored pulp, paper, and paperboard. Brightness is a commonly used industry term for the numerical value of the reflectance factor of a sample with respect to blue light of specific spectral and geometrical characteristics. This method requires an instrument employing diffuse illumination and 0 degree viewing geometry.

ANSI/TAPPI T 527 om-2013, Color of paper and paperboard (d/0, C/2)

This method specifies a procedure for measuring the color of paper or paperboard with tristimulus filter colorimeters or spectrophotometers incorporating diffuse/0 geometry and CIE (International Commission on Illumination) illuminant C.

ANSI/TAPPI T 529 om-2014, Surface pH measurement of paper

This non-destructive test may be used to measure the hydrogen ion concentration (pH) on the surface of the paper in books and documents that constitute the collections of libraries and government archives.

ANSI/TAPPI T 530 om-2012, Size test for paper by ink resistance (Hercules-type method)

This method measures the resistance of paper to permeation of an aqueous penetrant and is a useful general purpose test for degree of sizing. It is applicable to most bleached, unbleached, and colored paper or boards which are surface sized and/or internally sized.

ANSI/TAPPI T 546 om-2015, Machine-direction grammage variation measurement (gravimetric method)

This procedure can be used to determine the short term machine-direction variation in mass per unit area. These variations can be caused by defects in the stock approach system, headbox, or consistency control. This test method is not intended to identify the source of the variations, but rather to quantify them. The method has particular application to acceptance testing of both the papermaking process and the product.

ANSI/TAPPI T 547 om-2012, Air permeance of paper and paperboard (Sheffield method)

This method is used to measure the air permeance of a circular area of paper using a pressure differential of approximately 10 kPa (1.5 psig). In order to accommodate a wide range of paper products, rubber clamping plates are available for five commonly used orifice diameters: 9.5 mm (0.375 in.), 19.1 mm (0.75 in.), 38.1 mm (1.50 in.), 57.2 mm (2.25 in.), and 76.2 mm (3.00 in.).
ANSI/TAPPI T 659 om-2014, Internal bond strength (Scott type)

Printing, converting and many product applications subject paper and paperboard to impulses, impacts and shock loads into or out of the plane of the sheet. These can cause structural failures such as surface picks, blistering or delaminations within the interior of the sheet. The common denominators of these failures are a) the high velocity of the impact loads b) the short time period during which the material is stressed, frequently one to a few hundred milliseconds, and c) the planar nature of the resultant sheet failure. Test results from this method may correlate with product failures of this type.

ANSI/TAPPI T 572 sp-2013, Accelerated pollutant aging of printing and writing paper by pollution chamber exposure apparatus

This standard practice describes a laboratory procedure for the exposure of printing and writing paper to the common atmospheric pollutant gas nitrogen dioxide at elevated levels of concentration to permit accelerated aging of such paper.

ANSI/TAPPI T 573 sp-2015, Accelerated temperature aging of printing and writing paper by dry oven exposure apparatus

This standard practice describes a laboratory procedure for accelerating the aging of printing and writing paper within sealed glass tubes through exposure to elevated temperature within an oven.

ANSI/TAPPI T 578 sp-2011, Accelerated light aging of printing and writing paper by xenon-arc exposure apparatus

This standard practice describes a laboratory procedure for the exposure of printing and writing paper to xenon-arc light at elevated levels of light flux to permit accelerated aging of that type of paper.

ANSI/TAPPI T 648 om-2014, Viscosity of coating clay slurry

This method describes a procedure for the determination of the low- and high shear viscosity of coating clays. This is accomplished by the preparation of a completely dispersed 70% solids aqueous clay suspension with incremental introduction of dispersant to obtain the optimum dosage (minimum viscosity) for the low and high shearing rates.

ANSI/TAPPI T 650 om-2015, Solids content of black liquor

This method is designed to measure gravimetrically the solids content of weak and strong black liquors as they exist, or will exist, at the point of injection into the recovery furnace.

ANSI/TAPPI T 657 sp-2012, Sampling of fillers and pigments

This document describes procedures for sampling shipments of fillers, pigments, and other materials in finely divided form for the purpose of securing a sample for analysis. Procedures are given for sampling dry bulk and bagged shipments, as well as high-solids slurries.

ANSI/TAPPI T 692 om-2013, Determination of suspended solids in kraft green and white liquors

This method provides a means of determining the level of suspended solids in kraft green liquor and kraft white liquor.

ANSI/TAPPI T 702 om-2014, Rheological measurements for characterization of polyolefins: Low-density polyethylene (LDPE) for extrusion coating

In optimizing the extrusion coating processing performance it is of utmost importance to balance the rheology of the polymer. This method describes how rheological measurements can be used to characterize LDPE. The storage modulus and zero shear viscosity have been found to be useful parameters to predict the extrusion coating performance of LDPE.

ANSI/TAPPI T 802 om-2012, Drop test for fiberboard shipping containers

Describes procedures for determining the ability of fiberboard containers to protect their contents and/or to withstand impact in free-fall drops. These procedures are specifically designed for controlled drop testing of solid fiber or corrugated shipping containers. They do not apply to cylindrical containers or cans made of fiber. This test is not normally used on packages heavier than 68 kg (150 lb).

ANSI/TAPPI T 804 om-2012, Compression test of fiberboard shipping containers

This method is used for measuring the ability of corrugated or solid fiber shipping containers to resist external compressive forces.

ANSI/TAPPI T 807 om-2011, Bursting strength of linerboard

This method describes a procedure for measuring the bursting strength of linerboard using a disk shaped diaphragm. Basis weights for this method should be 98 g/square meter (20K/MSF) and higher. The minimum burst should be 350 kPa (51 psi). This method may also be used to test paperboard. A specimen is clamped between two platens with circular openings in their centers. An expansible diaphragm is distended through the lower platen by means of hydraulic pressure until the specimen ruptures. The maximum hydraulic pressure when the specimen ruptures is recorded.

ANSI/TAPPI T 809 om-2011, Flat crush of corrugating medium (CMT test)

This method describes a procedure for measuring the crushing resistance of a laboratory fluted strip of corrugating medium, and provides a means of estimating, in the laboratory, the potential flat crush resistance of a corrugated board.

ANSI/TAPPI T 810 om-2011, Bursting strength of corrugated board

This method describes a procedure for measuring the bursting strength of single wall and double wall corrugated board within the range of 690 kPa (100 psi) to 4825 kPa (700 psi) employing an instrument which uses a disk shaped, molded diaphragm. A specimen of board is clamped between two platens with circular opening in their centers. The lower platen is fixed; the upper platen has an adjustable depth but remains stationary for the duration of the test. An expandible diaphragm is distended through the lower platen by means of hydraulic pressure until the specimen bursts. The maximum hydraulic pressure when the specimen ruptures is recorded.

ANSI/TAPPI T 811 om-2011, Edgewise compressive strength of corrugated fiberboard (short column test)

This method describes procedures for determining the edgewise compressive strength (ECT), perpendicular to the axis of the flutes, of a short column of single-, double-, or triple-wall corrugated fiberboard. The method includes procedures for cutting the test specimen, specimen support (waxed edges), and two procedures for applying the compressive force (constant strain rate, or constant load rate).

ANSI/TAPPI T 812 om-2013, Ply separation of solid and corrugated fiberboard (wet)

This method describes a laboratory test for evaluating the resistance to ply separation of solid or corrugated fiberboard after exposure to water. It is intended primarily to distinguish between boards fabricated with weather-resistant adhesives and those with nonweather-resistant adhesives.

ANSI/TAPPI T 815 om-2012, Coefficient of static friction (slide angle) of packaging and packaging materials (including shipping sack papers, corrugated and solid fiberboard) (inclined plane method)

This method determines the coefficient of static friction of most packaging materials by measuring the angle at which one test surface begins to slide against another inclined surface as the incline is increased at a constant and prescribed rate. The test is frequently referred to as slide angle. The coefficient of friction is numerically equivalent to the tangent of that angle.

ANSI/TAPPI T 821 om-2012, Pin adhesion of corrugated board by selective separation

This method is used to measure the force required to separate corrugated board between the flute tips of corrugated medium and its linerboard facings.

ANSI/TAPPI T 822 om-2011, Ring crush of cardboard (rigid support method)

The ring crush test correlates with edgewise compression strength of paperboard. This method is intended for paperboard between 0.28 mm (0.011 in.) and 0.61 mm (0.024 in.) thick. It may be used with less reliability for paperboard as thin as 0.18 mm (0.007 in.) and as thick as 0.76 mm (0.030 in.).
ANSI/TAPPI T 825 om-2014, Flat crush test of corrugated board (rigid support method)
The flat crush test (1) is a measure of the resistance of the flutes in corrugated board to a crushing force applied perpendicular to the surface of the board under prescribed conditions. The test is satisfactory for single-faced or single wall (double-faced) corrugated board, but not for double-wall or triple-wall corrugated board, because of lateral motion of the central facing or facings.

ANSI/TAPPI T 826 om-2013, Short span compressive strength of containerboard
This method describes a procedure for determining the compressive resistance of containerboard.

ANSI/TAPPI T 831 om-2014, Water absorption of corrugating medium: water drop penetration test
The water absorbivity of corrugating medium is measured by dropping a drop of water on the surface of a specimen and determining the time in seconds for the drop to penetrate through the sheet and wet the lower surface.

ANSI/TAPPI T 832 om-2012, Water absorption of corrugating medium: float curl method
The water absorbivity of corrugating medium is measured by floating a specimen on the surface of a vessel of water and determining the time for the specimen to become saturated.

ANSI/TAPPI T 834 om-2012, Determination of containerboard roll hardness
This test method describes a procedure to determine the uniformity in relative hardness of rolls of containerboard. Since several devices are currently available that use significantly differing technologies to determine hardness, this method only addresses the actual measurement process and not the test equipment specifically.

ANSI/TAPPI T 835 om-2014, Water absorption of corrugating medium: water drop absorption test
The water absorbivity of corrugating medium is measured by dropping a drop of water on the surface of a specimen and determining the time in seconds for the drop to be completely absorbed as evidenced by the loss of sheen.

ANSI/TAPPI T 836 om-2013, Bending stiffness, four point method
This procedure specifies the method of determining the bending stiffness, also called flexural rigidity, in the machine and cross directions, of corrugated board using four-point loading. The procedure may also be used for solid boards and paperboard. The method is applicable to boards with a bending stiffness of 0.5 - 200 Nm (4.4 - 1770 lbf - in.).

ANSI/TAPPI T 839 om-2012, Edgewise compressive strength of corrugated fiberboard using the clamp method (short column test)
This method describes procedures for determining the edgewise compressive strength, with flutes vertical, loading perpendicular to the axis of the flutes, of a short column of single-, double-, or triple-wall corrugated fiberboard.

ANSI/TAPPI T 845 om-2014, Wet Pin Adhesion of Corrugated Board by Selective Separation
This method measures the force required to separate the linerboard facings from the medium in corrugated board after the board has been immersed in water for a period of time. It may be used to evaluate the water resistance properties or levels in water resistant adhesive.

**TCATA (Textile Care Allied Trades Association)**

ANSI Z8.1-2016, Standard for Commercial Laundry Equipment and Operations -- Safety Requirements
This standard applies to the safety requirements for the operation and use of commercial and industrial laundry equipment.

**TCAIA (ASC A300) (Tree Care Industry Association)**

ANSI A300 (Part 1)-2017, Tree, Shrub, and Other Woody Plant Management (Pruning)
A300 standards are performance standards for the management of trees, shrubs, and other woody plants. They are also a guide in the crafting of woody plant management specifications for federal, state, municipal, and private authorities including property owners, property managers, and utilities. BSR A300 (Part 1)-201x Pruning will provide standard practices for pruning of trees and other woody plants and pruning specification writing guide.

A300 (Part 10) Integrated Pest Management (IPM) standards are performance standards for implementing and maintaining Integrated Pest Management systems for trees and woody plants. IPM concepts, required program components, and system models are described. It is a guide in the drafting of IPM program specifications for consumers as well as federal, state, municipal, and private authorities including property owners, property managers, and utilities.

A300 (Part 2) Soil Management standards are performance standards for management of soil including soil modification, fertilization, and moisture management (drainage) for trees, shrubs, and other woody plants. It is a guide in the drafting of work project specifications for consumers as well as federal, state, municipal, and private authorities including property owners, property managers, and utilities.

ANSI A300 (Part 3)-2013, Tree Care Operations - Tree, Shrub, and Other Woody Plant Management - Standard Practices (Supplemental Support Systems)
A300 (Part 3) Supplemental Support Systems standards are performance standards for the installation of supplemental support systems for trees. Cabling, bracing, propping, and guying support methods are addressed. It is a guide in the drafting of supplemental support system specifications for consumers as well as federal, state, municipal, and private authorities including property owners, property managers, and utilities.

ANSI A300 (Part 4)-2014, Tree Care Operations - Tree, Shrub, and Other Woody Plant Management - Standard Practices (Lightning Protection Systems)
A300 (Part 3) Lightning Protection Systems standards are performance standards for the installation of lightning protection systems for trees. System design for trees is addressed. It is a guide in the drafting of tree lightning protection system specifications for consumers as well as federal, state, municipal, and private authorities including property owners, property managers, and utilities.

ANSI A300 (Part 5)-2012, Tree Care Operations - Tree, Shrub, and Other Woody Plant Management - Standard Practices (Management of Trees and Shrubs During Site Planning, Site Development, and Construction)
A300 (Part 5) Management of Trees and Shrubs During Site Planning, Site Development, and Construction standards are performance standards for management of trees, shrubs, and other woody plants before, during, and after the development process, including the project planning phase and post-project after care. It is a guide in the drafting of work project specifications for consumers as well as federal, state, municipal, and private authorities including property owners, property managers, and utilities.
TCNA (ASC A108) (Tile Council of North America)

ANSI A108.01-2016, General Requirements: Subsurfaces and Preparations by Other Trades
This specification is intended to describe the general requirements for substrates and subsurfaces and general guidelines for preparation by other trades as it relates to the installation of ceramic tile.

ANSI A108.02-2016, General Requirements: Materials, Environmental, and Workmanship
This standard outlines the requirements for delivery, storage and handling of materials at the jobsite. Also included are requirements for the installer to inspect the site prior to installation of the tile and preparation of the floor, curing the mortar bed, etc. prior to installing tile. This is the section which contains the requirements for acceptable workmanship such as consistent width of grout joints, acceptable lippage, and the types of things that are under control of the installer.

ANSI A108.10-1999 (R2010), Installation of Grout in Tilework
This standard outlines the requirements for installation of different types of grout including preparation of the grout joints and techniques for grouting, etc.

ANSI A108.11-2010 (R2016), Interior Installation of Cementitious Backer Units
This standard describes the specifications for interior installation of cementitious backer units.

ANSI A108.12-1999 (R2010), Installation of Ceramic Tile with EGP (Exterior Glue Plywood) Latex-portland Cement Mortar
This standard includes instructions on the installation of ceramic tile on Exterior or Exposure 1 plywood under different applications using EGP Latex-portland cement mortar. The standard identifies the types of substrates (wood) which may be used in which applications, etc.

ANSI A108.13-2005 (R2016), Installation of Load Bearing, Bonded, Waterproof Membranes for Thin-Set Ceramic Tile and Dimension Stone
This specification is a guideline for installing waterproof membrane that comply with ANSI A118.10.

ANSI A108.14-2010, Installation of Paper-Faced Glass Mosaic Tile
This standard outlines the process using the wet-set method with mosaic glass tiles (typically 2’X2’ or smaller but may vary). There are no standards yet for large format tiles. The guidelines for installing the mosaics using the wet-set method with Portland cement mortar are given. The mix ratios for mortars are given.

This specification is a guideline for installing paper-faced glass mosaic tile over portland cement mortar beds, cured a minimum of seven days, and cementitious backer units using manufacturer recommended ANSI A118.4 thin-sets combined with back buttering the sheets with grout during the installation process.

ANSI A108.16-2005 (R2016), Installation of Paper-Faced, Back-Mounted, Edge-Mounted, or Clear Film Face-Mounted Glass Mosaic Tile
This specification is a guideline for installing paper-faced, back-mounted, edge-mounted, or clear film face-mounted glass mosaic tile, 3/16 in. or thicker, using the direct bond method over portland cement mortar beds, cured seven days minimum, and cementitious backer units.

ANSI A108.17-2005 (R2016), Installation of Crack Isolation Membranes for Thin-Set Ceramic Tile and Dimension Stone
This specification is a guideline for installing crack isolation membranes that comply with ANSI A118.12.

ANSI A108.19-2017, Interior Installation of Gauged Porcelain Tiles and Gauged Porcelain Tile Panels/Slabs by the Thin-Bed Method bonded with Modified Dry-Sheet Cement Mortar or Improved Modified Dry-Sheet Cement Mortar
This specification provides interior installation procedures and requirements for installing gauged porcelain tiles and gauged porcelain tile panels/slabs that meet ANSI A137.3 tables 4 and 5.

ANSI A108.1A-2014, Installation of Ceramic Tile in the Wet-Set Method, with Portland Cements Mortar
This specification is intended to describe the requirements for installation of ceramic tile in the wet-set method.

ANSI A108.1b-1999 (R2010), Installation of Ceramic Tile on a Cured Portland Cement Mortar Setting Bed with Dry-Set or Latex-Portland Cement Mortar
This standard explains the requirements of installing tile on the mortar bed once it has been cured. There is not much detail; it refers to the flatness of the cured mortar bed.

ANSI A108.1C-1999 (R2016), Contractor’s Option: Installation of Ceramic Tile in the Wet-Set Method with Portland Cement Mortar or Installation of Ceramic Tile on a Cured Portland Cement Mortar Setting Bed with Dry-Set or Latex-Portland Cement Mortar
This standard gives the contractor the ability to select either A108.1A or A108.1B for installation of ceramic tile.
ANSI A108.4-2009, Installation of Ceramic Tile with Organic Adhesives or Water Cleanable Tile-Setting Epoxy Adhesive

This standard includes the guideline for installing tile using organic adhesives such as mastic. The guidelines include everything from where these types of products may be used, surface preparation, how thick to apply the adhesive, and how to grout tile which has been installed using the adhesive.

ANSI A108.5-1999 (R2010), Installation of Ceramic Tile with Dry-set Portland Cement Mortar or Latex-portland Cement Mortar

This standard explains the guidelines for dry-set portland cement mortars, including the proper method for using the trowel, mixing the mortar, and setting the tiles into the mortar. It also provides guidelines for adequate coverage for different applications.

ANSI A108.6-1999 (R2010), Installation of Ceramic Tile with Chemical Resistant, Water Cleanable Tile-setting and -Grouting Epoxy

This standard explains the guidelines for dry-set portland cement mortars, including the proper method for using the trowel, mixing the mortar, and setting the tiles into the mortar. It also provides guidelines for adequate coverage for different applications.

ANSI A108.8-1999 (R2010), Installation of Ceramic Tile with Chemical Resistant Furan Resin Mortar and Grout

This standard describes the minimum requirements for installing ceramic tile using furan resin mortar and grout including special preparation requirements needed for furan mortars. In addition to special tools, there are instructions regarding the need to protect the face of the tile from the furan grout.

ANSI A108.9-1999 (R2010), Installation of Ceramic Tile with Modified Epoxy Emulsion Mortar/Grout

This standard gives the requirements for installing tile using epoxy emulsion mortar and grout and includes some details about epoxies such as cleaning the tile right away if mortar gets on the face of the tile, instructions about the 48 hour wait prior to grouting tiles set with epoxy, and that this method is not designed for chemical resistance.

ANSI A118.1-2012, Standard Specification for Dry-Set Cement Mortar

This specification describes the test methods and the minimum requirements for standard dry-set cement mortar.

ANSI A118.10-2014, Specifications for Load Bearing, Bonded, Waterproof Membranes for Thin-Set Ceramic Tile and Dimension Stone Installation

This specification describes the test methods and minimum requirements for load bearing, bonded, waterproof membranes, including fungus resistance, seam strength, breaking strength, waterproofness, etc. Several of the tests are long-term as well as several other specifications; for example the 110-day water immersion shear strength test.

ANSI A118.11-1999 (R2010), Specifications for EGP (Exterior Glue Plywood) Latex-portland Cement Mortar

This specification provides the test methods and minimum physical property requirements for EGP mortar with latex. Properties include shear strength at various stages, and the types of plywood for testing are also described. The latex may be added to the mortar as an additive and doesn’t have to be in powder form.

ANSI A118.12-2014, Specifications for Bonded Sound Reduction Membranes for Thin-Set Ceramic Tile Installation

Membranes covered by this specification are bonded to a variety of manufacturer-approved substrates covered by ANSI specifications. Products within the scope of this specification are applied below ceramic tiles by traditional methods and materials. This standard applies to trowel applied, liquid, and flexible sheet membranes.

ANSI A118.15-2012, Standard Specifications for Improved Modified Dry-Set Cement Mortar

This specification describes the test methods and the minimum requirements for improved modified dry-set cement mortar.

This standard describes the test methods and physical properties for chemical resistant epoxy adhesives. These are tests for bond strength, water cleanability, sag, shrinkage, thermal shock, etc.

ANSI A118.4-2012, Standard Specifications for Modified Dry-Set Cement Mortar

This specification describes the test methods and the minimum requirements for modified dry-set cement mortar.

ANSI A118.5-1999 (R2016), Standard Specifications for Chemical Resistant Furan Mortars and Grouts for Tile Installation

This specification covers the requirements for chemical resistant furan resin mortars and grouts for the installation of ceramic units when tested in accordance with the methods designated herein.

ANSI A118.6-2010 (R2016), Standard Specifications for Standard Cement Grouts for Tile Installation

This specification describes the test methods and minimum requirements for standard cementitious grouts.

ANSI A118.7-2010 (R2016), Standard Specifications for High Performance Cement Grouts for Tile Installation

This specification describes the test methods and minimum requirements for high performance cement grouts.

ANSI A118.8-1999 (R2016), Standard Specifications for Modified Epoxy Emulsion Mortar/Grout

This specification describes the test methods and the minimum requirements for modified epoxy emulsion mortar/grout.

ANSI A118.9-1999 (R2016), Standard Specifications for Test Methods and Specifications for Cementitious Backer Units

This specification describes the test methods and the minimum requirements and values for cementitious backer units.

ANSI A136.1-2008 (R2013), Standard Specifications for Organic Adhesives for Installation of Ceramic Tile

This standard is for the use of manufacturers of organic adhesives, tile producers, architects, installing mechanics, and testing laboratories in producing, specifying, and testing organic adhesives for installation of ceramic tile.

ANSI A137.1-2017, National Specifications for Ceramic Tile

These specifications serve as a reference standard for buyers and specifiers of standard grade and second grade ceramic tile, decorative tile, and specialty tile. These specifications are also a guide to producers in maintaining quality control of the manufacture of such ceramic tile.

ANSI A137.2-2013, National Specifications for Glass Tile

These specifications describe manufacturing styles, body types, sizes and physical properties for standard grade glass tile; the basis for acceptance and methods of testing before installation; the marking of packaging and certification of tile; and definition of terms employed in these specifications.

ANSI A137.3-2017, Standard Specifications for Gauged Porcelain Tiles and Gauged Porcelain Tile Panels/Slabs

These specifications describe the minimum physical properties of Gauged Porcelain Tiles and Gauged Porcelain Tile Panels/Slabs and back-layered Gauged Porcelain Tiles and Gauged Porcelain Tile Panels/Slabs manufactured to a specific nominal thickness.
This standard establishes a consistent approach to the evaluation and determination of environmentally preferable and sustainable ceramic tiles, glass tiles and tile installation materials. The standard includes relevant criteria across product life cycle from raw material extraction through manufacturing, use, and end-of-life management.

This standard describes the test method for measuring dynamic coefficient of friction (DCOF) of hard surface flooring materials.

TIA (Telecommunications Industry Association)
ANSI J-STD-036-C-1-2013, Enhanced Wireless 9-1-1 Phase II
This addendum is being created to assign two POSOUR codes to be used in association with two new CoS indicators for support text to 911 and small fixed cells.

This modification to the industry’s E 9-1-1 (Emergency Services) Phase 2 standard will add 6 handset and 5 hybrid position source codes for geodetic position reporting and 3 Class of Service codes for civic address reporting (e.g. street address).

ANSI J-STD-036-C-2011, Enhanced Wireless 9-1-1 Phase II
This standard provides a solution for the handling of Wireless Enhanced Emergency Call for the FCC E911 phase II mandate by defining the messaging required to support information transfer to identify and locate wireless emergency services callers. This revision incorporates Femtoldentity parameter definition, and has added the parameter identifiers for the new Femtoldentity, MacroCellID, and MacroMSCID parameters.

ANSI/EIA/TIA 455-62-B-2003, Optical Fiber MacroBend Attenuation
Establishes uniform requirements for measuring macrobending sensitivity.

ANSI/TIA 1005-A-1-2015, Telecommunications Infrastructure Standard for Industrial Premises Addendum 1, M12-8 X-coding Connector
This addendum is to provide necessary information. The industry is adopting higher data rates that require new connectors that are small form factor and sealed. The M12-8 X coding connector has been adopted by many international standards organizations and national consortia for use in the industrial areas.

This default ballot is a result of the comment resolution held regarding SP-3-4822-RV1 and is limited to one (1) specific technical change. Other comments submitted to SP-3-4822-RV1 were resolved editorially. The results of the SP 3 4822 RV1 ballot consisted of 13 'abstain', 19 'approve' votes, 6 'approve with comments' votes, and 1 with "disapprove with comments".

ANSI/TIA 1019-A-2012 (R2016), Standard for Installation, Alteration and Maintenance of Antenna Supporting Structures and Antennas
The standard was prepared by TR-14 Committee on Structural Standards for Steel Antenna Towers and Antenna Supporting Structures to provide guidance on Installation, Alteration and Maintenance of Antenna Supporting Structures and Antennas.

ANSI/TIA 102-AABC-B-2-2007, Project 25 Trunking Control Channel Messages Addendum- ISSI
This addendum enhances trunking control channel messages to support: (1) identification of SUs using their full SUIDs in Supplementary Data messages; (2) assignment of a WGID and an AGID during affiliation to an SG whose home is in another WACN or System; (3) absence of valid target WUID when queuing or denying individual audience services involving an SU whose home is in another WACN or System; (4) inclusion of Twuid_validity in SYS_SRV_BCST messages; (5) ISSI-related deny reason codes.

This addendum introduces a high level functional and architectural overview of the security and key management architecture for TIA-102 system configurations. It provides an overview along with the functional and key management architectural models and descriptions.

This document provides an overview of the security services available in Land Mobile Radio systems. It provides the context in which to understand why security services are required and gives a general high level description of how they are provided.

The TIA-102 AADA-A standard describes the encryption protocol for land-mobile radios meeting the Project 25 requirements. This project will accept and consider contributions proposing editorial or technical changes to the published version.

This document provides an overview of the essential attributes of the trunking mode of operation for trunked voice and data services that operate in accordance with the TIA-102 standards. This document establishes general principles for a trunked air interface, designed for the family of Project 25 systems. Clause 1 defines new terms, definitions, and acronyms. Clause 2 provides a general overview of Project 25 trunking operation. Clause 3 provides an overview of trunked system Services. Clause 4 addresses the composite control channel.

ANSI/TIA 102-AABC-B-3-2008, Trunking Control Channel Messages Addendum for Supplementary Data ISSI
This addendum enhances trunking control channel messages to support: (1) identification of SUs using their full SUIDs in Supplementary Data messages; (2) assignment of a WGID and an AGID during affiliation to an SG whose home is in another WACN or System; (3) absence of valid target WUID when queuing or denying individual audience services involving an SU whose home is in another WACN or System; (4) inclusion of Twuid_validity in SYS_SRV_BCST messages; (5) ISSI-related deny reason codes.

The purpose of this addendum is to update information contained in TIA-102.AAAB "Trunking Control Channel Messages" that allow the operation of TDMA 2-slot traffic channels over a Project 25 compliant trunking system.

ANSI/TIA 102-AABC-B-5-2008, Trunking Control Channel Messages - Radio Unit Monitor Enhancements
As an addendum to TIA-102.AABC, this document only includes information relevant to the abovementioned enhancements. The reader is referred to TIA-102.AABC for all other pertinent information. The next complete revision of TIA-102.AABC will incorporate all of the data contained in this addendum.

ANSI/TIA 102-AABC-C-1-2011, Trunking Control Channel Messages Addendum
The purpose of this addendum is to update information contained in TIA-102.AAABC-C, "Trunking Control Channel Messages". This addendum defines the trunking control channel message changes required to support Project 25 Phase 2 Two-slot TDMA air interface for digital trunked radio systems. (Any other items?)

ANSI/TIA 102-AABC-D-1-2016, Trunking Control Channel Messages Addendum 1
This addendum adds enhancements to the Emergency Alert Request message to indicate an emergency generated internally or externally to the subscriber unit.
ANSI/TIA 102.AABC-D-2015, Trunking Control Channel Messages
This revision to the Trunking Control Channel Messages standard will incorporate several enhancements. It will absorb the existing Conventional Fallback addendum (ANSI/TIA-102.AABC-C-1) and provide additional clarifications to various aspects of wide area operation.

ANSI/TIA 102.AABF-A-2-2007, Project 25 Identity Extensions to link control word formats
The purpose of this addendum is to update ANSI/TIA 102.AABF-A-2004, Link Control Word Formats and Messages; (Ref. [1]). These enhancements provide for extended identification of the source of a call, status update, message update or call alert in cases where implicit identification of the source is insufficient.

ANSI/TIA 102.AABF-C-1-2012, Link Control Word Formats and Messages Addendum 1 - Conventional Fallback
This addendum adds a message for Conventional Fallback Operation.

ANSI/TIA 102.AABF-D-2015, Project 25 Link Control Word Formats and Messages
This revision to the Link Control Word Formats and Messages standard incorporates several enhancements. It will absorb the existing Conventional Fallback addendum (ANSI/TIA-102.AABF-C-1) and provide additional clarifications to various aspects of wide area operation.

Merge of OTAR Protocol document (TIA-102.AACA) with OTAR Operational Description document (TIA-102.AACB) to form OTAR Messages and Procedures document (TIA-102.AACA-A)

ANSI/TIA 102.BAED-2013, Packet Data Digital Link Control Procedures
This document specifies the Logical Link Control (LLC) procedures that permit the conveyance of Common Air Interface (CAI) data packets between air interface endpoints for all packet data configurations. The information necessary to enable interoperable LLC procedures for Packet Data is provided in this document or referenced in other documents as appropriate.

The objective of this document is to provide a specification of the Radio Management Protocols for the A Interface. The information necessary to enable interoperable radio management services and functionality over this interface is provided in this document or referenced in other documents as appropriate. The radio management protocols support the following three functions: (a) signaling used by the MDP to configure the SU (b) signaling to request information from the SU and (c) signaling related to alarm reporting or other unsolicited event reports generated by the SU.

ANSI/TIA 102.BAEG-2010, Mobile Data Peripheral Interface
This document specifies the protocols utilized on the Mobile Data Peripheral Interface which is designated as the A Interface in the TIA-102 Open System Interface Model. The information necessary to enable interoperable services and functionality on this interface is provided in this document or referenced in other documents as appropriate.

ANSI/TIA 102.BAEJ-2013, Conventional Management Service Specification for Packet Data
This document specifies the following Conventional Management Service (CMS) functions for the Conventional FDE data configuration: Packet Data Registration, Packet Data Scan, and Packet Data Supplementary Information. The messages and procedures necessary to enable interoperable CMS functionality for Packet Data is provided in this document or referenced in other documents as appropriate.

ANSI/TIA 102.BAJB-A-2014, Project 25 Tier 1 Location Services
The Tier 1 Location Service provides a simple SU-to-SU interface for the Direct Data and Repeated Data configurations. It utilizes a dedicated Service Access Point over the Common Air Interface to transport location information formatted as described in NMEA 0183, a commonly used location protocol. This service is appropriate for real-time field incident applications where the Location Service Host is resident on a portable device. It does not provide a mechanism to give location information to a host device on a fixed network and does not support more advanced configuration of triggering and reporting.

The Tier 2 Location Service provides a location request/response protocol that allows a Location Service Host to make a request for location information from an SU or MDP, providing parameters that control the transmission of location information. Immediate or periodic reports can be requested, and reports can be requested base on triggering events. The service can be used between SUs in the Direct Data or Repeated Data configurations, or between an SU and a DH in the Conventional FDE Data or Trunked FDE Data configurations. The location information is provided in an XML-based protocol and is compressed using the W3C EXI recommendation.

ANSI/TIA 102.CAAA-C-1-2010, Digital CAFM/CQPSK Transceiver Measurement Methods - Addendum 1 - Faded Channel Simulator
This addendum specifies the requirements for the faded channel simulator and will be used to replace the information that is given in TIA-102.CAAA-C. It is intended that upon future revision of document TIA-102.CAAA-C, the requirements of this addendum will be incorporated into that next revision.
The scope of the project is to revise the existing document to add methods of measurement for receivers that employ class D audio power amplifiers.

This project scope is to revise standard limit values affected by changes in measurement methods and to correct errors in Rev C. These changes will be necessary due to revision of Standard TIA-102.CAAA-C.

ANSI/TIA 102.CCAA-B-2016, Project 25, Phase 2 Two-Slot Time Division Multiple Access, Transceiver Measurement Methods
The scope of the project is to revise the existing document to correct for an error in the formulas in section 2.2.17.3 of the document, and to add a procedure for testing performance of receivers with class D audio power amplifiers.

ANSI/TIA 102.CCAB-A-2014, Project 25, Two Slot TDMA, Transceiver Performance Recommendations
This revision to the Two-Slot Time Division Multiple Access Transceiver Performance Recommendations standard will incorporate new equipment performance recommendation limits to address new measurement methods that will be implemented in the revision of the Two-Slot Time Division Multiple Access Transceiver Measurement Methods standard upgrade. Additionally, the TIA standard will be upgraded to an American National Standard.

This document applies to the accommodation and compensation of dispersion in fibre optic communication systems.

ANSI/TIA 1048-2005 (R2013), IEC 62005-7: Reliability of Fibre Optic Interconnecting Devices and Passive Components - Part 7: Life Stress Modeling
This document describes the life stress modeling for the reliability of fibre optic interconnecting devices and passive components.

ANSI/TIA 1057-2006 (R2011), Telecommunications - IP Telephony Infrastructure - Link Layer Discovery Protocol for Media Endpoint Devices
This Standard defines a set of organizationally-specific IEEE 802.1AB TLV extensions and a related MIAB module, for the purpose of improved deployment properties and multi-vendor interoperability between VoIP endpoint devices and IEEE 802 networking infrastructure elements. Where required for correct multi-vendor interoperation, specific constraints on IEEE 802.1AB protocol behavior, application-level interaction with the protocol elements, as well as constraints on existing IEEE 802.1AB TLVs and related MIAB module, are also defined.

The TIA-1063 standard is being revised to address several technical issues identified for performance requirements and testability. In addition, new proposals related to the digital signaling side of the ATA are expected to be reviewed and considered as part of the revision project.

TR-41.3 is developing guidelines in the area defined by the following scope: This standard defines measurement procedures and performance requirements for the handset generated audio band magnetic noise of wireline telephones. It can be used to evaluate devices with analog interfaces and digital interfaces that will reproduce sine waves in the telephone’s receiver.

ANSI/TIA 1152-A-2016, Requirements for Field Test Instruments and Measurements for Balanced Twisted-Pair Cabling
Revise ANSI/TIA-1152-2009 as determined in TIA TR-42.7, incorporating new specifications and other information as required to support field testing of cabling described in ANSI/TIA-568-C.2-1.

ANSI/TIA 1179-2010, Healthcare Facility Telecommunications Infrastructure Standard
This Standard specifies requirements for telecommunications infrastructure for healthcare facilities (e.g. hospitals, clinics). It specifies cabling, cabling topologies, and cabling distances. Additionally, pathways and spaces and ancillary requirements are addressed. Telecommunications cabling specified by this standard is intended to support a wide range of healthcare facilities and systems.

ANSI/TIA 1183-1-2016, Measurement Methods and Test Fixtures for Balun-Less Measurements of Balanced Components and Systems, Extending Frequency Capabilities to 2 GHz
The scope is to provide necessary information to extend measurement capabilities to 2 GHz with sufficient accuracy to support category 8 cabling standards: ANSI/TIA-568-C.2-1 (when published).

This Standard will supersede ANSI/TIA-1183 and its addendum 1183-1. It is intended to incorporate and revise as necessary the content of those Standards.

ANSI/TIA 1194-R1-2011 (R2017), Telecommunications - User Premises Equipment - Surge Resistibility of Smart Grid Equipment Connected to either DC or 120/240 V Single Phase AC and Metallic Communication Lines
Surge Resistibility of Smart Grid Equipment Connected to either DC or 120/240 V Single Phase AC and Metallic Communication Lines

ANSI/TIA 124-E-2006 (R2011), Wireless Radio Telecommunications Intersystem Non-Signaling Data Communication, DMH (Data Message Handler)
This document describes the messages and procedures required to perform call detail record data trans&#8211;mission between systems.

ANSI/TIA 222-G-1-2007 (R2016), Structural Standards for Steel Antenna Towers and Antenna Supporting Structures - Addendum 1
This section relates to the strength design of structural steel angles, solid rounds and tubular members used in latticed towers, poles and guyed masts. The following clauses are based on the AISC-LRFD-99. When the requirements in AISC-LRFD-99 differ from this Standard, this Standard shall govern. If other shapes or types of structures are utilized, the requirements of AISC-LRFD-99 shall be used.

ANSI/TIA 222-G-2-2009 (R2014), Structural Standards for Steel Antenna Towers and Antenna Supporting Structures- Addendum 2
This section defines: (i) the minimum acceptable analysis models and techniques, and (ii) the requirements to account for the dynamic effects of wind gusts.

ANSI/TIA 222-G-2-2005 (R2016), Structural Standard for Antenna Supporting Structures and Antennas
The objective of this document is to provide minimum criteria for specifying and designing steel antenna towers and antenna supporting structures. This Standard is not intended to supersede applicable codes. The information contained in this Standard was obtained from sources as referenced and noted herein and represents, in the judgement of the subcommittee, the accepted industry practices for minimum standards for the design of steel antenna supporting structures. This document contains a county by county listing of minimum basic wind speeds, as well as, a commentary on ice and other design criteria. It is for general information only.
ANSI/TIA 222-G-3-2014, Structural Standards for Steel Antenna Towers and Antenna Supporting Structures- Addendum 3

The intent of this Addenda is to provide a method of design and analysis for rigid base plate behavior resulting in insignificant anchor rod bending and insignificant secondary pole wall stresses under factored reactions from limit state strength loading conditions.

ANSI/TIA 222-G-4-2014, Structural Standards for Steel Antenna Towers and Antenna Supporting Structures- Addendum 4

This Design Supplement is intended to apply to self-supporting or braced lattice towers, guyed masts and pole structures that support single or multiple SWTs that may also support antennas and other appurtenances.

ANSI/TIA 322-2016, Loading, Analysis, and Design Criteria Related to the Installation, Alteration and Maintenance of Communication Structures

The scope of this Standard is intended to provide engineering criteria to evaluate a communication structure subjected to construction loads and to provide the design criteria for gin poles and the generation of their load charts. The means and methods for construction are not within the scope of this Standard

ANSI/TIA 41.000-E-9-2012, Mobile Application Part (MAP) Introduction

This part defines the range of application of the current issue of the series. It focuses on overall objectives and basic assumptions. Procedural details are presented in the other recommendations.

ANSI/TIA 41.200-E-2007 (R2012), Mobile Application Part (MAP) - Intersystem Handoff

This specification presents the recommendation for the handoff sequence between two different Mobile Switching Centers (MSCs). This is often called intersystem handoff. To perform an intersystem handoff means to switch a Mobile Station (MS) telephone call that is in progress on one MSC to a different MSC. In other words, an MS is assigned to a voice/traffic channel that is controlled by a different MSC. This project is to reaffirm the standard.

ANSI/TIA 41.290-E-2007 (R2013), Mobile Application Part (MAP) - Intersystem Handoff - Annex A

The Data Message Handler standard has some impact upon MAP. The changes which impact MAP Intersystem Operations are outlined in this standard. This project is to reaffirm the standard.

ANSI/TIA 41.321-E-1 [E]-2012, Mobile Application Part (MAP) - Voice Feature Scenarios: Call Delivery

This section of the TIA-41 series of standards depicts the interactions between network entities in various situations related to automatic roaming and Call Delivery (CD).

ANSI/TIA 41.321-E-2007 (R2013), Mobile Application Part (MAP) - Voice Feature Scenarios: Call Delivery

This section depicts the interactions between network entities in various situations related to automatic roaming and Call Delivery (CD). These scenarios are informative. This project is to reaffirm the standard.

ANSI/TIA 41.322-E-2007 (R2013), Mobile Application Part (MAP) - Voice Feature Scenarios: Call Forwarding

This section depicts the interactions between network entities in various situations related to automatic roaming and Call Forwarding—Busy (CFB). These scenarios are for illustrative purposes only. This project is to reaffirm this standard.

ANSI/TIA 41.323-E-2007 (R2013), Mobile Application Part (MAP) - Voice Feature Scenarios: Call Waiting

This section depicts the interactions between network entities in various situations related to automatic roaming and Call Waiting (CW). These scenarios are for illustrative purposes only. This project is to reaffirm this standard.

ANSI/TIA 41.324-E-1 [E]-2012, Mobile Application Part (MAP) - Voice Feature Scenarios: Calling Number Identification Presentation, Calling Number Identification Restriction

This section of the TIA-41 standards depicts the communications between network entities in various situations related to automatic roaming and Calling Number Identification Presentation (CNIP). These scenarios are for illustrative purposes only. This project is to reaffirm the standards.

ANSI/TIA 41.324-E-2007 (R2013), MOBILE APPLICATION PART (MAP)-VOICE FEATURE SCENARIOS: Calling Number Identification Presentation, Calling Number Identification Restriction

This standard depicts the communications between network entities in various situations related to automatic roaming and Calling Number Identification Presentation (CNIP). These scenarios are for illustrative purposes only. This project is to reaffirm this standards.

ANSI/TIA 41.325-E-2012, Mobile Application Part: Voice Feature Scenarios: Conference Calling

The scenarios in this Part of the TIA-41 standards depict features operating individually, i.e., feature interactions are not considered unless specifically noted.

This document depicts the interactions between network entities in various situations related to automatic roaming and Do Not Disturb (DND).

This section of the TIA-41 standards depicts the interactions between network entities in various situations related to automatic roaming and Flexible Alerting (FA).

This section of the TIA-41 series depicts the interaction between network entities in various situations related to automatic roaming and Mobile Access Hunting.

ANSI/TIA 41.328-E-2012, Mobile Application Part (MAP) - Voice Feature Scenarios: Mobile Access Hunting

This section of the TIA-41 standards depicts the interactions between network entities in various situations related to automatic roaming and Mobile Access Hunting (MAH). These scenarios are for illustrative purposes only.

ANSI/TIA 41.329-E-2012, Mobile Application Part (MAP) - Voice Feature Scenarios: Message Waiting Notification

This section of the TIA-41 standards depicts the interactions between network entities in various situations related to automatic roaming and Message Waiting Notification (MWN).

ANSI/TIA 41.330-E-2012, Mobile Application Part (MAP) - Voice Feature Scenarios: Password Call Acceptance / Selective Call Acceptance

This section of the TIA-41 standards depicts the interactions between network entities in various situations related to automatic roaming and Password Call Acceptance (PCA).

This section depicts the interactions between network entities in various situations related to automatic roaming and Priority Access and Channel Assignment (PACA).

This section depicts the interactions between network entities in various situations related to automatic roaming and Remote Feature Control (RFC).

This section of the TIA-41 standards depicts the interactions between network entities in various situations related to automatic roaming and Subscriber PIN Access (SPINA).
This section of the TIA-41 standards depicts the interactions between network entities in various situations related to automatic roaming and Voice Message Retrieval (VMR).

ANSI/TIA 41.335-E-2012, Mobile Application Part (MAP) - Voice Feature Scenarios: Calling Name Presentation, Calling Name Restriction
This section of the TIA-41 standards depicts the interactions between network entities in various situations related to automatic roaming and Calling Name Presentation (CNAP).

ANSI/TIA 41.336-E-2012, Mobile Application Part (MAP) - Voice Feature Scenarios: Wireless Emergency Services
This section of the TIA-41 series depicts the interactions between network entities in various situations related to automatic roaming and Calling Name Presentation (CNAP).

ANSI/TIA 41.350-E-2012, Mobile Application Part (MAP) - Voice Feature Scenarios: MDN-Based Validation
This section of the TIA-41 series depicts the interactions between network entities in various situations related to MDN-based subscription validation.

ANSI/TIA 41.371-E-2012, Mobile Application Part (MAP) - Broadcast Teleservice Transport Capability
This scenario describes the transfer of a message to several MSCs, and its successful delivery to MS-based SMEs via their respective Serving MSCs.

ANSI/TIA 41.372-E-2012, Mobile Application Part (MAP) - Border MSC SMS Scenarios
This section of the TIA-41 standards depicts the interactions between network entities in various situations related to the delivery of SMS messages to an MS that responds to a page in a Border MSC.

ANSI/TIA 41.400-E-2005 (R2012), Wireless Radiotelecommunications Intersystems Operations: Operations, Administration and Maintenance
Defines the intersystem operations, administration, and maintenance information flows and procedures required for intersystem trunk maintenance.

ANSI/TIA 41.500-E-2004 (R2010), Mobile Application Part - Introduction to Signaling Protocols
This section introduces the signaling protocols for this standard.

ANSI/TIA 41.510-E-2004 (R2010), Mobile Application Part - X.25 Transport Signaling Protocols
This section describes the X.25 transport signaling protocols.

ANSI/TIA 41.511-E-2004 (R2010), Mobile Application Part - ANS/SS7 Transport Signaling Protocols
TIA-41 series part which defines transport signaling protocols.

ANSI/TIA 41.512-E-2004 (R2010), Mobile Application Part - Parameter Types Signaling Protocols
This section describes the signaling protocols for ITU/SS7 transport.

ANSI/TIA 41.520-E-1 [E]-2012, Mobile Application Part (MAP) - TCAP Application Signaling Protocols
This document describes the application layer of the Mobile Applications Parts (MAP) Application Services.

ANSI/TIA 41.520-E-2004 (R2010), Mobile Application Part - TCAP Application Signaling Protocols
This section describes the application layer of the Mobile Applications Parts (MAP) Application Services.

ANSI/TIA 41.540-E-1 [E]-2012, Mobile Application Part (MAP) - Operations Signaling Protocols
This specification supports systems conforming to air-interface technologies AMPS, NAMPS, TDMA and CDMA, including cdma2000.

ANSI/TIA 41.540-E-2004 (R2010), Mobile Application Part - MAP Operations Signaling Protocols
This section describes the operations signaling protocols for MAP.

ANSI/TIA 41.550-E-1 [E]-2012, Mobile Application Part (MAP) - Parameters Signaling Protocols
This document describes the application layer of the Mobile Applications Parts (MAP) Application Services.

ANSI/TIA 41.550-E-2 [E]-2012, Mobile Application Part (MAP) - Parameters Signaling Protocols
This document describes the application layer of the Mobile Applications Parts (MAP) Application Services.

ANSI/TIA 41.550-E-2004 (R2010), Mobile Application Part - MAP Parameters Signaling Protocols
This section describes the MAP parameters signaling protocols.

ANSI/TIA 41.550-E-3 [E]-2012, Mobile Application Part (MAP) - PARAMETERS SIGNALING PROTOCOLS
New SystemMyTypeCode value assignment

ANSI/TIA 41.551-E-2004 (R2010), Mobile Application Part - Parameter Types Signaling Protocols
This section describes the parameter type signaling protocols.

ANSI/TIA 41.590-E-2004 (R2010), Mobile Application Part - MAP Operations Signaling Protocols
This section describes the compatibility signaling protocols for MAP.

ANSI/TIA 41.600-E-2005 (R2012), Wireless Radiotelecommunications Intersystems - Introduction to Procedures
This document describes the signaling and call processing procedures required to perform automatic roaming features and services. The messages required to perform the automatic roaming are defined in Part 540. Conformance with this document shall mean that a system's externally visible behavior is the same as the externally visible behavior of the abstract system described here.

ANSI/TIA 41.630-E-1 [E]-2012, Mobile Application Part (MAP) - Basic Call Processing
This document defines the methods for Mobile Applications Parts (MAP) basic call processing.

ANSI/TIA 41.630-E-2 [E]-2012, Mobile Application Part: Basic Call Processing
This document defines the methods for Mobile Applications Parts (MAP) basic call processing.

ANSI/TIA 41.630-E-2005 (R2012), Wireless Radiotelecommunications Intersystem - Basic Call Procedures
Describes the basic call procedures for wireless radiotelecommunication intersystems.

ANSI/TIA 41.640-E-1 [E]-2012, Mobile Application Part (MAP) - Intersystem Operations
This document defines methods for Mobile Applications Parts (MAP) intersystem operations.

ANSI/TIA 41.640-E-2005 (R2012), Wireless Radiotelecommunications Intersystems - Intersystem Procedures
Describes the intersystem procedures for wireless radiotelecommunication intersystems.

ANSI/TIA 41.641-E-1 [E]-2012, Mobile Application Part (MAP) - SMS
This document defines methods for mobile application SMS transmissions.

ANSI/TIA 41.641-E-2005 (R2012), Wireless Radiotelecommunications Intersystems - SMS
Describes SMS for wireless radiotelecommunication intersystems.

ANSI/TIA 41.642-E-2005 (R2012), Wireless Radiotelecommunications Intersystem - Segmentation
Describes the segmentation for wireless radiotelecommunication intersystems.

ANSI/TIA 41.650-E-2005 (R2012), Wireless Radiotelecommunications Intersystems - Common Voice Feature Procedures
Describes the common voice feature procedures for wireless radiotelecommunication intersystems.
This section describes the distributed plane and ANSI/TIA 41.730 Parts.

This section lists the annexes for this standard

This section describes the WIN feature for wireless radiotelecommunication intersystems.

This section describes the WIN feature for wireless radiotelecommunication intersystems.

This section describes the WIN feature for wireless radiotelecommunication intersystems.

This section describes the WIN feature for wireless radiotelecommunication intersystems.

ANSI/TIA 455-157-1994 (R2008), Measurement of Polarization Dependent Loss (PDL) of Single-Mode Fiber Optic Components
This document describes a procedure that can be applied to any single mode passive component to determine its sensitivity to changes in polarization.

ANSI/TIA 455-156-A-2000 (R2014), Salt Spray (Corrosion) Test for Fiber Optic Components
This document describes a test method intended to determine the effects of a controlled salt-laden atmosphere on fiber optic interconnecting devices, finishes, and mechanisms.

This standard determines the suitability of optical fibres to withstand the environmental condition of high humidity and high temperature

This test procedure applies to the testing of optical fiber cable. Related tests for connectors and other devices which may be connected to cables under test are discussed in 1.5.

This document describes a test methods and procedures for measuring the attenuation by substitution of short length multimode graded index and single mode optical cable assemblies.

ANSI/TIA 455-172-1986 (R2008), Flame Resistance of Firewall Connector
This document describes a procedure to determine the ability of a cabled and mated connector to resist firewall environments, such as flame or ignition of gases.

Establishes uniform requirements for measuring the chromatic dispersion of optical fibre

Establishes uniform requirements for measuring the geometrical characteristics of uncoated optical fibres

This document establishes uniform requirements for measuring the numerical aperture of optical fibre.

Pertains primarily to testing either fibers as produced by a fiber manufacturer or subsequently overcoated (tight buffered) using various polymers.

This document describes a test method to measure the pertinent coefficients of the logarithmic transfer matrix of a branching device in order to determine the ability of the device to carry out its design function.

ANSI/TIA 455-183-2000 (R2013), Hydrogen Effects on Optical Fiber Cable
The test procedure is intended to provide a type test which characterizes the effect on fiber attenuation due to hydrogen generated by the cable components only. The data must be used cautiously since such data does not account for potential generation of hydrogen from other sources in the installed environment.

ANSI/TIA 455-184-1991 (R2008), Coupling Proof Overload Test, Fiber optic Interconnecting Devices
This document describes a procedure to apply an overload torque to twist type coupling mechanisms. The procedure is applicable to threaded or bayonet twist type coupling mechanisms.

ANSI/TIA 455-185-1991 (R2008), Strength of Coupling Mechanism Fiber Optic Interconnecting Devices
This document describes a procedure to assure that the coupling mechanism of a connector-device combination will withstand the axial loads likely to be applied during normal service.

ANSI/TIA 455-186-1991 (R2008), Proposed New FOTP, Gauge Retention Force Measurement for the Fiber Optic Components
This document describes a procedure used to measure the retention characteristics of a resilient member of a fiber optic component (most commonly a connector). It is specifically intended for use when it is impracticable to define acceptance/rejection criteria for resilient members by the use of size limitations.

This document describes a test method to measure the forces or torques that are required to fully couple or uncouple a connector set.

ANSI/TIA 455-188-1991 (R2008), Low-Temperature Testing of Fiber Optics Components
This document describes a procedure intended for exposing a specimen to the environmental condition of extended low temperature (cold). It is not intended for exposing a specimen to the environmental condition of high temperature variation.

This standard describes the measurement methods and test procedures for determining mode field diameters.

ANSI/TIA 455-192-1999 (R2013), H-Parameter Test Method for Polarization-Maintaining Optical Fiber
This Standard specifies a method of measuring the h-parameter of single mode, highly linearly birefringent optical fiber (commonly called polarization-maintaining fibers). In the case of fibers having connectors attached to one or both ends, or for two or more such fibers joined in series, the polarization crosstalk is a more meaningful measure of performance than the h-parameter. The test method for measuring polarization crosstalk is the subject of FOTP-193.

ANSI/TIA 455-193-1999 (R2013), Polarization Crosstalk Method for Polarization-Maintaining Optical Fiber and Component
This Standard specifies a method of measuring the polarization crosstalk of single mode, highly linearly-birefringent (commonly called polarization-maintaining or PM) optical fiber and components. This Standard is applicable to fibers and components having connectors attached to one or both ends, and to two or more such entities joined in series. This Standard may also have application to other devices constructed from polarization-maintaining fibers and/or components. Hereafter both PM fibers and PM components will be referred to as specimens.

ANSI/TIA 455-194-1999 (R2008), Measurement of Fiber Pushback in Optical Connectors
This document describes a test to measure fiber pushback, defined as permanent or semi-permanent fiber motion under load. It does not include temporary fiber movement relative to the ferrule due to temperature variations, or permanent fiber withdraw that occurs when no load is present.

This standard describes the measurement methods and test procedures for determining coating geometry.

This document discusses the application of the pre-existing fiber test procedures for PMD measurement in fiber to the special case of fiber components. Special precautions are required to avoid several potential problems, and these problems and precautions are described for each of the applicable procedures. This document does not describe the test procedures in detail, merely the variations required for component measurements.

This document describes a procedure for the measurement of polarization-sensitive Differential Group Delay (DDG) of one or two port single mode fiber components over the 1.0 to 1.7 micrometer wavelength range. In this procedure, a modulated light source at a given wavelength is coupled into the component under test, and the phase of the modulated signal exiting the fiber at a first polarization state is compared with the phase at the second, orthogonal polarization state. For the purposes of this document, the component is considered to be measured at a single wavelength, and therefore the result reported is strictly the DDG.

ANSI/TIA 455-18-1998 (R2008), Cable Flexing for Fiber Optic Interconnecting Devices

This document describes a test method intended to determine the ability of fiber optic interconnecting devices, device interfaces, and strain relief to withstand bending and flexing stresses resulting from loads as might be experienced during installation and service conditions.

Describes the methods and test procedures for monitoring changes in optical transmittance.

ANSI/TIA 455-200-2001 (R2008), Insertion Loss of Connectorized Polarization - Maintaining Fiber or Polarizing Fiber Pigtailed Devices and Cable Assemblies

This document describes a procedure for the measurement of the insertion loss of a fiber optic interconnection on single mode, highly birefringent optical fiber, i.e. either polarization-maintaining fiber (PMF) or polarizing fiber (PZF).

ANSI/TIA 455-201-2001 (R2008), Return Loss of Connectorized Polarization-Maintaining Fiber or Polarizing Fiber Pigtailed Devices and Cable Assemblies

This document specifies a procedure for the measurement of the return loss of a fiber optic interconnection on single mode, highly birefringent optical fiber, i.e. either polarization-maintaining fiber (PMF) or polarizing fiber (PZF).

This FOTP is intended to characterize the encircled flux of two types of light sources: transmission light sources, which are usually coherent and substantially under-excite the mode volume of a multimode fiber, and measurement light sources, which are incoherent and must excite most of the mode volume of a multimode fiber.

ANSI/TIA 455-204-A-2013, FOTP-204 - Measurement of Bandwidth on Multimode Fiber

Revision to support OM4/adopt IEC test method.

ANSI/TIA 455-225-2015, FOTP-225 IEC 61745 End-Face Image Analysis Procedure for the Calibration of Optical Fibre Geometry Test Sets

This standard addresses the calibration of measurements made on single-mode fibres only; however, this type of test set may also be used to measure the geometrical parameters of the cores of multimode fibres, but evaluation of uncertainties associated with these measurements is beyond the scope of this standard.

ANSI/TIA 455-231-2003, IEC 61315 - Calibration of Fibre-Optic Power Meters

Standardizes all of the steps involved in the calibration process.

ANSI/TIA 455-231-2015, FOTP-231 IEC 61315 – Calibration of Fibre-Optic Power Meters

This international standard is applicable to instruments measuring radiant power emitted from sources which are typical for the fibre-optic communications industry. The standard describes the calibration of power meters to be performed by calibration laboratories or by power meter manufacturers.

This standard defines a test that determines the suitability of optical fibres to withstand the environment condition of changes in temperatures.

This document specifies two main methods for the determination of the low BER values by making accelerated measurements.

This document provides a parameter definition and a test method for obtaining optical signal-to-noise ratio (OSNR) using apparatus that measures the optical spectrum at a multichannel interface.

ANSI/TIA 455-239-2007, FOTP-239 - Fiber Optic Splice Loss Measurement Methods

This standard will provide a method for accurate measurement of low loss (0.05 dB or less) splices and provide a common method to evaluate the performance of splicing equipment, systems, or methods designed or intended to make low loss splices.

This test method describes a procedure for retrieving the polarization-mode dispersion (PMD&D185) of an installed single-mode optical cable fiber under test (FUT). The procedure is based on measurement and analysis, using polarization sensitive detection, of the transmission differences between pulses of light two closely spaced frequencies (or wavelengths ) launched from a single FUT end and reflected off the FUT far end.

ANSI/TIA 455-244-2011, Express Tube Optical Loss Measurements Methods

This test is applicable to cables containing a multiplicity of buffer tubes and specified for midspan access applications requiring expressed buffer tube storage (buffer tubes stored in their intact form; not cut, opened, or removed).

FOTP 25 existing test procedure is being revised to harmonize with international test method.

ANSI/TIA 455-2C-1998 (R2008), Impact Test Measurements for Fiber Optic Devices

This document describes a test method intended to determine the ability of fiber optic interconnecting devices to withstand impacts of the type that may be encountered in normal service.

ANSI/TIA 455-31-C-1994 (R2013), Proof Testing Optical Fibers by Tension

This test method describes procedures for briefly applying a specified tensile load to continuous lengths of all Class I and Class IV, glass/glass optical fibers. This FOTP should not be applied to Class II (glass/plastic) and Class III (all-plastic) fibers. This method is intended to ensure a minimum strength for fiber that survives proof testing. The minimum strength is a key parameter for determining the minimum survival time at loads less than the minimum strength. This method is intended to ensure a minimum strength for fiber that survives proof testing.
ANSI/TIA 455-32A-1990 (R2008), Fiber Optic Circuit Discontinuities
This document describes a method of testing a broad variety of passive and active fiber optic components or subsystems for susceptibility to discontinuities (transient output of transmission fluctuations) during the application of an external stimulus such as vibration or physical shock.

ANSI/TIA 455-33-B-2005 (R2013), FOTP33 - Optical Fiber Cable Tensile Loading and Bending
This test is intended to verify the ability of an optical fiber cable to perform satisfactorily as required by Detail Specifications (a) while undergoing tensile and bending forces and (b) after undergoing tensile and bending forces.

ANSI/TIA 455-35A-1990 (R2008), Fiber Optic Component Dust (Fine Sand) Test
This document describes a test method intended to ascertain the ability of fiber optic components to resist the effects of dry-dust (fine sand) laden atmosphere. This test simulates the effect of sharp-edged dust particles, up to 150 um size, which may penetrate into cracks, crevices and joints.

ANSI/TIA 455-37-A-1993 (R2013), Low or High Temperature Bend Test
This revision of FOTP -37 significantly expands the scope of the original issue by increasing the number of test procedures options.

ANSI/TIA 455-39-B-1999 (R2013), Fiber Optic Cable Water Wicking Test
This procedure is generally not intended for use on cables containing water swellable tapes, powders, or yarns. Swellable materials must absorb water in order to swell and build a block to further penetration of water. This test method may be used to look at the water wicking characteristics of such cables, however it must be understood that a certain amount of water absorption is necessary for such cables to pass water penetration requirements.

ANSI/TIA 455-3B-2009 (R2014), Procedure to Measure Temperature Cycling Effects on Optical Fiber Units, Optical Cable, and Other Passive Fiber Optic components
This test procedure describes a method for the determination of temperature cycling effects or the temperature dependence of attenuation on optical fiber units, cables, cable assemblies, connectors, and/or other passive fiber optic devices. This procedure tests the ability of the component to withstand changes in temperature of the surrounding atmosphere that may be encountered during operation.

ANSI/TIA 455-42A-1989 (R2008), Optical Crossstalk in Fiber Optic Components
This document describes a procedure to determine the crossstalk ratios between two optical paths in a cable, Connectorized cable, splice or similar device. In addition, the devices contribution to the crossstalk in a system may be determined. The effectiveness of the material surrounding the optical conducting device in restricting light paths to the other elements may also be measured.

ANSI/TIA 455-56C-2009 (R2017), Test Method for Evaluating Fungus Resistance of Optical Fiber and Cable
This method is intended to evaluate the adequacy of optical fibers and cables to retain their structural integrity and performance level under environmental conditions favorable for the development of fungal growth. These conditions are: high humidity, a warm atmosphere, and the presence of inorganic salts.

ANSI/TIA 455-57-B-1994 (R2013), Preparation and Examination of Optical Fiber Endface for Testing Purposes
This procedure provides guidelines for acceptable optical fiber endface appearance and defines the techniques that are commonly employed to obtain such appearance. This procedure is intended to promote uniformity in fiber end preparation quality for testing purposes only and does not address issues associated with endface preparation and examination for the purposes of permanent termination (i.e., connectorization and splicing). This FOTP is not intended to require examination of every fiber end, nor is it intended to establish firm requirements, and is made available only to provide guidelines for various levels of end quality that may be called out in other FOTPs. Lastly, the intent of this method shall not be confused with the intent of FOTP -179, which is concerned primarily with the comparison of relative results.

This standard determines the suitability of optical Fibre to withstand the environmental condition of high temperature (dry heat).

This document describes a procedure to define the exposure conditions for testing resistance of fiber optic components to temperature shock. It also outlines the general approach used for measuring and evaluating the ability of a fiber optic component to withstand sudden changes of ambient temperature that could arise during shipment, storage, or use.

This standard defines the test that determines the suitability of optical fibre to withstand the environmental condition of immersion in distilled or demineralized water.

ANSI/TIA 455-8-B-2000 (R2008), Measurement of Splice or Connector Loss and Reflectance Using an OTDR
This document describes the use of optical time-domain reflectometer (OTDR) to indirectly measure attenuation and reflectance of a splice or connector.

ANSI/TIA 455-80-C-2003, Measuring Cutoff Wavelength of Uncabled Single-Mode Fiber by Transmitted Power
Establishes uniform requirements for measuring cut-off wavelength of single-mode optical fibre.
This document addresses the wideband (150 to 7000 Hz) voice transmission requirements specific to analog telephones equipped with headsets.

ANSI/TIA 470.130-C-2008 (R2016), Telecommunications - Telephone Terminal Equipment - Headset Acoustic Performance Requirements for Analog Telephones with Headsets

This standard provides transmission requirements for analog telephones when used with a headset. The requirements in this standard apply to telephones intended to be connected to the Public Switched Telephone Network (PSTN). These requirements should ensure compatibility and satisfactory performance to the user in a high percentage of installations. The interface between the telephone and the headset is outside the scope of this standard.

ANSI/TIA 470.132-2013, Telecommunications – Telephone Terminal Equipment – Transmission Requirements for Wideband Analog Telephones with Headsets

This document addresses the wideband (150 to 7000 Hz) voice transmission requirements specific to analog telephones equipped with headsets.

ANSI/TIA 470.210-F-2016, Telecommunications - Telephone Terminal Equipment - Resistance and Impedance Performance Requirements for Analog Telephones

Project to revise ANSI/TIA 470.210-E to remove impedance requirements related to B-Type ringing.

ANSI/TIA 470.220-E-2016, Telecommunications - Telephone Terminal Equipment - Alert Acoustic Output Performance Requirements for Analog Telephones

This project is a result of discussion during the May meeting about the fact that the ATIS removed reference to anything other than 20 Hz ringing in the 2000 revision of its ANSI/TI 401 network interface standard (now ATIS-0600401.2006). A liaison request to ACTA (see TR41-15-05-007-L) for guidance on this matter was forward to the ATIS Copper/Optical Access, Synchronization, and Transport Committee (COAST) and resulted in a reply indicating that 20 Hz ringing is all that needs to be supported (see TR41-15-05-008-L)

ANSI/TIA 470.230-C-2005 (R2012), Telecommunications - Telephone Terminal Equipment - Network Signaling Performance Requirements for Analog Telephones

This standard defines the DTMF, Pulse Dial, and Flash network signaling performance requirements for Customer Premises Equipment (CPE) intended for connection to the Public Switched Telephone Network (PSTN). These requirements should ensure compatibility and satisfactory performance to the user in a high percentage of installations.

ANSI/TIA 470.310-D-2010 (R2016), Telecommunications - Telephone Terminal Equipment - Cordless Telephone - Range Measurement Procedures

This standard establishes procedures and criteria for evaluating Cordless Telephone Range Performance in a traditional outdoor environment as well as a controlled laboratory environment.

ANSI/TIA 492AAAA-B-2008, Detail specification for 62.5-micrometer core diameter/125-micrometer cladding diameter class Ia graded-index multimode optical fibers

This Detail Specification applies to class Ia, graded-index, 62.5/125 micron multimode optical fiber used as a component in the manufacture of fiber-optic cable.

ANSI/TIA 492AAAB-A-2008, Detail Specification for 50-um Core Diameter/125-um Cladding Diameter Class Ia Graded-Index Multimode Optical Fibers

This Detail Specification applies to class Ia, graded-index, 50/125 micron multimode optical fiber used as a component in the manufacture of fiber-optic cable.

ANSI/TIA 492AAAC-B-2008, Detail specification for 850-nm laser-optimized, 50-micrometer core diameter/125-micrometer cladding diameter class Ia graded-index multimode optical fibers

This Detail Specification applies to class Ia, graded-index, 50/125 micron multimode optical fiber used as a component in the manufacture of fiber-optic cable.

ANSI/TIA 4950-A-2014, Requirements for Battery-Powered, Portable Land Mobile Radio Applications in Class I, II, and III, Division 1, Hazardous (Classified) Locations

This revision effort intends to further enhance the focus of this document on portable Land Mobile Radio (LMR) applications. The revision will solidify document coverage of the new technologies in use in portable LMR today.

ANSI/TIA 4953-A-2015, Telecommunications - Communications Products - Amplified Telephone Measurement Procedures and Performance Requirements

This revision project is proposed to make the following changes to the existing standard: 1) Add requirements for digital interface telephones. 2) Add requirements for sidetone. 3) Add requirements for distortion for any volume control setting and any input level. 4) Remove the “Maximum Usable Gain” measurement clause. 5) Add requirements for testing send level during conversation simulation. 6) Revise the requirements for the “Mild” criteria to align with the volume control requirements for regular telephones. These revisions are necessary to improve the applications for this standard.

ANSI/TIA 4957.000-A-2017, Overview and Architecture for a Field Area Network

Revise to add new operational modes for Smart Grid, smart metering, and related applications.

ANSI/TIA 4957.100-A-2017, Layer 1 Standard

Specification for the Smart Utility Network

Revise to add new operational modes for Smart Grid, smart metering, and related applications.

ANSI/TIA 4957.200-2013, Layer 2 Standard

Specification for the Smart Utility Network

This is the second part of a multi-part standard specification for the smart utility network. This part covers OSI Layer 2, including the MAC, DLL and forwarding sub-layers. It is intended for networks with a wireless mesh topology.

Specification of a Data Link Sub-Layer

Revise to add new operational modes for Smart Grid, smart metering, and related applications.

Specification for the Field Area Network

Revise to add new operational modes for Smart Grid, smart metering, and related applications.

ANSI/TIA 4957.400-A-2017, Layer 4

Specification for the Field Area Network

Revise to add new operational modes for Smart Grid, smart metering, and related applications.

ANSI/TIA 4957.500-2017, Smart Utility Network-Security

To define key management and other security protocols necessary to fully implement Layer 2 security for Smart Utility Networks.
ANSI/TIA 4963-2013, Electrical Characteristics of Reversible Balanced Voltage Digital Interface Circuits

This new Standard is an enhanced version of TIA-485-A, Electrical Characteristics of balanced voltage digital interface circuits. The new Standard accommodates that generators and receivers are immune of the interchange of binary signals in multipoint interconnection of digital equipment. When implemented within the guidelines of this Standard, multiple generators and receivers may be attached to a common interconnecting cable. The generators and receivers operate with no errors if the balanced interconnecting cables are connected normally or with the differential signal wires reversed. It is planned that users reference this Standard for the point-to-point interchange of binary signals between equipment and components at signaling rates up to 5 Mbps over a single differential transmission line of nominal test load of 60Ω. Higher rates and different transmission line impedance are possible in optimal application.

ANSI/TIA 4965-2012 (R2017), Telecommunications - Telephone Terminal Equipment - Receive Volume Control Requirements for Digital and Analog Wireline Terminals

This standard establishes receive volume control requirements and testing methods for narrowband digital, wideband digital, and analog wireline terminals. Currently, volume control requirements for these types of terminals are included in different standards documents, each with their own revision cycle. Government agencies currently reference outdated revisions of these multiple standards documents for their volume control regulations. Combining the volume control requirements into one standard that can be referenced by these government agencies will help ensure that their requirements are harmonized and up to date.

ANSI/TIA 4966-2014, Telecommunications Infrastructure Standard for Educational Facilities

This Standard specifies telecommunications infrastructure requirements for educational buildings and spaces. It specifies cabling, cabling topologies, and cabling distances - all of which are intended to support a wide range of services and systems. Additionally, pathways and spaces (e.g. sizing and location), and ancillary requirements are addressed. Modern digital telecommunications in educational buildings require a robustly designed building infrastructure to support the numerous systems that rely on the electronic transport of information.

ANSI/TIA 4994-2015, Standard for Sustainable Information Communications Technology

Scope: This Standard addresses the requirements associated with the planning, architecture, design, integration and operation of sustainable information communications technology (ICT). Justifications: This standard describes sustainable concepts for ICT such as lowering energy consumption, reducing material consumption and mitigating the environmental impact.

ANSI/TIA 5017-2016, Telecommunications - Physical Network Security Standard

This document covers the security of telecom cables, pathways, spaces, & other elements of the physical infrastructure. It includes design guidelines, installation practices, administration, & management. It addresses guidelines for new construction as well as renovation of existing buildings. The document also provides installation guidelines, for implementing security cabling systems for premises security systems with an integrated security approach. Justification: This Standard will enable the planning and installation of physical network security systems that protect critical telecommunications infrastructure elements

ANSI/TIA 5041-2016, FAST Digital IF Architecture and Open Standard Digital IF Interfaces

define a standard interface to connect modems, switches and transmitters at a digital intermediate frequency

ANSI/TIA 5045-2017, Numeric Identifier for Conventional Analog Operation

This project provides a standardized numeric identifier messaging format for conventional analog subscriber units.

ANSI/TIA 5048-2017, Automated Infrastructure Management (AIM) Systems - Requirements, Data Exchange and Applications

This standard specifies the requirements and recommendations for the attributes of Automated Infrastructure Management (AIM) systems, explains how AIM systems can contribute to operational efficiency, and specifies a framework of requirements and recommendations for data exchange with other systems.

ANSI/TIA 526-14-C-2015, Optical Power Loss Measurement of Installed Multimode Fiber Cable Plant; Modification of IEC 61280-4-1 edition 2, Fiber - Optic Communications Subsystem Test Procedures - Part 4-1: Installed Cable Plant - Multimode Attenuation Measurement

Modify Foreword to change document from adoption of IEC 61280-4-1ed2 for regional variances. These variances would change presently normative aspects to become informative.

This part of IEC 61280 applies to fibre optic general communication subsystems. The object of this part is to measure the optical power coupled from the output of a transmitter under test into single-mode optical fibre cable containing dispersion-unshifted fibre or dispersion-shifted fibre.

This procedure can be used to measure the optical loss between any two passively-connected points, including end terminations, of a single-mode optical fiber cable plant. The optical fiber cable plant, as the term is used here, may consist of optical fiber cables, connectors, mounting panels, jumper cables, and other passive components, but may not include active components.

ANSI/TIA 568-C.0-1-2010, Generic Telecommunications Cabling for Customer Premises-Addendum 1, Updated Reference for Balanced Twisted-Pair Cabling

This addendum updates balanced twisted-pair references in ANSI/TIA-568.C.0 to the current balanced twisted pair cabling standards of ANSI/TIA-568-C.2 and ANSI/TIA-1152.

ANSI/TIA 568-C.2-1-2016, Balanced Twisted-Pair Telecommunications Cabling and Components Standard, Addendum 1: Specifications for 100 Next Generation Cabling

Develop a new category of cabling to support future applications beyond 10GBASE-T. A new category of cabling to support increased capacity for future applications.

Introduce category 6A patch cord testing requirements to allow test heads qualified to IEC 61935-2 to be used to qualify a patch cord to TIA 568C.2 C6A compliance. Justification.... TIA C6A test heads and ISO C6A test heads used for measurement of patch cords have slightly differing requirements. These difference cause negligible difference to measured patch cord results, however create a situation where a patch cord test head cannot be both TIA and ISO compliant. This causes practical difficulties in both laboratory and field measurements of cords.

ANSI/TIA 568-C.2-2-2009, Balanced Twisted-Pair Telecommunications Cabling and Components Standard

This Standard specifies minimum requirements for balanced twisted-pair telecommunications cabling (e.g. channels and permanent links) and components (e. g. cable, connectors, connecting hardware, patch cords, equipment cords, work area cords, and jumpers) that are used up to and including the telecommunications outlet/connector and between buildings in a campus environment. This Standard also specifies field test procedures and applicable laboratory reference measurement procedures for all transmission parameters.
ANSI/TIA 568-C.3-1-2011, Optical Fiber Cabling Components Standard - Addendum 1: Addition of OM4 Cables Optical Fiber and 24-fiber array connectors

This addendum updates ANSI/TIA-568-C.3 with the addition of 50/125 micrometer laser-optimized OM4 cabled optical fiber and components for 24-fiber array connectors. Acronyms for optical fiber cable types are also added.

ANSI/TIA 568-D.3-2016, Optical Fiber Cabling Component Standard

This Standard is applicable to premises optical fiber cabling and components. Specified in this Standard are requirements for components, such as cable, connectors, connecting hardware and cords. Basic connectivity arrangements formed from these components are also defined. Connector test requirements and guidelines for field testing are also incorporated into this Standard.

ANSI/TIA 568-D.0-D-2015, Generic Telecommunications Cabling for Customer Premises

This Standard specifies requirements for generic telecommunications cabling. It specifies requirements for cabling system structure, topologies and distances, installation, performance and testing. The Standard needs revision to reorganize content among its parts for ease of maintenance. Certain types of equipment outlets are added. Coaxial cabling is incorporated by reference to ANSI/TIA-568-C.4.

ANSI/TIA 568.1-D-2015, Commercial Building Telecommunications Infrastructure Standard

This Standard specifies requirements for telecommunications cabling within a commercial building and between commercial buildings in a campus environment. It defines terms, specifies cabling topology, lists cabling requirements, establishes cabling distances, sets telecommunications outlet/connector configurations and provides additional useful information.

ANSI/TIA 568.4-D-2017, Broadband Coaxial Cabling and Components Standard

This document will supersede and replace ANSI/TIA568C. 4. This Standard specifies requirements and recommendations for 75 broadband coaxial cabling, cables, cords, and connecting hardware to support community antenna television (CATV, commonly referred to as cable television), satellite television, and other applications supported by the telecommunications infrastructure (star topology) defined by ANSI/TIA568C. 0D and other topologies specified within this Standard. Included are transmission requirements, mechanical requirements, testing requirements, and adequate testing procedures.

ANSI/TIA 569-C-2012, Telecommunications Pathways and Spaces

This default ballot is a result of the comment resolution held regarding SP-3-4817-RV3-F and is limited to 5 specific technical changes. Other comments submitted to SP-3-4817-RV3-F were resolved editorially. The results of the SP-3-4817-RV3-F ballot consisted of 15 'abstain', 16 'approve' votes, 4 'approve with comments' votes, and 2 with "disapprove with comments" votes.

ANSI/TIA 569-D-1-2016, Telecommunications Pathways and Spaces: Addendum 1 - Revised Temperature and Humidity Requirements for Telecommunications Spaces

This Addendum specifies new temperature and humidity requirements and recommendations for telecommunications spaces to harmonize with the ASHRAE Thermal Guidelines for Data Processing Environments, 4th Edition published in 2015.

ANSI/TIA 569-D-2015, Telecommunications Pathways and Spaces

This standard specifies requirements for telecommunications pathways and spaces. New revision needed to: • Incorporate content of addendum ANSI/TIA-569-C-1 • Align content with draft ANSI/TIA-568-D-D • Revise/clarify requirements for distributor rooms, conduit

ANSI/TIA 570-B-1-2009, Residential Telecommunications Infrastructure Standard - Addendum 1: Additional Requirements for Broadband Coaxial Cabling

This Addendum specifies additional requirements and recommendations for 75 &##937; broadband coaxial cabling, cables, cords and connecting hardware to support community antenna television (CATV, commonly referred to as cable television), satellite television and other applications in residences as part of a telecommunications infrastructure as defined by ANSI/TIA-570-B. Included are transmission and mechanical requirements and requirements related to electromagnetic compatibility (EMC) for cabling, cables and connectors; cable installation and connector termination procedures; and field testing procedures.

ANSI/TIA 570-C-2012, Residential Telecommunications Infrastructure Standard

ANSI/TIA-570-B, published in 2004 and reaffirmed in 2010, is due for revision. The revision will include content from Addendum 1, modifications to harmonize with ANSI/TIA-568-C Series and draft ANSI/TIA-569-C, and information on new technologies or advancements.

ANSI/TIA 571-C-2015, Telecommunications - Communications Products - Electrical, Thermal and Mechanical Environmental Performance Requirements

TIA-571-B is up for 5-year review. It has been determined that updating and revisions are required. Some items that need consideration are: • Scope – Expansion of the scope to include telecommunications equipment typically found at the premises in today’s broadband environment; • Vibration Tests – It is now generally recognized that random vibration is more representative of real-world conditions and should replace the current sinusoidal vibration tests; • Surge tests – Consideration should be given to TIA 1194, “Surge Resistibility of Smart Grid Equipment Connected to either DC or 120/240 V Single Phase AC and Metallic Communication Lines” as well as a complete review of this section to make sure the standard reflects the latest technologies, installations and adequately addresses the real surge environment for various types of equipment. Different testing paths should be considered for different uses and installations of equipment. For example, consumer/enterprise, portable/installed equipment, etc.

ANSI/TIA 598-D-2014, Optical Fiber Cable Coding

This standard defines the recommended identification scheme or system for individual fibers, fiber units, and groups of fiber units within a cable structure. The methods contained herein may be used to identify and locate specific fibers for the purpose of connection, termination, or testing within a communication system or for the topography of long haul, feeder route, subscriber, or distribution applications for both on-premises and outside plant use.

ANSI/TIA 603-E-2016, Land Mobile FM or PM - Communications Equipment - Measurement and Performance Standards

The scope of the project is to revise the existing document to add methods of measurement for receivers employing class D audio power amplifiers.

ANSI/TIA 604-108-2008 (R2015), FOCIS 10B Fiber Optic Connector Intermateability Standard - Type LC

FOCIS 10B presents the intermateability standard for simplex and duplex connectors with the commercial designation LC, and is issued as an addendum to TIA/EIA 604, Fiber Optic Connector Intermateability Standards. The provisions of TIA/EIA 604 apply to this document.

ANSI/TIA 604-18-2015, FOCIS 18 Fiber Optic Connector Intermateability Standard - Type MPO-16

This document develops a Fiber Optic Connector Intermateability Standard that accommodates a 1x16 and 2x 16 Multifiber Push-On/Multifiber Termination Push-On connector assembly.
ANSI/TIA 604-5-D-2007, FOCIS 5, Fiber Optic Connector Intermateability Standard, Type MPT

FOCIS 5 presents the intermateability standard for connectors with the commercial designation of MPO, and is used as an addendum to TIA/EIA-604, Fiber Optic Connector Intermateability Standards. The provisions of TIA/EIA-604 apply to this document.

ANSI/TIA 606-B-1-2015, Administration Standard for Commercial Telecommunications Infrastructure - Automated Infrastructure Management Systems

The purpose of this addendum is to update the core functions, auxiliary functions, and usage recommendations for automated infrastructure management (AIM) systems specified in TIA-606-B to harmonize with ISO/IEC 14763-2-1 Implementation and operation of customer premises cabling Part 2: Planning and installation – Amendment for inclusion of AIM systems and ISO/IEC 18598 Automated Infrastructure Management (AIM) Systems – Requirements, Data Exchange and Applications

ANSI/TIA 606-C-2017, Administration Standard for Telecommunications Infrastructure

This Standard specifies administration systems for telecommunications infrastructure within buildings (including commercial, industrial, residential, and data center premises) and between buildings. This infrastructure may range in size from a building requiring a single telecommunications space (TS) and associated elements, to many TSs and associated elements in multiple campus locations. This Standard applies to administration of telecommunications infrastructure in existing, renovated, and new buildings.

ANSI/TIA 607-C-1-2016, Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises Addendum 1 - Bonding in Multitenant Buildings

This Addendum specifies requirements for a generic telecommunications bonding infrastructure in multi-tenant buildings. This Addendum may also be used as a guide for the renovation or retrofit of existing systems.

ANSI/TIA 607-C-2015, Generic Telecommunications Grounding (Earthing) and Bonding for Customer Premises

This Standard specifies requirements for a generic telecommunications bonding and grounding infrastructure and its interconnection to electrical systems and telecommunications systems. This Standard may also be used as a guide for the renovation or retrofit of existing systems. Revision needed to incorporate addenda, update references and harmonize with ISO/IEC 30129.

ANSI/TIA 631-B-2011 (R2017), Telecommunications - Telephone Terminal Equipment - Radio Frequency Immunity Requirements

Revise existing standard to clarify Scope of base document is limited to telephones with handsets but to also add an informative annex suggesting how the test methods and requirements in the standard may be extended to other telephony products such as speakerphones, answering systems, and telephones with headsets.

ANSI/TIA 637-C-1(E)-2007, Short Message Services (SMS) for Wideband Spread Spectrum Systems - Release C Addendum 1

The Short Message Service (SMS) allows the exchange of short messages between a mobile station and the wireless system, and between the wireless system and an external device capable of transmitting and optionally receiving short messages.

ANSI/TIA 637-C-1(E)-2007, Call Forwarding—Busy Features Description

This standard describes wireless features for mobile phones that operate on the cdma2000 network.

ANSI/TIA 637-C-2-2007 (R2013), Wireless Features Description - Addendum 3

This suite of standards present a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses call delivery for the series.

ANSI/TIA 637-C-1(F)-2007 (R2013), Wireless Features Description - Addendum 4

This suite of standards present a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses call forwarding—default for the series.

ANSI/TIA 644-000-B-2003 (R2013), Wireless Features Description: Call Forwarding—Busy Call Forwarding (CFB)

This suite of standards present a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses call forwarding—default for the series.

ANSI/TIA 646-000-B-3-2007 (R2013), Wireless Features Description: Call Forwarding—Default (CFD)

This suite of standards present a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses call forwarding—default for the series.
This suite of standards present a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Call Waiting (CW) for the series.

This suite of standards present a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Call Forwarding—No Answer (CFNA) for the series.

This suite of standards present a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Conference Calling (CC) for the series.

This suite of standards present a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Conference Calling (CC) for the series.

This suite of standards present a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Conference Calling (CC) for the series.

This suite of standards present a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Conference Calling (CC) for the series.

This suite of standards present a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Flexible Alerting (FA) for the series.
ANSI/TIA 664-513-B-2007 (R2013), Wireless Features Description: Message Waiting Notification (MWN)

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Message Waiting Notification (MWN) for the series.

ANSI/TIA 664-514-B-2007 (R2013), Wireless Features Description: Mobile Access Hunting (MAH)

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Mobile Access Hunting (MAH) for the series.

ANSI/TIA 664-515-B-2007 (R2013), Wireless Features Description: Password Call Acceptance (PCA)

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Password Call Acceptance (PCA) for the series.

ANSI/TIA 664-516-B-2007 (R2013), Wireless Features Description: Preferred Language (PL)

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Preferred Language (PL) for the series.

ANSI/TIA 664-517-B-2007 (R2013), Wireless Features Description: Priority Access and Channel Assignment (PACA)

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Priority Access and Channel Assignment (PACA) for the series.

ANSI/TIA 664-518-B-2007 (R2013), Wireless Features Description: Remote Feature Control (RFC)

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Remote Feature Control (RFC) for the series.

ANSI/TIA 664-519-B-2007 (R2013), Wireless Features Description: Selective Call Acceptance (SCA)

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Selective Call Acceptance (SCA) for the series.

ANSI/TIA 664-520-B-2007 (R2013), Wireless Features Description: Subscriber PIN Access (SPINA)

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Subscriber PIN Access (SPINA) for the series.

ANSI/TIA 664-521-B-2007 (R2013), Wireless Features Description: Subscriber PIN Intercept (SPINI)

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Subscriber PIN Intercept (SPINI) for the series.
This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber rooms. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Voice Privacy (VP) for the series.

ANSI/TIA 664-532-B-2007 (R2013), Wireless Features Description: Non-public Service Mode (NP)

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Non-public Service Mode (NP) for the series.

ANSI/TIA 664-533-B-2007 (R2013), Wireless Features Description: Over-the-Air Service Provisioning (OTASP)

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Over-the-Air Service Provisioning (OTASP) for the series.

ANSI/TIA 664-534-B-2007 (R2013), Wireless Features Description: Service Negotiation (SN)

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Service Negotiation (SN) for the series.

ANSI/TIA 664-535-B-2007 (R2013), Wireless Features Description: User Group (UG)

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. This part discusses User Group (UG) for the series.

ANSI/TIA 664-536-B-2007 (R2013), Wireless Features Description: Group 3 Analog Facsimile Service (G3 AFax)

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Group 3 Analog Facsimile Service (G3 AFax) for the series.

ANSI/TIA 664-537-B-2007 (R2013), Wireless Features Description: Wireless Intelligent Network Feature Descriptions

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Wireless Intelligent Network Feature Descriptions for the series.

ANSI/TIA 664-601-B-2007 (R2013), Wireless Features Description: Short Message Delivery

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Short Message Delivery for the series.

ANSI/TIA 664-602-B-2007 (R2013), Wireless Features Description: Wireless Messaging Teleservice

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Wireless Messaging Teleservice for the series.

ANSI/TIA 664-603-B-2007 (R2013), Wireless Features Description: Wireless Paging Teleservice

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Wireless Paging Teleservice for the series.
ANSI/TIA 664-701-B-2007 (R2013), Wireless Features Description: Mobile Station Functionality

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Mobile Station Functionality for the series.

ANSI/TIA 664-801-B-2007 (R2013), Wireless Features Description: System Functionality

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses System Functionality for the series.

ANSI/TIA 664-802-B-2007 (R2013), Wireless Features Description: Subscriber Confidentiality

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Subscriber Confidentiality for the series.

ANSI/TIA 664-803-B-2007 (R2013), Wireless Features Description: Network Services

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Network Services for the series.

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses System Functionality for the series.

This suite of standards presents a recommended plan for the implementation of uniform features for use in wireless telecommunications systems. Its intent is to describe services and features so that the manner in which they are used by a subscriber can remain reasonably consistent from system to system. It is not intended to require that specific service offerings be required of all service providers. This document describes a subset of wireless features that a wireless subscriber can use in any wireless system into which the subscriber roams. The selected subset consists of features that are more likely to be used when roaming, and features that are necessary to implement full intersystem operation. This part discusses Over-the-Air Parameter Administration for the series.

ANSI/TIA 678-B-2011, Data Transmission Systems and Equipment - Serial Asynchronous Automatic Dialing and Control for Character Mode DCE on Wireless Data Services

Applies to the interconnection of data terminal equipment (DTE) and data circuit-terminating equipment (DCE) employing serial binary data operation via the 100-series interchange circuits or data operation over equivalent logical circuits.

ANSI/TIA 758-B-2012, Customer-Owned Outside Plant Telecommunications Infrastructure Standard

This default ballot is a result of the comment resolution held regarding SP-3-3339-RV2 and is limited to 6 specific technical changes. Other comments submitted to SP-3-3339-RV2 were resolved editorially. The results of the SP-3-3339-RV2 ballot consisted of 22 ‘abstain’, 12 ‘approve’ votes, 2 ‘approve with comments’ votes, and 1 with “disapprove with comments”.

This standard addresses the technical issues associated with Type 1, Type 2, and Type 2.5 Customer Premises Equipment for services such as Calling Identity Delivery, Visual Message Waiting Indicator, Calling Identity Delivery on Call Waiting and Call Waiting Deluxe. The Type 1 and Type 2 issues were previously addressed in TIA/EIA-716 and TIA/EIA-777 respectively. This document is intended to replace both TIA/EIA-716 and TIA/EIA-777. The services use On-Hook and Off-Hook signaling with data frames packaged in Single Data Message Format (SDMF), and Multiple Data Message Format (MDMF)
ANSI/TIA 855-A-2011 (R2016),
Telecommunications - Telephone Terminal Equipment - Stutter Dial Tone Detection Device - Performance Requirements

This document provides specifications for Customer Premises Equipment (CPE) devices designed to automatically detect stutter dial tone (SDT) on an analog telephone line. TIA-968-B includes regulatory requirements related to automatic stutter dialtone detection devices for connection to the network. This standard includes criteria to meet the TIA-968-B requirements and additional requirements for the performance of these devices.

ANSI/TIA 862-B-2016, Structured Cabling Infrastructure Standard for Intelligent Building Systems

This Standard specifies minimum requirements for intelligent building system cabling infrastructure including cabling topology, architecture, design and installation practices, test procedures, and components. The cabling infrastructure specified by this Standard is intended to support a wide range of systems, particularly those that utilize or can utilize IP-based infrastructure. Justification: Revision of the document to include additional information regarding cabling supporting intelligent building systems.

This service description document details the Inband Signaling Protocol between Transcoder/Rate adapter Units (TRAU) for speech traffic channels for the Tandem Free Operation (TFO) of Speech Coders, sometimes also termed "Vocoder Bypass." It is applied to the cdma2000 standards.

The scope of this document is to define the physical layer (PHY) of the Scalable Adaptive Modulation (SAM) Wideband Air Interface (WAI). The WAI called Uw is the interface between the fixed network equipment (FNE) and a subscriber unit (SU) or directly between subscribers units in a wideband system. The general wideband system model is shown in Figure 1, and illustrates the Radio to FNE Mode of operation.

ANSI/TIA 902.BAAC-A-2007 (R2013), WIDEBAND AIR INTERFACE MEDIA ACCESS CONTROL / RADIO LINK ADAPTATION (MAC/RLA) LAYER SPECIFICATION

This document defines the Media Access Control / Radio Link Adaptation (MAC/RLA) layer of the Wideband Air Interface (WAI). The WAI called UW is the interface between the Fixed Network Equipment (FNE) and the Mobile Radio (MR), or directly between MRS in a wideband system. The general wideband system model is shown in Figure 1 and illustrates the Radio to FNE Configuration as defined in [1]. A Vehicular Repeater (VR) may additionally act as a relay between Fixed Station (FS) and MR when coverage limitations require the use of this local coverage area extension.

This document is the Scalable Adaptive Modulation (SAM) radio channel coding specification for the Wideband Air Interface (WAI).

ANSI/TIA 902.BAAE-A-2007 (R2013), WIDEBAND AIR INTERFACE LOGICAL LINK CONTROL (LLC) LAYER SPECIFICATION

This document defines the Logical Link Control (LLC) layer of the Wideband Air Interface (WAI). The wideband air interface called Uw is the interface between the fixed network equipment (FNE) and the subscriber units, or directly between subscriber units in a wideband system. The general wideband system model is shown in Figure 1 and illustrates the Radio to FNE Mode of operation. A Vehicular Repeater (VR) may additionally act as a relay between FS and MR when coverage limitations require the use of this local coverage area extension.

ANSI/TIA 902.BAAF-A-2007 (R2013), WIDEBAND AIR INTERFACE MOBILITY MANAGEMENT (MM) LAYER SPECIFICATION PUBLIC SAFETY WIDEBAND DATA STANDARDS PROJECT DIGITAL RADIO TECHNICAL STANDARDS

This document defines the Mobility Management (MM) layer of the Wideband Air Interface (WAI). The wideband air interface called Uw is the interface between the fixed network equipment (FNE) and the MRC units, or directly between MRC units in a wideband system. The general wideband system model is shown in Figure 1 and illustrates the Radio to FNE Mode of operation. A Vehicular Repeater (VR) may additionally act as a relay between FS and MR when coverage limitations require the use of this local coverage area extension.

ANSI/TIA 902.BAEB-A-2007 (R2013), WIDEBAND AIR INTERFACE PACKET DATA SPECIFICATION PUBLIC SAFETY WIDEBAND DATA STANDARDS PROJECT DIGITAL RADIO TECHNICAL STANDARDS

This document is the packet data specification for the Wideband Air Interface (WAI). The wideband air interface called Uw is the interface between the fixed network equipment (FNE) and the subscriber units, or directly between subscriber units in a wideband system. The general wideband system model is shown in Figure 1 and below illustrates the Radio to FNE Mode of operation. A Vehicular Repeater (VR) could additionally act as a relay between FS and MR when coverage limitations require the use of this local coverage area extension.

ANSI/TIA 912-C-2015, Telephony Equipment - Voice Gateway Transmission Requirements

This standard covers transmission requirements for voice gateways (VGs) that provide routing functions between telephones, traditional public and private networks, and modern packet-based networks. VGs include packet-based enterprise equipment, residential gateways, ADSL-based Integrated Access Devices (IADs), and cable-based Multimedia Terminal Adapters (MTAs). The main purpose of this revision is to add requirements for supporting wideband (nominally 100 to 7,000 Hz) analog telephones that may be connected to voice gateways for providing High Definition (HD) voice services such as those available using Voice over Internet Protocol (VoIP).

ANSI/TIA 920.000-B-2015, Telecommunications - Communications Products - Overview of Transmission Requirements for Digital Interface Communications Devices

This standard provides an overview of the structure of the ANSI/TIA-920 series of standards that establish audio transmission performance requirements for digital telephones regardless of protocol or digital format. Transmission may be over any digital interface including Local or Wide Area Networks, Universal Serial Bus (USB), Firewire/IEEE Std 1394, public ISDN or digital over twisted pair wire. This includes TDM-based and packet-based (e.g. VoIP) telephones. These telephones may be connected through modems, voice gateways, wireless access points, or PBXs, or they may be personal computer-based telephones. This revision will add updated requirements for narrowband (300 to 3400 Hz) telephones, previously found in ANSI/TIA-810-B, to the existing wideband (150 to 6800 Hz) requirements in the TIA-920-A series and upgrade the series to ANSI status. The term “wideband” will be dropped from the document title since the revised standard will cover both wideband and narrowband telephones.

ANSI/TIA 920.110-B-2015, Telecommunications - Telephone Terminal Equipment - Transmission Requirements for Digital Telephones with Handsets

This standard establishes audio transmission performance requirements for handset equipped digital telephones regardless of protocol or digital format. Transmission may be over any digital interface including Local or Wide Area Networks, Universal Serial Bus (USB), Firewire/IEEE Std 1394, public ISDN or digital over twisted pair wire. This includes TDM-based and packet-based (e.g. VoIP) telephones. These telephones may be connected through modems, voice gateways, wireless access points, or PBXs, or they may be personal computer-based telephones.
ANSI/TIA 942-B-2006 (R2012), Wireless Telecommunications - Terminal Equipment - Technical Requirements for Connection of Terminal Equipment to the Telephone Network

This Standard specifies technical criteria for terminal equipment approved in accordance with Title 47 of the U.S. Code of Federal Regulations (47 C.F.R.), Part 68 for direct connection to the public switched telephone network, including private line services provided over wireline facilities owned by providers of wireline telecommunications. This addendum adds a new sub-clause specifying the use of an acoustic stimulus signal when testing analog telephones having electroacoustic transducers for live voice input for compliance with out-of-band emissions and in-band longitudinal signal requirements.

ANSI/TIA 948-B-2009 (R2016), Telecommunications - Telephone Terminal Equipment - Technical Requirements for Connection of Terminal Equipment to the Telephone Network

This Standard specifies technical criteria for terminal equipment approved in accordance with Title 47 of the U.S. Code of Federal Regulations (47 C.F.R.), Part 68 for direct connection to the public switched telephone network, including private line services provided over wireline facilities owned by providers of wireline telecommunications.

ANSI/TIA 948-B-3-2016, Telecommunications - Telephone Terminal Equipment - Technical Requirements for Connection of Terminal Equipment to the Telephone Network - Addendum 3

This addendum provides changes to TIA-948-B, Telecommunications - Telephone Terminal Equipment - Technical Requirements for Connection of Terminal Equipment to the Telephone Network. This addendum will remove the AC and DC impedance requirements when subjected to the Type B ringing frequencies and voltage levels. All other clauses in TIA-968-B are not affected.

This standard defines the interfaces between a telecommunications service provider (TSP) and a Law Enforcement Agency (LEA) to assist the LEA in conducting lawfully authorized electronic surveillance.

ANSI/TIA J-STD-025-B-2006 (R2012), Lawfully Authorized Electronic Surveillance (CALEA)

This document defines the interfaces between a telecommunications service provider (TSP) and a Law Enforcement Agency to assist the LEA in conducting lawfully authorized electronic surveillance.

ANSI/TIA J-STD-025-B-3-2013, Lawfully Authorized Electronic Surveillance (LAES) - Addendum 3 - Support for BSD or Subnet

This addendum consists of additions and modifications to ANSI/J-STD-025-B for supporting BSD or Subnet information in the Location Information parameter type of the cdma2000&174; Abstract Syntax for PacketData CII Delivery.

This Standard provides a solution for the handling of Wireless Enhanced Emergency Calls for the FCC E911Phase II mandate. Carrier position reporting to emergency services systems, as mandated by the Federal CommunicationCommission (FCC) under docket 94-102 (including orders 96-264, 99-96 and 99-245) has been addressed bythis Interim Standard without considering position reporting privacy restrictions that may be desirable for future position reporting services. For this reason, this Standard does not preclude these other service restrictions. Position reporting privacy restrictions are beyond the scope of this Standard, and are not addressed here.

This document is a guideline providing methods of representing the process statistics of the chromatic dispersion of optical fibres and related components that may be combined in a link.

This document provides guidelines for the calculation of polarization mode dispersion (PMD) in optical fibre systems to accommodate the statistical variation of PMD and differential group delay (DGD) in optical fibre cables and components.
TOY-TIA (Toy Industry Association)
ANSI Z315.1-2012, Safety Requirements for Tricycles
This standard covers the safety requirements for all tricycles intended for use by children 8 years and under. While the addition of a push handle does not by itself change the classification of a product from a tricycle to a stroller (or other juvenile product), there exist in the marketplace some hybrid products (i.e. tricycle/stroller combinations that have canopies, reclining seats, and/or restraint systems, etc.) which are intended and marketed to fulfill both functions.

TPI (Truss Plate Institute)
ANSI/TPI 1-2014, National Design Standard for Metal Plate Connected Wood Truss Construction
This standard establishes minimum requirements for the design and construction of metal plate connected wood trusses. This standard describes the materials used in a truss, both lumber and steel, and design procedures for truss members and joints. Responsibilities, methods for evaluating the metal connector plates, and manufacturing quality assurance are also contained in this standard.

UAMA (ASC B7) (Unified Abrasives Manufacturers’ Association)
ANSI B7.1-2010, Safety Requirements for the Use, Care and Protection of Abrasive Wheels
Standard sets forth requirements for the safe use, care and protection of abrasive wheels and the machines for which they are designed. Included in this standard are the requirements for safety guards, handling and mounting techniques.

ANSI B7.7-2003 (R2011), Safety Requirements for Abrading Materials with Coated Abrasive Systems
Standard establishes the minimum safety requirements related to the usage of coated abrasive forms. The requirements apply to all hand-held and fixed mounted machine operations that use some form of coated abrasive product, and to safety-related maintenance precautions for the machines and parts.

ANSI B74.12-2012, Specifications for the Size of Abrasive Grain-Grinding Wheels, Polishing and General Industrial Uses
Purpose of this standard is to establish a nationally recognized basis for checking the size of abrasive grain for use in the manufacture of grinding wheels, general polishing and other industrial uses such as pressure blasting, lithoplate grinding, etc.

ANSI B74.13-2016, Markings for Identifying Grinding Wheels and Other Bonded Abrasives
This standard applies to grinding wheels and other bonded abrasives: segments, bricks, sticks, hones, rubs, and other shapes, which are tools used to remove material, alter shape or size, produce a desired surface or accuracy of dimension, or a combination of these objectives. The standard does not apply to specialties such as sharpening stones, or to grinding wheels normally distributed in resale and certain specialized industrial markets, where radically different symbols are commonly used.

ANSI B74.14-2007 (R2013), Methods of Chemical Analysis of Aluminum Oxide Abrasive Grain and Abrasive Crude
These methods cover procedures for the chemical analysis of aluminum oxide abrasive grain and abrasive crude. The methods apply to products as sold commercially but not necessarily after alteration in service.

ANSI B74.15-1992 (R2013), Methods of Chemical Analysis of Silicon Carbide Abrasive Grain and Abrasive Crude
These methods cover procedures for the chemical analysis of silicon carbide grain and abrasive crude. The methods apply to products as sold commercial but not necessarily after alteration in service.

ANSI B74.16-2002 (R2014), Checking the Size of Diamond and Cubic Boron Nitride Abrasive Grain
To establish a common basis for checking the size of diamond and cubic boron nitride (CBN) grain for use in the manufacture of diamond grinding wheels, saws and other industrial diamond products.

ANSI B74.18-2016, Specifications for Grading of Certain Abrasive Grain on Coated Abrasive Material
Correction to tables. This standard specifies grading requirements for the screen grit sizes called macrogrits and the microgrit sizes of aluminum oxide, zirconia alumina, silicon carbide, and garnet abrasive grains for use on coated abrasive products.

ANSI B74.19-2016, Test for Determining the Magnetic Content of Abrasive Grains
To establish a nationally recognized basis for determining the magnetic content of abrasive grain used in the manufacture of grinding wheels, coated abrasive products, etc.
ANSI B74.20-2004 (R2016), Specification for Diamond and CBN Powders in Sub-Sieve Sizes
This standard defines the characterization of sub-sieve size diamond and CBN powders for general industrial use. However there are special applications such as the electronics and pyrocrystallizing diamond/CBN (PCD/PCBN) industries that require custom specifications to be agreed upon between the miconizer and the end user. This standard does not attempt to address these special situations.

ANSI B74.21-2002 (R2014), Fatigue Proof Test Procedure for Vitrified Wheels
To outline a proof test method that will increase the degree of surety at which a vitrified wheel will not fail from normal operating stresses due to fatigue during its useful lifetime.

ANSI B74.22-1991 (R2014), Design Test for Type 27 Portable Grinding Wheels
To outline a test method to be applied to 9” x 1/4” Type 27 wheel designs that set a minimum safety standard to help avoid grinding wheel failure in the event the wheel incurs a crack in use that is not visible to the naked eye.

ANSI B74.23-2002 (R2014), Measuring Relative Crystal Strengths of Diamond and Cubic Boron Nitride
To establish an agreed method for checking the relative strengths of diamond and cubic boron nitride (CBN) grains for use in the manufacture of saw blades and other industrial diamond products.

ANSI B74.24-2016, Specification for Abrasive Materials for Blasting
To establish a specification for manufactured mineral type abrasive materials used with pressure blasting equipment. The abrasives are generally used for blast cleaning metal surfaces to remove scale, rust, paint, encrusted sand, dirt, and other foreign material, and to prepare surfaces for applied finishes such as paints, plasma spray and metal plating.

ANSI B74.3-2003 (R2014), Specifications for Shapes and Sizes of Diamond or CBN Abrasive Products
Details a system to describe the shape of complete diamond or CBN wheels either unitary or built of composite parts and includes mounted wheels and hand hones.

ANSI B74.4-1992 (R2013), Procedure for Bulk Density of Abrasive Grains
The method of test is primarily intended for determining the bulk density of abrasive grains.

UL (Underwriters Laboratories, Inc.)
ANSI/ISA 12.01.01-2013, Definitions and Information Pertaining to Electrical Equipment in Hazardous (Classified) Locations
This document provides general guidance for safe design, installation, and maintenance of electrical equipment in hazardous (classified) locations using appropriate means to prevent ignition of flammable gases and vapors, flammable liquids, combustible dusts, or ignitable fibers or flyings.

ANSI/ISA 12.13.04/FM 6325-2007 (R2014), Performance Requirements for Open Path Combustible Gas Detectors
This standard provides minimum requirements for fixed and transportable open path gas detection apparatus. This standard specifies the construction, performance and testing of open path (line-of-sight) gas monitors that sense the presence of combustible gas or vapor concentrations in air.

ANSI/ISA 60079-0 (12.00.01)-2013, Explosive Atmospheres - Part 0: Equipment - General Requirements
This standard specifies the general requirements for construction, testing and marking of electrical equipment and Ex Components intended for use in explosive atmospheres. Explosive atmospheres are identified by the National Electric Code®(NEC®); ANSI/NFPA 70 as hazardous (classified) locations and include the following specified locations: Class I, Zone 0; Class I, Zone 1; Class I, Zone 2; Zone 20; Zone 21; and Zone 22.

ANSI/ISA 60079-1 (12.22.01)-2009 (R2013), Explosive Atmospheres - Part 1: Equipment Protection by Flameproof Enclosures ‘d’
This standard contains specific requirements for the construction and testing of electrical equipment with the type of protection flameproof enclosure ‘d’, intended for use in Class I, Zone 1, explosive gas atmospheres.

ANSI/ISA 60079-10-1-2014, Explosive atmospheres - Part 10-1: Classification of areas - Explosive gas atmospheres
This standard is concerned with the classification of areas where flammable gas or vapor or mist hazards may arise and may then be used as a basis to support the proper selection and installation of equipment for use in a hazardous area. It is intended to be applied where there may be an ignition hazard due to the presence of flammable gas or vapor, mixed with air under normal atmospheric conditions.

ANSI/ISA 60079-10-2 (12.10.05)-2013, Explosive Atmospheres - Part 10-2: Classification of areas - Combustible dust atmospheres
This standard is concerned with the identification and classification of areas where explosive dust atmospheres and combustible dust layers are present, in order to permit the proper assessment of ignition sources in such areas.

ANSI/ISA 60079-11 (12.02.01)-2014, Explosive atmospheres - Part 11: Equipment protection by intrinsic safety "i"
This standard specifies the construction and testing of intrinsically safe apparatus intended for use in an explosive atmosphere and for associated apparatus, which is intended for connection to intrinsically safe circuits which enter such atmospheres.

ANSI/ISA 60079-15 (12.12.02)-2013, Explosive atmospheres - Part 15: Equipment protection by type of protection "n"
This standard specifies requirements for the construction, testing and marking for Group II electrical equipment with type of protection "n" intended for use in explosive gas atmospheres. This standard applies to electrical equipment where the rated voltage does not exceed 15 kV r.m.s. a.c. or d.c. This standard is applicable to non-sparking electrical equipment and also to electrical equipment with parts or circuits producing arcs or sparks or having hot surfaces which, if not protected in one of the ways specified in this standard, could be capable of igniting a surrounding explosive gas atmosphere.

ANSI/ISA 60079-18 (12.23.01)-2012, Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations: Type of Protection - Encapsulation "m"
This standard gives the specific requirements for the construction, testing, and marking of electrical apparatus, parts of electrical apparatus and Ex components with the type of protection encapsulation “m”.

ANSI/ISA 60079-26 (12.00.03)-2011, Explosive Atmospheres - Part 26: Equipment for Use in Class I, Zone 0 Hazardous (Classified) Locations
This standard specifies the particular requirements for construction, test and marking for electrical equipment of Group II intended for use in Class I, Zone 0 as defined in the National Electrical Code, ANSI/NFPA 70. This electrical equipment, within the operational parameters specified by the manufacturer, ensures a very high level of protection that includes rare faults related to the equipment or two faults occurring independently of each other.

ANSI/ISA 60079-28 (12.21.02)-2013, Explosive Atmospheres - Part 28: Protection of equipment and transmission systems using optical radiation
This standard explains the potential ignition hazard from equipment using optical radiation intended for use in explosive gas and combustible dust atmospheres. It describes precautions and requirements to be taken when using optical radiation transmitting equipment in explosive gas and combustible dust atmospheres.

ANSI/ISA 60079-29-1 (12.13.01)-2013, Explosive Atmospheres - Part 29-1: Gas detectors - Performance requirements of detectors for flammable gases
This part of ISA-60079-29 specifies general requirements for construction, testing and performance, and describes the test methods that apply to portable, transportable and fixed apparatus for the detection and measurement of flammable gas or vapour concentrations with air. The apparatus, or parts thereof, are intended for use in explosive gas atmospheres and in mines susceptible to firedamp.
ANSI/ISA 60079-29-2 (12.13.02)-2012, Explosive Atmospheres - Part 29-2: Gas detectors - Selection, installation, use and maintenance of detectors for flammable gases and oxygen

This part of ISA-60079-29 gives guidance on, and recommended practice for, the selection, installation, use and maintenance of electrically operated group II apparatus intended for use in industrial and commercial safety applications for the detection and measurement of flammable gases complying with the requirements of ISA-60079-29-1 and ANSI/ISA -12.13.04.

ANSI/ISA 60079-6 (12.00.05)-2009 (R2013), Explosive atmospheres - Part 6: Equipment protection by oil-immersion "o"

This standard specifies the requirements for the design, construction and testing of oil-immersed electrical equipment, oil-immersed parts of electrical equipment and Ex components in the type of protection oil immersion "o", intended for use in explosive gas atmospheres.

ANSI/ISA 60079-7 (12.16.01)-2008 (R2013), Explosive Atmospheres - Part 7: Equipment protection by increased safety "e"

This standard specifies the requirements for the design, construction, testing and marking of electrical apparatus where the rated voltage does not exceed 11 kV r.m.s. a.c. or d.c. Additional measures are applied to ensure that the apparatus does not produce arcs, sparks, or excessive temperatures in normal operation or under specified abnormal conditions.

ANSI/ISA 61010-031, Amendment 1-2010, Safety Requirements for Electrical Equipment for Measurement, Control, and Laboratory Use - Part 031: Safety requirements for hand-held probe assemblies for electrical measurement and test

The proposal is to include the IEC 2008 Amendment 1 to IEC 61010-031 within ANSI/ISA-61010-031, the US adoption of the IEC standard co-published with UL and CSA. The text is proposed to be published in the ISA, UL, and CSA versions of the standard in order to maintain the standard's harmonized status.

ANSI/ISA 61010-2-030-2012 (82.02.03), Safety Requirements for Electrical Equipment for Measurement, Control, and Laboratory Use - Part 2-030: Particular requirements for testing and measuring circuits

This clause of Part 1 is applicable except as follows: Equipment included in scope Replace the text with the following: This part of IEC 61010 specifies safety requirements for testing and measuring circuits which are connected for test or measurement purposes to devices or circuits outside the measurement equipment itself.

ANSI/ISA 92.00.02-2013, Installation, Operation, and Maintenance of Toxic Gas-Detection Instruments

This standard gives guidance on, and recommended practice for, the selection, installation, use and maintenance of electrically operated equipment intended for use in industrial and commercial safety applications for the detection and measurement of toxic gases complying with the requirements of ANSI/ISA-92.00.01 and ISA-92.00.04.

ANSI/ISA 92.00.04-2014, Performance Requirements for Open Path Toxic Gas Detectors

This standard provides minimum requirements for fixed and transportable open path toxic gas detection equipment. This standard specifies the construction, performance and testing of open path (line-of-sight) gas detectors that sense the presence of toxic gas concentrations in air.

ANSI/ISA 92.04.01 Part 1-2007 (R2013), Performance Requirements for Instruments Used to Detect Oxygen-Deficient/Oxygen-Enriched Atmospheres

This standard addresses the details of construction, performance, and testing of portable, mobile, and stationary electrical instruments used to provide a warning of the presence of oxygen-deficient or oxygen-enriched atmospheres.

UL 1-2007 (R2012), Standard for Safety for Flexible Metal Conduit

Reaffirmation of current ANSI which covers flexible aluminum and steel conduit designed for use as metal raceway for wires and cables.

UL 100-2012 (R2016), Standard for Safety for Sustainability for Gypsum Boards and Panels

The criteria in this standard were developed based on the life cycle stages of gypsum boards and panels. Sustainability factors considered in this standard are: materials, energy, manufacturing and operations, health and environment, product performance, and product stewardship. Credit for innovations in these, or other factors not listed, is also addressed in this standard.

UL 100-2012a, Standard for Sustainability for Gypsum Boards and Panels

Proposed revisions to the proposed First Edition of the Standard for Sustainability for Gypsum Boards and Panels, UL 100

UL 1004-1-2017, Standard for Safety for Rotating Electrical Machines - General Requirements (Proposal dated 8-26-16)

The following is proposed: (1) Exception for non-metallic functional parts and revised definition, and (2) Requirements for separation of circuits

UL 1004-1-2017a, Standard for Safety for Rotating Electrical Machines - General Requirements (Proposal dated 11-18-16)

This recirculation proposal provides revisions to the UL 1004-1 proposal dated 8-26-16.

UL 1004-1-2017b, Standard for Safety for Rotating Electrical Machines - General Requirements (proposal dated 1-27-17)

This recirculation proposal provides revisions to Topic 2 of the UL 1004-1 proposals dated 8-26-16 and 11-18-16 for the addition of requirements to address separation of circuits.

UL 1004-2-2015, Standard for Safety for Impedance Protected Motors (Proposal dated 12-19-14)

Proposal to remove the cheesecloth requirement from the locked-rotor temperature and endurance tests.

UL 1004-3-2015, Standard for Safety for Thermally Protected Motors (Proposal dated 11-7-14)

The following changes are proposed: (1) Remove the cheesecloth requirement from the lock-rotor temperature and endurance tests, and (2) Revised running heating test for direct drive fan air-over motors.

UL 1004-4-2015, Standard for Safety for Electric Generators (Proposal dated 3-6-15)

This proposal aligns the UL 1004-4 harmonic distortion test method with the UL 2200 test method.

The proposals include the following: (1) Alternative to Drip Proof Test, and (2) Expand scope to include larger Horsepower, IEC design N, Single phase motors, and motors rated using IP codes of IPX2

This recirculation proposal provides revisions to the UL 1004-5 proposal dated 1-22-16.

UL 1004-6-2012 (R2017), Standard for Servo and Stepper Motors (proposal dated 12-2-16)

UL proposes a reaffirmation of ANSI Approval of UL 1004-6. This Standard applies to servo and stepper motors. The requirements are intended to evaluate the suitability of the motor for normal use when fed from an appropriate controller (drive) through its manufacturer declared normal operating region.

UL 1004-7-2016, Standard for Safety for Electronically Protected Motors (Proposal dated 3-11-16)

It is proposed to add an option for the evaluation of electronically protected motors for use in appliances.

UL 1004-8-2009 (R2014), Standard for Safety for Inverter Duty Motors (Proposal dated 12-13-13)

UL is proposing to reaffirm the ANSI approval of UL 1004-8. No new revisions are being proposed.
UL 1004-9-2016, Standard for Safety for Form Wound and Medium Voltage Rotating Electrical Machines

UL proposes a new standard which covers field-installed machines with form wound windings and rated for applications between 460 V and up to 34,000 V. This standard also applies to field-installed machines employing random winding windings and rated for applications above 1,000 V and up to 7,200 V.

UL 1008-2015, Standard for Safety for Transfer Switch Equipment

The intent of this proposal is to correct errors that appear in various requirements of UL 1008.

Provides the proposed First Edition of the Standard for Medium-Voltage Transfer Switches, UL 1008A (Recirculation).

Covers solid-state automatic transfer switches intended for use in ordinary locations to provide for lighting and power only in option stand-by systems in accordance with Article 702 of the “American National Standard National Electrical Code,” ANSI/NFPA 70.

UL 101-2002 (R2012), Standard for Safety for Leakage Current for Appliances

Reaffirm the ANSI Approval of UL 101

UL 1012-2012 (R2016), Standard for Safety for Power Units Other than Class 2

Reaffirmation of ANSI approval is proposed for UL 1012

UL 1017-2015, Standard for Safety for Vacuum Cleaners, Blower Cleaners, and Household Floor Finishing Machines

The proposed 9th edition of Standard for Safety for Vacuum Cleaners, Blower Cleaners, and Household Floor Finishing Machines

UL 1017-2015a, Standard for Safety for Vacuum Cleaners, Blower Cleaners, and Household Floor Finishing Machines

The proposed 9th edition of Standard for Safety for Vacuum Cleaners, Blower Cleaners, and Household Floor furnishing.

UL 1022-2012 (R2016), Standard for Safety for Line Isolation Monitors

UL 1023-2013, Standard for Safety for Household Burglar-Alarm System Units

Correction of Table 16.1 for Minimum Spacings

UL 1023-2013a, Standard for Safety for Household Burglar-Alarm System Units

Revision to minimum spacing requirements.

UL 1026-2016a, Standard for Safety for Electric Household Cooking and Fooderving Appliances (Proposals dated 11/20/15)

2. Addition of Separate Action for Stay On Function forToaster Ovens, New 22.12.1 and 22.12.2. 3. Redundant Control Based of Food Load Ignition Test, New 22.18, 55.2.13, 55.2.14,55.2.10.6, 60.4, 60.4.1, 60.4.2, Revised 71.6.

Instruction Manual References to Extension Cords, Proposed Changes to 69.12

UL 1026-2016c, Standard for Safety for Electric Household Cooking and Fooderving Appliances (Proposals dated 4/15/16)

1. Button or Coin Cell Batteries of Lithium Technology - Proposed Reference to UL 4200A, New 33.7.  2. Breakable Surface Impact Utensil - Clarification of Dimensions/Material, Revised 55.2.3.5.  3. Smart Enabled Unattended Products - Exception to "Start" Button Activation for Products without Normally Heated Exterior Surfaces, Revised SA3.3.  4. Various Corrections Including Changes to the Title of the Standard, Revised 41.1.9, 41.2.10, Section 49, 55.3.2.  5. Removal of Definition in 4.16.  6. Clarification of 22.12.1 and 22.12.2

Smart Enabled Toaster Ovens

UL 1029-2012 (R2017), Standard for Safety for High-Intensity-Discharge Lamp Ballasts

Reaffirmation and Continuance of the Fifth Edition of the Standard for High-Intensity- Discharge Lamp Ballast, UL 1029, as an American National Standard

UL 103-2012 (R2017), Standard for Safety for Factory-Built Chimneys for Residential Type and Building Heating Appliances

Reaffirm UL 103 as an American National Standard. UL 103 covers factory-built chimneys intended for venting gas, liquid, and solid-fuel fired residential-type appliances and building heating appliances in which the maximum continuous flue-gas outlet temperatures do not exceed 1000°F (538°C).

The following changes are being proposed: (1) Deletion of 6.4 which references the use of X-rays to determine insulation spacing; (2) Addition of an exception to 14.2 for testing in a forced-air ambient condition.

Revised Electrical Transient Tests, Section 44

UL 1037-2016, Standard for Safety for Antitheft Alarms and Devices

This covers the addition of new tiered performance requirements for residential security containers

UL 104-2016, Standard for Safety for Elevator Door Locking Devices and Contacts

UL 104 covers the following elevator appliances intended for installation and operation on horizontal and vertically opening hoistway doors and gates and car doors and gates in accordance with the requirements of the Safety Code for Elevators and Escalators, ASME A17.1: a) Hoistway-Door Interlocks; b) Hoistway-Door Electric Contacts; c) Hoistway-Door Combination Mechanical Lock and Electric Contacts; d) Hoistway Gate Electric Contacts; e) Car Door Interlocks; and f) Car Door Electric Contacts.

UL 1040-2001 (R2017), Standard for Safety for Fire Test of Insulated Wall Construction

UL proposes a reaffirmation for ANSI approval of UL 1040.

UL 1042-2016, Standard for Safety for Electric Baseboard Heating Equipment

1. Clarification of Requirements for Heating Elements

UL 1042-2016a, Standard for Safety for Electric Baseboard Heating Equipment

1. Clarification of Requirements for Heating Elements

UL 1046-2012 (R2017), Standard for Grease Filters for Exhaust Ducts

UL proposes a reaffirmation for ANSI approval of UL 1046.

UL 1047-2010 (R2015), Standard for Safety for Isolated Power Systems Equipment

UL 1053-2011 (R2015), Standard For Ground-Fault Sensing and Relaying Equipment

Reaffirmation of ANSI Approval for UL 1053.

UL 1054-2008 (R2013), Special-Use Switches

UL 1059-2011, Standard for Safety for Terminal Blocks

The following changes in requirements to the Standard for Terminal Blocks, UL 1059, are being proposed: 1. Addition of exception to 9.1 for performing Mercurox Nitrate or Moist Ammonia Stress Corrosion tests

UL 1062-2014, Standard for Safety for Unit Substations

These requirements cover unit substations of 1000 kVA single phase and 3000 kVA 3-phase maximum having a maximum nominal primary or secondary rating of 600 volts. Their construction, installation, and use are intended to be in accordance with the National Electrical Code, ANSI/NFPA 70.

This proposal includes the following topics: (1) Addition of requirements to allow the measured DC resistance values to be adjusted based on the construction of the cable (2) Addition of requirements to clarify preparation of the sample for the oil immersion test (3) Revision to reinforce requirements for a single conductor wire (4) Revision to Table 17.1 to remove unnecessary footnote

Addition of Requirements to Allow the Measured DC Resistance Values to be Adjusted Based on the Construction of the Cable

UL 1066-2017, Standard for Safety for Low-Voltage AC and DC Power Circuit Breakers Used in Enclosures

1. Revision to SC2.5 to Clarify Testing Requirements for Circuit Breakers with a Remotely Operated Racking Mechanism 2. Revision of the Scope to Increase the Maximum Allowable Voltage of Low-Voltage Power Circuit Breakers

This proposal is a Reaffirmation and Continuance of the Fifth Edition of the Standard for Safety for Electrically Conductive Equipment and Materials for Use in Flammable Anesthetizing Locations.

UL 1067-2011, Standard for Safety for Electrically Conductive Equipment and Materials for Use in Flammable Anesthetizing Locations

This recirculation proposal provides revisions to the proposal document dated June 3, 2011 for the Fifth Edition of the Standard for Electrically Conductive Equipment and Materials for Use in Flammable Anesthetizing Locations, UL 1067 based on a comment received.

UL 1069-2017, Standard for Safety for Hospital Signaling and Nurse Call Equipment

The requirements in this standard cover the individual units and equipment that operate within the context of a fundamental hospital signaling nurse call system (NCS).

UL 1072-2013, Standard for Safety for Medium-Voltage Power Cables

Revised Supplementary Jacket Thickness Requirements

UL 1076-2015, Standard for Safety for Proprietary Burglar Alarm Units and Systems

Revision to minimum spacing requirements.

UL 1077-2016, Standard for Safety for Supplementary Protectors for Use in Electrical Equipment

Clarification for Measuring Spacings as Described in Table 16.1

UL 1077-2016a, Standard for Safety for Supplementary Protectors for Use in Electrical Equipment

Clarification for Measuring Spacings as Described in Table 16.1

UL 1081-2016, Standard for Safety for Swimming Pool Pumps, Filters, and Chlorinators

Proposals to add requirements for electronic circuits, to allow the use of UL 840 to evaluate clearance and creepage distances, and to update requirements for switches

UL 1081-2017, Standard for Safety for Swimming Pool Pumps, Filters, and Chlorinators

These requirements apply to electric motor-operated water pumps of the nonsubmersible type, pump-filter combinations, and chlorinators for use with swimming pools, hot tubs, and spas, to be used in accordance with the National Electrical Code, NFPA 70. The pump is secured directly to the motor or the pump and motor are factory secured to a common frame. It also covers electric pool cleaners.

UL 1081-2017a, Standard for Safety for Swimming Pool Pumps, Filters, and Chlorinators

These requirements apply to electric motor-operated water pumps of the nonsubmersible type, pump-filter combinations, and chlorinators for use with swimming pools, hot tubs, and spas, to be used in accordance with the National Electrical Code, NFPA 70. The pump is secured directly to the motor or the pump and motor are factory secured to a common frame.

UL 1082-2017, Standard for Safety for Household Electric Coffee Makers and Brewing Type Appliances (Proposals dated 9/30/16)

Carafe Handle Security Test

UL 1082-2017a, Standard for Safety for Household Electric Coffee Makers and Brewing Type Appliances (Proposals dated 11/25/16)

Carafe Handle Security Test

Instruction Manual References to Extension Cords, Proposed Changes to 56.11

UL 1083-2016a, Standard for Safety for Household Electric Skillets and Frying-Type Appliances (Proposals dated 4/15/16)

1. Button or Coin Cell Batteries of Lithium Technology - Proposed Reference to UL 4200A, New 24.10.  2. Breakable Surface Impact Utensil - Clarification of Dimensions/Material, Revised 46.2.5

UL 1083-2016b, Standard for Safety for Household Electric Skillets and Frying-Type Appliances, Proposals Dated 8/5/16

Use of Commercially Available Peanut Oil for Testing of Deep Fryers, Oil Fondues, and Skillets, Revised 31.2.2.1, 31.2.4.3, 31.2.10.1, 40.2, 46.3.1, 46.4.1

UL 1086-2016, Standard for Safety for Household Trush Compactors

UL 1088-2015, Standard for Safety for Temporary Lighting Strings

The following changes in requirements to the Standard for Temporary Lighting Strings, UL 1088/ULC-S1088, are being proposed: 1. Proposed New Edition of the Joint UL/ULC Standard for Temporary Lighting Strings, UL 1088/ULC-S1088

UL 1089-2009 (R2013), Standard for Safety for Tube Fittings for Flammable and Combustible Fluids, Refrigeration Service, and Marine Use

UL 109 covers fittings to be used in tubing carrying: a) Fuel gases such as acetylene, liquefied petroleum gas (LP-gas), and other liquefied and non-liquefied flammable gases that are stable because of their composition or because of the conditions of storage; b) Refrigerants; c) Gasoline or gasohol formulated in accordance with ANSI/ASTM D 4814; d) Diesel fuel formulated in accordance with ANSI/ASTM D 975; e) Heating fuel oils formulated in accordance with ANSI/ASTM D 396; and f) Kerosene formulated in accordance with ANSI/ASTM D 3699.

UL 1090-2016, Standard for Safety for Electric Snow Blowers

1. Replace battery operated requirements in UL 1090 with General Requirements for Battery-Powered Appliances, UL 2595

UL 1097-2012 (R2016), Standard for Safety for Double Insulation Systems for Use in Electrical Equipment

UL 10A-2009 (R2013), Standard for Safety for Tin-Clad Fire Doors

UL 10B-2015, Standard for Safety for Fire Tests of Door Assemblies
1. Revision to minimum qualifications for the test probe. 2. Addition of furnace pressure probes. 3. Revision to Thermocouple Attachment Method.

UL 10C-2016, Standard for Safety for Positive Pressure Fire Tests of Door Assemblies
1. Strengthening of existing neutral pressure plane requirements.

UL 10C-2016a, Standard for Safety for Positive Pressure Fire Tests of Door Assemblies
1. Oxygen percentage readings.

UL 110-2017, Standard for Sustainability for Mobile Phones
This Proposed First Edition of the Standard for Sustainability for Mobile Phones, UL 110, is designed to reduce environmental impacts associated with the design, manufacture, use, and disposal of mobile phones.

UL 1123 -2011a, The Standard for Marine Buoyant Devices, UL 1123
These 3 proposals include revisions to: the Dynamic Strength Test; Buoyancy Scale Accuracy; and the requirements for Measuring Excess Body Strap Lengths.

UL 1123-2011b, Standard for Safety for Marine Buoyant Devices
This 4/22/11 UL 1123 proposal specifies Additional Marking for Type V Rescue's Harness PFDs.

UL 1123 new label proposal

UL 1123-2017a, Standard for Marine Buoyant Devices
This recirculation proposal provides revisions to the UL 1123 proposal dated 7-1-16.

UL 1123-2017b, Standard for Marine Buoyant Devices
This recirculation proposal provides revisions to the UL 1123 proposal dated 9-23-16.

UL 1175-2010 (R2014), Standard for Safety for Buoyant Cushions
This proposal adds a reaffirmation for ANSI approval for UL 1175. (NOTE: This standard was prematurely listed in the Call-for-Comment section of last week’s issue of Standards Action. The correct closing date for orders and comments is October 20, 2014.)

UL 1177-2011 (R2015), Standard for Safety for Buoyant Vests
UL proposes a reaffirmation for ANSI approval for UL 1177.

UL 1180-2017, Standard for Fully Inflatable Recreational Personal Flotation Devices
This recirculation proposal provides revisions to the UL 1180 proposal dated 9-9-16.

UL 1180-2017a, Standard for Fully Inflatable Recreational Personal Flotation Devices
This recirculation proposal provides revisions to the UL 1180 proposal dated 9-9-16.

UL 1191-2013, The Standard for Safety for Components for Personal Flotation Devices
This 10/4/13 UL 1191 proposal includes changes to the Metal Hardware Exposures for Webbing and Lacing closures and adjusters (Tables 19.2 and 20.1).

This 3/6/2009 UL 1197 recirculation bulletin includes changes to the following proposal: Storage Case Warning for Users to Verify Appropriate Sizing

UL 1197-2013, Standard for Safety for Immersion Suits
This 9/20/13 UL 1197 proposal includes proposed changes to the Climbing Test for Immersion Suits.

UL 1201-2016, Standard for Sensor Operated Backwater Prevention System

UL 1201-2016a, Standard for Sensor Operated Backwater Prevention System

UL 120202-2014 (R2017), Standard for Safety for Recommendations for the Preparation, Content, and Organization of Intrinsic Safety Control Drawings (Proposal dated 04-28-17)

This proposal includes clarification of cylindrical and straight joints in Section SA6.

This proposal includes 1) Revisions to 10.2.1 and Section 34; and 2) Revisions to 15.1 and Section 24 to align UL 1203 with the current ferrous metal electrical enclosure corrosion protection requirements in UL 50E.

This revision includes proposed changes to 10.2.1 and Section 34 per comments received on proposal dated 06-26 -15.

UL 120404-2012 (R2015), Standard for Pressurized Enclosures (Proposal dated 09-04 -15)

UL 1206-2012a, Standard for Electric Commercial Clothes-Washing Equipment
1. Installation Clearances and Cycle Selection

UL 121203-2011 (R2015), Standard for Portable Electronic Products Suitable for Use in Class I and II, Division 2, Class I, Zone 2 and Class III, Division 1 and 2 Hazardous (Classified) Locations (Proposal dated 09-04-15)
Reaffirmation and Continuance of the 1st Edition of the ANSI/ISA-12.03-03-2011 Standard for Portable Electronic Products Suitable for Use in Class I and II, Division 2, Class I, Zone 2 and Class III, Division 1 and 2 Hazardous (Classified) Locations under UL 121203.

UL 122-2007 (R2015), Standard for Safety for Photographic Equipment
Reaffirmation of ANSI approval is proposed for this standard.

UL 122001-2009 (R2014), General Requirements for Electrical Ignition Systems for Internal Combustion Engines in Class I, Division 2 or Zone 2, Hazardous (Classified) Locations (proposal dated 06-27-14)
Reaffirmation and Continuance of the First Edition of the General Requirements for Electrical Ignition Systems for Internal Combustion Engines in Class I, Division 2 or Zone 2, Hazardous (Classified) Locations, UL 122001, as an American National Standard.
UL 122701-2011 (R2016), Standard for Safety for Requirements for Process Sealing between Electrical Systems and Flammable or Combustible Process Fluids (Proposal dated 03-11-16)

UL 122701-2017, Standard for Safety for Requirements for Process Sealing Between Electrical Systems and Flammable or Combustible Process Fluids (Proposal dated 01-20-17)

UL 123-2014a, Standard for Safety for Oxy-Fuel Gas Torches

New definitions are being added to the Glossary section.

UL 1236-2016, Standard for Safety for Battery Chargers for Charging Engine-Start Batteries (Proposal Date 1/15/16)

1. Modify Supplement SC to allow a communication interface to take the place of physical meters and alarms. 2. Modify Supplement SE to allow a communication interface to take the place of physical meters and alarms.

UL 1238-2016, Standard for Safety for Control Equipment for Use with Flammable Liquid Dispensing Devices

The following topic is being proposed: 1) Add laminated glass and glass with protective coatings for panels.

UL 1240-2012, Standard for Electric Commercial Clothes-Drying Equipment

1. Exception to 49.22 for Non-tumbling Dryers

UL 12402-5-2015, Standard for Safety for Personal Flotation Devices - Part 5: Buoyancy Aids (Level 50) - Safety requirements

This proposal includes changes to the 5-8-15 proposed first edition of UL 12402-5.

UL 12402-9-2015, Standard for Safety for Personal Flotation Devices - Test Methods

This proposal includes changes to the 5-8-15 proposed first edition of UL 12402-9.

UL 1241-2013, Standard for Safety for Junction Boxes for Swimming Pool Luminaires

Proposed revisions to the requirements for bonding to the common bonding grid, number of grounding terminations required, and strain relief and installation instructions

UL 1242-2014, Standard for Safety for Electrical Intermediate Metal Conduit - Steel

Document (dated 1-10-14) proposes the addition of requirements for IMC manufactured from stainless steel and the removal of figure 14 and all applicable references to figure 14.

UL 1247-2014, Standard for Safety for Diesel Engines for Stationary Fire Pumps

The following changes to UL 1247 are being proposed: 1. Revisions to the Terminal Block Arrangement and Associated Requirements; 2. Revisions to Clarify Requirements, Update Test Methods and Correlate With NFPA 20-2013; and 3. Revision to Over-current Protection Criteria

UL 1247-2014a, Standard for Safety for Diesel Engines for Driving Stationary Fire Pumps

The following changes for UL 1247 are being proposed: 1. Further Modifications to Signaling Criteria and Figure 11.1

UL 125-2015, Standard for Flow Control Valves for Anhydrous Ammonia and LP-Gas (Proposals dated 10/10/14)

1. Update Glossary Definition in 6.6 to Reflect Current NFPA Definition. 2. Clarification of the Materials Used for a Lever on a Hose Nozzle Valve, Addition of Exception No. 3 to 8.3.3. Revisions to the Deformation Test to Delete the Machine Oil in 23.2; Delete Second External Leakage Test in 23.3; Revision to the Moist Ammonia Air Stress Cracking Test, 34.2 to replace Teflon with PTFE tape.

UL 1254-2016, Standard for Pre-Engineered Dry Chemical Extinguishing System Units

UL proposes an alternate ultraviolet light exposure test method for UL 1254.

UL 1254-2016a, Standard for Pre-Engineered Dry Chemical Extinguishing System Units

UL proposes a revision to the requirements of extinguant gases in order to allow additional flexibility in the development of products.

UL 1256-2013, the Standard for Fire Test of Roof Deck Constructions

1. Clarification of 1.5 Regarding the Development of the Conditions of Acceptance 2. Clarification of 15.2 that Melting Thermal Plastic Insulation is Not Prohibited

UL 1261-2016, Standard for Safety for Electric Water Heaters for Pools and Tubs

1. Proposal to Add Requirements for Electronic Circuits 2. Proposal to Allow the Use of Standard UL 840 to Evaluate Clearance andCreepage Distances 3. Proposal to Update Requirements for Switches

UL 1261-2016a, Standard for Safety for Electric Water Heaters for Pools and Tubs

Proposal to Add Requirements for Button or Coin Cell Batteries of Lithium Technologies, New 3A12

UL 127-2015, Standard for Safety for Factory-Built Fireplaces

UL proposes an addition of floor temperatures beyond the hearth extension.

UL 1275-2010 (R2014), Standard for Safety for Flammable Liquid Storage Cabinets

1. Reaffirmation and Continuance of the Fourth Edition of the Standard for Flammable Liquid Storage Cabinets, UL 1275

UL 1277-2013, Standard for Safety for Electrical Power and Control Tray Cables with Optional Optical-Fiber Members

Revision of the Dielectric Voltage-Withstand Test to Allow Testing with DC Voltage

UL 1278-2016, Standard for Safety for Movable and Wall- or Ceiling-Hung Electric Room Heaters

1. Polymeric materials enclosure requirements. 2. Allowed use of S" type power supply cords vs "H" type cords. 3. New requirement for soldering internal connections. 4. Wire size AWG for internal wiring based on current

UL 1278-2016a, Standard for Safety for Movable and Wall- or Ceiling-Hung Electric Room Heaters

1. Polymeric materials enclosure requirements. 2. Wire size AWG for internal wiring based on current

UL 1278-2016b, Standard for Safety for Movable and Wall- or Ceiling-Hung Electric Room Heaters

3. Clarification of Requirements for Heating Elements

UL 1278-2016c, Standard for Safety for Movable and Wall- or Ceiling-Hung Electric Room Heaters

3. Clarification of Requirements for Heating Elements

1. Revision of Requirements for Capacitors

UL 1283-2015a, Standard for Safety for Electromagnetic Interference Filters (Proposal dated 07-24-15)

This proposal includes a revision to Section 27, Temperature, to be in line with IEC 60939

UL 1283-2017, Standard for Safety for Electromagnetic Interference Filters

1. Proposed 7th edition of UL 1283 to delete appliance filters that are now covered under UL 60939-3.
UL 1286-2014, Standard for Safety for Office Furnishings
1. Additional Requirement for Vertically Adjustable Surfaces. 2. Revisions to Align with the New Edition of BIFMA X5.9, Storage Units. 3. Additional Requirements for a New Supplement Covering Office Furnishings Attached to the Building Structure. 4. Revisions to Align with the New Edition of BIFMA X5.5, Desk and Table Products.

UL 1286-2014a, Standard for Safety for Office Furnishings
1. Revised Figure for Vertically Adjustable Surfaces.

UL 13-2015, Standard for Safety for Power-Limited Circuit Cables
1. Inclusion of Low Voltage LED Wire

1) Addition of Stainless Steel as a Welded and Corrugated Metal Sheath. 2) Addition of LP Ratings.

UL 1309-2014, Standard for Safety for Marine Shipboard Cable
Revision to requirements for individually shielded components and overall shielding in 11.1

UL 1309-2014a, Standard for Safety for Marine Shipboard Cable (Proposal dated 04-11-14)
The proposal includes a revision to increase the Dielectric Constant for Silicone S100 in Table 5.2

UL 1309-2017, Standard for Safety for Marine Shipboard Cable (Proposals dated 9/16/16)
1. Updates to the Standard for Safety for Marine Shipboard Cable, UL 1309 to Coordinate with the Recommended Practice for Marine Cable for Use on Shipboard and Fixed or Floating Facilities, IEEE 1580, Revised Table 4.2 and Table 38.1; 2. Definition of Spacing Between Cable Holes, Revised 29.2; 3. Correction to Test Temperature in 29.3; 4. Clarification of Reference to Test, Revised 5.4.2.1; 5. Clarification to Constructions Subject to Requirement, Revised 14.1.2, 14.1.3, and 14.2.1; 6. Updated IEC Standard Number, Revised 40.1 (j)

UL 1309-2017a, Standard for Safety for Marine Shipboard Cable (Proposal dated 3/10/17)
5. Clarification to Constructions Subject to Requirement, Revised 14.1.3

UL 1310-2017, Standard for Safety for Class 2 Power Units (Proposal dated 10-21-16)
The following is proposed: 1) Exception to the maximum voltage requirements for a power supply in a no-load condition, and 2) Clarification of spacing required on a semiconductor device

UL 1313-2015, Standard for Nonmetallic Safety Cans for Petroleum Products
The following changes in requirements to the Standard for Nonmetallic Safety Cans for Petroleum Products, UL 1313, are being proposed: 1. Clarify general requirements in Section 3.2. Update references to ASTM standards. 3. Revise UV test methods in Section 26.3 to reflect updated practice

UL 1314-2005 (R2014), Standard for Safety for Special-Purpose Metal Containers
The following is being proposed: 1. Reaffirmation and Continuance of the Fourth Edition of the Standard for Special-Purpose Metal Containers, UL 1314, as an American National Standard

UL 1315-2003 (R2012), Standard for Safety for Metal Waste Paper Containers
The following is being proposed: 1. Reaffirmation and Continuance of the First Edition of the Standard for Metal Waste Paper Containers, UL 1315, as an American National Standard

Replace ASTM G26 with ASTM G155 in 21.1

UL 1322-2010 (R2015), Standard for Safety for Fabricated Scaffold Planks and Stages
This standard covers requirements for the following; a) Wood, metal, or a combination of wood and metal fabricated planks; b) Fabricated platforms for use with suspended, fixed, or rolling scaffold; c) Modular suspended platforms; d) Scaffold decks; e) Mobile work stands; and f) Work cages (basket).

UL 1323-2014, Standard for Safety for Scaffold Hoists
Proposed new paragraph 5.3 requires electrical features of a control box to be evaluated to the Standard for Industrial Control Equipment, UL 508 or the Standard for Power Conversion Equipment, UL 508C.

UL 1323-2014a, Standard for Safety for Scaffold Hoists
These proposals cover the following topics: 1) Editorial revisions; 2) Grounding and bonding; 3) Motor requirements; and 4) Increase voltage rating to 1000 V.

UL 1323-2014b, Standard for Safety for Scaffold Hoists
This proposal revises requirements for hoisting speed in paragraph 5.1.

UL 1332-2016, Standard for Safety for Organic Coatings for Steel Enclosures for Outdoor Use Electrical Equipment
Covers the proposed fifth edition of UL 1332, which includes revisions to clarify existing text, additional terminology, updating of standard references, replacement of obsolete standard references and changes to reflect current practice.

UL 136-2010 (R2015), Standard for Safety for Pressure Cookers (Proposal Dated 1-16-15)
These requirements cover household-type cooking utensils known as pressure cookers or pressure sauce pans which operate at a nominal pressure of 15 psig (103 kPa) or less. They are intended for use over gas- or electric-top burners of residential-type cooking ranges. These requirements do not cover pressure cookers intended for pressure frying with oil. These requirements do not evaluate the toxicity of coatings or the physiological effects of consuming food prepared by use of these appliances. These requirements do not evaluate the operation or use of removable or replaceable parts.

UL 1370-2016, Standard for Safety for Unvented Alcohol Fuel Burning Decorative Appliances
UL proposes the following changes to UL 1370: modifications to the scope, fuel capacity and test room size, editorial correction and addition, and test requirements for outdoor appliances.

UL 1384-2017, Standard for Water-Based Automatic Extinguisher Units
UL proposes the First Edition of the Standard for Water-Based Automatic Extinguisher Units, UL 1384.

UL 140-2008 (R2012), Relocking Devices for Safes and Vaults (Proposal Dated 5/18/12)
These requirements cover relocking devices for the following: Light vault doors, Heavy vault doors, and Safes or chests. Relocking devices are intended to relock the bolt mechanism or door of a vault, safe, or chest in the event that the combination lock is subjected to attack.

UL 141-2011 (R2016), Standard for Safety for Garment Finishing Appliances (Proposal dated 6-17-16)

UL 1411-2011 (R2015), Standard for Safety for Transformers and Motor Transformers for Use in Audio-, Radio-, and Television-Type Appliances
Reaffirmation of ANSI approval is proposed for UL 1411

UL 1412-2012 (R2016), Standard for Safety for Fusing Resistors and Temperature-Limited Resistors for Radio- and Television-Type Appliances
Reaffirm UL 1412 as an American National Standard. UL 1412 covers fusing resistors and temperature-limited resistors to be employed in radio- and television-type appliances. These requirements also apply to resistor mounting assemblies intended for use with such resistors. These requirements cover fusing resistors and temperature-limited resistors for use in radio- and television-type appliances in circuits that do not involve potentials greater than 2500 V peak.
UL 1413-2012 (R2016), Standard for Safety for High-Voltage Components for Television-Type Appliances
Reaffirm UL 1413 as an American National Standard. UL 1413 covers flyback transformers, high-voltage multipliers, deflection yokes and picture-tube high-voltage-neck components intended to be employed in television-type appliances. Protective devices or circuits that are an integral part of a component are to be considered as part of that component.

UL 1416-2012 (R2017), Standard for Safety for Overcurrent and Overtemperature Protectors for Radio- and Television-Type Appliances
Reaffirm UL 1416 as an American National Standard. UL 1416 covers overtemperature protectors, and overcurrent protectors to be employed in radio- and television-type appliances in applications where the protectors are relied upon to limit power, current, or both.

UL 1417-2012 (R2017), Standard for Safety for Special Fuses for Radio- and Television-Type Appliances
Reaffirm UL 1417 as an American National Standard. UL 1417 covers special types of fuses not covered by separate requirements and that are for use in radio- and television-type appliances where they are relied upon to limit power or current, or both. These requirements also apply to holders intended to accept such special fuses, where the holder may be an integral part of the fuse design.

UL 1419-2011 (R2016), Standard for Safety for Professional Video and Audio Equipment
These requirements cover video and audio equipment rated 600 volts or less and operated and maintained by trained personnel under the conditions of controlled access. They cover such equipment as video tape recorders, audio/video editing equipment, audio/video receiving and processing equipment, signal transmission equipment, television cameras, video digitizers, video monitors, metering equipment and similar equipment. This Standard also covers auxiliary equipment and accessories which by themselves may not perform the desired function of the equipment outlined above but are used in addition to or as a supplement to the basic equipment.

UL 1420-2013, Standard for Safety for Steel Aboveground Tanks for Flammable and Combustible Liquids

UL 1424-2010 (R2015), Standard for Safety for Cables for Power-Limited Fire-Alarm Circuits

UL 1425-2010 (R2015), Standard for Safety for Non-Power-Limited Fire-Alarm Circuits

UL 1426-2010 (R2015), Standard for Electrical Cables for Boats

UL 1429-2009 (R2013), Standard for Safety for Pullout Switches

UL 1439-2011a, Standard for Safety for Tests for Sharpness of Edges on Equipment

UL 1439-2013, Standard for Safety for Tests for Sharpness of Edges on Equipment
Alternate Sensing Tapes and Revised Tape Properties

UL 1444-2014, Standard for Safety for LP-Gas Regulators
These proposals cover clarification of requirements, revised Moist Ammonia-Air Stress Cracking Test, and the addition of the Endurance Test for manual shut off valves.

UL 1441-2005 (R2013), Standard for Safety for Coated Electrical Slewing
Reaffirmation of the Standard for Coated Electrical Slewing, UL 1441.

This proposal contains the following revisions: (1) Revision to the Scope (2) Revision to Reference Publications (3) Revision to the definition of Cycle (4) Replacement of Insulation System and Insulation System Class with EIS Electrical Insulation System (5) Clarification of definitions for Major and Minor System Components (6) Revision to the definition of Crossover Insulation (7) Revision to the definition of Securement Tape (8) Revision to the definition of Window Insulation

UL 1446-2016a, Standard for Safety for Systems of Insulating Materials - General

UL 1447-2013, Standard for Safety for Electric Lawn Mowers
UL is proposing Revision to the Battery Voltage Level Requirements for Battery-operated Lawn Mowers

UL 1447-2013a, Standard for Safety for Electric Lawn Mowers
This proposal covers the removal of the Thrown Object Test in Section 69 due to duplication in ANSI B71.1

UL 1449-2016, Standard for Safety for Surge Protective Devices
1. Revision of PV Requirements 2. Testing Methods for Combination Type SPDs 3. Interchangeability of Metal Oxide Varistors (MOVs) 4. Addition of Tolerance Requirements 5. Addition of Requirements for DC SPDs 6. Addition of Requirements for Open Type SPDs 7. Addition of Requirements for SPDs Intended for Connection Using Exposed Wiring Methods 8. SPDs with Only N-G Protection 9. Editorial Corrections to Table 36.2 10. Clarification of Test Method for Fault Current and Overcurrent Tests 11. Type 3 SPD - Cord Connected Intended to be Permanent Mounted on Furniture

UL 1450-2013, Standard for Safety for Motor-Operated Air Compressors, Vacuum Pumps, and Painting Equipment
1. Clarification of the Probe Title for Figure 12.2 2. Addition of an Exception to Paragraph 27.4 to Clarify Printed Wiring Board Spacings. 3. Deletion of the Specification for cheesecloth from the Standard. 4. Correction of Paragraph 46.1.7 by Removing the Reference to Inflators. 5. Addition of an Allowance for DC Use During Production Line Dielectric Testing. 6. Addition of a Specific Reference to Inflators in Paragraph 46.1.8. 7. Revision of Marking Size Requirements to be According to Font Size Rather than Fractional Size. 8. Revision to the Flash Point Requirements by Additionally Restricting the Use to a Higher Flash Point.
UL 1450-2013a, Standard for Safety for Motor-Operated Air Compressors, Vacuum Pumps, and Painting Equipment

1. Deletion of Section 6, Attachments.

This proposal covers the following topic: 1) Revision to polymeric material and thermal insulation requirements

UL 1453-2017a, Standard for Safety for Electric Booster and Commercial Storage Tank Water Heaters

The following topic is being proposed: 1) Addion of requirements for outdoor use equipment.

End Connections and Outlet Pressure/Flow Requirements, Proposed Changes to Section 7, 7.1, 7.2, 7.3, 7.4, and Table 9A.1

UL 147-2016, Standard for Safety for Hand-Held Torches for Fuel Gases

This proposal is being issued to add requirements for battery-operated torches.

UL 1472-2015, Standard for Safety for Solid State Dimming Controls

The following is being proposed: (1) Revision and addition of requirements for ground leakage current.

UL 1472-2015a, Standard for Safety for Solid State Dimming Controls

The following is being proposed: (1) Revision and addition of requirements for ground leakage current.

UL 1478-2004 (R2013), Standard for Safety for Fire Pump Relief Valves
direct acting (spring loaded) and pilot operated fire pump relief valves of nominal 3/4 inch (19.05 mm) size and larger, intended for use in water supply systems for fire protection service.

UL 1478A-2013, Standard for Safety for Pressure Relief Valves for Sprinkler Systems

Pressure relief valves intended for use in sprinkler systems for fire protection service to relieve excessive pressures caused by thermal expansion, downstream of a pressure reducing valve or in valve trim.

UL 1479-2015, Standard for Fire Tests of Through-Penetration Firestops

Including test provisions for membrane penetration type firestop systems.

UL 1479-2015a, Standard for Fire Tests of Through-Penetration Firestops

The following topic for the Fire Tests of Through-Penetration Firestops, UL 1479, is being recirculated: 1. Including test provisions for membrane penetration type firestop systems.

UL 147A-2009 (R2013), Standard for Safety for Nonrefillable (Disposable) Type Fuel Gas Cylinder Assemblies

These requirements cover nonrefillable cylinder assemblies for use with propane, Methlyacetylene-Propadiene, Stabilized (MPS-Gas), and propylene.

UL 147A-2009a, Standard for Safety for Nonrefillable (Disposable) Type Fuel Gas Cylinder Assemblies

Clarification of the fire test in paragraph 14.5.

UL 147B-2016, Standard for Safety for Nonrefillable (Disposable) Type Metal Container Assemblies for Butane

The following topics are being proposed: (1) Revise construction requirements for pressure vessel and (2) Update requirements for protective coatings.

UL 1480-2016, Standard for Safety for Speakers for Fire Alarm and Signaling Systems, Including Accessories, (proposal dated 5-10-13)

New proposed 6th edition of UL 1480, is a binational standard with requirements for the U.S. and Canada covering speakers rated at 300 V or less for fire alarm and signaling systems and intended for indoor and/or outdoor installation in accordance with CSA C22.1, Canadian Electrical Code, Part I, and National Electrical Code, NFPA 70.

UL 1480-2016a, Standard for Safety for Speakers for Fire Alarm and Signaling Systems, Including Accessories

New proposed 6th edition of UL 1480, is a binational standard with requirements for the U.S. and Canada covering speakers, rated at 300 V or less, for fire alarm and signaling systems and intended for indoor and/or outdoor installation in accordance with CSA C22.1, Canadian Electrical Code, Part I, Safety Standard for Electrical Installations, and National Electrical Code, NFPA 70.

UL 1480-2016b, Standard for Safety for Speakers for Fire Alarm and Signaling Systems, Including Accessories

Recirculation of changes for the proposed 6th edition of UL 1480, is a binational standard with requirements for the U.S. and Canada covering speakers, rated at 300 V or less, for fire alarm and signaling systems and intended for indoor and/or outdoor installation in accordance with CSA C22.1, Canadian Electrical Code, Part I, Safety Standard for Electrical Installations, and National Electrical Code, NFPA 70.

UL 1480A-2016, Standard for Safety for Speakers for Commercial and Professional Use

New proposed first edition of UL 1480A, covering speakers for indoor and/or outdoor use in dry, damp, wet, or underwater locations intended for a) Commercial and professional audio systems providing non-emergency sound reinforcement; b) Non-fire emergency voice-warning systems in accordance with the National Electrical Code, NFPA 70.

UL 1482-2011 (R2015), Standard for Safety for Solid-Fuel Type Room Heaters

Reaffirmation of ANSI approval is proposed to be adopted.

UL 1484-2008 (R2013), Standard for Safety for Residential Gas Detectors

Electrically operated gas detectors intended for installation in residential occupancies and recreational vehicles (RVs). Gas detectors intended to detect flammable gases such as propane and natural gas. All remote accessories that may be connected to a gas detector.

UL 1486-2003 (R2013), Standard for Safety for Quick Opening Devices for Dry Pipe Valves for Fire (Proposal dated 6-14-13)

This standard covers quick opening devices intended for attachment to dry pipe valves to reduce the time delay in operation of the valve following opening of one or more sprinklers. The quick opening devices consist of accelerators and exhausters for use with a specific dry pipe valve design. The products covered by this standard are intended for use in fire protection service as outlined by the Standard for Installation of Sprinkler Systems, NFPA 13.

UL 1489-2016, Standard for Safety for Fire Tests of Fire Resistant Pipe Protection Systems Carrying Combustible Liquids

The proposed first edition of the Standard for Fire Tests of Fire Resistant Pipe Protection Systems Carrying Combustible Liquids, UL 1489. This standard covers products such as, but not limited to, sleeve, wrap or spray-on type fire protection systems applied over or on to rigid piping networks typically consisting of short sections of thick wall pipe connected with threaded or welded fittings that are assembled on site. It also describes a standard test method to develop the data necessary for evaluating fire resistive pipe protection systems for specific applications.

UL 14B-2008 (R2013), Standard for Safety for Sliding Hardware for Standard, Horizontally Mounted Tin-Clad Fire Doors

These requirements apply to hardware for horizontally sliding fire doors which have demonstrated in fire tests fire-resistive properties warranting their use with two-ply and three-ply tin-clad fire doors tested in accordance with the Standard for Fire Tests of Door Assemblies, UL 10B (NFPA No. 252).

UL 14B-2008a, Standard for Sliding Hardware for Standard, Horizontally Mounted Tin-Clad Fire Doors

Update of standard references in paragraphs 1.1 and 1.2.

UL 14C-2008 (R2013), Standard for Safety for Swinging Hardware for Standard Tin-Clad Fire Doors Mounted Singly and in Pairs

These requirements apply to hardware for swinging fire doors which have demonstrated in fire tests fire-resistive properties warranting their use with two-ply and three-ply tin-clad fire doors tested in accordance with the Standard for Fire Tests of Door Assemblies, UL 10B (NFPA No. 252).
UL 14C-2008a, Standard for Swinging Hardware for Standard Tin-Clad Fire Doors Mounted Singly and in Pairs

Update of standard references in paragraphs 1.1 and 1.2.

UL 150-2011 (R2015), Standard for Safety for Antenna Rotators

Reaffirm UL 150 as an American National Standard. UL 150 covers antenna rotators for household & commercial use that generally consist of a mast-mounted (generally outdoors), motorized drive unit that rotates the antenna to the desired receiving azimuth; an indoor located (usually near TV- or radio-receiving equipment) user-operated control unit that delivers operating power and direction signals to the drive unit; & a length of multiple-conductor Class-2 circuit cable to electrically interconnect the drive and control units. These requirements do not cover systems that use a stationary antenna and change or rotate the receiving pattern by electronic or switching.

UL 1517-2012, Standard for Safety for Hybrid Personal Floatation Devices

This 2/3/2012 UL 1517 proposal includes changes to the quantity of cartridges required with a hybrid PFD.

UL 153-2017, Standard for Safety for Portable Electric Luminaires

The following changes in requirements to the Standard for Portable Electric Luminaires, UL 153, are being proposed: 1. Add requirements for instant-start ballast and lampholder compatibility. 2. Add requirements for use of split SPT-2 cords.

UL 153-2017a, Standard for Safety for Portable Electric Luminaires

The following changes in requirements to the Standard for Portable Electric Luminaires, UL 153, are being proposed: 1. Add requirements for USB and POE Portable Luminaires. 2. Scope clarification relative to decorative lighting 3. Revise definition of ‘Lamp’& ‘2211; in Glossary. 4. Clarify requirements for portable luminaires intended for use without a shade. 5. Add requirements for lampholders for use with instant start ballasts. 6. Add requirements for button and coin batteries. 7. Add requirements for overcurrent protection. 8. Clarify and consolidate requirements for surface mounted units. 9. Remove requirements for internal wiring protection for cord and chain.

UL 154-2009 (R2014), The Standard for Safety for Carbon-Dioxide Fire Extinguishers

UL proposes a reaffirmation for ANSI approval for UL 154.

UL 155-2009 (R2013), Standard for Tests for Fire Resistance of Vault and File Room Doors

These requirements cover the test procedure applicable to the fire-resistance classification of doors, intended for the protection of openings of vaults and file rooms. Recommendations for record protection equipment and techniques, including the use and installation of vault or file room door assemblies, are contained in the Standard for Protection of Records, NFPA 232. The terms “vault doors” and “file room doors” refer to assemblies consisting of doors, single or in pairs, the frame into which doors are hung, and the necessary hardware. These assemblies are intended to provide fire resistance and protection to contents from heat.

UL 1557-2014, Standard for Safety for Electrically Isolated Semiconductor Devices

(Proposal dated 8/29/14)

Addition of Semiconductor Devices Incorporating Thermistor Type Devices, New Supplement SA

UL 1558-2016, Standard for Safety for Metal-Enclosed Low-Voltage Power Circuit Breaker Switchgear

The requirements of UL 1558 cover metal-enclosed low-voltage power circuit breaker switchgear assemblies containing but not limited to such devices as low-voltage power circuit breakers, other interrupting devices, switches, control, instrumentation and metering, protective and regulating equipment.

UL 1558-2017, Standard for Safety for Metal-Enclosed Low-Voltage Power Circuit Breaker Switchgear

This proposal involves an editorial revision of requirements for Wire Bending Space in Table 16.2.

UL 1559-2011b, Standard for Safety for Insect-Control Equipment - Electrocuton Type

UL proposes the following change to UL 1559: addition of 70.1.2a for allowance of date code markings on attachment plug blades.

UL 1559-2012, Standard for Safety for Insect-Control Equipment - Electrocuton Type

UL proposes revisions to UL 1559 to add requirements for insect-electrocution equipment which generates ultraviolet (UV) radiation.

UL 1561-2015, Standard for Safety for Dry-Type General Purpose and Power Transformers

1. Addition of Overload Test Requirements for 240 C Insulation System

UL 1563-2016, Standard for Safety for Electric Spas, Equipment Assemblies, and Associated Equipment

Proposal to Add Requirements for Button or Coin Cell Batteries of Lithium Technologies, New 7A.5

UL 1564-2013, Standard for Safety for Industrial Battery Chargers (Proposal dated 1-18-13)

The proposal includes revisions to remove references to asbestos materials.

UL 1565-2013 (R2017), Standard for Safety for Positioning Devices

1. Reaffirmation and Continuance of the Fifth Edition of the Standard for Positioning Devices, UL 1565, as an American National Standard

UL 1567-2012 (R2016), Receptacles and Switches Intended for Use with Aluminum Wire

Reaffirmation of ANSI Approval for UL 1567

UL 1569-2016, Standard for Safety for Metal-Clad Cables

The following are being proposed: 1. Revision to permit Ground/Bond conductor to be laid straight for MC Cable having interlocked armor that is intended for use as a ground path and to permit conductors sized 18 and 16 AWG in addition to the prescribed 14-6 AWG size range. 2. Revised length of lay requirement for the signal and/or control cables within a pre-cabled group.

UL 1574-2012 (R2016), Standard for Safety for Track Lighting Systems

The following is being proposed: 1. Reaffirmation and Continuance of the Third Edition of the Standard for Track Lighting Systems, UL 1574, as an American National Standard

UL 1577-2015, Standard for Safety for Optical Isolators (Proposals dated 10/10/14)

1. Deletion of Upper Limit, Production Dielectric Isolation Tolerance (5%) Boundary, Revised 17.2 and Deleted 17.3 2. Deletion of Scope Paragraph, 1.6 3. Removal of Withdrawn ASTM Standard from 13.2

Correction to Metric Conversion of Ohms per 1000 Feet for 25 AWG Conductors at 20 Degrees C in Table 30.4.

ICP Test Method, New 492.8.1; Revised 492.2, 492.3, 492.7, 492.8, 492.9.
The following changes in requirements to the Standard for Luminaires, UL 1598, are being proposed: 1. Revise requirements for mechanical joints and fastenings in Section 5.10.2. Add wire style TFN to Table 6.9.2.3. Correct Enclosed Lamp Compartment entry in legend to Figure 7.2.1.1.4. Increase minimum temperature ratings in Table 7.2.2.1.1 for partially enclosed lamp compartment rated 60 W or less. 5. Revise Canada only branch circuit disconnect requirements for fluorescent luminaires. 6. Change language for polymeric lenses in luminaires. 7. Remove Canadian requirements to Exit signs. 8. How to replace incandescent bulbs with CFLs and LEDs. 9. Additional Canada only annex for RV luminaires. 10. Clarification of required marking in Clause 11.3.4. 11. Clarification of required rating for expansion as Table 19.16.1.

UL 1598A-2005 (R2014), Standard for Safety for Supplemental Requirements for Luminaires for Installation on Marine Vessels

The following is being proposed: 1. Reaffirmation and Continuance of the First Edition of the Standard for Supplemental Requirements for Luminaires for Installation on Marine Vessels, UL 1598A, as an American National Standard

UL 1598B-2014, Standard for Safety for Supplemental Requirements for Luminaire Reflector Kits for Installation on Previously Installed Fluorescent Luminaires

The following changes in requirements to the Standard for Supplemental Requirements for Luminaire Reflector Kits for Installation on Previously Installed Fluorescent Luminaires, UL 1598B, are being proposed: 1. Clarify Requirements for Luminaire Retrofit Kits that Provide Replacement Lampholders or Instant Start Ballasts

UL 1598C-2016, Standard for Light-Emitting Diode (LED) Retrofit Luminare Conversion Kits

1. Supplemental Requirements for Marine Luminaires

UL 1602-2011 (R2017), Standard for Safety for Gasoline-Engine-Powered, Rigid-Cutting-Member Edgers and Edger Trimmers

UL 1610-2016, Standard for Safety for Central-Station Burglar-Alarm Units

This covers a proposal to address single-path communications, alarm control unit.

UL 1610-2016a, Standard for Safety for Central-Station Burglar-Alarm Units

This covers a proposal to address remote access to alarm panels, via smart devices and/or the internet

UL 1610-2016b, Standard for Safety for Central-Station Burglar-Alarm Units

Revises the following proposal as the result of comments received: 1. Single-path communications, alarm control unit

UL 1610-2016c, Standard For Central-Station Burglar-Alarm Units

1. Expand electronic media to include website.

UL 1610-2016d, Standard for Safety for Central-Station Burglar-Alarm Units

Revisions based on comments received on the proposal for remote access to alarm panels, via smart devices and/or the internet.

UL 1618-2009 (R2013), Standard for Safety for Wall Protectors, Floor Protectors, and Hearth Extensions

UL proposes a reaffirmation for ANSI approval of UL 1618.

UL 162-2015, Standard for Safety for Foam Equipment and Liquid Concentrates

The following is being proposed: (1) Revision to Moist Ammonia Test criteria; (2) Revision to Drop Test for larger containers; (3) Revision to exposure tests for polymeric materials and fiberglass components used in parts other than containers; (4) Addition of National and International Standards reference.

UL 1626-2012a, Standard for Safety for Residential Sprinklers for Fire-Protection Service

Recirculation of proposal for UL 1626 regarding Polymeric Sprinklers

UL 1626-2017, Standard for Residential Sprinklers for Fire-Protection Service

UL 1635-2015, Standard for Safety for Digital Alarm Communicator System Units

Revision to minimum spacing requirements.

UL 1637-2016, Standard for Safety for Home Health Care Signaling Equipment

These requirements cover individual units that comprise a home health care system intended for use in indoor residential locations, and a complete system in which a signal initiating device may be connected to receiving equipment at a residence or to continuously monitored receiving equipment at a central supervising station. Components may include signal initiating devices, control units, transmitters, digital communicators, receiving, processing, and displaying equipment. A product that contains features new or different shall be evaluated using the appropriate component and end-product requirements to maintain the acceptable level of safety.

UL 1638-2016, Standard for Safety for Visible Signaling Devices for Fire Alarm and Signaling Systems, Including Accessories

Recirculation of changes for the proposed 5th edition of UL 1638A, covering visual signaling devices intended only for general use – electrically-operated visual signaling appliances rated 300 volts or less, intended for indoor locations, outdoor locations, or both, in accordance with the National Electrical Code, NFPA 70.

UL 1640-2016, Standard for Safety for Portable Power-Distribution Equipment

The requirements of UL 1640 cover portable power-distribution equipment intended for use in the following locations: a) Carnivals, circuses, fairs, and similar locations in accordance with Article 525 of the National Electrical Code (NEC), NFPA 70; b) Exhibition halls in accordance with Article 518 of the NEC; c) Motion picture and television studios and similar locations in accordance with Article 530 of the NEC; d) Theaters, audience areas of motion-picture and television studios, and similar locations in accordance with Article 520 of the NEC; and e) Temporary installations at construction sites in accordance with Article 590 of the NEC.

UL 1640-2016a, Standard for Safety for Portable Power-Distribution Equipment

This project covers revised versions of the following proposals for UL 1640 that were published for ballot on May 27, 2016: 1) Revision of the Scope of UL 1640 and 2) Addition of Requirements for the Use of “Weather Resistant” Receptacles for Equipment Rated for Outdoor Use.

UL 1640-2016b, Standard for Safety for Portable Power-Distribution Equipment

This project covers revised versions of the following proposals for UL 1640 that were published for ballot on May 27, 2016: 1) Revision of the Scope of UL 1640 and 2) Addition of Requirements for the Use of “Weather Resistant” Receptacles for Equipment Rated for Outdoor Use.
The following changes are being proposed; 1. Revisions to 4.1 for the Standards to which control units may be evaluated; 2. Revisions to 5.1.2 for removal of NFPA 74 and adding Chapter 29 of NFPA 72; 3. Revisions to 16.4 referencing codes after verification.

UL 1647-2016, Motor-Operated Massage and Exercise Machines
The following changes in requirements to UL 1647, they are: 1. Deletion of Repetitive Requirements in 29.4, 30 and 31.2. Removal of Section 77.

UL 1647-2016a, Standard for Safety for Motor-Operated Massage and Exercise Machines (Proposal dated 10/14/16)
This proposal includes (1) Revision of requirements to allow detachable power supply cords and change in terminology of a ‘cord set’ to a ‘detachable power supply cord’.

UL 1650-2016, Standard for Safety for Portable Power Cables (Proposal dated 1/29/16)
Tensile Strength for TPE Jacket, Proposed Change to Table 8.3.

UL 1651-2015, Standard for Safety for Optical Fiber Cable
1. Addition of the Physical Properties Test. 2. Revision to Marking Requirements. 3. Addition of “LS” Cable Designation.

UL 1651-2015a, Standard for Safety for Optical Fiber Cable
3. Addition of “LS” Cable Designation.

UL 1653-2014, Standard for Safety for Electrical Nonmetallic Tubing
Document dated 8/8/14 proposes the addition of trade size 2-1/2 (63) for use in Canada only. The National Electrical Code specifies the maximum size for ENT as trade size 2 (52); however, the Canadian Electrical Code has no such limitation. Therefore new clause 7.5.1.2 and revisions to clauses 9.1, 9.2, and Tables 1 - 3 are being proposed for this binational ENT standard.

UL 1655-2009a (R2014), Standard for Safety for Community-Antenna Television Cables
This Standard states the construction, test, and marking requirements covering the safety of single and multiple coaxial and coaxial/optical-fiber cables for the distribution of radio frequency signals such as employed in a community antenna television system, and for supplying low-energy power at a potential not exceeding 60 volts to equipment directly associated with the signal distribution.

These requirements cover the blades of attachment plugs and current taps intended to be connected to the conductors of flexible cords using crimped connections, for use on cord sets and power-supply cords complying with the Standard for Cord Sets and Power-Supply Cords, UL 817.

UL 1660-2014, Standard for Safety for Liquid-Tight Flexible Nonmetallic Conduit
Document dated 1/31/14 proposes the new fifth edition of UL 1660 which covers liquid-tight flexible nonmetallic conduit in the 3/8 - 4 (12 - 103) trade sizes of Type LFNC-A (Layered), Type LFNC-B (Integral), and Type LFNC-C (Corrugated) constructions. The new edition removes the Canadian deviation for direct burial stiffness, and provides additional clarifications and reference updates. The conduit is intended for installation in accordance with the National Electrical Code (NEC) and the Canadian Electrical Code (CEC), Part 1.

UL 1666-2012 (R2017), Standard for Safety for Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts (Proposal dated 11/4/16)
This is a fire test for determining values of flame propagation height for electrical and optical-fiber cables that are for installation vertically in shafts or in vertical runs that penetrate one or more floors. The purpose of this test is to determine whether the flame propagation characteristics of these riser cables are in accordance with the National Electrical Code.

UL 1678-2016, Standard for Safety for Household, Commercial, and Institutional-Use Carts and Stands for Use with Audio/Video Equipment
1. Revision to Requirements for Flat Panel Television Test Fixture

UL 1678-2016a, Standard for Safety for Household, Commercial, and Institutional-Use Carts, Stands and Entertainment Centers for Use with Audio and/or Video Equipment
Revision of Requirements for the Simulated TV Test Fixture with Respect to Weight of Product and Center of Gravity

UL 1678-2016b, Standard for Safety for Household, Commercial, and Institutional-Use Carts, Stands and Entertainment Centers for Use with Audio and/or Video Equipment
1. Revision of Requirements for the Simulated TV Test Fixture with Respect to Weight of Product and Center of Gravity

UL 1678-2016c, Standard for Safety for Household, Commercial, and Institutional-Use Carts, Stands and Entertainment Centers for Use with Audio and/or Video Equipment
1. Revisions to address potential injury from different loading and unloading scenarios. 2. Additional requirements regarding the securement of an audio or video device to the cart, stand or entertainment center. 3. Revisions to address polymeric components whose failure would cause the supported weight of the audio or video product to be released. 4. Addition of requirements for testing wide handles with the load distributed between two 3-inch areas on the single handle. 5. Revision to Figure 16.6 (Appurtenance Loading).

UL 1681-2012 (R2016), Wiring Device Configurations
Reaffirmation of ANSI Approval for UL 1681

UL 1682-2017, Plugs, Receptacles, and Cable Connectors, of the Pin and Sleeve Type
This standard applies to pin and sleeve type plugs, receptacles, power inlets, and connectors, rated up to 800 amperes and up to 600 volts ac or dc, and which may include up to eight pilot contacts. These devices are intended to provide power from branch circuits, or are for direct connection to the branch circuit in accordance with the Canadian Electrical Code Part I, the National Electrical Code (NEC), ANSI/NFPA 70, and the Mexican Electrical Code, NOM 001-SEDE, using copper conductors, for use in either indoor or outdoor nonhazardous locations. In Canada, the terminals of a device intended to accommodate aluminum conductors also comply with CSA C22.2 No. 65.

UL 1682-2017a, Standard for Safety for Plugs, Receptacles, and Cable Connectors, of the Pin and Sleeve Type
The Proposed Fifth Edition of the Standard for Safety for Plugs, Receptacles, and Cable Connectors, of the Pin and Sleeve Type, UL 1682, as a Trinational Standard with CSA and ANCE.

UL 1685-2010 (R2015), Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables

UL 1686-2014, Standard for Safety for Pin and Sleeve Type
Addition of 4 O’Clock Dimensional Configuration with a Rated Voltage Not Exceeding 50 V
UL 1690-2011 (R2015), Standard for Safety for Data-Processing Cable
These requirements cover electrical cables consisting of one or more current-carrying copper, aluminum, or copper-clad aluminum conductors with or without either or both grounding conductor(s), and one or more optical-fiber members, all under an overall jacket. These electrical and composite electrical/optical-fiber cables are intended for use (optical and electrical functions associated in the case of a hybrid cable) in accordance with Article 645 and other applicable parts of the National Electrical Code (NEC) under the raised floor of a computer room.

UL 1691-2014, Standard for Safety for Single Pole Locking-Type Separable Connectors
1. Revisions to Figures B1.1 - B1.3 for Clarification of Dimensions and Tolerances and to Address Non-TPE (Rigid) Housings

UL 1692-2009 (R2014), Standard for Safety for Polymeric Materials - Coil Forms

UL 1694-2010 (R2015), Standard for Safety for Tests for Flammability of Small Component Materials

UL 1696-2015, Standard for Safety for Nonmetallic Protection Tubing (NMPT)
Recirculation of changes (document dated 10/3/14) for the proposed Second Edition of the Standard for Mechanical Protection Tubing (MPT) and Fittings, UL 1696

Clarification of the Carbonized Path Arc Ignition Test 2. Clarification of Supplement SA Requirements 3. Revision to the Lamp Burnout Test to Allow the Use of Higher Wattage Bulbs 4. Addition of Supplement SC-AFCIs with Optional Automonitoring Function 5. Revision to the Unwanted Tripping Test to Address High Wattage Electronic Dimmers 6. Revision to 37.5 to Include Combination Type AFCIs 7. Revision to Supplement SA Marking Requirements 8. Revision to Performance Tests for Circuit-Breaker Type AFCIs 9. Additional Installation Instructions for Circuit-Breaker Type AFCIs

UL 1703-2017a, Standard for Flat-Plate Photovoltaic Modules and Panels 1. Clarification for the Use of Coatings at the Interconnection of a Module and a Junction Box.

UL 1703-2017b, Standard for Flat-Plate Photovoltaic Modules and Panels 1. Clarification for the Use of Coatings at the Interconnection of a Module and a Junction Box.

UL proposes a new edition of UL 1709.

UL 1709-2017a, Standard for Rapid Rise Fire Tests of Protection Materials for Structural Steel
This recirculation proposal provides revisions to the UL 1709 proposal dated 2-12-16.

UL 1715-2003 (R2017), Standard for Safety for Fire Test of Interior Finish Material
UL proposes a reaffirmation for ANSI approval of UL 1715.

UL 1730-2007 (R2017), Standard for Safety for Smoke Detector Monitors and Accessories for Individual Living Units of Multifamily Residences and Hotel/Motel Rooms
Reaffirmation of UL 1730 that covers electrically operated smoke detector monitors intended to be used in ordinary indoor locations.

UL proposes revised requirements for the vent test temperature and rating clarification.

UL proposes requirements for harmonizing UL 1738 with UL 5636 and improving performance of condensing gas vents.

UL proposes changing the implementation of the recent Rain Test proposal for UL 1738.

UL 1739-2017, Standard for Safety for Pilot-Operated Pressure-Control Valves for Fire-Protection Service
1. Outlet Pressure Setting

UL 174-2012 (R2016), Standard for Safety for Household Electric Storage Tank Water Heaters
Reaffirm UL 174 as an American National Standard. UL 174 covers household electric storage tank and small capacity storage tank water heaters rated no more than 600 volts and 12 kilowatts.

UL 1740-2007, Standard for Safety Robots and Robotic Equipment
1. Proposed New (Third) Edition for UL 1740 including the following changes: a) Requirements for operation upon failure to complete intended motion/Locked rotor abnormal test; b) Requirement for equipment to stop and alert teacher prior to a “singularity” event; c) Provision of easily unlocked means to exit workcell from within; d) Requirement that manufacturers provide Lockout/Tagout procedures in the Service and Maintenance Manual; e) Requirement that the brake release mechanism be readily accessible without the use of a key or special tools; and more.

UL 1767-2015, Standard for Safety for Early-Suppression Fast-Response Sprinklers
The following changes in the requirements for UL 1767, are being proposed: 1. Revisions to Clarify Requirements and Update Testing Details 2. ESFR Sprinklers Having a RTI Greater Than 36 (m - s)1/2 3. Revised Heat Resistance Test Requirements 4. Sprinkler Test Orientation for Salt Spray Exposure

UL 1769-2016, Standard for Safety for Cylinder Valves
This proposal is being issued to add requirements for valves with quick coupling connections.

UL 1773-2016, Standard for Safety for Termination Boxes (Proposal dated 02-26-16) Revisions to introduce requirements for self-illuminated mounting posts and pedestals and to incorporate a reference to the Rain and Splash Test detailed in the Standard for Power Outlets, UL 231.

UL 1776-2013a, Standard for Safety for High-Pressure Cleaning Machines, Proposal dated August 23, 2013
Deletion of Draft Hood Requirements

UL 1777-2009a (R2014), Standard for Safety for Chimney Liners
UL proposes a reaffirmation for ANSI approval of UL 1777.

UL 1778-2014, Standard for Safety for Uninterruptible Power Systems
This Standard applies to movable, stationary, fixed, and built-in UPS for distribution systems up to 600 V a.c. This equipment is designed to be installed in accordance with the CEC, Part I, CSA C22.1, or the NEC, ANSI/NFPA 70, and the Standard for the Protection of Electronic Computer Data-Processing Equipment, ANSI/NFPA 75. This Standard is intended to reduce the risk of fire, electric shock, or injury to persons from installed equipment, both as a single unit or as a system of interconnected units, subject to installing, operating, and maintaining the equipment in the manner prescribed by the manufacturer.
UL 1778-2014a, Standard for Safety for Uninterruptible Power Systems

This Standard applies to movable, stationary, fixed, and built-in UPS for distribution systems up to 600 V a.c. This equipment is designed to be installed in accordance with the CEC, Part I, CSA C22.1, or the NEC, ANSI/NFPA 70, and the Standard for the Protection of Electronic Computer Data-Processing Equipment, ANSI/NFPA 75. This Standard is intended to reduce the risk of fire, electric shock, or injury to persons from installed equipment, both as a single unit or as a system of interconnected units, subject to installation, operating, and maintaining the equipment in the manner prescribed by the manufacturer.

UL 1784-2015, Standard for Safety for Air Leakage Tests of Door Assemblies

The following changes in requirements to the Standard for Air Leakage Tests of Door Assemblies, UL 1784, are being proposed: 1. General revisions to update the current requirements in UL 1784

UL 1784-2015a, Standard for Safety for Air Leakage Tests of Door Assemblies

The following topics for the Standard for Air Leakage Tests of Door Assemblies, UL 1784, are being recirculated: 1. General revisions to update the current requirements in UL 1784

UL 1786-2012a, Standard for Safety for Direct Plug-In Nightlights

The following topics for the Standard for Direct Plug-In Nightlights, UL 1786, are being recirculated: 1. Revision to requirements for direct plug-in nightlights with child-appealing qualities

UL 1786-2012b, Standard for Safety for Direct Plug-In Nightlights

The following topics for the Standard for Direct Plug-In Nightlights, UL 1786, are being recirculated: 1. Revision to requirements for direct plug-in nightlights with child-appealing qualities

UL 1786-2014, Standard for Safety for Direct Plug-In Nightlights

The following changes in requirements to the Standard for Direct Plug-In Nightlights, UL 1786, are being proposed: 1. Revise polarization requirements for nightlights provided with switches 2. Add reference to UL 8750 for requirements for isolated output LED drivers 3. Revise paragraph 11.5.1 to include cadmium sulfide photocells 4. Add ballast construction requirements to correlate with UL 935 5. Add requirements for nightlights with vessels containing liquid 6. Revise paragraph 1.3 to exclude direct plug in devices such as plasma light 7. Propose additional testing to determine suitability of mechanism and contacts of devices that rotate to accommodate receptacle orientation (add 7.7.4, 11.11, and 11.12)

UL 180-2012a, Standard for Safety for Liquid-Level Gauges for Oil Burner Fuels and Other Combustible Liquids (Bulletin dated August 17, 2012)

Proposed Eighth Edition of the Standard for Safety for Liquid-Level Indicating Gauges for Oil Burner Fuels, UL 180, update coverage of gauge types currently available, and to address outdated requirements for construction, function, and compatibility that are reflective of the expected uses; changes to the following major areas: (a) Scope and Glossary, (b) Construction Requirements, (c) Performance Requirements, and (d) Markings and Instructions.

UL 180-2017, Standard for Liquid-Level Gauges for Oil Burner Fuels and Other Combustible Liquids

The following is being proposed: 1. The required use of liquid level gauges in combustible liquid tanks should reflect the increased capacities typically allowed in these applications. 2. NFPA 110 should be added to the scope since the majority of generator fuel tanks covered by this Code are for combustible liquids that require liquid level gauges.

Includes changes to the requirements for control of the certification mark for portable extinguishers.

Includes changes to the requirements for control of the certification mark for portable extinguishers.

UL 181-2013 (R2017), Standard for Safety for Factory-Made Air Ducts and Connectors

UL proposes a reaffirmation for UL 181.

UL 181A-2013 (R2017), Standard for Closure Systems for Use With Rigid Air

UL proposes a reaffirmation for ANSI approval of UL 181A.

UL 181B-2013 (R2017), Standard for Closure Systems for Use with Flexible Air Ducts and Air Connectors

UL proposes a reaffirmation for UL 181B.

UL 1820-2004 (R2013), Standard for Safety for Fire Test of Pneumatic Tubing for Flame and Smoke Characteristics

UL 1820 is a test method for determining values of flame propagation distance and optical smoke density for pneumatic tubing that is to be installed in ducts, plenums, and other spaces used for environmental air. The purpose of this test method is to determine whether the flame-propagation and smoke-generating characteristics of these tubes are in accordance with the provisions of Installation of Air Conditioning and Ventilating Systems, NFPA 90A.

UL 1821-2015a, Standard for Safety for Thermoplastic Sprinkler Pipe and Fittings for Fire Protection Service

Proposed changes to the 10-31-2014 proposal for Unfinished Basement Fire Tests in UL 1821.

1. Transition from Carbon Arc to Xenon Arc

UL 183-2016, Standard for Safety for Manufactured Wiring Systems

UL proposes the addition of requirements for MC-PCS cables with non Class 2 power conductors.

UL 1838-2015a, Standard for Safety for Low Voltage Landscape Lighting Systems

1. Editorial Revision. 2. Power Supply Cord Types. 3. Location of marking for wet location power units with doors

UL 1838-2017, Standard for Safety for Low Voltage Landscape Lighting Systems

UL 1839-2016, Standard for Safety for Automotive Battery Booster Cables

1. Proposed revision to paragraph 3.1 to clarify the requirements for conductor materials

UL 1863-2012 (R2016), Standard for Safety for Communications-Circuit Accessories

These requirements cover telecommunications-circuit accessories, such as jack and plug assemblies, quick-connect terminal assemblies, telephone wall plates, telephone extension cords, cross-connect terminal-block assemblies, maintenance terminal modules, terminal enclosures, cable-splice enclosures, network-interface devices, wire-guide assemblies, and connector boxes. These devices are intended to be used in telecommunications networks that have an operating root-mean-square (rms) voltage to ground less than 150 volts and installed or used in accordance with the National Electrical Code, ANSI/NFPA 70.

UL 1876-2011 (R2015), Standard for Safety for Isolating Signal and Feedback Transformers for Use in Electronic Equipment

Reaffirmation of ANSI approval is proposed for UL 1876.

UL 1887-2004 (R2013), Standard for Safety for Fire Test of Plastic Sprinkler Pipe for Visible Flame and Smoke Characteristics

UL 1887 is a test method for determining values of flame propagation distance and optical smoke density for plastic sprinkler pipe that is to be installed in ducts, plenums, and other spaces used for environmental air.
UL 1889-2009 (R2013), Standard For Safety For Commercial Filters for Cooking Oil
UL 1889 covers commercial filters for cooking oil rated 600 volts or less and intended for use in accordance with the National Electrical Code, NFPA 70. UL 1889 covers both portable filters and fixed filters intended to be used with a specific fryer or fryers or with any fryer or fryers.

UL 1897-2015, Standard For Uplift Tests for Roof Covering Systems
The following topic for the Standard for Uplift Tests for Roof Covering Systems, UL 1897, is being recirculated: a) Adds clarity to UL 1897 as it relates to the conditions of acceptance, and b) Includes the 2 X 2 pull test and 5 X 9 wind uplift test methods.

UL 19-2013, Standard For Safety for Lined Fire Hose and Hose Assemblies
The following is being proposed: 1. Revision to scope 2. Revision regarding length of hose 3. Revision to correct typographical error and to add 200 psi service test pressure rating for single jacketed hose in the 2 -1/2 to 6 inch size 4. Revisions to Kink Test, Repeated Bending Test, Abrasion Test, Heat Resistance Test, Fold Resistance Test, Wet Hose Test, Low Temperature Test, Friction Loss Test, Accelerated Aging Test of Threads, Accelerated Aging Test of Linings and Covers, Ozone-Exposure Test of Linings and Covers, Water Immersion Test of Linings, Pull Test, Accelerated Aging Test of Hose Assembly, and Accelerated Aging Test of Gaskets

UL 1917-2013, Standard For Safety for Solid-State Fan Speed Controls
(1) Addition of an Abnormal Switching Test. Check

UL 193-2016, Standard For Safety for Alarm Valves for Fire-Protection Service
Revise the Hydrostatic Test Requirements in the Strength of Body Test, 28.1 and Bolt Strength, 10.13; Pressure Gauge Updates, Revised 26.2 and 29.1.8

UL 1951-2017, Standard For Safety for Electric Plumbing Accessories
UL 1951 covers equipment connected to or used with plumbing in commercial or household locations. Examples of equipment covered by these requirements are irrigation equipment, sprinkler controls, pedicure spas, water controls located in kitchens and bathrooms, electric faucets, toilets and toilet flushing systems. All equipment is intended for installation and use in accordance with the National Electrical Code, NFPA 70, and is rated 600 volts or less.

The following is being proposed: 1. Revisions to address the use of flammable refrigerants 2. Clarifications and updates to Section 6, Assembly requirements 3. Clarifications to Table 52.1, Tests on Nonmetallic Materials 4. Updates to Hose Assembly requirements 5. Miscellaneous updates and clarifications 6. Corrections to remove references to UL 984 7. Corrections to switches and controllers requirements

UL 197-2014, Standard for Safety for Commercial Electric Cooking Appliances
(Proposal dated 5/2/14)
1. Addition of Door Opening Test, New SA.9, New Clauses 65A and 65B

UL 1971-2008 (R2013), Standard For Safety for Signaling Devices for the Hearing Impaired
Reaffirmation of current ANSI which covers emergency-signalizing devices for the hearing impaired. The devices and/or systems covered by this standard are suitable for use in a controlled environment, or in an uncontrolled environment as indicated in the product marking. These devices are to be used in accordance with the requirements of the National Fire Alarm Code, NFPA 72.

UL 1973-2016, Standard For Batteries for Use In Light Electric Rail (LER) Applications and Stationary Applications

UL 1978-2013 (R2017), Standard For Safety for Grease Ducts
UL proposes a reaffirmation for UL 1978.

UL 1981-2014, Standard For Safety for Central-Station Automation Systems (Proposal dated 5-30-14)
This recirculation proposal provides modifications to the UL 1981 proposed first edition dated 1-10-14.

UL 1981-2014a, Standard For Safety for Central-Station Automation Systems (Proposal dated 5-30-14)
This recirculation proposal provides modifications to the UL 1981 proposed first edition dated 1-10-14.

UL 1989-2013, Standby Batteries
1. UL 1989 is being proposed for approval as an American National Standard.

UL 1989-2013a, Standby Batteries
1. UL 1989 is being proposed for approval as an American National Standard.

UL 198M-2003 (R2013), Standard For Safety for Mine-Duty Fuses
UL proposes a reaffirmation for ANSI approval of UL 198M.

UL 199-2013 (R2017), Standard For Safety for Automatic Sprinklers for Fire-Protection Service
UL proposes a reaffirmation for UL 199.

UL 1990-2017, Standard For Safety for Nonmetallic Underground Conduit with Conductors (proposal dated 11/18/16)
1. Revised Title for Section 13.2. Add a Test Temperature Requirement into Clause 13.2.3. Revised Table 13.1

UL 1993-2017, Standard For Safety for Self-Ballasted Lamps and Lamp Adapters
UL 1993-2017a, Standard for Safety for Self-Ballasted Lamps and Lamp Adapters

These requirements cover floor proximity and other egress path marking and lighting systems that provide a visual delineation of the path of egress and are also used to identify significant egress path features such as doors, stair balusters, obstacles or information placards. These systems are intended for installation and use as required by codes such as the Life Safety Code, NFPA 101; the Building Construction and Safety Code, NFPA 5000, and the International Building Code.

Proposals to clarify requirements for path marking signs.

Proposals for the color temperature range for LED activation source

The following changes in requirements to the Standard for Heating and Cooling Equipment, UL 1995, are being proposed: 1. Adding requirements for equipment employing power supply cords, appliance couplers, and inlets. 2. Adding requirements for condensing units intended to be used in refrigerator or freezer applications and employing flammable refrigerants. 3. Revisions to electric resistance heater requirements. 4. Products with photovoltaic modules, photovoltaic module input circuits or utility interactive inverters, used with HVAC equipment. 5. Component requirements - moving component requirements from clause 81 into the body of the standard. 6. Requirements for coolant distribution equipment for use in Information Technology Equipment (ITE) rooms. 7. Revisions to the scope to remove those products covered by the ANCE/CSA/UL trinational standard 60335-2-40. 8. Update clause 46.13 to clarify when to de-energize any heat source other than refrigerant heat. 9. Provisions for CO2 transcritical systems. 10. Editorial revisions and clarifications. 11. Update Table 39.5 for the maximum acceptable temperature requirements for Class E insulation, correct temperature for item (B) (3) Class A windings. 12. Maximum power supply cord length of 15 feet for computer room air conditioners. 13. Definition for computer room air conditioners. 14. Revisions to Section 26.10 covering switches, controllers and disconnects. 15. Definition of extra low voltage. 16. Revisions to clause 68.7 covering the supply voltage mentioned in Table 39.6. 17. Clause 77, Change in number of fatigue test samples. 18. Addition of new section that specifically covers heat pump pool heaters. 19. Revision to 28.3 covering the following items originally proposed in the document dated 10

The following is being recirculated: 1. Revision to 28.2 and 28.3 covering motor starting capacitor requirements.

UL 1996-2016, Standard for Safety for Electric Duct Heaters
The following is being proposed: 1. Addition of safety critical functions; 2. Addition of requirements to allow the use of UL 840 to evaluate clearance and creepage distances; 3. Addition of requirements for electronic circuits

Clarification of Requirements for Negative Condition Branch Failure Mode; Revision of the Requirements to Address the Effects of Power Supply Voltage Variations; Editorial Revision of Table A2.1 Formatting

Clarification of Requirements for Negative Condition Branch Failure Mode

- Adds requirements to address separable jumper connector intended for use with separable terminal assemblies; - Flammability testing of self-contained switches; - Switch markings; - Flush switch with integral adjustable mounting yoke; and - Two- or three-circuit switches.

UL 2007A-2011 (R2016), Shatter Containment of Lamps For Use In Regulated Food Establishments
Reaffirmation of the 1st edition of UL 2007A which covers the following: These requirements cover shatter containment mechanisms for lamps, for use in food establishments, that are intended to prevent contamination of food. Types of lamps covered by these requirements include incandescent, halogen, linear fluorescent, pin-base compact fluorescent, screw base compact fluorescent, high intensity discharge (HID), and solid state. These requirements do not apply to the lighting fixtures (luminaires), lamp holders or other apparatus that support the lamps and/or shatter containment mechanism.

UL 201-2015, Standard for Safety for Garage Equipment (Proposals dated July 18, 2014)
These requirements cover equipment intended for use indoors in an automotive repair facility. Products covered by this standard are equipment used in servicing and repairing automobiles, dynamometers, battery testers, roll-up brake lathes, distributor testers, driveway signals, engine analyzers, exhaust emissions testers, generator-alternator-regulator testers, growlers, ignition testers, rectifier diode testers, timing lights, fluid changing equipment, tire changers, tune-up testers, wheel alignment and balance equipment, powered and nonpowered tool cabinets.

UL 201-2015a, Standard for Safety for Garage Equipment (Proposal dated 1/23/15)
ANSI approval of the Proposed Third Edition of the Standard for Garage Equipment, UL 201; Recirculation of 61.4.2.

UL 2017-2016, Standard for Safety for General-Purpose Signaling Devices and Systems

UL 2021-2016, Standard for Safety for Fixed and Location-Dedicated Electric Room Heaters
1. Clarification of Requirements for Heating Elements

UL 2021-2016a, Standard for Safety for Fixed and Location-Dedicated Electric Room Heaters
1. Clarification of Requirements for Heating Elements

UL 2024-2015, Standard for Safety for Cable Routing Assemblies and Communications Raceways
The intent of this proposal is to update the requirements of UL 2024 to correlate with the requirements of NFPA 90A-2015.

UL 2024-2015a, Standard for Safety for Cable Routing Assemblies and Communication Raceways (Proposal Date 6/12/15)
1. Removal of references to optical fiber raceways, signaling raceways and coaxial cable raceways from the current edition of the standard. 2. Clarification that the UL 723 test of Section 11A is an alternate method for qualifying plenum rated communications raceways to Section 11 of NFPA 262.

UL 203-2015, Standard for Safety for Pipe Hanger Equipment for Fire Protection Service
This proposal for UL 203 involves changes to the requirements in Paragraphs 6.2, 6.6, and 15.2 and the addition of Paragraph 6.2.1.

UL 2034-2017, Standard for Safety for Single and Multiple Station Carbon Monoxide Alarms
Document dated 10-7-2016 proposes the following revisions: 1. Supplemental Means For Operating the Sensitivity Test Feature 2. Pre-alarm Notification 3. Remote Alarm Reset/Silence 4. Primary and Secondary Power Supply Requirements 5. Correction to Paragraph 75.2.4

UL 2034-2017a, Standard for Safety for Single and Multiple Station Carbon Monoxide Alarms
UL 2039-2016, Standard for Flexible Connector Piping For Fuels
The first edition of the standard is being proposed and covers primary, secondary, and coaxial types of flexible connector pipes intended for short length transfer and containment of the specific liquid fuels (or vapors thereof) identified in this standard, at commercial (public) or fleet (private) automotive motor vehicle fueling stations.

To resolve comments received by UL to a proposal dated April 10, 2015 to publish UL 203A as an American National Standard.

UL 203A-2015a, Standard for Safety for Sway Brace Devices for Sprinkler System Piping
To resolve comments received by UL to a proposal dated April 10, 2015 to publish UL 203A as an American National Standard.

UL 2040-2015, Standard for Safety for Folding Rollaway Tables
These requirements apply to folding rollaway tables. They may have integral benches or stool seating. This does not apply to any electrical circuitry integral to or provided with these. The requirements covering the intended electrical product to be used with these tables shall be applicable to any electrical circuits in the table. Electrical devices shall comply with the requirements for such devices. A product that contains features, characteristics, components or systems different from those covered by the requirements in this std, and that involves a risk of fire, electric shock or injury shall be evaluated to appropriate component and end-product requirements.

Reinforcement of Code Language, New 1.4; Proposed Change to Test Equipment and Instrumentation, Section 3; Revised and Renumbered Section for Pretest Calibration; Revised 6.1.3, 6.2.2, 6.2.4 in the Test Procedures section; Revised Heat Release Calculations; Relocate Normalized Optical Density to Appx. B; Clarifications to Appx. A; Remove Normalized Measurements to Appx. B

UL 2044-2004 (R2016), Standard for Safety for Commerical Closed-Circuit Television Equipment
Reaffirm UL 2044 as an American National Standard. UL 2044 covers closed-circuit television equipment that are intended for commercial use on supply circuits that receive their signals from a video-recorded medium or image-producing devices in a closed circuit television system.

UL 2061-2015, Standard for Safety for Adapters and Cylinder Connection Devices for Portable LP-Gas Cylinder Assemblies
This proposal revises the Moist Ammonia Air Stress Cracking Test.

UL 207-2014, Standard for Safety for Refrigerant-Containing Components and Accessories, Nonelectrical
The following is being proposed: 1. Revisions to permit certain high-side components based on a reduced test pressure. 2. Addition of alternative moist ammonia test. 3. Clarifications and corrections. 4. Revisions to refrigerant requirements

UL 2075-2013, Standard for Safety for Gas and Vapor Detectors and Sensors
Addition of Field Service Test

1. Revision to requirements for TC Modification.

UL 2089-2011 (R2015), Standard for Safety for Vehicle Battery Adapters
Reaffirmation of ANSI approval is proposed for UL 2089.

UL 2089-2011a, Standard for Safety for Vehicle Battery Adapters
This recirculation proposal provides revisions to the proposed third edition of UL 2089.

UL 209-2016, Standard for Safety for Surface Cellular Metal Floor Raceways and Fittings
Document dated 4-1-16 proposes revisions to installation instructions allowing an option to access a manufacturer’s website for the information.

UL 21-2015, Standard for Safety for LP-Gas Hose
1. Additional options to measure pressure. 2. Hose length. 3. Additional valve types. 4. Update of fuel oil type

UL 2108-2015, Standard for Safety for Low Voltage Lighting Systems

UL 2108-2015a, Standard for Low Voltage Lighting Systems
1. Refinement of Expanded Class 2 Marking Allowance for Power Units.

UL 2108-2017, Standard for Low Voltage Lighting Systems
1. Address Equipment for Use in Environmental Air Spaces 2. Revise Requirements for Enclosure Openings 3. Addition of Electrical Ratings for Power Units and Luminaires

UL 2115-2010 (R2014), Standard for Safety for Processed Solid-Fuel Firelogs
UL proposes a reaffirmation for ANSI approval of UL 2115.

UL 2127-2017, Standard for Inert Gas Clean Agent Extinguishing System Units
UL proposes the Third Edition of the Standard for Inert Gas Clean Agent Extinguishing System Units, UL 2127.

UL 2129-2017, Standard for Safety for Halocarbon Clean Agent Fire Extinguishers
It is recognized that there is not one size fits all quality values for halon replacements, therefore ASTM publishes a quality specification for each extinguishing agent. Revise UL standard to reference applicable ASTM quality specification or equivalent.

UL 213-2013, Standard for Safety for Rubber Gasketed Fittings for Fire-Protection Service
This proposal is to include additional requirements for Standard Grooves in UL 213.

UL 213-2013a, Standard for Safety for Rubber Gasketed Fittings for Fire-Protection Service
This proposal is to include additional requirements for Standard Grooves in UL 213.

UL 213C-2015, Standard for Safety for Grooved and Plain End Fittings
Clarification of Marking Requirements in Paragraphs 13.2 and 13.3

UL 2157-2015, Standard for Safety for Electric Clothes Washing Machines and Extractors
1. The following is being proposed: Adoption of the Third Edition which includes the following changes: (a) revision to polymeric materials requirements and addition of nichrome wire test; (b) addition of clothes washer lid switch redundancy; (c) addition of the option to use a tradename for manufacturer identification; (d) addition of requirements for installation and user maintenance instructions for ungrounded parts; (e) addition of requirements for washing machines with heating elements; (f) revision to clarify the risk of injury due to spillage of wash water through the door or lid opening; (g) revision of requirements for standards referenced for electric motors and motor overload protection; (h) clarification of requirements for polarity of single-pole switches and automatic controls; (i) correction to requirements for bonding conductors of components or separate electrical enclosures; (j) addition of requirements for polymeric materials in contact with or close proximity to live parts; (k) clarification of requirements for nonfunctional parts; (l) addition of flammability requirements; (m) revision to strength and impact test specimens to be molded; (n) addition of supplement SA for ozone generating washing machines; (o) addition of supplement SB for smart enabled washing machines; (p) revisions to relocate component requirements and delete component appendix; (q) revisions to revise and clarify control requirements; (r) editorial type clarifications

UL 2157-2015a, Standard for Safety for Electric Clothes Washing Machines and Extractors
UL 2158-2015, Standard for Safety for Electric Clothes Dryers

UL 2158A-2013 (R2017), Standard for Safety for Clothes Dryer Transition Duct
UL proposes a reaffirmation for UL 2158A.

UL 2162-2014, Standard for Safety for Commercial Wood-Fired Baking Ovens - Refractory Type
UL proposes the First Edition of the Standard for Commercial Wood-Fired Baking Ovens - Refractory Type, UL 2162.

UL 2166-2017, Standard for Halocarbon Clean Agent Extinguishing System Units
UL proposes the Third Edition of the Standard for Halocarbon Clean Agent Extinguishing System Units, UL 2166.

UL 2167-2011 (R2017), Standard for Safety for Water Mist Nozzles for Fire Protection Service
UL proposes a reaffirmation for UL 2167.

UL 217-2016, Standard for Safety for Smoke Alarms
Proposal (dated 10-7-2016) to update the Polyurethane Flaming and Smoldering and Cooking Nuisance Tests to match the recently published requirements in UL 268, Smoke Detectors for Fire Alarm Systems.

UL 218-2015, Standard for Fire Pump Controllers
Correlating UL 218 with the 2013 Edition of NFPA 20. Revise the definitions in UL 218 to correlate with the definitions in the NEC. Revising the requirements covering service equipment markings to include a reference to NEC Article 230. Revisions to the construction requirements, dielectric withstand test, disconnecting means, diesel engine drive controllers, dump valves, variable speed fire pump controllers, markings, the deletion of requirements covering the limited service controllers for electric motor driven fire pumps, and the addition of Section 17, Routine Tests.

UL 218-2015a, Standard for Fire Pump Controllers
The National Building Code of Canada and CE Code, Part 1 recognize only emergency generators and not stand-by generators. Clause 11.4.1 was revised to remove ‘stand by’ for #8221; to comply with the Canadian codes. Clarification of the use of medium voltage & #8221; term generated the need to add medium voltage & #8221; definition from C22.2 No. 253 as added clause 5.18.

UL 218-2015b, Standard for Fire Pump Controllers
Revisions to 7.14.1, 7.14.2, 14.2.7 and Annex A due to comments received on CSA’s Ballot.

UL 2182-2017, Standard for Refrigerants
Revisions to clarify the common flammable refrigerant requirements covering many UL standards.

UL 218A-2004 (R2013), Battery Contactors for Use in Diesel Engines Driving Centrifugal Fire Pumps
These requirements cover battery contactors for use in the starting systems of diesel engines driving centrifugal fire pumps, in accordance with the Standard for the Installation of Stationary Pumps for Fire Protection, NFPA 20. These requirements cover battery contactors for use in starting systems rated 50 volts maximum.

UL 219-2013, Standard for Safety for Lined Fire Hose for Interior Standpipes
The following is being proposed: 1. Revision to scope with respect to NFPA references.

UL 219-2013a, Standard for Safety for Lined Fire Hose for Interior Standpipes
The following is being proposed: 1. Revision to scope with respect to NFPA references.

UL 2196-2006 (R2012), Standard for Safety for Tests for Fire Resistive Cables
The test method described in this standard is intended to evaluate the fire resistive performance of electrical cables as measured by functionality during a period of fire exposure, and following exposure to a hose stream.

UL 22-2010 (R2014), Standard for Safety for Amusement and Gaming Machines (Proposal Dated 9/5/14)
These requirements cover electrical, electronic, and electromechanical commercial amusement and gaming machines and accessories that are intended to be used in accordance with the National Electrical Code, NFPA 70. Amusement and gaming machines as covered by this standard are intended for indoor use only, except that they will be investigated for outdoor use or use in a protected location if so designated by the manufacturer. These requirements do not cover coin-operated sound-recording and -reproducing machines or carnival rides.

UL 2200-2015, Standard for Safety for Stationary Engine Generators Assemblies
1. Revision to Paragraph 41.1.3.3 to Add Higher Pressure Flexible Fuel Tubing and Hose Types for Gasoline or Diesel Fuel

UL 2200-2015a, Standard for Safety for Stationary Engine Generators Assemblies
1. Revision to Paragraph 41.1.3.3 to Add Higher Pressure Flexible Fuel Tubing and Hose Types for Gasoline or Diesel Fuel

The following is being proposed: 1. Revisions to scope for clarification purposes 2. Addition of paragraph 5.2.4 for clarification 3. Revision to paragraphs 6.1.1 and 14.1 to address personnel protection systems 4. Revision to paragraph 13.1 to address vehicle connectors 5. Addition of absence of cooling means test to body of standard and revision of supplement SA to remove test and add reference 6. Addition of production line tests

The following is being proposed: Revisions to clarify classified area use.

UL 2208-2006 (R2015), Standard for Safety for Solvent Distillation Units
UL proposes a Reaffirmation of ANSI approval for UL 2208.

1. Clarification on preparation of samples for UL 2218 Impact Tests. 2. First time ANSI approval of UL 2218.

Revisions to Add Low Ambient Requirements for Cable Glands to Section 24, 37.2 and 37.3.

UL 2225-2017a, Standard for Safety for Cables and Cable-Fittings for Use in Hazardous (Classified) (Proposal dated 01-27-17)
This recirculation proposal provides revisions to the UL 2225 proposal dated November 25, 2016.

UL 2227-2014, Standard for Safety for Overfilling Prevention Devices
Revisions to the test container requirements in the Operation Test.

1. Revision to Require a Ground Monitor/Interrupter Circuit for Hardwired and Cord-Connected EVSE (Deletion of Cable Flexing Test, Section 37 of UL 2231 -2) 2. Clarification of Requirements for Isolation Monitors for EV Charging Equipment 3. Additional Reference to CSA C22.2 No. 0.4. Addition of Definition for Programmable Components
1. New Section for Environmental Sequence
2. Power Interruption
5. Leakage Current Requirements
6. Ground Monitor/Interrupter (GM/I)
7. Manufacturing and Production Line Tests
8. Clarification of Scope 9 Cable Flexing Test
10. Weld Monitor Self Test
11. Exemption of the Dielectric Withstand after the Extra-Low-Resistance Ground Fault Test and Short Circuit Test
12. EMC Exposure
13. Programmable Components and Reliability of Solid State Circuitry

Addition of Evaluation Requirements for Conduit and Hardware Devices.

7. Deletion of Plates.
8. Clarification of the Term ‘Bushings.’
10. Additional Requirements for Protector Plates.
11. Deletion of Insulated Standoff Requirements for Canada in Accordance with the CEC.
12. New Section for Environmental Sequence
13. Power Interruption
14. Minimum Delay for the Automatic Reset of an Operating Mechanism in 14.3

UL 2231-2016, Standard for Safety for Personnel Protection Systems for Electric Vehicle (EV) Supply Circuits; Part 2: Particular Requirements for Protection Devices for Use in Charging Systems

1. Component Accessibility, Proposed Change to 8.2.8
2. Correction to Clause Reference in 35.7.3
3. Use of “Type WR” Receptacles, New 8.2.11
4. Addition of “Loop Feed Current Rating”, New 3.6.1 and 32.3
5. “Extra-Duty” Outlet Box Hoods, Revised 5.7.2

UL 2333-2003 (R2014), Standard for Safety for Infrared Thermometers
UL proposes a reaffirmation for ANSI approval of UL 2333.

UL 2235-2012, Standard for Safety for Low Voltage Lighting Fixtures for Use in Recreational Vehicles
The following changes in requirements to the Standard for Low Voltage Lighting Fixtures for Use in Recreational Vehicles, UL 2235, are being proposed: 1. Add requirements for RV luminaires suitable for direct contact with bedding (or similar) materials 2. Revision to ambient temperature measurement method

UL 2344-2012, Standard for Safety for Material Lifts
These requirements cover manually, electrically and pneumatically powered lifts. They are intended for the lifting and transport of materials and not for the movement or support of people. They are rated 250 volts or less, to be employed in nonhazardous environmental locations in accordance with the National Electrical Code, NFPA 70.

UL 2351-2014, Standard for Safety for Spray Nozzles for Fire-Protection Service
The following changes to UL 2351 are being proposed: 1. Revisions to More Closely Align Text with UL’s Sprinkler Standards, Clarify Requirements and Update Testing Details 2. New Air Bath Test for Automatic Nozzles with Glass Bulb Heat Responsive Elements; 3. New Heat Resistance Test Requested; and 4. Protection of Glass Bulb Tips

This proposal contains the following revisions: (1) Revision of requirements to specify solvent-based enamel (2) Revision of requirements for taped wrapped wire (3) Revision of requirements to incorporate fully insulated wire (FIW)

UL 2353-2016a, Standard for Safety for Single- and Multi-Layer Insulated Winding Wire
3. Revision of requirements to incorporate fully insulated wire (FIW).
These requirements cover the test methods for measuring the fire performance of sheet plastics used in semi-conductor wet bench tool construction.

UL 2367-2009 (R2014), Standard for Safety for Solid State Overcurrent Protectors
UL proposes a reaffirmation for UL 2367.

The intent of this proposal is: 1) To propose revisions to clarify the test, requirements, and test methods of UL 2368 and 2) To propose revisions of UL 2368 to require Intermediate Bulk Containers (IBCs) to be filled with Mineral Seal Oil for Fire Testing rather than water and a small quantity of Heptane.

UL 2388-2014a, Standard for Safety for Flexible Lighting Products
This covers revisions to requirements for Class 2 power supplies; revisions for conductor sizes and miscellaneous editorial revisions

UL 2388-2014b, Standard for Safety for Flexible Lighting Products
This covers revisions to requirements for Class 2 power supplies; revisions for conductor sizes and miscellaneous editorial revisions

UL 2388-2017, Standard for Safety for Flexible Lighting Products
Revision to the weight requirement for the Flexing Test and the Crimp Connection Securesness Test for conductors smaller than 18 AWG

UL 2390-2009, The Standard for Test Method for Wind Resistant Asphalt Shingles with Sealed Tabs

UL 2390-2009a, The Standard for Test Method for Wind Resistant Asphalt Shingles with Sealed Tabs

This proposed First Edition of UL 2416 covers requirements for Audio/Video, Information and Communication Technology Equipment Cabinet, Enclosure and Rack Systems. For the purpose of this proposed Standard cabinet, enclosure and rack systems are all referred to as ‘enclosure systems.

UL 242-2004 (R2013), Standard for Safety for Nonmetallic Containers for Waste Paper

UL 2420-2012a (R2016), Standard for Safety for Belowground Reinforced Thermosetting Resin Conduit (RTRC) and Fittings
1. Reaffirmation and Continuous of the First Edition of the Standard for Belowground Reinforced Thermosetting Resin Conduit (RTRC) and Fittings

This 1/31/14 proposal includes a proposed second edition of the Standard for Durability of Spray-Applied Fire Resistive Coatings. The second edition also includes a proposed standard title change to, the Standard for Durability of Fire Resistive Coatings and Materials.

UL 2438-2014, Standard for Safety for Outdoor Seasonal-Use Cord-Connected Wiring Devices (Proposal dated 06-13-14)
The proposal contains a revision to add audio features, flasher controls, different number of receptacles, and change in power supply cord length

UL 2442-2014, Standard for Safety for Wall- and Ceiling-Mounts and Accessories
Revisions of requirements to address field cutting and drilling of video mounting systems

UL 2443-2016, Flexible Sprinkler Hose With Fittings for Fire Protection Service
Updated maximum span between end brackets to be provided in the installation instructions. High pressure flow test revised to include testing using the minimum length of hose in addition to the maximum length of hose. Revisions throughout the standard to clarify and update test methods.

UL 2459-2014, Standard for Safety for Insulated Multi-Pole Splicing Wire Connectors
These revisions cover the following proposals: 1) Clarification of Clause 1.3; 2) LED retrofit application addition to scope; 3) Editorial revisions; 4) Mechanical Sequence, wire combinations under single clamping means and revision to address testing max and min sizes in a wire range; and 5) Mechanical Sequence orientation when testing mating (separable-type) device having multi-port line side connections (feed thru or daisy chain).

UL 2460-2015, Standard for Safety for Nonshielded Cable (Proposal dated 8-7-15)
UL proposes the first edition of UL 2460 which covers single-conductor, nonshielded cables rated 3000 or 8000 volts, 90°C that are intended solely for use as factory-installed wiring in equipment (internal wiring), in industrial applications where such cable systems are maintained by trained personnel, not as Type MV.

1. Editorial Correction in Table 5. 2. Recovery Voltage Clarification.

UL 248-10-2011 (R2015), Standard for Safety for Low-Voltage Fuses - Part 10: Class L Fuses
Reaffirmation of ANSI Approval for UL 248-10

UL 248-11-2011 (R2015), Standard for Safety for Low-Voltage Fuses - Part 11: Plug Fuses
Reaffirmation of ANSI Approval for UL 248-11

UL 248-12-2011 (R2015), Standard for Safety for Low-Voltage Fuses - Part 12: Class R Fuses
Reaffirmation of ANSI Approval for UL 248-12

Reaffirmation of ANSI approval for UL 248-13

UL 248-14-2005 (R2015), Standard for Safety for Low-Voltage Fuses - Part 14: Supplemental Fuses
Reaffirmation of ANSI approval for UL 248-14.

Reaffirmation of ANSI approval for UL 248-15.

UL 248-16-2004 (R2013), Standard for Safety for Low-Voltage Fuses - Part 16: Test Limiters
UL proposes a reaffirmation for UL 248-16.

The following changes are being recirculated: Proposed First Edition of UL 248-19, the Standard for Safety for Photovoltaic Fuses.

UL 248-2-2005 (R2014), Standard for Safety for Low-Voltage Fuses - Part 2: Class C Fuses
Reaffirmation of ANSI Approval for UL 248-2

UL 248-3-2005 (R2014), Standard for Safety for Low-Voltage Fuses - Part 3: Class CA and CB Fuses
Reaffirmation of ANSI Approval for UL 248-3

UL 248-4-2005 (R2014), Low-Voltage Fuses - Part 4: Class CC Fuses
Reaffirmation of ANSI Approval for UL 248-4

UL 248-5-2005 (R2015), Low-Voltage Fuses - Part 5: Class G Fuses
Reaffirmation of ANSI Approval for UL 248-5

UL 248-6-2005 (R2015), Low-Voltage Fuses - Part 6: Class H Non-Renewable Fuses
Reaffirmation of ANSI Approval for UL 248-6
UL 248-7-2005 (R2015), Standard for Safety for Low-Voltage Fuses - Part 7: Class H Renewable Fuses
Reaffirmation of ANSI Approval for UL 248-7
UL 248-8-2011 (R2015), Standard for Safety for Low-Voltage Fuses - Part 8: Class J Fuses
Reaffirmation of ANSI Approval for UL 248-8
Reaffirmation of ANSI approval for UL 248-9.
UL 25-2016, Standard for Safety for Meters for Flammable and Combustible Liquids and LP-Gas
This proposal is being issued to revise the Moist Ammonia-Air Stress Cracking Test.
UL 25-2016a, Standard for Safety for Meters for Flammable and Combustible Liquids and LP-Gas
The following topic is being proposed: 1) Addition of torque requirements for larger size valve.
UL 2515-2014, Standard for Safety for Aboveground Reinforced Thermosetting Resin Conduit (RTRC) and Fittings (Proposal dated 9-20-2013)
Document (dated 9-20-2013) proposes revisions to tensile strength requirements to align with those of UL 2420, Belowground Reinforced Thermosetting Resin Conduit (RTRC) and Fittings.
UL 2515A-2016, Standard for Safety for Supplemental Requirements for Extra Heavy Wall Reinforced Thermosetting Resin Conduit (RTRC) and Fittings
Document (dated 7-10-2015) proposes new requirements to evaluate Extra Heavy Wall Aboveground RTRC for use at extended support distances as permitted by the NEC.
UL 2515A-2016a, Standard for Safety for Supplemental Requirements for Extra Heavy Wall Reinforced Thermosetting Resin Conduit (RTRC) and Fittings
Based on a previous proposal that did not achieve consensus, this document (dated 12-04-2015) proposes new requirements to evaluate Extra Heavy Wall Aboveground RTRC for use at extended support distances as permitted by the NEC.
UL 2518-2016, Standard for Safety for Air Dispersion Systems
UL 252-2015, Standard for Safety for Compressed Gas Regulators
Proposal to add requirements for backpressure regulators
UL proposes revisions to UL 2523 to add requirements for ANSI/ASME pressure vessel stamps.
UL 2523-2013a, Standard for Safety for Solid Fuel-Fired Hydronic Heating Appliances, Water Heaters and Boilers
This re-circulation proposal provides revisions to the UL 2523 proposals dated 9-21-12.
UL 252A-2010 (R2015), Standard for Safety for Compressed Gas Regulator Accessories
Reaffirmation of the Fourth Edition of the Standard for Safety for Compressed Gas Regulator Accessories, UL 252A, as an American National Standard. UL 252A covers accessories intended for direct connection to the low or delivery pressure side of compressed gas regulators. These devices are not intended for direct connection to high or storage cylinder pressures. Accessories covered by these requirements are intended for use with compressed gases such as air, carbon dioxide, inert gases, fuel gases, nitrogen, nitrous oxide and oxygen.
UL 2556-2015, Standard for Safety for Wire and Cable Test Methods (Proposal dated 05-01-15)
This recirculation provides revisions to the UL 2556 proposed new edition dated 5-1-15.
UL 2556-2015a, Standard for Safety for Wire and Cable Test Methods (Proposal dated 05-01-15)
This recirculation provides revisions to the UL 2556 proposed new edition dated 5-1-15.
Proposals including: 1. Proposed new test methods for spread spectrum technologies. 2. Identification of UL 2560 requirements considered to be met by a product that already complies with UL 60950-1. 3. Proposal to provide an additional option (the use of a symbol) for marking a device, such as a switch, intended for emergency service. 4. Products intended for outdoor use. 5. Proposed changes to the battery life test, and 6. Requirements for openings in non-resident-accessible equipment
UL 2560-2015a, Standard for Safety for Emergency Call Systems for Assisted Living and Independent Living Facilities
Proposed new test methods for spread spectrum technologies; proposal to provide an additional option (the use of a symbol) for marking a device, such as a switch, intended for emergency service; and requirements for openings in non-resident-accessible equipment
UL 2561-2009 (R2013), Standard for Safety for 1400 Degree Fahrenheit Factory-Built Chimneys
UL proposes a reaffirmation for ANSI approval of UL 2561.
UL 2565-2013, Standard for Safety for Semiautomatic Metal Sawing Machines
1. The Proposed First Edition And First Time ANSI Approval Of The Standard For Semiautomatic Metal Sawing Machines
UL 2572-2016, Mass Notification Systems
Revision of the Short Range Radio Frequency Device Test Methods to Incorporate Spread Spectrum Technology. Revisions Added for New and Revised Class Designations and Operation for NACs, IDCs, and SLCs. Miscellaneous Editorial Revisions, Corrections, and Clarifications.
UL 2572-2016a, Mass Notification Systems
Revision of the Short Range Radio Frequency Device Test Methods to Incorporate Spread Spectrum Technology. Revisions Added for New and Revised Class Designations and Operation for NACs, IDCs, and SLCs. Miscellaneous Editorial Revisions, Corrections, and Clarifications.
UL 2575-2012, Lithium Ion Battery Systems for Use in Electric Power Tool and Motor Operated, Heated and Lighting Appliances
Covers: (1) Proposal to correct standard title reference error in 29.3.
UL 2577-2013, Standard for Safety for Suspended Ceiling Grid Low Voltage Systems and Equipment
The following topics for the Standard for Suspended Ceiling Grid Low Voltage Systems and Equipment, UL 2577/ULC-S2577, are being recirculated: 1. The Proposed First Edition of the Joint UL/ULC Standard for Suspended Ceiling Grid Low Voltage Systems and Equipment, UL 2577/ULC-S2577
UL 2577-2017, Standard for Safety for Suspended Ceiling Grid Low Voltage Systems and Equipment
The following changes in requirements to the Standard for Suspended Ceiling Grid Low Voltage Systems and Equipment, UL 2577/ULC-S2577, are being proposed: 1. Add new definition for Low Voltage/Extra-Low Voltage and revise voltage references throughout the standard to correlate with the Canadian Electrical Code, Part 1, and the National Electrical Code, NFPA 70
UL 2580-2016, Standard for Batteries for Use In Electric Vehicles
1. Correction of IEC standard number. 2. Clarification of the Overcharge Test and revision of the Isolation Test and External Fire Exposure Test. 3. Revision of samples numbers for cell testing in 16.2 and 16.3.
UL 2580-2016a, Standard for Batteries for Use In Electric Vehicles
2. Clarification of the Overcharge Test and revision of the Isolation Test and External Fire Exposure Test. 3. Revision of samples numbers for cell testing in 16.2 and 16.3.
UL 2586-2014, Standard for Safety for Hose Nozzle Valves
This proposal clarifies the test methods of the Operation Test, Sensitivity Test, Hose Nozzle Endurance Test, and Drop Test.
UL 2586-2014a, Standard for Safety for Hose Nozzle Valves
Recirculation of proposal for paragraph 17.1.

UL 2586-2014b, Standard for Safety for Hose Nozzle Valves
These revisions clarify the secondary shut off operation requirements.

UL 2586A-2016, Standard for Hose Nozzle Valves for Gasoline and Gasoline/Ethanol Blends with Nominal Ethanol Concentrations up to 85 Percent (E0 - E85)
The following is being proposed: 1. Update requirements to include alternate requirements for compression set limits of constant pressure static face seals

UL 2586B-2015, Standard for Safety for Hose Nozzle Valves with Nominal Ethanol Concentrations up to 85 Percent (B20), Kerosene, and Fuel Oil
These requirements cover hose nozzle valves that are intended to be used for the control of diesel fuel, biodiesel fuel, diesel/biodiesel blends with nominal biodiesel concentrations up to 20 percent (B20), kerosene, and fuel oil.

UL 2592-2015, Standard for Safety for Low Voltage LED Wire (Proposal dated 10/10/14)
These requirements cover single-conductor and multi-conductor, unjacketed, 18 – 10 AWG (0.807 - 5.16 mm squared), low voltage LED wire rated 105°C - 250°C (221°F - 482°F), and 300 or 600 volts, suitable for installation in dry and damp, or wet locations. These wires are for use with signs, outline lighting, and interior lighting where the wire is only connected to the output of the driver to the LED array, is only accessible during user servicing of the sign, and is not required to be additionally enclosed by the sign enclosure, in accordance with the Standard for Electrical Signs, UL 48.

UL 2594-2016, Standard for Safety for Electric Vehicle Supply Equipment

UL 2594-2016a, Standard for Safety for Electric Vehicle Supply Equipment
18. Withdrawal of Proposal: Revision of Requirements for Surface Temperatures

UL 2594-2016b, Standard for Safety for Electric Vehicle Supply Equipment

UL 2595-2015, Standard for General Requirements for Battery-Powered Appliances
1. The proposed Bi-National Standard Resulting in the 2nd Edition Including the Following Changes: a) Revisions to Add References to the Applicable CSA Standards; b) New and Clarified Definitions; c) Clarifications and New Requirements for Markings and Instructions; d) Clarification of Requirements for Harnesses; e) Clarification that All Cells Shall Comply with the Requirements of UL 62133; and f) Revision of Indent G Instructions Providing Guidance that the End Product Standard be Revised to Also Include a Statement that UL 2595 Functional Safety Requirements for an Electronic Safety Control Circuit Fulfills the Requirements of the End-Product Standard.

UL 2595-2015a, Standard for Safety for General Requirements for Battery-Powered Appliances
1. The proposed Bi-National Standard Resulting in the 2nd Edition Including the Following Changes: a) Revisions to Add References to the Applicable CSA Standards; b) New and Clarified Definitions; c) Clarifications and New Requirements for Markings and Instructions; d) Clarification of Requirements for Harnesses; e) Clarification that All Cells Shall Comply with the Requirements of UL 62133; and f) Revision of Indent G Instructions Providing Guidance that the End Product Standard be Revised to Also Include a Statement that UL 2595 Functional Safety Requirements for an Electronic Safety Control Circuit Fulfills the Requirements of the End-Product Standard.

UL 25A-2016, Standard for Safety for Meters for Gasoline and Gasoline/Ethanol Blends with Nominal Ethanol Concentrations up to 85 Percent (E0 - E85)
This proposal is being issued to revise the Moist Ammonia-Air Stress Cracking Test.

UL 25A-2016a, Standard for Safety for Meters for Diesel Fuel, Biodiesel Fuel, Diesel/Biodiesel Blends with Nominal Biodiesel Concentrations up to 20 Percent (B20), Kerosene, and Fuel Oil
The following topic is being proposed: 1) Addition of torque requirements for larger size valve.

UL 25B-2016, Standard for Safety for Meters for Diesel Fuel, Biodiesel Fuel, Diesel/Biodiesel Blends with Nominal Biodiesel Concentrations up to 20 Percent (B20), Kerosene, and Fuel Oil
The following topic is being proposed: 1) Addition of torque requirements for larger size valve.

UL 25A-2016b, Standard for Safety for Meters for Diesel Fuel, Biodiesel Fuel, Diesel/Biodiesel Blends with Nominal Biodiesel Concentrations up to 20 Percent (B20), Kerosene, and Fuel Oil

UL 260-2008 (R2017), Standard for Safety for Dry Pipe and Deluge Valves for Fire-Protection Service
UL proposes a reaffirmation for UL 260.

This 2/6/15 proposal adds a Furnace Exposure Test to UL 263.

UL 268-2016, Standard for Safety for Smoke Detectors for Fire Alarm Systems
Proposed new seventh edition of binational standard UL 268, updating requirements for both the United States and Canada including new requirements for multi-criteria smoke detectors and polyurethane flaming and smoldering tests.

UL 268-2016a, Standard for Safety for Smoke Detectors for Fire Alarm Systems
Recirculation of changes for proposed seventh edition of UL 268 published on 6-27-2014, including the addition of a ‘Do not paint&8221; marking symbol.

UL 268-2016b, Standard for Safety for Smoke Detectors for Fire Alarm Systems
Recirculation of changes for proposed seventh edition of UL 268 published on 6-27-2014, includes addition of a ‘Do not paint&8221; marking symbol and corrections to the original proposal.

UL 268-2016c, Standard for Safety for Smoke Detectors for Fire Alarm Systems
June 3, 2016 document proposes changes to original proposal dated 2-12-16 regarding cooking nuisance and polyurethane flaming and smoldering tests for the seventh edition of UL 268.

UL 268A-2016, Standard for Safety for Smoke Detectors for Duct Application
Proposal dated 7-1-2016 adds a reference to the Field Services Test in UL 268 for paragraph 53.1.

UL 2703-2015, Standard for Mounting Systems, Mounting Devices, Clamping/Retention Devices, and Ground Lugs for Use with Flat-Plate Photovoltaic Modules and Panels
1. The First Edition of the Standard for Mounting Systems, Mounting Devices, Clamping/Retention Devices, and Ground Lugs for Use with Flat-Plate Photovoltaic Modules and Panels, UL 2703, which covers rack mounting systems and clamping devices for flat-plate photovoltaic modules and panels that comply with the Standard for Flat-Plate Photovoltaic Modules and Panels, UL 1703, intended for installation on or integral with buildings, or to be freestanding (i.e., not attached to buildings).

The proposal is to add UL 62368-1 as a permitted base standard.

UL 2743-2016, Standard for Portable Power Packs

Revisions to the first edition of UL 2743 are being recirculated: The First edition of UL 2743, Standard for Portable Power Packs covers: Portable and movable power packs provided with one or more batteries or electrochemical capacitor modules. If provided with a battery, the battery shall be either a lead acid or lithium ion battery. The power packs are provided with one or more inputs, and they are provided with one or more outputs. For power packs provided with a booster function, the power packs are used for providing a temporary power source to a depleted land vehicle battery, rated 12 or 24 V, to provide emergency starting power.

UL 2743-2016a, Standard for Portable Power Packs

Revisions to the first edition of UL 2743 are being recirculated: The First edition of UL 2743, Standard for Portable Power Packs covers: Portable and movable power packs provided with one or more batteries or electrochemical capacitor modules. If provided with a battery, the battery shall be either a lead acid or lithium ion battery. The power packs are provided with one or more inputs and they are provided with one or more outputs. For power packs provided with a booster function, the power packs are used for providing a temporary power source to a depleted land vehicle battery, rated 12 or 24 V, to provide emergency starting power.

UL 275-2013, Standard for Safety for Automotive Glass-Tube Fuses

This proposed Ninth edition of the Standard for Safety for Automotive Glass-Tube Fuses is being issued to obtain ANSI Approval. No technical changes have been made to the standard.

UL 2775-2016, Standard for Safety for Fixed Condensed Aerosol Extinguishing System Units

UL proposes an alternate ultraviolet light exposure test method for UL 2775.

UL 2788-2014, Standard for Safety for Industrial and Commercial Vibrators (Proposal dated 2-21-14)

UL proposes the first edition of UL 2788 which covers industrial and commercial vibrators intended to facilitate the flow and settling of granular materials and slurries.

UL 2790-2010a, R2014, Standard for Safety for Commercial Incinerators

UL proposes a reaffirmation for ANSI approval of UL 2790.

UL 283-2016, Standard for Safety for Air Fresheners and Deodorizers (Proposal dated 5-20-16)

This proposal includes alternative test methods for flash point fragrances

UL 283-2016a, Standard for Safety for Air Fresheners and Deodorizers (proposal dated 8-19-16)

This proposal includes (1) STP-1 supply cords for lightweight products (2) Revision to increase the allowed temperature of hot liquids

UL 283-2016b, Standard for Safety for Air Fresheners and Deodorizers (proposal dated 10-28-16)

This Recirculation proposal provides revisions to the UL 283 proposal dated 2016-05-20.

The following changes in requirements to the Standard for Fire Test of Plastic Water Distribution Plumbing Pipe for Visible Flame and Smoke Characteristics, UL 2846, are being proposed: 1. Revision of the Scope of Products Covered by UL 2846

UL 291-2012 (R2016), Standard for Safety for Automated Teller Systems (Proposal Dated 4/1/16)

These requirements cover the construction and security of equipment intended to automatically dispense currency when operated as intended by an authorized customer, and to provide a limited degree of protection against unauthorized removal of currency.

UL 294-2013, Standard for Safety for Access Control System Units

Proposed new edition including: Revised scope; Updated general requirements; Updated glossary; new requirements for single point lock; Defined tiered access control performance levels; Revised enclosure opening requirements; Addition of separation of circuit requirements; Revised field wiring and terminal requirements; Revised electrical spacing requirements; New secondary power section; New test emulated system requirements; New Class 2 and 3 circuit tests; Revised component temperature test; Revised Input/Output Circuit Transient Test; Revised Destructive Attack Test; New line security requirements; Revised marking requirements; and updated Appendix A.

UL 294B-2013, Standard for Safety for Power Over Ethernet (PoE) Power Sources for Access Control Systems and Equipment

This proposed first edition covers requirements for the evaluation of Power over Ethernet (PoE) power sources for access control systems and equipment. The power sources may be provided integral with the access control equipment or as a separate device supplying power. The equipment is intended to comply with Article 725.121 of the National Electrical Code. Equipment covered by this standard provides a nominal source voltage of 48 or 53 V DC. This standard applies to all connected equipment and interconnections necessary to ensure normal operation of the PoE powered control system.

UL 295-2017, Standard for Safety for Commercial-Industrial Gas Burners

The following topics are being proposed: 1) Addition of requirements for gas assist (pre-mix) burners and 2) Clarification of requirements for high gas pressure switch.

UL 295-2017a, Standard for Safety for Commercial-Industrial Gas Burners

The following topic is being recirculated: 1) Addition of requirements for gas assist (pre-mix) burners.

UL 296-2017, Standard for Safety for Oil Burners

The following topic is being proposed: 1) Revise requirements for programming and timings for burners.

UL 296-2017a, Standard for Safety for Oil Burners

The following topic is being recirculated: 1) Revise requirements for programming and timings for burners.

UL 299-2012, Standard for Safety for Dry Chemical Fire Extinguishers

This 10/21/11 UL 299 proposal includes clarifications of cylinder requirements with DOT and TDRG specifications.

UL 30-2004 (R2014), Standard for Safety for Metal Safety Cans

The following is being proposed: 1. Reaffirmation and Continuance of the Ninth Edition of the Standard for Metal Safety Cans, UL 30, as an American National Standard

UL proposes requirements for appliance specific nozzle coverage and grease auto-ignition temperature for UL 300.

This re-circulation proposal provides revisions to the UL 300 proposal dated 5-16-14.
UL 305-2012a (R2017), Standard for Safety for Panic Hardware
UL proposes a reaffirmation for ANSI approval of UL 305.

UL proposes a reaffirmation for ANSI approval for UL 307A.

UL 310-2014, Standard for Safety for Electrical Quick-Connect Terminals
Proposed Ninth Edition of the Standard for Safety for Electrical Quick-Connect Terminals

UL 310-2014a, Standard for Safety for Electrical Quick-Connect Terminals
Proposed Ninth Edition of the Standard for Safety for Electrical Quick-Connect Terminals

UL 312-2010 (R2015), Standard for Safety for Check Valves for Fire-Protection Service (Proposal dated 1-16-15)
These requirements cover check valves of 1 NPS and larger, used in piping systems supplying water for fire protection service. The check valves covered by these requirements are intended for installation and use in accordance with the Standards: NFPA 11; NFPA 13; NFPA 14; NFPA 15; NFPA 20; NFPA 22; NFPA 24; NFPA 750; and NFPA 13R.

UL 32-2014, Standard for Safety for Metal Waste Cans
The following changes in requirements to the Standard for Metal Waste Cans, UL 32, are being proposed: 1. Clarify intent of trade sizes shown in Table 1; 2. Add marking requirement for waste cans with flat sides

UL 325-2017, Standard for Door, Drapery, Gate, Louver, and Window Operators and Systems

UL 325-2017a, Standard for Door, Drapery, Gate, Louver, and Window Operators and Systems
7. Editorial Changes

UL 325-2017b, Standard for Door, Drapery, Gate, Louver, and Window Operators and Systems
1. The Proposed Seventh Edition of the Standard for Door, Drapery, Gate, Louver, and Window Operators and Systems, UL 325, Incorporating Requirements Applicable for Canada

UL 33-2010 (R2015), Standard for Safety for Heat Responsive Links for Fire Protection Service
Reaffirmation of the Standard for Safety for Heat Responsive Links for Fire Protection Service, as an American National Standard

UL 330-2017, Standard for Safety for Hose and Hose Assemblies for Dispensing Flammable Liquids
The following is being proposed: 1. Revision to requirement for samples in the tensile strength and elongation tests. 2. Clarification of ethanol levels and fuels not covered by the standard. 3. Deletion of scope paragraph 1.3 regarding fuels not covered in paragraph 1.1.

UL 330B-2015, Standard for Safety for Hose and Hose Assemblies for Use With Dispensing Devices Dispensing Diesel Fuel, Biodiesel Fuel, Diesel/Biodiesel Blends With Nominal Biodiesel Concentrations Up To 20 Percent (B20), Kerosene, and Fuel Oil
First edition of the Standard for Hose and Hose Assemblies for Use With Dispensing Devices Dispensing Diesel Fuel, Biodiesel Fuel, Diesel/Biodiesel Blends With Nominal Biodiesel Concentrations Up To 20 Percent (B20), Kerosene, and Fuel Oil is being proposed

UL 331-2008a, Strainers for Flammable Fluids and Anhydrous Ammonia (proposal dated 1/4/08)
Revise item (a) in proposed new exception to 5.3 for clarification.

Non-Potable Water Strainers, New Supplement SA

UL 331A-2015, Standard for Safety for Strainers for Gasoline and Gasoline/Ethanol Blends with Nominal Ethanol Concentrations Up to 85 Percent (E0—E8S) (Proposal dated 10/17/14)
The requirements cover complete, self-contained strainer or filter assemblies intended for use with fuels designated below. Although these devices are designated strainers, they may be either strainers or filters according to the common terminology of the industry. Strainers and filter assemblies covered by these requirements are intended for use with one or more of the following fuels: ANSI/ASTM D975; ANSI/ASTM D7467; ANSI/ASTM D6751; ANSI/ASTM D3699; ANSI/ASTM D396.

UL 340-2009 (R2014), Standard for Safety for Tests for Comparative Flammability of Liquids
This standard provides a method, based on the results of specified flammability tests, for the classification of fluids or liquids as nonflammable, or as flammable with the degree of fire hazard rated both in general terms and on a numerical scale, in comparison with well-known products whose hazards have been established by field experience.

UL 343-2013, Standard for Safety for Pumps for Oil-Burning Appliances (Proposal dated 8/10/12)
These requirements cover pumps that are intended to be used as part of oil-burning appliances or installed in fuel-oil piping systems serving such equipment. Oil-burning appliance pumps may be either automatic or power-operated.

UL 346-2005 (R2014), Standard for Safety for Waterflow Indicators for Fire Protective Signaling Systems
The following is being proposed: 1. Reaffirmation and Continuance of the Fifth Edition of the Standard for Waterflow Indicators for Fire Protective Signaling Systems, UL 346, as an American National Standard

UL 347-2016, Standard for Safety for Medium-Voltage AC Contactors, Controllers, and Control Centers
Proposed Sixth Edition of UL 347, Standard for Safety for Medium-Voltage AC Contactors, Controllers, and Control Centers

UL 347-2016a, Standard for Safety for Medium-Voltage AC Contactors, Controllers, and Control Centers
This standard is applicable to ac contactors with rated voltages of 1 501 to 7 200 V, and metal-enclosed contactor-based controllers, control centers, and other control assemblies and associated equipment with rated voltages of 751 to 7 200 V, designed for operation at frequencies of 50 or 60 Hz on three-phase systems. These requirements cover equipment intended for use in ordinary (non-hazardous) locations and installed in accordance with the applicable local installation codes and standards. These requirements, as modified by the applicable national standards for fire pump controllers, also cover fire pump controllers.

UL 355-2011 (R2016), Standard for Cord Reels
These requirements cover cord reels for general use, as well as cord reels - herein referred to as special-use cord reels - intended to be mounted on or in electrical utilization equipment such as appliances, portable lamps, or similar equipment. These requirements also cover reels for use in factories, household workshops, garages, commercial facilities and construction sites where an additional degree of protection against the risk of the entrance of water, dust or other contaminants might be needed. A cord reel, as covered by these requirements, is a reel equipped with, or intended for use with, a length of flexible cord.

UL 360-2015, Standard for Safety for Liquid-Tight Flexible Metal conduit

Document (dated 10-24-14) proposes the replacement of references to ASTM Oil No. 2 with IRM 902 oil and a correction to a typo in Xenon-air cooled transformers and dc output power supplies intended to supply fountains, swimming pool, and spa luminaires in accordance with Article 680 of the National Electrical Code, ANSI/NFPA 70.

UL 363-2011 (R2015), Standard for Knife Switches

UL 365-2015a, Standard for Safety for Police Station Connected Burglar Alarm Units and Systems
1) Revision of minimum wire size requirements for field wiring terminals and modification of the requirements for field wiring leads. (2) Revisions to attack and tamper-resistant alarm sounding device requirements.

UL 365-2015b, Standard for Safety for Police Station Connected Burglar Alarm Units and Systems
(1) Revision of minimum wire size requirements for field wiring terminals and modification of the requirements for field wiring leads. (2) Revisions to attack and tamper-resistant alarm sounding device requirements.

UL 3703-2015, Standard for Safety for Solar Trackers
1. Correction of a reference in paragraph 16.2 and the deletion of Section 69, Emergency Movement of Platform Without Drive Power Test.

UL 3703-2015a, Standard for Safety for Solar Trackers
1. Correction of a reference in paragraph 16.2 and the deletion of Section 69, Emergency Movement of Platform Without Drive Power Test.

UL 3730-2014a, Standard for Photovoltaic Junction Boxes
1. The First Edition of the Standard for Photovoltaic Junction Boxes, UL 3730, which covers photovoltaic junction boxes intended to be attached to photovoltaic modules and panels. In addition, these requirements cover photovoltaic junction boxes intended for factory and field wiring and may include conduit openings, wiring leads, and/or photovoltaic connectors intended for interconnection of PV modules. The products covered by these requirements are intended to be installed in accordance with the National Electrical Code, ANSI/NFPA 70.

UL 3730-2017, Standard for Photovoltaic Junction Boxes
1. Expansion of UL 3730 to Include Junction Boxes up to 1500 V dc or Less

UL 379-2013, Standard for Safety for Power Units for Fountain, Swimming Pool, and Spa Luminaires
ANSI approval of UL 379, which covers field-installed air-cooled transformers and dc output power supplies intended to supply fountain, swimming pool, and spa luminaires in accordance with Article 680 of the National Electrical Code, ANSI/NFPA 70.

Reaffirmation of current ANSI which covers manual signaling boxes for fire alarm systems intended for permanent installation and use in ordinary locations in accordance with the National Electrical Code, NFPA 70, and the National Fire Alarm Code, NFPA 72.

Reaffirmation of ANSI approval is proposed for UL 385.

UL 391-2006 (R2014), Standard for Safety for Solid-Fuel and Combination-Fuel Central and Supplementary Furnaces
UL proposes a reaffirmation for ANSI approval of UL 391.

UL 399-2013a, Standard for Safety for Drinking Water Coolers
The following is being proposed: 1. Revision of requirements for switches and controllers

UL 399-2017, Standard for Safety for Drinking Water Coolers (Proposal dated 11-4-16)
This proposal includes (1) Addition of parameters for alternative capacitor requirements in UL 60384-14 (2) Addition of start-to-discharge test to allow pressure relief valves, other than ASME stamped valves, on pressurized product systems (3) Clarification of requirements involving ultraviolet radiation lamps (4) Align controls requirements with water heater controls requirements and add alternate protective electronic controls requirements (5) Revisions to Supplement SB for drinking water coolers employing a flammable refrigerant (6) Addition of requirements for remotely operated drinking water coolers (7) Clarification of test enclosure requirements...

UL 4-2008 (R2013), Standard for Safety for Armored Cable

UL 401-2017, Standard for Safety for Portable Spray Hose Nozzles for Fire-Protection Service
1. Inlet Pressure Ratings 2. Revisions to Clarify Requirements and Update Testing Details

UL 404-2015, Standard for Safety for Gauges, Indicating Pressure, for Compressed Gas Service
Proposal to clarify pressure gauge construction

UL 405-2014, Standard for Safety for Fire Department Connection Devices
Eliminate the criteria for comparing the area of the inlet and outlet openings in favor of including a new table which specifies the maximum number of each size of fire department connection inlet and roof manifold outlet that is permitted.

UL 407-2004 (R2013), Standard for Safety for Manifolds for Compressed Gases
Reaffirmation of the Seventh Edition of the Standard for Safety for Manifolds for Compressed Gases, UL 407, as an American National Standard. UL 407 covers equipment for manifolding high-pressure gas cylinders to supply gas for various industrial and commercial applications. Cylinders are manifolded for the purpose of centralizing the gas supply, to provide a continuous supply of gas, or to provide gas at a rate in excess of that which may be obtained from a single cylinder.
UL 412-2017, Standard for Refrigeration Unit Coolers
Addition Of Requirements For Remotely Operated Unit Coolers. Proposal To Update And Clarify Controls Requirements; Add Alternate Protective Electronic Controls Requirements And Alternate Spacings Requirements. Addition Of Reference To Across-The-Line Capacitor Standards. Revisions To Refrigerant Requirements.

Resolve comments received by UL to the following proposals for UL 414, which were originally published on February 1, 2008: (1) Requirements for Current Carrying Part of Potential Jaw Assembly; (3) Addition of Requirements for Rejection Clips; and (6) Addition of Appendix for Explanatory Information Regarding Wire Bending Distance

UL 414-2009c, Standard for Safety for Meter Sockets
The following are proposed requirements for UL 414: 1. Addition of Spacing Requirements for Uninsulated Live Parts of the Same Polarity; 3. Clarification of Temperature Rise Requirements for Potential Jaw Assemblies; 4. Clarification of Requirements for Rating of Metering Transformer Cabinets Intended for Use with "Donut Type" Current Transformers; and 5. Removal of Reference to UL 486E, the Standard for Equipment Wiring Terminals for Use with Aluminum and/or Copper Conductors.

UL 414-2016, Standard for Safety for Meter Sockets
This proposal for UL 414 involves the addition of requirements for clamping jaw designs for Meter Sockets.

UL 4200A-2015, Standard for Safety for Products Incorporating Button or Coin Cell Batteries of Lithium Technologies

UL 4248-1-2013, Standard for Safety for Fuseholders - Part 1: General Requirements
The following changes in requirements to UL 4248-1, are being proposed: 1. Revision to clarify the term 'ferrous'; 2. Revision to address the specification of torque values; 3. Revision to include UL 486E as a reference in Appendix B.4; 4. Revision to correct a typographical error in Clause 7.5.3; 5. Revision to specify the fuse shall be retained in the load side of the fuseholder; 6. Alternatives for the evaluation of the adequacy of surface tracking characteristics of polymeric materials used in fuseholders rated >600 volts less than or equal to 35 kV; 7. Introduction of exception to requirement for withstand testing.

UL 4248-11-2007 (R2012), Standard for Safety for Fuseholders - Part 11: Type C (Edison Base) and Type S Plug Fuse
UL proposes a reaffirmation for ANSI approval of UL 4248-11.
UL 44-2014, Standard for Safety for Thermoset-Insulated Wires and Cables
1. Proposed New Edition of UL 44 2. Revision to the Conductor Sizes Subject to the VW-1 Flame Test

This recirculation proposal provides revisions to the UL 44 recirculation dated 04-19-13.

This recirculation proposal provides revisions to the UL 44 recirculation dated 04-19-13.

UL 441-2006 (R2014), Standard for Safety for Gas Vents
UL proposes a reaffirmation for ANSI approval of UL 441.

UL 443-2008 (R2013), Standard for Safety for Steel Auxiliary Tanks for Oil-Burner Fuel (Bulletin dated December 21, 2012)
Reaffirmation and Continuance of the Sixth Edition of the Standard for Steel Auxiliary Tanks for Oil-Burner Fuel, UL 443, as an American National Standard

UL 444-2017, Standard for Safety for Communications Cables (Proposals Dated 6/3/16)
Proposed Fifth Edition of the Standard for Communication Cables, UL 444, including the following changes: (a) Revision to Paragraph 5.9.2 to Ensure Proper Bonding; (b) LP Cables; (c) Revision to Recognized Markings in Canada; (d) Correction to Drop Weight in Paragraph 7.13.3; (e) Addition of Material Type TPE to Tables 9 & 10; (f) Update to Table A1 in Appendix A; (g) Editorial Corrections

UL 448-2016, Standard for Safety for Centrifugal Stationary Pumps for Fire-Protection Service
The following changes to the Standard for Safety for Centrifugal Stationary Pumps for Fire-Protection Service, UL 448, are being proposed: 1. Requirements Addressing Multistage Multipump Fire Pumps 2. Clarification of Requirements Related to Pump Construction and Performance Testing 3. Revised Requirements Related to Keyways to Secure Shafts and Impellers

UL 448A-2013, Standard for Flexible Couplings and Connecting Shafts for Stationary Fire Pumps
The following changes for UL 448A are being proposed: 1. Clarify and Update Requirements Related to the Construction, Performance Testing and Marking of Flexible Couplings and Connecting Shafts

UL 448B-2013, Standard for Safety for Residential Fire Pumps for One- and Two-Family Dwellings and Manufactured Homes
The following changes in requirements for UL 448B are being proposed: 1. Clarify and Update Requirements Related to Pump Construction and Performance Testing

UL 448C-2014, Standard for Safety for Stationary, Rotary-Type, Positive-Displacement Pumps for Fire-Protection Service
The following changes in UL 448C are being proposed: 1. Clarification and Updating of Requirements Related to Pump Construction, and Performance Testing and Marking; and 2. Revised Marking Requirements

UL 452-2011 (R2015), Standard for Safety for Antenna-Discharge Units
Reaffirm UL 452 as an American National Standard. UL 452 covers antenna-discharge units for radio and television receiving equipment and amateur radio-transmitting and -receiving equipment, to be employed in accordance with the National Electrical Code, NFPA 70. An antenna-discharge unit as covered by these requirements consists of a gap, a fixed resistance or other discharge element, or a combination of such features, connected between each antenna lead-in terminal and a grounding terminal.

1. Overcurrent Protection for Output AC Circuits. 2. Revision to replace Carbon Arc testing with Xenon Arc testing for UV exposure.

UL 458-2015a, Standard for Power Converters/Inverters and Power Converter/Inverter Systems for Land Vehicles and Marine Crafts
1. Branch rated breakers in output circuit of inverter.

UL 464-2016, Standard for Safety for Audible Signaling Devices for Fire Alarm and Signaling Systems, Including Accessories
New proposed 10th edition of UL 464, a binational standard with requirements for the U.S. and Canada covering electrically operated bells, sirens, horns, and similar audible signaling devices, rated at 300 V or less, for fire alarm and signaling systems and intended for indoor and/or outdoor installation in accordance with CSA C22.1, Canadian Electrical Code, Part I, CAN/ULC-S524, Installation of Fire Alarm Systems, and National Electrical Code, NFPA 70, National Fire Alarm and Signaling Code, NFPA 72.

UL 464-2016a, Standard for Safety for Audible Signaling Devices for Fire Alarm and Signaling Systems, Including Accessories
Recirculation of changes for the proposed 10th edition of UL 464, a binational standard with requirements for the U.S. and Canada covering electrically operated bells, sirens, horns, and similar audible signaling devices, rated at 300 V or less, for fire alarm and signaling systems and intended for indoor and/or outdoor installation in accordance with CSA C22.1, Canadian Electrical Code, Part I, CAN/ULC-S524, Installation of Fire Alarm Systems, and National Electrical Code, NFPA 70, National Fire Alarm and Signaling Code, NFPA 72.

UL 464A-2016, Standard for Safety for Audible Signal Appliances for General Signaling Use
New proposed first edition of UL 464A, covering electrically and electronically operated bells, buzzers, horns, and similar audible signal appliances, rated 300 volts or less, for commercial general signaling service and intended for indoor or outdoor locations or both in accordance with the National Electrical Code, NFPA 70.

UL 466-2004 (R2013), Standard for Safety for Electric Scales UL 466 (Proposal dated March 8, 2013)
These requirements cover portable scales, including counter, jewelry, grain, floor, and other electronic scale designations. These scales are ordinarily of the computing type, that are rated 250 volts, or less. These scales consist of an attachment plug, a length of flexible cord, a switch, one or more lamps, lampshades, ballasts if electric-discharge lamps are used, and associated internal wiring. They are intended to be used in accordance with the National Electrical Code, NFPA 70.

UL 467-2013 (R2017), Standard for Safety for Grounding and Bonding Equipment
Reaffirmation of the Tenth Edition of the Standard for Grounding and Bonding Equipment, UL 467.

UL 467-2013a, Standard for Safety for Grounding and Bonding Equipment
The following changes to UL 467 are being recirculated: a) Editorial revisions; b) Revise definition for Intersystem Bonding Termination; c) Revise Clause 6.6.4; d) Delete proposed Clauses 6.4.8 and 6.4.9; e) Add UPC label note in Clauses 10.8 and D.3.2; f) Revise requirements in Annex C; and g) Delete proposed Annex E.

UL 47-2004 (R2017), Standard for Safety for Semiautomatic Fire Hose Storage Devices
UL proposes a reaffirmation of UL 47.

UL 4703-2014, Standard for Safety for Photovoltaic Wire (Proposal Dated 5-9-14)
This Standard covers single-conductor, insulated and integrally or non-integrally jacketed, sunlight resistant, photovoltaic wire rated 90°C, 55°C, 105°C, 60°C, 125°C, or 150°C wet, dry, and ground, 0°C, 60°C, 100°C, or 200°C V for interconnection wiring of grounded and ungrounded photovoltaic power systems as described in Wiring Systems, Article 690, and other applicable parts of the National Electrical Code (NEC), NFPA 70.

UL 4703-2014a, Standard for Safety for Photovoltaic Wire (Proposal Dated 5-9-14)
This Standard covers single-conductor, insulated and integrally or non-integrally jacketed, sunlight resistant, photovoltaic wire rated 90°C, 55°C, 105°C, 60°C, 125°C, or 150°C wet, dry, and ground, 0°C, 60°C, 100°C, or 200°C V for interconnection wiring of grounded and ungrounded photovoltaic power systems as described in Wiring Systems, Article 690, and other applicable parts of the National Electrical Code (NEC), NFPA 70.
UL 471-2016, Standard for Commercial Refrigerators and Freezers
The following is being proposed: 1. Addition of UL 60335-1 based requirements for the evaluation of electronic circuits. 2. Addition of requirements for thermoelectric refrigerators

UL 471-2016a, Standard for Safety for Commercial Refrigerators and Freezers
Update and clarify Section 9, Field Supply Connections; revise Section 90, Installation And Operating Instructions; addition of requirements to the alternate strength and fatigue test; and update temperature of fan motor windings during the fan failure test.

UL 474-2015, Standard for Safety for Dehumidifiers
The following is being proposed: 1. Addition of test condition to ensure component temperature limits are not exceeded in event of a refrigerant loss

UL 474-2015a, Standard for Safety for Dehumidifiers
The following is being proposed: 1. Addition of supplement for requirements for alternative path for electronic controls

UL 474-2015b, Standard for Safety for Dehumidifiers
The following is being recirculated: 1. Addition of test condition to ensure component temperature limits are not exceeded in event of a refrigerant loss

UL 48-2014, Electric Signs
1. Addition of requirements for laminated or organic-coated glass and revision to test method. 2. Addition of requirements for signs with photovoltaic systems or modules.

UL 482-2005 (R2014), Standard for Safety for Portable Sun/Heat Lamps
The following is being proposed: 1. Reaffirmation and Continuance of the Ninth Edition of the Standard for Portable Sun/Heat Lamps, UL 482, as an American National Standard.

UL 484-2016, Standard for Room Air Conditioners
Addition of Requirements Covering Button or Coin Cell Batteries of Lithium Technologies, Section 32A.

UL 486A-486B-2016, Standard for Safety for Wire Connectors
The following topic is being proposed: 1) Delete restriction on compact conductor size allowance.

UL 486C-2016, Standard for Safety for Splicing Wire Connectors
The following topic is being proposed: 1) Delete restriction on compact conductor size allowance.

UL 486D-2015, Standard for Safety for Sealed Wire Connector Systems
This proposed new edition includes the following topics: (a) NEC 555.9 and use in marina (salt environment), Clause 1.1; (b) Normative reference updates, Section 2.2; (c) Wire size units, AWG/kcmil, units, Clauses 3.1 and 3.2; (d) Wire conductor test clarification, Clause 7.1.1; (e) Two conductor requirement, Clause 9.1.2; (f) Conductor insulation for size 16 AWG and smaller, Clause 9.1.4; (g) Impact Test apparatus, Figure A.1; and (h) Clarification to Clause 10.2.

UL 486E-2015, Standard for Safety for Equipment Wiring Terminals for Use with Aluminum and/or Copper Conductors
This proposal includes the addition of requirements for testing with uninsulated conductors.

UL 486F-2015, Standard for Safety for Bare and Covered Ferrules
This proposal modifies requirements for plastic sleeve.

UL 489-2016, Standard for Safety for Molded-Case Circuit Breakers, Molded-Case Switches and Circuit-Breaker Enclosures

UL 489-2016a, Standard for Safety for Molded-Case Circuit Breakers, Molded-Case Switches and Circuit-Breaker Enclosures

UL 489A-2008 (R2013), Standard for Safety for Circuit Breakers for Use in Communications Equipment
The requirements of this standard cover single pole or multi-pole DC rated circuit breakers intended for use as branch circuit overcurrent and short-circuit protection in communications equipment. All poles of multi-pole circuit breakers covered by this standard operate at the same potential. The requirements of this standard cover devices rated 600 volts DC or less. This standard is intended to be used with the Standard for Molded-Case Circuit Breakers, Molded-Case Switches and Circuit-Breaker Enclosures, UL 489, as the requirements of this standard modify tests described in that standard.

UL 489B-2016, Standard for Safety for Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures For Use With Photovoltaic (PV) Systems

UL 489B-2016a, Standard for Safety for Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures For Use With Photovoltaic (PV) Systems

UL 493-2012 (R2016), Standard for Safety for Thermoplastic-Insulated Underground Feeder, and Branch-Circuit Cables (Proposal dated 8/26/16)
These requirements cover 14 - 4/0 AWG single-conductor PVC-insulated and -jacketed underground feeder and branch-circuit cable and flat multiple-conductor PVC-jacketed underground feeder and branch-circuit cables containing two or three 14 - 6 AWG PVC-insulated circuit conductors with or without a grounding conductor. These Type UF cables are intended for use in accordance with Article 340 and other applicable parts of the National Electrical Code, ANSI/NFPA-70 in wiring systems operating at a potential of 600 V or less.

UL 496-2013, Standard for Safety for Lampholders
The following changes in requirements to the Standard for Lampholders, UL 496, are being proposed: 1. Add peak voltage requirement equal to pulse rating for test potential of lampholders made of inorganic material 2. Clarify RTI temperature marking to avoid interference with IEC T-marking 3. Revision to the scope of the standard to clarify that outlet-box lampholders with shades are not covered 4. Addion of ratings for GU24 lampholders 5. Addition of test method for Switched GU24 Lampholders

UL 496-2013a, Standard for Safety for Lampholders

UL 496-2013b, Standard for Safety for Lampholders
The following topics for the Standard for Lampholders, UL 496, are being recirculated: 1. Add peak voltage requirement equal to pulse rating for test potential of lampholders made of inorganic material 3. Revision to the scope of the standard to clarify that outlet-box lampholders with shades are not covered 6. Revision of mold stress-relief test method to address temperature rated fluorescent lampholders
UL 497-2004 (R2013), Standard for Safety for Protectors for Paired-Conductor Communications Circuits
UL 497 covers protectors for paired-conductor communications circuits to be used in accordance with Article 800 of the National Electrical Code, NFPA 70. A communications circuit protector consists of single- and multiple-pair air gap arresters, gas tube arresters, or solid state arresters, with or without fuses or other voltage-limiting devices. A circuit protector is intended to protect equipment, wiring, and personnel against the effects of excessive potentials and currents in telephone lines caused by lightning, contacts with power conductors, power induction, and rises in ground potential.

UL 497A-2004 (R2017), Standard for Safety for Secondary Protectors for Communications Circuits
Covers the third edition of UL 497A, secondary protectors for use in single- or multiple-pair-type communications circuits that are intended to be installed in accordance with Article 800 of the National Electrical Code, ANSI/NFPA 70.

UL 497B-2004 (R2017), Standard for Safety for Protectors for Data Communications and Fire Alarm Circuits
Covers the fourth edition of UL 497B, protectors for data communications and fire-alarm circuits.

UL 497C-2004 (R2017), Standard for Safety for Protectors for Coaxial Communications Circuits
Covers the second edition of UL 497C, protectors for use on coaxial cable circuits to be used in accordance with the applicable requirements of the National Electrical Code, NFPA 70.

This proposal includes: (1)Revision to SG4.3 use of nonmetallic sheathed interconnect devices (2) New Supplement SH - Magnetically Coupled Cord Connector and Inlet

This proposal includes: 1. Addition of insertion testing for 5-15R and 5-20R normal household receptacles 2. Receptacles identified for use with 75° C Insulated Conductors 3. Editorial correction to specify the pin material for test pin B of the grounding contact test

UL 498-2016b, Standard for Safety for Attachment Plugs and Receptacles (Proposal dated 04/08/16)
The following changes are being recirculated: Proposed changes to Attachment Plugs and Receptacles: 1. Additional exemption added to address Horsepower Overload Testing for specific configurations. 2. Supplement SG, Use of Nonmetallic Sheathed Cable Interconnects

UL 498-2016c, Standard for Safety for Attachment Plugs and Receptacles
1. Revision to paragraph 15.3.6 to reference UL 1681.

UL 498-2017, Standard for Safety for Attachment Plugs and Receptacles
This proposal is for the identification of Horsepower ratings for ANSI/NEMA Configurations L25-30R and L26-30R in Tables 115.2 and 183.2 of UL 498.

UL 498-2017a, Standard for Safety for Attachment Plugs and Receptacles
This is a revised version of the proposal for the identification of Horsepower ratings for ANSI/NEMA Configurations L25-30R and L26-30R in Tables 115.2 and 183.2 that was published by UL on December 2, 2016.

This proposal includes the following revisions: (1)Addition of requirements for child-appealing or toy-like features (2)Addition of requirements to address the perimeter of a current tap enclosure to prevent single-pole insertion.

This recirculation provides revisions to the proposal dated 11-27-2015.

UL 498C-2017, Standard for Safety for Appliance and Flatiron Plugs
UL 498C covers flatiron and appliance plugs intended for use on cord-connected portable cooking or heating appliances rated up to 20 A, 250 Volts or less, intended for use in ordinary non-hazardous locations - all intended for connection to a branch circuit for use in accordance with the National Electrical Code, NFPA 70 and the Canadian Electrical Code, Part I, CSA C22.1-15.

UL 499-2017, Standard for Safety for Electric Heating Appliances
1. Proposal to Revise Requirements for Steam Generators

UL 5-2016, Standard for Safety for Surface Metal Raceways and Fittings
Document dated 4-1-16 proposes revisions to installation instructions allowing an option to access a manufacturer’s website for the information.

UL 50-2015, Standard for Safety for Enclosures for Electrical Equipment, Non-Environmental Considerations
UL proposes a new edition of UL 50.

UL 506-2008 (R2012), Standard for Safety for Specialty Transformers
These requirements cover ignition transformers for use with gas burners and oil burners and specialty step-up transformers used in applications such as insect electrocuting. Transformers incorporating overcurrent or over-temperature protective devices, transient voltage surge protectors, or power factor correction capacitors are also covered by these requirements. These transformers are intended to be used in accordance with the National Electrical Code, NFPA 70.

UL 508-2013, Standard for Safety for Industrial Control Equipment
Covers revisions to the following topics based on comments received: (a) Equipment door opening 90 degrees from the closed position (b) Field wiring terminals marking

UL 508S-1-2013, Standard for Safety for Low Voltage Transformers - Part 1: General Requirements
Addition of Requirements for Double Insulation

UL 508S-2-2012, Standard for Safety for Low Voltage Transformers - Part 2: General Purpose Transformers

UL 508S-3-2012, Standard for Safety for Low Voltage Transformers - Part 3: Class 2 and Class 3 Transformers

UL 508C-2016, Standard for Safety for Power Conversion Equipment
Covers: (1) Addition of requirements for modular drive systems; (2) Modification of short-circuit testing requirements; (3) Clarification of control circuit transformer protection requirements; (4) Revision of ratings for capacitors in AC circuits; (5) Revision of marking and instruction requirements to use appropriate signal words; (6) Revision of frequency requirements for dielectric voltage withstand testing; (7) Revision of breakdown of components testing in secondary circuits; and (8) Revision of Table 63.1 to include marking requirements in 56.6 and 56.7.
UL 508C-2016a, Standard for Safety for Power Conversion Equipment
Revisions to the proposed requirements for Modular Drive Systems as the result of comments received.

UL 508C-2016b, Standard for Safety for Power Conversion Equipment
Covers: (a) Slash and Straight Voltage Ratings for Drives with a 3-Phase Input; (b) Clarification of the test sample for the single phasing test as per Table 39.1; (c) Revision to the conductor temperature limit during the Temperature Test; (d) Revision to the temperature recording intervals during the Temperature Test; (e) Addition of a time limit for the Breakdown of Components Test; (f) Revision of 56.7 to align with requirements in NFPA 70; (g) Revisions to Plenum Rated Drives

UL 50E-2015, Standard for Safety for Enclosures for Electrical Equipment, Environmental Considerations
UL proposes a new edition of UL 50E.

UL 51-2015, Standard for Safety for Power-Operated Pumps and Bypass Valves for Anhydrous Ammonia, LP-Gas, and Propylene
(Project) proposed 1-16-15
Pressure Marking, Proposed Change to 25.2

UL 51A-2015, Standard for Safety for Metallic Outlet Boxes
4. Revision to the Type of Vibrator Referenced for Testing in Clause 12.18.7

UL 51A-2015a, Standard for Safety for Metallic Outlet Boxes
1. Clarification for the Evaluation of Covers. 2. Clarification of the Term & #178;Cross-Sectional Area& #178; of Conduit Bodies. 3. Clarification of Conduit Bodies, including New and Deleted Requirements. 4. Revision to the Type of Vibrator Referenced for Testing in Clause 12.18.7 . 5. Correction of a Dimension in Clause 13.11

UL 51B-2012a, Standard for Safety for Conduit, Tubing, and Cable Fittings
(1) Proposed Sixth Edition: Modifications to clauses 7.18.2 and 8.33.1.1 after consideration of comments; (2) Proposed changes to clause 8.3.1 to specify smaller range of sheet metal thicknesses for snap-in type fittings.

UL 51B-2014, Standard for Safety for Conduit, Tubing and Cable Fittings
1. Proposed Revision And Addition Of Requirements Specific To Conduit Bodies To Distinguish Between Requirements Applicable To Conduit Bodies For Use With Rigid PVC Conduit And Requirements Applicable To Conduit Bodies For Use With Rigid Metal Conduit, Electrical Metallic Tubing and Intermediate Metal Conduit 2. Proposed Revision And Addition Of Construction And Marking Requirements Specific To The Dimensional Criteria For Conduit Bodies To Align With Changes To The 2014 National Electrical Code 3. Proposed Revision Of Requirements For Conduit Bodies To Clarify That The Cross-Sectional Area Of A Conduit Body Is Internal To The Body 4. Proposed Revision And Deletion Of Requirements For Thread Count For The Connection Of Conduit As A Result Of The Introduction Of Thread Gaging Requirements 5. Proposed Addition And Revision Of Construction And Test Requirements To Clarify Existing Requirements Specific To Reducing Washers For Use In Wet Locations or Liquid-Tight Applications 6. Proposed Addition Of Clause 5.19.4 To Clarify Construction And Test Requirements For Sealing-Type Conduit Locknuts For Use In Wet Locations Or Liquid-Tight Applications 7. Proposed Addition Of Construction And Test Requirements Applicable To Sealing Rings 8. Proposed Addition Of Requirements To Specify Tools Required For The Assembly Of Fitting Samples To Be Tested 9. Proposed Revision To Clause 8.5.3 To Allow The Use Of Memineralized Water As A Substitute For Distilled Water For The Metallic Coating Thickness Test 10. Proposed Revision To Clause 8.5.4 To Align The Test Method For The Metallic Coatings Thickness Test With Similar Tests In Other UL Standards 11. Proposed Revision To Clause 8.7.4 To Align The Test Method For The Use of Mating Threads For Conduit

UL 51C-2014, Standard for Safety for Nonmetallic Outlet Boxes, Flush-Device Boxes, and Covers
1. Clarification of the Use of Nonmetallic Material in the Ground Path. 2. Revision to the Minimum RTI Requirement for Box Extenders. 3. Correction of UL 5148 Clause Reference Regarding Nonmetallic Cable Clamps. 4. Clarification of the Requirements to Evaluate the Combination of Receptacle and Cover as an Assembly. 5. Clarification of the Cross Sectional Area of Conduit Bodies.

UL 51C-2014a, Standard for Safety for Nonmetallic Outlet Boxes, Flush-Device Boxes, and Covers
2. Revision to the Minimum RTI Requirement for Box Extenders. 4. Clarification of the Requirements to Evaluate the Combination of Receptacle and Cover as an Assembly.

UL 51C-2014c, Standard for Safety for Nonmetallic Outlet Boxes, Flush-Device Boxes, and Covers
1. Clarification of the Use of Sealing Compound for Damming Scrub-Water Solution When Conducting Scrub-Water Exclusion Test. 2. Correlation of RTI Requirements for Polymeric Box Extenders. 3. Revisions to Section S3, Resistance to Ultraviolet Light and Water, by Adding an Option for Xenon-Arc Method. 4. Revisions to Improve the Correlation of Fixture/Luminaire and Ceiling Suspended Fan Support Requirements Between UL 514C and the Standard for Metallic Outlet Boxes, UL 51A. 5. Revisions to Improve the Correlation of Floor Box Requirements Between UL 514C and the Standard for Metallic Outlet Boxes, UL 51A.

UL 51C-2014d, Standard for Safety for Nonmetallic Outlet Boxes, Flush-Device Boxes, and Covers
1. Clarification of the Use of Sealing Compound for Damming Scrub-Water Solution When Conducting Scrub-Water Exclusion Test. 4. Revisions to Improve the Correlation of Fixture/Luminaire and Ceiling Suspended Fan Support Requirements Between UL 514C and the Standard for Metallic Outlet Boxes, UL 51A. 5. Revisions to Improve the Correlation of Floor Box Requirements Between UL 514C and the Standard for Metallic Outlet Boxes, UL 51A.

UL 51D-2016, Standard for Safety for Cover Plates for Flush-Mounted Wiring Devices
1. Proposed Revision And Addition Of Requirements To Clarify Requirements Applicable To Outlet Box Hood Types Of Other Than The Extra-Duty Type 2. Proposed Addition Of Resistance To Ignition Test Requirements To Clarify That The Test Sample May Be A Finished Cover Plate Or Plate Material 3. Proposed Revision Of The Tables In Clause 8.1.1 And Clause 8.1.2 To Clarify Resistance To Moisture Test Requirements Applicable To Cover Plates And Various Types Of Outlet Box Hoods 4. Proposed Revisions To Clarify That Cover Plates Are To Be Hinged To Outlet Box Hoods During The Cold Impact Test 5. Proposed Addition Of Requirements To Exempt Outlet Box Hood With Very Low-Profile After Installation From The Impact Resistance Test 6. Proposed Addition To The Hinge Stress Test Requirements To Clarify That The Specimen Orientation Specified For The Test Applies For The Test Only And Not To The Installation Orientation Specified By The Manufacturer 7. Proposed Revision To Clause 5.3.8 To Clarify All Requirement Applicable To Outlet Box Hoods Marked

UL 521-2016, Standard for Safety for Heat Detectors for Fire Protective Signaling Systems
Proposal dated 8-26-2016 adds an alternative symbol for the “Do Not Paint” marking referenced in paragraph 53.1 and additionally updates the titles of ASTM standards referenced throughout the document

UL 525-2008 (R2012), Standard for Safety for Flame Arresters (Proposal bulletin dated 05-25-12)
UL 539-2017, Standard for Safety for Single and Multiple Station Heat Alarms

Document dated 9-30-2016 proposes revisions to the oven test in section 24 and proposes a new Rate-of-Rise Operation Test for the standard.

UL 539-2017a, Standard for Safety for Single and Multiple Station Heat Alarms

1. Alternative Paintbrush Marking for “Do Not Paint” Requirement

UL 541-2016, Refrigerated Vending Machines

1. Proposed Addition And Revision Of Requirements To Provide An Alternate Method of Evaluating Protective Electronic Circuits And Controls 2. Proposed Addition and Revisions Of Requirements To Clarify Requirements And To Allow For An Alternate Compliance Method For Testing Vending Machines Having A Flammable Refrigerant 3. Proposed Revisions To And Addition Of Requirements To Address Vending Machines With Remote Operation Or Monitoring Functionality

UL 542-2005 (R2014), Standard for Safety for Fluorescent Lamp Starters

The following is being proposed: 1. Reaffirmation and Continuance of the Ninth Edition of the Standard for Fluorescent Lamp Starters, UL 542, as an American National Standard

UL 551-2009 (R2013), Standard for Safety for Transformer-Type Arc-Welding Machines

UL 555-2016, Standard for Safety for Fire Dampers (Proposal dated 08-19-16)

The following changes in requirements to the Standard for Fire Dampers, UL 555, are being proposed: 1. The Long Term Holding Test 2. Temperature range expansion for Dynamic Closure Test

UL 555S-2016, Standard for Safety for Smoke Dampers (Proposal Dated 08-19-16)

The following changes in requirements to the Standard for Smoke Dampers, UL 555S, are being proposed: 1. Alignment between UL 555 group of standards

UL 558-2016, Standard for Safety for Industrial Trucks, Internal Combustion Engine-Powered (Proposal dated 8-19-16)

This proposal includes (1) Wiring and cable exposure to fuel drippage (2) Overcurrent protection devices (3) Electrical system protection (4) Sparking component enclosure requirement (5) Manual disconnect switch

UL 558-2016a, Standard for Safety for Industrial Trucks, Internal Combustion Engine-Powered (Proposal dated 10-28-16)

This Recirculation proposal provides revisions to the UL 558 proposal dated 2016-08-19.

UL 561-2011, Standard for Safety for Floor-Finishing Machines (Proposal dated 5/13/11)

Adds component requirements to the body of the standard and incorporates specific component requirements that are being applied within the end product requirements.

UL 561-2011a, Standard for Safety for Floor-Finishing Machines (Proposal dated 9/16/11)

Recommended Failure Rate, Revised 16A.4.3

UL 563-2017, Standard for Ice Makers

Proposal to add a reference to UL 60335-1 based requirements for the evaluation of electronic circuits.

UL 565-2013, Standard for Safety for Liquid-Level Gauges for Anhydrous Ammonia and LP-Gas (Proposal dated 7-26-13)

Changes to the proposed sixth edition of UL 565

UL 567-2014, Standard for Safety for Emergency Breakaway Fittings, Swivel Connectors and Pipe-Connection Fittings for Petroleum Products and LP-Gas

UL proposes to clarify and revise the Moist Ammonia-Air Stress Cracking Test.

UL 567A-2015, Standard for Safety for Emergency Breakaway Fittings, Swivel Connectors and Pipe-Connection Fittings for Gasoline and Gasoline/Ethanol Blends with Nominal Ethanol Concentrations up to 85 Percent (E0 - E85)

These requirements cover emergency breakaway fittings, swivel connectors and pipe-connection fittings of the threadless compression type for gasoline and gasoline/ethanol blends with nominal ethanol concentrations up to 85 percent (E0 - E85).

UL 567A-2015a, Standard for Safety for Emergency Breakaway Fittings, Swivel Connectors and Pipe-Connection Fittings for Gasoline and Gasoline/Ethanol Blends with Nominal Ethanol Concentrations up to 85 Percent (E0 - E85)

This proposal covers the following topics: 1) Relocation of paragraph 9.1 to the Scope section and 2) Revised Moist Ammonia Air Stress Cracking Test.

UL 567B-2015, Standard for Safety for Emergency Breakaway Fittings, Swivel Connectors and Pipe-Connection Fittings for Diesel Fuel, Biodiesel Fuel, Diesel/Biodiesel Blends with Nominal Biodiesel Concentrations up to 20 Percent (B20), Kerosene, and Fuel Oil

These requirements cover emergency breakaway fittings, swivel connectors and pipe-connection fittings of the threadless compression type for diesel fuel, biodiesel fuel, diesel/biodiesel blends with nominal biodiesel concentrations up to 20 percent (B20), kerosene, and fuel oil.

UL 568-2016, Standard for Safety for Emergency Breakaway Fittings, Swivel Connectors and Pipe-Connection Fittings for Diesel Fuel, Biodiesel Fuel, Diesel/Biodiesel Blends with Nominal Biodiesel Concentrations up to 20 Percent (B20), Kerosene, and Fuel Oil

This proposal covers the following topics: 1) Relocation of paragraph 9.1 to the Scope section and 2) Revised Moist Ammonia Air Stress Cracking Test.

UL 568-2004 (R2014), Standard for Safety for Nonmetallic Cable Tray Systems

Reaffirmation of current ANSI which covers requirements for nonmetallic cable trays and associated fittings designed for use in accordance with the rules of the Canadian Electrical Code (CEC) Part 1, and the National Electrical Code#174; (NEC).

UL 569-2013, Standard for Safety for Pigtails and Flexible Hose Connectors for LP-Gas

1. Revision to Section 14 - Bending Test - Metallic Tubing; 2. Revision to Section 15 - Bending Test - Hose

UL 574-2014, Standard for Safety for Electric Oil Heaters (Proposals Dated 2/7/14)

UL 583-2016, Standard for Safety for Electric-Battery-Powered Industrial Trucks

UL proposes the following changes to UL 583: removal of 150 volt statement in 1.4, addition of new battery cable requirements, addition of UL 2271 to Section 15.2, and exception of 17.1.2.

UL 583-2016a, Standard for Safety for Electric-Battery-Powered Industrial Trucks (Proposal dated 7-15-16)

This proposal includes (1) Removal of marking requirements for supplying an electrical schematic with the truck (2) LVLE qualification of a regulating network (3) Revision to grounding of a truck (4) Revision to allow generators under motors and electromechanical brakes (5) Revision to dielectric voltage withstand to allow multiple energy sources on trucks (6) Revision to define the power source for Type EE trucks

UL 583-2016b, Standard for Safety for Electric-Battery-Powered Industrial Trucks (Proposal dated 9-30-16)

This Recirculation proposal provides revisions to the UL 583 proposal dated 2016-07-15.

UL 586-2009 (R2014), Standard for Safety for High-Efficiency, Particulate, Air Filter Units

The following is being proposed: Reaffirmation of the Ninth Edition of the Standard for High-Efficiency, Particulate, Air Filter Units
UL 588-2015, Standard for Safety for Seasonal and Holiday Decorative Products
This covers: 1) Revision of decorative outfit product accessory length; and 2) Addition of CXTW-S

UL 588-2015a, Standard for Safety for Seasonal and Holiday Decorative Products
This covers revisions to the scope of the standard and revisions to the requirements for Class 2 power supplies

UL 588-2015b, Standard for Safety for Seasonal and Holiday Decorative Products
Revises the following proposals as the result of comments received: Miscellaneous Revisions and Revision to Amenity of Cords; 2) Revision to Requirements of Tree Poles Employing Seasonal Use Extension Cords; and 3) Revised Requirements for Parallel-Connected Lighting Strings

UL 588-2015c, Standard for Safety for Seasonal and Holiday Decorative Products
This covers: 1) Miscellaneous Revisions and Revision to Ampacity of Cords; 2) Revision to Requirements of Tree Poles Employing Seasonal Use Extension Cords; and 3) Revised Requirements for Parallel-Connected Lighting Strings

UL 588-2015d, Standard for Safety for Seasonal and Holiday Decorative Products
This covers revisions for motorized products employing 20 AWG SPT-2W.

UL SA-2015, Standard for Safety for Nonmetallic Surface Raceways and Fittings
Proposed Fourth Edition of the Standard for Nonmetallic Surface Raceways and Fittings, UL SA

UL SA-2015a, Standard for Safety for Nonmetallic Surface Raceways and Fittings
Upon review of comments responding to UL's original proposal dated 9-26-14, UL is recirculating revised changes (dated 1-16-15) to the proposed Fourth Edition of UL SA.

UL SA-2015b, Standard for Safety for Nonmetallic Surface Raceways and Fittings
Upon review of comments responding to UL's recirculation on 1-16-15, UL is recirculating a change (dated 3-27-15) to the proposed Fourth Edition of UL SA.

UL SB-2014, Standard for Safety for Strut-Type Channel Raceways and Fittings
Addition of Xenon-arc Conditioning as an Option to Carbon-arc

UL SC-2016, Standard for Safety for Surface Metal Raceways and Fittings for Use with Data, Signal, and Control Circuits
Proposes revisions to installation instructions and external standards references.

UL 6-2014, Standard for Safety for Electrical Rigid Metal Conduit - Steel
Document (dated 3-28-2014) proposes marking limitations on small trade size elbows and nipples

UL 60034-1-2016, Standard for Safety for Rotating Electrical Machines - Part 1: Rating and Performance
UL proposes to adopt the requirements of IEC 60034-1, which covers rating and performance criteria applicable to all rotating electrical machines.

UL 60034-1-2016, Standard for Safety for Rotating Electrical Machines - Part 1: Rating and Performance
UL proposes to adopt the requirements of IEC 60034-1, which covers rating and performance criteria applicable to all rotating electrical machines.

UL proposes the identical adoption of IEC 60034-2-1:2014 (2nd Edition), the Standard for Rotating electrical machines - Part 2-1: Standard methods for determining losses and efficiency from tests (excluding machines for traction vehicles), as UL 60034-2-1. This part of IEC 60034 is intended to establish methods of determining efficiencies from tests, and also to specify methods of obtaining specific losses. This standard applies to d.c. machines and to a.c. synchronous and induction machines of all sizes within the scope of IEC 60034-1.

UL 60065-2015, Standard for Safety for Audio, Video and Similar Electronic Apparatus - Safety Requirements

UL 60065-2015a, Standard for Safety for Audio, Video and Similar Electronic Apparatus - Safety Requirements
The proposed eighth edition of the Standard for Audio, Video and Similar Electronic Apparatus - Safety Requirements, UL 60065. This new edition is based on the Eighth Edition of IEC 60065. Technical changes to the IEC Standard have been incorporated into the new edition of the UL Standard. National Differences from the Seventh Edition of UL 60065 were reviewed and updated in the new edition.

This proposal incorporates technical and editorial revisions that address the ISA and UL comments received during the preliminary review.

UL 60079-0-2013, Standard for Safety for Explosive Atmospheres - Part 0: Equipment - General Requirements
This recirculation proposal provides revisions to the bulletin dated May 11, 2012 for the PNE of UL 60079-0 based upon the comments received. This revision is a complete rewrite of text to coincide with the IEC text and contains US deviations.

This proposal provides revisions to the proposal document dated January 23, 2015 for the Adoption of IEC 60079-1, Explosive Atmospheres - Part 1: Equipment Protection by Flameproof Enclosures "d" (7th ed, issued by IEC June 2014) as a new IEC-based UL standard, UL 60079-1 to applicable requirements per accepted comments received.

UL 60079-11-2014, Standard for Safety for Explosive Atmospheres - Part 11: Equipment Protection by Intrinsic Safety "i" (Proposal Ballot dated 08-16-13)
This bulletin proposes revisions to update ANSI/UL 248-1 references and clarification for Figure 2

UL 60079-11-2014a, Standard for Safety for Explosive Atmospheres - Part 11: Equipment Protection by Intrinsic Safety "i" (Proposal Ballot dated 01-24-14)
This bulletin proposes revisions to clause 7.3 for non-intrinsically safe circuit connections of galvanically separating components

UL 60079-15-2013 (R2017), Standard for Safety for Explosive Atmospheres - Part 15: Equipment Protection by Type of Protection "n" (Proposal dated 03-03-17)

UL 60079-17-2017, Standard for Safety for Explosive Atmospheres - Part 17: Electrical Installations Inspection and Maintenance (Proposal dated 02-17-17)
This proposal provides revisions to the proposal document dated July 25, 2016 for the Adoption of IEC 60079-17, Explosive Atmospheres - Part 17: Electrical Installations Inspection and Maintenance (fifth edition, issued by IEC November 2013) as a new IEC-based UL standard, UL 60079-17 to the applicable requirements per comments received.

UL 60079-17-2017a, Standard for Safety for Explosive Atmospheres - Part 17: Electrical Installations Inspection and Maintenance (Proposal dated 02-17-17)
This proposal provides revisions to the proposal document dated July 25, 2016 for the Adoption of IEC 60079-17, Explosive Atmospheres - Part 17: Electrical Installations Inspection and Maintenance (fifth edition, issued by IEC November 2013) as a new IEC-based UL standard, UL 60079-17 to the applicable requirements per comments received.

UL 60079-18-2016a, Standard for Safety for Explosive Atmospheres - Part 18: Equipment Protection by Encapsulation "m" (Proposal dated 01-29-16)

This proposal includes a revision for 10 e) to align with the tests specified in 8.2.2 and correct the conflict with the NEC.

This proposal includes a revision for 10 e) to include the appropriate US terms for EPLs.

UL 60079-2-2010 (R2015), Standard for Safety for Explosive Atmospheres - Part 2: Equipment Protection by Pressurized Enclosures "p"

Reaffirmation and Continuance of the Standard for Explosive Atmospheres - Part 2: Equipment Protection by Pressurized Enclosures "p"

This proposal provides revisions to the proposal document dated December 16, 2016 for the Adoption of IEC 60079-2, Explosive Atmospheres - Part 2: Equipment Protection by Pressurized Enclosure "p", (sixth edition, issued by IEC July 2014) as a new UL IEC-based UL standard, UL 60079-2 to the applicable requirements per comments received.

Reaffirmation and Continuance of the Standard for Explosive Atmospheres - Part 25: Intrinsically Safe Electrical Systems

This proposal provides revisions to the proposal document dated August 19, 2016 for the Adoption of IEC 60079-26, Explosive Atmospheres - Part 26: Equipment with Equipment Protection Level (EPL) Ga (third edition issued by IEC October 2014) as a new IEC-based UL standard, UL 60079-26 to the applicable requirements per comments received.

UL 60079-31-2015a, Standard for Safety for Explosive Atmospheres - Part 31: Equipment Dust Ignition Protection by Enclosure "t" (Proposal dated 04-03-15)

This proposal provides revisions to the proposal document dated January 23, 2015 for the Adoption of IEC 60079-31, Explosive Atmospheres - Part 31: Equipment Dust Ignition Protection by Enclosure "t" (second edition, issued by IEC November 2011) as a new IEC-based UL standard, UL 60079-31 to applicable requirements per comments received.

UL 60079-5-2016, Standard for Safety for Explosive Atmospheres - Part 5: Equipment Protection by Powder Filling "q" (Proposal dated 01-29-16)

UL 60079-6-2016, Standard for Safety for Explosive Atmospheres - Part 6: Equipment Protection by Liquid Immersion "o" (Proposal dated 01-29-16)

UL 60079-7-2008 (R2013), Standard for Safety for Explosive Atmospheres - Part 7: Equipment Protection by Increased Safety "e"

UL 60079-7-2017, Standard for Safety for Explosive Atmospheres - Part 7: Equipment Protection by Increased Safety "e" (Proposal dated 06-03-16)

UL 60079-7-2017a, Standard for Safety for Explosive Atmospheres - Part 7: Equipment Protection by Increased Safety "e" (Proposal dated 12-16-16)

This proposal provides revisions to the proposal document dated June 3, 2016 for the Adoption of IEC 60079-7, Explosive Atmospheres - Part 7: Equipment Protection by Increased Safety "e" (fifth ed, issued by IEC June 2015) as a new IEC-based UL standard, UL 60079-7 to the applicable requirements per comments received.

UL 603-2013, Standard for Safety for Power Supplies for Use with Burglar-Alarm Systems

Modification of Table 26.1 to add Access Control System Units

UL 60320-1-2011 (R2015), Standard for Appliance Couplers for Household and Similar General Purposes - Part 1: General Requirements

UL 60335-1-2016a, Standard for Safety of Household and Similar Electrical Appliances, Part 1: General Requirements

UL 60335-2-24-2017a, Household and Similar Electrical Appliances, Part 2: Particular Requirements for Refrigerating Appliances, Ice-Cream Appliances and Ice-Makers

UL 60335-2-3-2016, Standard for Household and Similar Electrical Appliances, Part 2: Particular Requirements for Electric Irons

UL 60335-2-34-2013, Standard for Safety for for Household and Similar Electrical Appliances, Part 2: Particular Requirements for Motor-Compressors

Document (dated 9-7-2012) is proposing the Fifth Edition of UL 60335-2-34, a trinational IEC-based standard covering motor compressor requirements harmonized for Canada, Mexico, and the U.S. The standard will be aligned with IEC 60335-2-34, Fourth Edition, Amendment 2

In recent years, millions of dehumidifiers have been recalled due to a potential fire hazard. The industry has determined that the cause of the overwhelming majority of the dehumidifier fires is due to loss of charge in combination with small unventilated polymeric compressor enclosures. Therefore, UL is proposing to add these requirements.

UL 60335-2-40-2017a, Household and Similar Electrical Appliances, Part 2: Particular Requirements for Electrical Heat Pumps, Air-Conditioners and Dehumidifiers

In recent years, millions of dehumidifiers have been recalled due to a potential fire hazard. The industry has determined that the cause of the overwhelming majority of the dehumidifier fires is due to loss of charge in combination with small unventilated polymeric compressor enclosures. Therefore, UL is proposing to add these requirements.

UL 60335-2-79-2016, Standard for Safety for Household and Similar Electrical Appliances, Part 2: Particular Requirements for High Pressure Cleaners (proposal dated 9-4-15)

UL 60335-2-8-2012, Safety for Household and Similar Electrical Appliances, Part 2: Particular Requirements

1. Revision of the IEC text to incorporate amendment 2 of IEC 60335-2-8 issued September 2008 and revision to minimize the number of national differences and more closely align with the IEC standard.

UL 60335-2-8-2012a, Standard for Safety for Household and Similar Electrical Appliances, Part 2: Particular Requirements for Shavers, Hair Clippers, and Similar Appliances

1. Revision of the IEC text to incorporate amendment 2 of IEC 60335-2-8 issued September 2008 and revision to minimize the number of national differences and more closely align with the IEC standard.

1. Removal of Figure 9D lowes modification.

UL 60691-2016, Standard for Safety for Thermal-Links - Requirements and Application Guide

The following changes in requirements to the Standard for Thermal-Links - Requirements and Application Guide, UL 60691, are being proposed: 1. ANSI Approval of the Fourth Edition of UL 60691

UL 60730-1-2016, Automatic Electrical Controls, Part 1: General Requirements

Adopt the fifth edition of IEC 60730-1 as the fifth edition of UL 60730-1.

UL 60730-2-10-2013, Automatic Electrical Controls for Household and Similar Use; Part 2: Particular Requirements for Motor Starting Relays

This part of IEC 60730 applies to controls for automatically controlling the starting windings of single phase motors associated with equipment for household and similar use. This standard applies to motor-starting relays using NTC or PTC thermistors, additional requirements for which are contained in Annex I. This standard also covers centrifugal switches intended to be integrated into motors. Such devices are tested with the intended motor as an integrated control.

UL 60730-2-11-2013, Automatic Electrical Controls for Household and Similar Use; Part 2: Particular Requirements for Energy Regulators

In general, this part of IEC 60730 applies to energy regulators for use in, on, or in association with equipment for household and similar use, including energy regulators for heating, air conditioning and similar applications. The equipment may use electricity, gas, oil, solid fuel, solar thermal energy, etc. or a combination thereof. This standard applies to the inherent safety, to the operating values, operating times and operating sequence where such are associated with equipment safety, and to the testing of automatic electrical energy regulator devices used in, or in association with, household or similar equipment.

UL 60730-2-12-2014, Automatic Electrical Controls for Household and Similar Use; Part 2: Particular Requirements for Electrically Operated Door Locks

In general, this part of IEC 60730 applies to electrically operated door locks intended to prevent the opening of doors in equipment for household and similar use. This standard applies to the inherent safety, to the operating values, operating sequences where such are associated with equipment protection, and to the testing of door locks used in, or in association with, household and similar equipment.

UL 60730-2-12-2017, Standard for Automatic Electrical Controls - Part 2-12: Particular Requirements for Electrically Operated Door Locks

The IEC published the third edition of IEC 60730-2-12 in April 2015. Therefore, UL is proposing the third edition of UL 60730-2-12.

This part of IEC 60730 applies to automatic electrical humidity sensing controls for use in, on or in association with equipment for household and similar use, including controls for heating, air-conditioning and similar applications. The equipment may use electricity, gas, oil, solid fuel, solar thermal energy, etc. or a combination thereof. This standard applies to automatic electrical controls, mechanically or electrically operated, responsive to or controlling humidity.
UL 60730-2-14-2013 (R2017), Standard for Automatic Electrical Controls; Part 2: Particular Requirements for Electric Actuators

This part of IEC 60730 applies to electric actuators for use in, on, or in association with equipment for household and similar use for heating, air-conditioning and ventilation. The equipment may use electricity, gas, oil, solid fuel, solar thermal energy, etc., or a combination thereof. This part 2 applies to electric actuators using NTC or PTC thermistors, additional requirements for which are contained in annex J.

UL 60730-2-15-2014, Standard for Automatic electrical controls for household and similar use - Part 2-15: Particular requirements for automatic electrical air flow, water flow and water level sensing controls

This standard covers automatic electrical air flow, water flow and water level sensing controls for use in, or in association with, boilers with a maximum pressure rating of 2 000 kPa (20 bar) and equipment for general household and similar use including controls for heating, air-conditioning and similar applications. Examples are water flow and water level sensing controls of the float or electrode-sensor type used in boiler applications and air flow, water flow and water level sensing controls for swimming pool pumps, water tank pumps, cooling towers, dishwashers, washing machines, air conditioning chillers and ventilation applications.

UL 60730-2-2-2014, Standard for Automatic Electrical Controls for Household and Similar Use; Part 2: Particular Requirements for Thermal Motor Protectors

This proposal revises the requirements covering the endurance test and adds deviation and drift requirements to provide a performance/reliability bench mark for thermal motor protectors when tested to the manufacturer’s declared electrical and thermal rating.

This part of IEC 60730 applies to the partial evaluation of thermal motor protectors as defined in IEC 60730-1 for household and similar use, including heating, air conditioning and similar applications as well as for sealed (hermetic and semi-hermetic type) motor-compressors.

UL 60730-2-3-2013, Standard for Automatic Electrical Controls for Household and Similar Use; Part 2: Particular Requirements for Thermal Protectors For Ballasts For Tubular Fluorescent Lamps

This part of IEC 60730 applies to the evaluation of thermal protectors for ballasts for tubular fluorescent lamps. This standard applies to thermal protectors using NTC or PTC THERMISTORS, additional requirements for which are contained in Annex J. Requirements concerning the testing of the combination of ballast and thermal protector are given in IEC 61347-1 and UL 935. This standard applies to the inherent safety, to the OPERATING VALUES, OPERATING TIMES, and OPERATING SEQUENCES where such are associated with equipment safety and to the testing of thermal protectors used to protect ballasts for tubular lamps from overheating.

UL 60730-2-5-2014, Standard for Safety for Automatic Electrical Controls for Household and Similar Use, Part 2: Particular Requirements for Automatic Electrical Burner Control Systems

Document (dated 2-1-2013) is proposing the Third Edition of UL 60730-2-5, a binational IEC-based standard covering electrical burner control system requirements harmonized for Canada and the U.S. The standard will be aligned with IEC 60730-2-5, Third Edition, Amendment 2

UL 60730-2-6-2016, Standard for Automatic Electrical Controls - Part 2-6: Particular Requirements for Automatic Electrical Pressure Sensing Controls Including Mechanical Requirements

The IEC published the third edition of IEC 60730-2-6 in April 2015. Therefore, UL is proposing the third edition of UL 60730-2-6.

UL 60730-2-7-2014, Standard for Automatic Electrical Controls for Household and Similar Use - Part 2-7: Particular Requirements for Timers and Time Switches

This part of IEC 60730 applies to TIMERS and TIME SWITCHES for household and similar use that may use electricity, gas, oil, solid fuel, solar thermal energy, etc., or a combination thereof, including heating, air conditioning and similar applications. This standard is also applicable to individual TIMERS utilized as part of a control system or TIMERS which are mechanically integral with multifunctional controls having non-electrical outputs. This standard does not apply to time-delay switches within the scope of IEC 60669-2-3. Devices which only indicate time or passage of time are not included.

UL 60730-2-8-2007 (R2012), Standard for Automatic Electrical Controls for Household and Similar Use - Part 2: Particular Requirements for Electrically Operated Water Valves, Including Mechanical Requirements

This part 2-8 applies to electrically operated WATER VALVES for use in, on or in association with equipment for household and similar use that may use electricity, gas, oil, solid fuel, solar thermal energy, etc., or a combination thereof, including heating, air-conditioning and similar applications. This part 2-8 is also applicable to electrically operated WATER VALVES for appliances within the scope of IEC 60335. These requirements do not cover VALVES for marine use. This part 2-8 contains requirements for electrical features of WATER VALVES and requirements for mechanical features of VALVES that affect their intended OPERATION.

UL 60730-2-8-2017, Automatic Electrical Controls for Household and Similar Use; Part 2: Particular Requirements for Electrically Operated Water Valves, Including Mechanical Requirements

The IEC issued edition 2.2 of IEC 60730-2-8 in November 2015. The previous UL edition was based on edition 2.1 of IEC 60730-2-8. Therefore, UL is proposing to adopt the revisions contained in the second amendment to edition No. 2 of IEC 60730-2-8.

UL 60730-2-9-2017, Automatic Electrical Controls - Part 2-9: Particular Requirements for Temperature Sensing Controls

This standard covers automatic electrical temperature sensing controls for use in, on or in association with equipment, including electrical controls for heating, air-conditioning and similar applications. The equipment may use electricity, gas, oil, solid fuel, solar thermal energy, etc., or a combination thereof.

1. Proposed Revision To Align The UL Version Of 60745-1, Figure 1 To The IEC Version Of 60745-1, Figure 1

UL 60745-2-12-2008 (R2013), Standard for Safety for Hand-Held Motor-Operated Electrical-Tools Safety - Part 2-12: Particular Requirements for Concrete Vibrators

1. Deletion of Clause 1DV, 2DV And Revision To Clause 8.1DV To Remove The Reference To CSA Z62.1 And Class 2C Chain Saws

The following changes are being recirculated: Proposed changes to Hand-Held Motor-Operated Electric Tools - Safety - Part 2-15: Particular Requirements for Hedge Trimmers: (1) New and revised requirements that address extended-reach hedge trimmers.

Proposed Revision Of Clause 19.103DV To Specify Requirements For Category 4 Hedge Trimmers

1. Addition Of National Difference Clauses To Specify Ratchet Drivers In The Scope Of The Standard And To Clarify Test Requirements As They Apply To Ratchet Drivers

1. Proposed Revision To Clause 8.1DV To Allow For The Use Of Alternative Marking For Cut-Off Machines With A Permanently Fixed Guard

1. Proposed Addition Of Clause 24.4DV.1 To Allow For The Use Of Lighter Duty Supply Cord For Rotary Tools

UL 60745-2-3-2013, Standard for Hand-Held Motor-Operated Electrical - Tools Safety - Part 2-3: Particular Requirements for Grinders, Polishers, and Disk-Type Sanders

1. Proposed Revisions To Align Amendments No. 1 And No. 2 For IEC 60745-2-3, Second Edition And Proposed National Differences To The IEC Text

UL 60745-2-4-2009 (R2014), Standard for Safety for Hand-Held Motor-Operated Electrical - Tools Safety - Part 2-4: Particular Requirements for Sanders and Polishers Other Than Disk Type

UL 60745-2-5-2012 (R2017), Standard for Safety for Hand-Held, Motor-Operated Electric Tools - Safety - Particular Requirements for Circular Saws

UL 60745-2-6-2009 (R2014), Hand-Held Motor-Operated Electric Tools - Safety - Part 2-6: Particular Requirements for Hammers

UL 608-2012 (R2017), Standard for Safety for Burglary Resistant Vault Doors and Modular Panels
UL proposes a reaffirmation for UL 608.

UL 609-2015, Standard for Safety for Local Burglar Alarm Units and Systems
Revision to minimum spacing requirements

UL 60939-3-2016, Standard for Safety for Passive filter units for electromagnetic interference suppression - Part 3: Passive filter units for which safety tests are appropriate (Proposal dated 5-6-16)
This proposal includes adoption of IEC 60939-3, Passive filter units for electromagnetic interference suppression - Part 3: Passive filter units for which safety tests are appropriate as a new IEC-based UL Standard, UL 60939-3 with US differences.

UL 60947-1-2013, Standard for Safety for Low-Voltage Switchgear and Controlgear - Part 1: General rules
This standard applies, when required by the relevant product standard, to switchgear and controlgear hereinafter referred to as "equipment" and intended to be connected to circuits, the rated voltage of which does not exceed 1 000 V a.c. or 1 500 V d.c. It does not apply to low-voltage switchgear and controlgear assemblies which are dealt with in IEC 60439.

UL 60947-4-1A-2014, Standard For Safety For Low-Voltage Switchgear and Controlgear - Part 4-1: Contactors and Motor-Starters - Electromechanical Contactors and Motor-Starters

UL 60947-4-2-2014, Standard for Safety for Low-Voltage Switchgear and Controlgear - Part 4-2: Contactors and Motor-Starters - AC Semiconductor Motor Controllers and Starters
Cover revisions to the previously proposed first edition based on comments received.

UL 60947-5-1-2014, Standard for Safety for Low-Voltage Switchgear and Controlgear - Part 5-1: Control Circuit Devices and Switching Elements - Electromechanical Control Circuit Devices
This covers revisions to the previously proposed standard based on comments received.

UL 60947-5-2-2014, Standard for Safety for Low-Voltage Switchgear and Controlgear - Part 5-2: Control Circuit Devices and Switching Elements - Proximity Switches
Applies to inductive and capacitive proximity switches that sense the presence of metallic and/or non-metallic objects, ultrasonic proximity switches that sense the presence of objects and/or non-mechanical magnetic proximity switches that sense the presence of objects with a magnetic field. These proximity switches are self-contained, have semiconductor switching elements(s), and are intended to be connected to circuits, the rated voltage of which does not exceed 250 V 50 Hz/60 Hz a.c. or 300 V d.c.

UL 60947-7-1-2017, Standard for Safety for Low-Voltage Switchgear And Controlgear - Part 7-1: Ancillary Equipment - Terminal Blocks for Copper Conductors
1. Revision to National Differences to the Standard for Low-Voltage Switchgear and Controlgear &ndash; Part 7-1: Ancillary Equipment &ndash; Terminal Blocks for Copper Conductors, UL 60947-7-1 to include Canada

UL 60947-7-2-2017, Standard for Safety for Low-Voltage Switchgear and Controlgear - Part 7-2: Ancillary Equipment - Protective Conductor Terminal Blocks for Copper Conductors
1. Revision to National Differences to the Standard for Low-Voltage Switchgear and Controlgear &ndash; Part 7-2: Ancillary Equipment - Protective Conductor Terminal Blocks for Copper Conductors, UL 60947-7-2 to include Canada

UL 60947-7-3-2017, Standard for Safety for Low-Voltage Switchgear and Controlgear - Part 7-3: Ancillary Equipment - Safety Requirements for Fuse Terminal Blocks
1. Revision to National Differences to the Standard for Low-Voltage Switchgear and Controlgear &ndash; Part 7-3: Ancillary Equipment - Safety Requirements for Fuse Terminal Blocks, UL 60947-7-3 to include Canada

Proposals to (1) align with Amendment 2 and Corrigendum 1 to IEC 60950-1; (2) Annexes P.1 and P.2 to address the editorial maintenance of the Standard and (3) update references based on the latest versions of the National Electrical Code (NEC) and the Canadian Electrical Code (CEC).

UL 60950-22-2011, Standard for Safety for Information Technology Equipment - Safety - Part 22: Equipment to be Installed Outdoors
(1) Proposed Addition of UL 50E and CAN/CSA C22.2 No. 94.2 as Alternative Component Standards and (2) Proposal to Update References Based on the Latest Versions of the National Electrical Code (NEC) and the Canadian Electrical Code (CEC)

UL 60950-23-2007 (R2016), Standard for Safety for Information Technology Equipment - Safety - Part 23: Large Data Storage Equipment
Reaffirmation and Continuance of the First Edition of the Standard for Information Technology Equipment - Safety - Part 23: Large Data Storage Equipment, UL 60950-23, as an American National Standard

This proposal includes revisions to 6.10.4, 11.6 and addition of new Annex DVE for permanently installed equipment.

UL 61010-2-010-2015, Standard for Safety for Electrical Equipment for Measurement, Control, and Laboratory Use - Part 010: Particular Requirements for Laboratory Equipment for Heating of Materials

UL 61010-2-020-2016, Standard for Safety Requirements for Measurement, Control, and Laboratory Use - Part 2-020: Particular Requirements for Laboratory Centrifuges

UL 61010-2-201-2014, Standard for Safety Requirements for Electrical Equipment for Measurement, Control, and Laboratory Use - Part 2-201: Particular Requirements for Control Equipment

This is an identical adoption of IEC 61010-2-101 which specifies safety requirements and related verification tests for control equipment of the following types: programmable controllers (PLC and PAC); the components of Distributed Control Systems (DCS); the components of remote I/O systems; industrial PC (computers) and Programming and Debugging Tools (PADTs); Human-Machine Interfaces (HMI); any product performing the function of control equipment and/or their associated peripherals, which have as their intended use the control and command of machines, automated manufacturing and industrial processes.

UL 61010-2-201-2017, Standard for Safety Requirements for Electrical Equipment for Measurement, Control, and Laboratory Use - Part 2-201 Particular Requirements for Control Equipment This proposal represents the addition of requirements for the durability of Markings for Open Equipment to Clause 5.3 of UL 61010-2-201 as a National Difference.

UL 61058-1-2013, Switches for Appliances - Part 1: General Requirements

1. National Differences for the use of thermostat material. 2. RTI clarification text and instructions on thickness of material. 3. Clarification of DVB-4.1.

UL 61131-2-2008 (R2017), Standard for Safety for Programmable Controllers - Part 2: Equipment Requirements and Tests The intent of this proposal is to seek reaffirmation of UL 61131-2 as an American National Standard.
UL 61215-1-1-2017, Standard for Terrestrial photovoltaic (PV) modules - Design qualification and type approval - Part 1-1: Special requirements for testing of crystalline silicon photovoltaic (PV) modules

1. First Edition of the UL IEC-Based Standard for Terrestrial photovoltaic (PV) modules - Design qualification and type approval - Part 1-1: Special requirements for testing of crystalline silicon photovoltaic (PV) modules, UL 61215-1-1, with no US National Differences.

UL 61215-1-2017, Standard for Terrestrial photovoltaic (PV) modules - Design qualification and type approval - Part 1: Test requirements

UL 61215-2-2017, Standard for Terrestrial photovoltaic (PV) modules - Design qualification and type approval - Part 2: Test procedures

UL 61215-2012 (R2016), Standard for Crystalline Silicon Terrestrial Photovoltaic (PV) Modules - Design Qualification and Type Approval

Reaffirmation and Continuance of the First Edition of the Standard for Crystalline Silicon Terrestrial Photovoltaic (PV) Modules - Design Qualification and Type Approval, UL 61215, as an American National Standard

UL 6142-2012, Standard for Safety for Small Wind Turbine Systems

Document (dated 12-2-2011) is recirculating changes to the proposed first edition of UL 6142, originally published on 9-16-11, which consists of requirements for small wind turbine systems and electrical subassemblies intended for use in stand-alone (not grid-connected) or utility interactive applications.

This part of IEC 61496 specifies general requirements for the design, construction and testing of ELECTROSENSITIVE PROTECTIVE EQUIPMENT (ESEP) for the safeguarding of machinery. Special attention is directed to functional and design requirements that ensure an appropriate safety related performance is achieved.

This part of IEC 61496 specifies requirements for the design, construction and testing of ELECTROSENSITIVE PROTECTIVE EQUIPMENT (ESEP) for the safeguarding of machinery, employing ACTIVE OPTO-ELECTRONIC PROTECTIVE DEVICES (AOEPDs) for the sensing function. Special attention is directed to features that ensure an appropriate safety-related performance is achieved.

UL 61646-2012 (R2016), Standard for Thin-Film Terrestrial Photovoltaic (PV) Modules - Design Qualification and Type Approval

Reaffirmation and Continuance of the First Edition of the Standard for Thin-Film Terrestrial Photovoltaic (PV) Modules - Design Qualification and Type Approval, UL 61646, as an American National Standard

UL 618-2010 (R2015), Standard for Safety for Concrete Masonry Units

The following is being proposed: 1. Reaffirmation and Continuance of the Ninth Edition of the Standard for Concrete Masonry Units, UL 618, as an American National Standard

UL 61800-5-1-2015, Standard for Safety for Adjustable Speed Electrical Power Drive Systems; Part 5-1: Safety Requirements - Electrical, Thermal and Energy

Revises the following proposals as the result of comments received: Revision to the conductor temperature limit during the Temperature Test, Table 15DV based on comments received.

UL 61800-5-1-2017a, Standard for Safety for Adjustable Speed Electrical Power Drive Systems; Part 5-1: Safety Requirements - Electrical, Thermal and Energy

Proposed revisions cover: Revision to Annex DVC for accessible secondary circuits; Revision to the conductor temperature limit during the Temperature Test; Revision to the plenum rated drive requirements; Addition of Thermal Memory Retention Tests in Table 17DV; Revision to output/output wiring for Breakdown of Components Tests; Clarification of the Breakdown of Components Test - High fault currents specification; Revisions to Table 28DV; Revision to the semiconductor fuse marking; Elimination of 30 A ground fuse in Short Circuit Testing; Clarification for Speed Sensitivity Test; and Editorial corrections.

Covers revision to the proposed first edition of UL 61800-5-2, based on comments received.

UL 61800-5-2-2012a, Standard for Safety for Adjustable Speed Electrical Power Drive Systems; Part 5-2: Safety Requirements - Functional

Covers revision to the proposed first edition of UL 61800-5-2, based on comments received.

This Standard applies to electromechanical elementary relays for incorporation into low voltage equipment (circuits up to 1000 V alternate current or 1500 V direct current). It defines the basic functional and safety requirements and safety-related aspects for applications in all areas of electrical engineering or electronics, such as: general industrial equipment, electrical facilities, electrical machines, electrical appliances for household and similar use, and business equipment, building automation equipment, automation equipment, electrical installation equipment, medical equipment, control equipment, telecommunications, vehicles, transportation.

UL 61965-2009 (R2014), Standard for Safety for Mechanical Safety for Cathode Ray Tubes

This standard specifies the requirements for flexible cords, elevator cables, electric vehicle cables, and hoistway cables rated 600 V maximum and intended for use in accordance with CSA C22.1, Canadian Electrical Code (CEC), Part I and CAN/CSA-C22.2 No. 0, General Requirements - Canadian Electrical Code, Part II, in Canada, NOM-001-SEDE, La Norma de Instalaciones Electricas (Mexican Electrical Code [MEC]), in Mexico, and NFPA 70, National Electrical Code (NEC), in the United States.

Recirculation of changes to the proposed new edition of UL 62. Revised proposals to update titles of ANCE standards, editorial changes, and clarifications.

UL 62093-2017, Standard for Balance-of-System Components for Photovoltaic Systems - Design Qualification Natural Environments

UL 621 - 2017, Standard for Safety for Ice Cream Makers (UL proposal 12/09/16)
The following changes in requirements to UL 621, they are:
1. Proposal to add UL 60335-1 based requirements for the Evaluation of Electronic Circuits.

UL 62108-2017, Standard for Concentrator Photovoltaic (CPV) Modules and Assemblies - Design Qualification and Type Approval

UL 62275-2016, Standard for Safety for Cable Management Systems - Cables Ties for Electrical Installations (Proposal dated 5-29-15)
The proposed second edition of UL 62275, which is a trinational IEC adoption with modifications, is proposed.

UL 62275-2016a, Standard for Safety for Cable Management Systems - Cables Ties for Electrical Installations (Proposal dated 12-18-15)
This recirculation proposal provides revisions to the UL 62275 proposed new edition dated 5-29-15.

The proposed second edition of the Standard for Audio/video, information and communication technology equipment - Part 1: Safety requirements, UL 62368-1. This new edition is based on the Second Edition of IEC 62368-1: Technical changes to the IEC Standard have been incorporated into the new edition of the UL Standard. National Differences from the First Edition of UL 62368-1 were reviewed and updated in the new edition.

UL 626-2012, Standard for Safety for Water Fire Extinguishers
These 10/21/11 UL 626 proposals include:
clarification of the cylinder requirements with DOT and TDGR specifications and deletion of the carbide precipitation test

1. Proposed Addition of Clause 8.20V To Require Markings On Tools Be Written In The Official Language Of The Country In Which The Tool Is Sold

UL 62841-2-14-2016, Electric Motor-Operated Hand-Held Tools, Transportable Tools And Lawn And Garden Machinery - Safety - Part 2 -14: Particular Requirements for Hand-Held Planers

UL 62841-2-4-2015, Standard for Safety for Electric Motor-Operated Hand-Held Tools, Transportable Tools And Lawn And Garden Machinery - Safety - Part 2-4: Particular Requirements for Hand-Held Sanders and Polishers Other Than Disc Type

UL 62841-2-8-2016, Standard for Safety for Electric Motor-Operated Hand-Held Tools, Transportable Tools And Lawn And Garden Machinery - Safety - Part 2-8: Particular Requirements For Hand-Held Shears and Nibblers

UL 62841-3-1-2016, Standard for Safety for Electric Motor-Operated Hand-Held Tools, Transportable Tools and Lawn and Garden Machinery - Safety - Part 3-1: Particular Requirements for Transportable Table Saws
1. Proposed Adoption Of The First Edition Of IEC 62841-3-1, Standard For Electric Motor-Operated Hand-Held Tools, Transportable Tools And Lawn And Garden Machinery - Safety - Part 3-1: Particular Requirements For Transportable Table Saws, As The First Edition Of UL 62841-3-1 2. Proposed Addition Of Active Injury Mitigation System (AIMS Requirements For Table Saws

UL 62841-3-10-2016, Standard for Electric Motor-Operated Hand-Held Tools, Transportable Tools and Lawn and Garden Machinery - Safety - Part 3-10: Particular Requirements for Transportable Cut-Off Machines

UL 62841-3-10-2016, Standard for Electric Motor-Operated Hand-Held Tools, Transportable Tools and Lawn and Garden Machinery - Safety - Part 3-10: Particular Requirements for Transportable Cut-Off Machines
UL 62841-3-4-2016, Standard For Electric Motor-Operated Hand-Held Tools, Transportable Tools And Lawn And Garden Machinery - Safety - Part 3-4: Particular Requirements For Transportable Bench Grinders

UL 62841-3-6-2016, Standard For Electric Motor-Operated Hand-Held Tools, Transportable Tools And Lawn And Garden Machinery - Safety - Part 3-6: Particular Requirements For Transportable Diamond Drills With Liquid System

1. Proposed Addition Of Clause 1DV To Modify The Scope Of The Standard By Specifying A 400 mm Saw Blade Diameter 2. Proposed Revision To Table 4, Required Performance Levels, And Deletion Of Table 4DV To Align With Changes In IEC Corrigendum 1 Of IEC 62841-3-9 3. Proposed Revision To The Marking Requirements in Clause 8.3 To Align With Changes In IEC Corrigendum 2 Of IEC 62841-3-9

UL 634-2015, Standard For Safety for Connectors and Switches for Use with Burglar-Alarm Systems

This covers updates, revisions and clarifications for magnetically operated switches.

UL 635-2012 (R2016), Standard for Safety for Insulating Bushings

UL 635 covers insulating bushings and accessories for insulating bushings used for the following purposes in electrical equipment: a) Insulating bushings used for the protection of cables, flexible cords, and insulated wires, where routed through internal or external walls of electrical equipment; b) Insulating bushings used to provide strain-relief for flexible cord and single conductor insulated wiring and to protect such cords or wiring; and c) Accessories to insulating bushings used to supplement the characteristics of the bushing.

UL 636-2008 (R2013), Standard for Safety for Holdup Alarm Units and Systems

These requirements cover holdup alarm systems of the remote-station type intended for installation in banks, stores, cashiers’ cages, pay offices, and the like to provide a means of transmitting a silent call for help in the event of interior robbery. These systems are divided into the following three classes: Bandit-Resisting Enclosure and Alarm, Semiautomatic Alarm, and Manual Alarm.

UL 639-2012, Standard for Safety for Intrusion-Detection Units

Revision to the Corrosion Test is being proposed.

UL 639-2012a, Standard for Safety for Intrusion-Detection Units

Revision to the Corrosion Test based on comments received.

UL 641-2009 (R2013), Standard for Safety for Type L Low-Temperature Venting Systems

UL proposes a reaffirmation for ANSI approval of UL 641.

UL 6420-2012, Standard for Safety for Equipment Used for System Isolation and Rated as a Single Unit

Covers revisions to the proposed first edition of UL 6420 based on comments received.

UL 644-2014, Standard for Safety for Container Assemblies for LP-Gas (Proposal dated 2/14/14)

Recirculation of changes to 1.3 and 3.2 originally proposed 11-1-13.

UL 651-2016, Standard for Safety for Schedule 40, 80, Type EB and A Rigid PVC Conduit and Fittings

Document dated 4-1-2016 proposes the exemption of permanency of printing requirements for Schedule 40 and 80 conduit when markings are laser-printed and the removal of the reference to ASTM D648, which has been withdrawn.

UL 651A-2017, Standard for Safety for Schedule 40 and 80 High Density Polyethylene (HDPE) Conduit

1. Correction to explanatory or approximate impact weight value stated in parentheses.

UL 66-2011 (R2016), Standard for Safety for Fixture Wire

UL 668-2016, Standard for the Safety of Hose Valves for Fire-Protection Service (Proposal Dated 05/27/2016)

To allow for grooved inlets and alternative thread types where the valve is used in areas specifying different threading.

UL 67-2016, Standard for Safety for Panelboards (proposal dated 04-22-16)

Revisions to Service Barrier Requirements (Section 5.4)

UL 67-2016a, Standard for Safety for Panelboards (proposal dated 09-30-16)

The following changes in requirements are being proposed: 1) Revisions to Increase Voltage from 600 to 1000 V; and 2) Correction to Spacing Requirements for (Snap) Switches.

UL 6703-2017, Standard for Connectors for Use in Photovoltaic Systems

1. Expansion of UL 6703 Scope to include single-pole devices up to 1500 V dc or less

UL 674-2017, Standard for Safety for Electric Motors and Generators for Use in Hazardous (Classified) Locations (Proposal dated 02-17-17)

This proposal provides revisions to the Thermocouple Requirements.

UL 676-2015, Standard for Safety for Underwater Luminaires and Submersible Junction Boxes

Proposals regarding requirements for (1) flexible cord and connectors, (2) permitted cord size for low voltage luminaires, (3) drainage and water entry openings, (4) decelerating unit construction, (5) marking of isolated low voltage luminaires, and (6) submersible luminaires.

UL 676-2015a, Standard for Safety for Underwater Luminaires and Submersible Junction Boxes

Proposals for marking of isolated low voltage luminaires and for submersible luminaires

These requirements cover emergency vault ventilators and vault-ventilating ports for installation in a wall. Emergency vault ventilators are intended to provide fresh air to persons locked in the vault by accident or during a robbery. Vault-ventilating ports are intended for connection to an outside ventilating system that provides circulating air while the vault is open.

UL 681-2014, Standard for Safety for Installation and Classification of Burglar and Holdup Alarm Systems

Provides criteria for the installation of protective wiring and devices for burglar alarm systems covering premises, stockrooms, alarmed areas, safes, vaults, night depositories, automated teller machines, and other security containers. The amount of alarm protection installed in a system is designated as the extent of protection. These requirements also cover the installation of holdup alarm initiating devices used to send holdup or duress signals to an off premises location.

[Footer Information]
UL 687-2011 (R2015), Standard for Safety for Burglary Resistant Safes (Proposal Dated 9/25/15)

UL 69-2013, Standard for Safety for Electric-Fence Controllers
1. Revision to scope. 2. Software managed outputs. 3. Addition and revision of requirements to relocate component standard references from Appendix A into the body of the standard as component requirements.

UL 69-2013a, Standard for Safety for Electric-Fence Controllers
1. Revision to scope. 2. Software managed outputs. 3. Addition and revision of requirements to relocate component standard references from Appendix A into the body of the Standard as component requirements.

UL 69-2013b, Standard for Safety for Electric-Fence Controllers
Direct Plug-In Electric Fence Controllers

UL 696-2010 (R2015), Standard for Safety for Electric Toys
These requirements cover electrically-operated toys. The package for the toy is considered part of the toy. An electric product is considered a toy if it is designed, manufactured, or marketed as a plaything for children under the age of 3. For a toy that mimics the form or function of an established general-use appliance, the established requirements shall be considered. These requirements do not cover toys for outdoor use, sewing machines, flatirons, toys that operate with water, toys that operate with a gas or liquid under pressure toy transformers, or toys intended to operate from the secondary of a toy transformer at a potential of 30 volts rms or less.

UL 697-2012 (R2016), Standard for Safety for Toy Transformers
UL proposes to reaffirm the ANSI approval of UL 697.

UL 697-2012a, Standard for Safety for Toy Transformers (proposal dated 2-17-12)
This recirculation proposal provides revisions to the UL 697 proposal dated 12-9-11.

UL 698A-2012 (R2016), Standard for Safety for Industrial Control Panels Relating to Hazardous (Classified) Locations (proposal dated 9-30-16)

UL 6A-2014, Standard for Safety for Electrical Rigid Metal Conduit - Aluminum, Red Brass and Stainless Steel
Document (dated 3-28-2014) proposes marking limitations on small trade size elbows and nipples and revisions to conduit with a protective coating for use with threaded couplings.

UL 7001-2015, Sustainability Standard for Household Refrigeration Appliances
The following changes in requirements to the Standard for Sustainability for Household Refrigeration Appliances, AHAM 7001/CSA R7001/UL 7001, are being proposed: 1. Addition of note to 9.5.2.1 (b) to provide guidance and clarification to the standard’s text. 2. Editorial revisions to address administrative requirements listed in the standard.

UL 7003-2016, Standard for Sustainability for Household Clothes Washers
This Standard covers clothes washing appliances for household and residential style commercial use (e.g., a coin-operated appliance in an apartment building) included within the scope of the U.S. Department of Energy (DoE) and Natural Resources Canada (NRCan) minimum energy performance requirements. This includes the following product categories: a) top loading, compact [less than 45L (1.6 cu. ft. capacity)]; b) top loading, standard; c) front loading, standard; and, d) front loading, compact [less than 45L (1.6 cu. ft. capacity)].

UL 7004-2017, Standard for Sustainability for Household Cooking Appliances
This Standard covers: a) built-in cook tops: i) electric powered: 1) radiant; 2) halogen; 3) coil; 4) induction; and 5) grill; ii) gas powered: 1) sealed burner; and 2) open burner; b) built-in ovens: i) electric powered: 1 single cavity; and 2) multiple cavity; ii) gas powered: 1) single cavity; and 2) multiple cavity; and c) ranges: i) electric powered: 1) free standing; 2) built-in; 3) single cavity; and 4) multiple cavity; ii) gas powered: 1) free standing; 2) built-in; 3) single cavity; and 4) multiple cavity; iii) hybrid gas/electric: 1) free standing; 2) built-in; 3) single cavity; and 4) multiple cavity.

UL 7005-2017, Standard for Sustainability for Household Clothes Drying Appliances
This Standard covers: a) electric clothes dryers; and b) gas clothes dryers.

UL 705-2016, Standard for Safety for Power Ventilators
1. Addition of a New Appendix to Provide Examples of Controls Intended to be Used as Operating or Protective Controls.

UL 705-2016a, Standard for Safety for Power Ventilators
1. Addition of a New Appendix to Provide Examples of Controls Intended to be Used as Operating or Protective Controls.

UL 705-2016b, Standard for Safety for Power Ventilators

UL 710-2012 (R2017), Standard for Exhaust Hoods for Commercial Cooking Equipment
UL proposes a reaffirmation for ANSI approval of UL 710.

UL 711 CAN/ULC-S508-2009 (R2013), Standard for Safety for Nonmetallic-Sheathed Cables (Proposal dated 07-03-15)
This proposal includes reorganization of UL 719.

UL 72-2015, Standard for Tests for Fire Resistance of Record Protection Equipment
Revisions to update the document with current practices as well as include new diagrams that are helpful to the user in setting up and conducting the testing.

UL 723-2013, The Standard for Safety for Test of Surface Burning Characteristics of Building Materials
These 4/12/13 UL 723 proposals: replace “inorganic reinforced cement board” with “fiber-cement board” throughout the standard; include changes to the referenced mounting methods in 4.3, and revises A1.4 to add more details for fiber-cement board.

UL 729-2008 (R2016), Standard for Safety for Oil-Fired Floor Furnaces
Reaffirm UL 729 as an American National Standard. UL 729 covers oil-fired floor furnaces.

UL 73-2012, Motor-Operated Appliances
Covers: (1) Date code marking on attachment plug blade for insect and rodent control equipment; and (2) Addition and revision of requirements for battery-operated products with rechargeable and automatic flashlights and lanterns.

UL 73-2012a, Motor-Operated Appliances
1. New requirements for insect and rodent control appliances which generate ultraviolet (UV) radiation.

UL 730-2008 (R2016), Standard for Safety for Oil-Fired Wall Furnaces
Reaffirm UL 730 as an American National Standard. UL 730 covers oil-fired, vented, fan-type wall furnaces.
UL 731-2004 (R2016), Standard for Safety for Oil-Fired Unit Heaters
Reaffirm UL 731 as an American National Standard.
UL 731 covers oil-fired unit heaters.

UL 732-1997 (R2013), Standard for Safety for Oil-Fired Storage Tank Water Heaters
UL proposes a reaffirmation for ANSI approval for UL 732.

UL 737-2011 (R2015), Standard for Safety for Fireplace Stoves
Reaffirmation of ANSI approval is proposed for UL 737.

This proposal for UL 746A covers the Addition of UV/Water Program Investigation (Code E) for Color/Pigmentation Variations to Table 9.1.

UL 746A-2017a, Standard for Safety for Polymeric Materials - Short Term Property Evaluations
This proposal for UL 746A covers the following topics:
a) Clarification of Thickness Requirement for Comparative Tests (Other than Flammability) in Table 9.2 and b) Inclusion of Material Grouping Scheme in UL 746A for Comparative Tracking Index (CTI) Test Method as per IEC 60112 Based on IEC 60664.

UL 746B-2016, Standard for Safety for Polymeric Materials - Long Term Property Evaluations
The following items are proposals for UL 746B:
- Removal of Two-Component Variable from Silicone Rubber Material Specified in Table 7.1;
- Assignment of a Generic Thermal Index Temperature of 95°C to PPA in Table 7.1; and
- Fixed Temperature Evaluation for Exceptionally Durable Materials Specified in Paragraph 13.4 and new Table 13.2 and new Paragraph 13.4.1.

UL 746B-2016a, Standard for Safety for Polymeric Materials - Long Term Property Evaluations
The following topics are covered in this recirculated proposal for UL 746B:
- Assignment of a Generic Thermal Index Temperature of 85°C to PPA in Table 7.1 and
- Fixed Temperature Evaluation for Exceptionally Durable Materials Specified in Paragraph 13.4 and new Table 13.2 and new Paragraph 13.4.1.

UL 746C-2017, Standard for Safety for Polymeric Materials - Use in Electrical Equipment Evaluations
This proposal represents a clarification of HWI PLC-0 Determination in Table 6.1.

UL 746C-2017a, Standard for Safety for Polymeric Materials - Use in Electrical Equipment Evaluations
This proposal covers considerations for parts made by Additive Manufacturing technology.

UL 746D-2014, Standard for Safety for Polymeric Materials - Fabricated Parts
The following changes in requirements to UL 746D are being proposed:
1. Revision in Recycled Plastics Section 10.3.3 (g) to reflect ignition test (GWIT)

This covers proposed changes to the following topics based on comments received:
a) Split ANSI Grade CEM-3 into Grades CEM-3.0 and CEM-3.1; and b) Expansion of the Ash Content Range for Types FR-4.0 and FR-4.1 in Table 8.2.

UL 746F-2016, Standard for Safety for Polymeric Materials - Flexible Dielectric Film Materials for Use in Printed-Wiring Boards and Flexible Materials Interconnect Constructions
The following items are the proposed new and revised requirements for UL 746F:
a) Addition of requirements for an Alternate Condition for Flammability samples to new Paragraphs 4.3 and 4.4;
b) Addition of references to Section 7 and Table 7.1 of UL 746B, and to Section 8 of UL 746F, to Paragraph 8.1.1; c) Addition of requirements to clarify the required samples for IR testing of Non-Homogenous Films to Table 8.2; d) Addition of requirements for sample thickness tolerance to a new Table 8.6; e) Replacement of references to Thermal Shock with references to Thermal Stress throughout UL 746F; and f) Deletion of the reference to Coverlay Test from Paragraph 12.3.2.

UL 749-2017, Standard for Safety for Household Dishwashers
UL proposes a new edition of UL 749.

UL 749-2017a, Standard for Safety for Household Dishwashers (Proposal dated 10-7-16)
This Recirculation proposal provides revisions to the UL 749 proposal dated 2015-11-20.

UL 751-2016, Standard for Safety for Refrigerated Vending Machines
1. Proposed Addition And Revision Of Requirements To Provide An Alternate Method of Evaluating Protective Electronic Circuits And Controls 2. Proposed Addition Of Requirements To Address Vending Machines With Remote Operation Or Monitoring Functionality

UL 752-2006 (R2015), Standard for Safety for Bullet Resisting Equipment (Proposal dated 9/25/15)
These requirements cover materials, devices, and fixtures used to form bullet-resisting barriers which protect against robbery, holdup, or armed attack such as those by snipers. This standard can also be used to determine the bullet resistance of building components that do not fit the definition of equipment, such as windows, walls, or barriers made out of bullet resistant materials.

The requirements cover alarm accessories for automatic water-supply control valves for use in automatic sprinkler equipment for fire protection service. Accessories may include water motors and gongs, pressure-operated switches, and other electrical and nonelectrical attachments, components, or units commonly used with alarm, dry-pipe and pre-action valves. The electrical alarm accessories for automatic water-supply control valves are intended for fire-protective signaling use in ordinary locations in accordance with the National Electrical Code, ANSI/NFPA 70.

UL 758-2016, Standard for Safety for Appliance Wiring Material (Proposals Dated 1/29/16)
Proposed Change to the Note in Table 14.1; Proposed Change to Correct the EP References in Table 7.1; Proposed Change to Add 3508#176;C Class 10 Nickel Coated Copper Conductor to Table 5.2

UL 758-2016a, Standard for Safety for Appliance Wiring Material (Proposal Dated 6/24/16)
Addition of Mixed Conductor, New 5.7.9.1

Norm Conformity with the Standard for Conductors of Insulated Cables, IEC 60228

UL 758-2017a, Standard for Safety for Appliance Wiring Material (Proposal dated 2/10/17)
Norm Conformity with the Standard for Conductors of Insulated Cables, IEC 60228

Addition of Nickel to Table 5.3

1. Production-Line Dielectric Test and DC Dielectric Voltage-Withstand Test Potentials, Revised 49.1 and 49.2; and Revised Table 49.1 2. Addition of Stability Factor Test to Table 3.9

UL 763-2014, Standard for Motor-Operated Commercial Food Preparing Machines
1. Filtered Ventilation Openings 2. Leakage Current Limit for Stationary Ice/Beverage Dispensers with EMI Suppression Filtering

UL 763-2014a, Standard for Motor-Operated Commercial Food Preparing Machines
1. Filtered Ventilation Openings 2. Leakage Current Limit for Stationary Ice/Beverage Dispensers with EMI Suppression Filtering
UL 768-2013, Standard for Safety for Combination Locks (Proposal Dated 12-02-11 & 4-26-13)

Recirculation of changes to the Removal of the Requirement for Three Separate Experts for the Manipulation Tests, Revised 10.5.2 and 10.5.5. Removal of the Requirement for Three Separate Experts for the Manipulation Tests, Revised 10.5.2

The requirements cover the construction and security of night depository entrances. The units are intended to permit the deposit of cash, checks, and similar items, from outside a building into a chute connected to a depository within the building. A night depository is intended primarily for protection against theft of deposits by: a) Fishing the deposits from the depository; b) Trapping the deposits by preventing them from entering the depository, and then extracting the deposits; and c) Entering the night depository by force with the aim of common burglary tools.

UL 773A-2016, Standard for Safety for Nonindustrial Photoelectric Switches for Lighting Controls

Requirements cover controls of the light or presence-sensitive types, or both, for indoor or outdoor service; intended for the control of loads up to a maximum of 20 A and maximum 347 V; installations on 50 Hz or 60 Hz systems or DC up to 60 V; and intended to be installed in accordance with the NEC, NFPA 70, the CEC Part I, CSA C22.2 No. 0, and NOM 001 SEDE. These requirements do not cover devices: that are locking type, used for area or roadway lighting fixtures; that monitor or control safety critical loads or personal protection circuits; intended to be installed in areas designated hazardous locations; or intended to be installed for manufacturing process control.

UL 773A-2016a, Standard for Safety for Nonindustrial Photoelectric Switches for Lighting Control

Requirements cover controls of the light or presence-sensitive types, or both, for indoor or outdoor service; intended for the control of loads up to a maximum of 20 A and maximum 347 V; installations on 50 Hz or 60 Hz systems or DC up to 60 V; and intended to be installed in accordance with the NEC, NFPA 70, the CEC Part I, CSA C22.2 No. 0, and NOM 001 SEDE. These requirements do not cover devices: that are locking type, used for area or roadway lighting fixtures; that monitor or control safety critical loads or personal protection circuits; intended to be installed in areas designated hazardous locations; or intended to be installed for manufacturing process control.

UL 778-2017, Standard for Safety for Motor-Operated Water Pumps

These requirements cover submersible and nonsubmersible motor-operated pumps intended to be used in ordinary locations in accordance with the National Electrical Code, NFPA 70.

UL 779-2011 (R2016), Standard for Safety for Electrically Operated Pumps for Petroleum Dispensing Products

This proposal is being issued to revise the Moist Ammonia-Air Stress Cracking Test.

UL 789-2003 (R2017), Standard for Safety for Indicator Posts for Fire-Protection Service

UL proposes a reaffirmation of UL 789.

UL 79-2016, Standard for Safety for Power-Operated Pumps for Petroleum Dispensing Products

This proposal is being issued to revise the Moist Ammonia-Air Stress Cracking Test.

UL 790-2014, Standard Test Methods for Fire Tests of Roof Coverings

Revisions to a) the Scope to clarify that the standard covers relative fire characteristics; b) to several sections covering a) the required number of assemblies to be tested and b) that the requirements shall be applied in sequence; c) that clarify sample preparation; d) to clarify that the spread of flame observations are made during the test, not after the test has ended; e) of the burning-brand test covering the placement of the Class A and Class B brands; and f) to the test report to require that the climatic conditions for the weathering exposure shall be reported. New requirement covering conditioning of the self-sealing shingle test decks.

The following topics for the Standard for Test Methods for Fire Tests of Roof Coverings UL 790 are being recirculated. Revisions to the Scope to clarify that the standard covers relative fire characteristics so as not to be confused with the term fire resistance. Revisions to several sections covering a) the required number of assemblies to be tested and b) that the requirements shall be applied in sequence. Addition of a new requirement covering conditioning of the self-sealing shingle test decks at a temperature of 135 to 140°F (57 to 60°C) for a continuous period of 16 hours. Revisions of the burning-brand test covering the placement of the Class A and Class B brands.

UL 793-2017, Standard for Automatically Operated Roof Vents for Smoke and Heat

1. Proposed revision to Section 5, Assembly 2. Proposed revision to Section 12, Fire Resistance Test
UL 797A-2017, Standard for Safety for Electrical Metallic Tubing - Aluminum and Stainless Steel

1. Removal of the term "mandrel"

UL 79A-2016, Standard for Safety for Power-Operated Pumps for Gasoline and Gasoline/Ethanol Blends with Nominal Ethanol Concentrations up to 85 Percent (E0 - E85)

This proposal is being issued to revise the Moist Ammonia-Air Stress Cracking Test.

UL 79B-2016, Standard for Safety for Power-Operated Pumps for Diesel Fuel, Biodiesel Fuel, Diesel/Biodiesel Blends with Nominal Biodiesel Concentrations up to 20 Percent (B20), Kerosene, and Fuel Oil

Power-Operated Pumps for Diesel Fuel, Biodiesel Fuel, Diesel/Biodiesel Blends with Nominal Biodiesel Concentrations up to 20 Percent (B20), Kerosene, and Fuel Oil

UL 8-2016, Standard for Water Based Agent Fire Extinguishers

It is being proposed to remove the requirement that a siphon tube not be displaced from the vertical axis during assembly.

UL 80-2009 (R2014), Standard for Safety for Steel Tanks for Oil-Burner Fuels and Other Combustible Liquids, Bulletin dated November 22, 2013

Reaffirmation and Continuance of the Twelfth Edition of the Standard for Safety for Steel Tanks for Oil-Burner Fuels and Other Combustible Liquids

UL 810-2014, Standard for Safety for Capacitors

1. Revision to Dielectric Voltage-Withstand Test. 2. Revision to Sample Preparation.

UL 810A-2012 (R2017), Standard for Safety for Electrochemical Capacitors

UL 810B-2016, Standard for DC Power Capacitors

The following topic for the Standard for DC Power Capacitors, UL 810B, is being recirculated: 1. The proposed first edition of the Standard for DC Power Capacitors, UL 810B. This standard covers dc power capacitors with or without integral protection intended to reduce the risk of rupture and venting of the capacitor enclosure under internal fault conditions. These requirements apply to capacitors that are intended for use in dc power electronic applications such as switching circuits, dc filtering, and renewable energy systems.

UL 814-2011 (R2015), Standard for Safety for Gas-Tube-Sign Cable (Proposal dated 8/21/15)

These requirements cover single-conductor, 18 - 10 AWG, gas-tube-sign cables with temperature ratings of 105°C - 250°C (221°F - 482°F), and ratings of 5000 volts, 10000 volts, or 15000 volts. The cables are for use with gas-tube systems for signs, outline lighting, and interior lighting in accordance with the National Electrical Code and the Standard for Electrical Signs, UL 48.

This Recirculation proposal provides revisions to the UL 817 proposal dated 2015-07-10.

UL 817-2016c, Standard for Safety for Cord Sets and Power-Supply Cords (Proposal dated 12-04-15)

This proposal includes an increase in the ampacity rating for an 18 and 17 AWG seasonal-use cord set

1. Addition of Requirements for Tamper Resistant Features, New Supplement SE

UL 817-2017a, Standard for Safety for Cord Sets and Power-Supply Cords

Various changes to the Standard for Cord Sets and Power-Supply Cords are being proposed.

UL 82-2016, Standard for Safety for Electric Gardening Appliances

The proposal is to add the following: 1.) New and revised requirements for extended-reach pole pruners 2.) New and revised requirements for cordless brushcutters

UL 82-2016b, Electric Gardening Appliances

The following changes in requirements to the UL 82, are being proposed: 1a. Proposed Revisions To Reduce The Tip Speed Measurement For Trimmers.

UL 823-2007 (R2016), Standard for Safety for Electric Heaters for Use in Hazardous (Classified) Locations (Proposal dated 02-26-16)

UL 827-2016, Standard for Safety for Central-Station Alarm Services

Document dated 4-29-16 proposes requirements that include equivalent options for communication services providers and an alternate approach to Central Station automation system resiliency -- performance based expression of requirements

UL 827-2016a, Standard for Safety for Central-Station Alarm Services

Document dated 8-5-16 recirculates changes that were originally proposed on 4-29-16, including requirements for equivalent options for communication services providers and an alternate approach to Central-Station automation system resiliency.

UL 83-2014, Standard for Safety for Thermoplastic-Insulated Wires and Cables

Proposed New Edition of UL 83

UL 83-2014a, Standard for Safety for Thermoplastic-Insulated Wires and Cables

1. Proposed New Edition of UL 83

UL 83-2014b, Standard for Safety for Thermoplastic-Insulated Wires and Cable (recirculation dated 04-19-13)

This recirculation proposal provides revisions to the UL 83 recirculation dated 04-19-13

This proposal includes revisions to Section 5 Special Designations

UL proposes the first edition of UL 83A which specifies the requirements for 600 V, single-conductor, fluoropolymer-insulated wires and cables in accordance with NFPA 70, National Electrical Code (NEC).

UL 840-2012 (R2016), Standard for Insulation Coordination Including Clearances and Creepage Distances for Electrical Equipment

Reaffirmation of ANSI Approval for UL 840

UL 842-2015, Standard for Safety for Valves for Flammable Fluids

This proposal corrects the requirement for Fuel H in paragraph 26.1.1.

UL 842A-2015, Standard for Safety for Valves for Gasoline and Gasoline/Ethanol Blends with Nominal Ethanol Concentrations up to 85 Percent (E0 - E85)

These requirements cover valves that are intended to be used for the control of fluids and their vapors for gasoline and gasoline/ethanol blends with nominal ethanol concentrations up to 85 percent (E0 - E85).

UL 842B-2015, Standard for Safety for Valves for Diesel Fuel, Biodiesel Fuel, Diesel/Biodiesel Blends with Nominal Biodiesel Concentrations up to 20 Percent (B20), Kerosene, and Fuel Oil

These requirements cover valves that are intended to be used for the control of fluids and their vapors for diesel fuel, biodiesel fuel, diesel/biodiesel blends with nominal biodiesel concentrations up to 20 percent (B20), kerosene, and fuel oil.
UL 844-2016, Standard for Safety for Luminaires for Use in Hazardous (Classified) Locations (Proposal dated 01-22-16)

This proposal includes revisions to add glass requirements for Class I, Division 1 to Section 10.

UL 845-2011, Standard for Safety for Motor Control Centers

The following changes are being proposed: Addition of 4.2, Revision of 6.3. 3. Revision of 6.3.50, Addition of 6.3.62, Revision of wording in Tables 7, 8, and 9, Revision of 8.1.7.0 and addition of 8.2.2.5.6, Revision of 8.2.4.1, Revision to 8.2.10.3, Addition of 8.2.13.15 and 8.2.13.16, Revision of clauses to reference Table 17, Addition of 8.2.20.7 (d), Revision of 8.2.26.11, Revision of 8.2.31.3.1, Revision of 9.3.18, 15. Revision of 9.10.3.3, 9.10.10.5, and 8.3.10, Revision of 9.10.7, Revision of 9.12.1.6, Revision of 9.12.6.3 and addition of 9.12.6.4, Revision of Table 19, Revision of Table 20, Revision of Table 22, Revision of Table 24, Revisions to Table 27.

UL 852-2010 (R2014), Standard for Safety for Metallic Sprinkler Pipe for Fire Protection Service

UL 852 covers metallic pipe intended for use in water based fire protection systems for water distribution or valve trim applications.

UL 854-2014, Standard for Safety for Service-Entrance Cables (Proposal dated 08-22-14)

This proposal includes revisions to Tables 14.1, 14.2 and 14.4 to allow XL composite insulation as an inner layer

UL 857-2011 (R2016), Standard for Safety for Busways

The intent of this proposal is to seek reaffirmation of UL 857 as an American National Standard.

UL 858-2017, Standard for Safety for Household Electric Ranges

UL 858-2017a, Standard for Safety for Household Electric Ranges

This proposal includes (1) Addition of requirements for personal grooming appliances incorporating button or coin cell batteries of lithium technologies (2) New and revised references and relocated Section 33.

UL 864-2014, Standard for Control Units and Accessories for Fire Alarm Systems

UL 864-2014a, Standard for Control Units and Accessories for Fire Alarm Systems

UL 867-2016, Standard for Safety for Electrostatic Air Cleaners (Proposal dated 7-29-16)

This proposal includes (1) Addition of requirements for household appliances incorporating button or coin cell batteries (2) Addition of grounding symbol

UL 870-2016, Wireways, Auxiliary Gutters, and Associated Fittings

1. Protection from Sharp Edges.

UL 875-2016, Standard for Safety for Electric Dry-Bath Heaters (Proposal dated 8-19-2016)

The following is proposed: 1. Add requirements for electronic circuits 2. Allow the use of UL 840 to evaluate clearance and creepage distances 3. Update requirements for switches 4. Add reference to requirements for the Button or Coin Cell Batteries of Lithium Technologies

UL 8750-2016, Standard for Safety for Light Emitting Diode (LED) Equipment for Use in Lighting Products

The following changes in requirements to the Standard for Light Emitting Diode (LED) Equipment for Use in Lighting Products, UL 8750, are being proposed: 1. Add Supplement SE - Requirements for Class P LED Drivers

UL 8750-2016a, Standard for Safety for Light Emitting Diode (LED) Equipment for Use in Lighting Products

The following topics for the Standard for Light Emitting Diode (LED) Equipment for Use in Lighting Products, UL 8750, are being recirculated: 1. Add Supplement SE - Requirements for Class P LED Drivers

UL 8750-2016b, Standard for Safety for Light Emitting Diode (LED) Equipment for Use in Lighting Products

The following changes in requirements to the Standard for Light Emitting Diode (LED) Equipment for Use in Lighting Products, UL 8750, are being proposed: 1. Revise potting compound requirements

UL 8752-2012, Standard for Safety for Organic Light Emitting Diode (OLED) Panels

The following topics for the Standard for Organic Light Emitting Diode (OLED) Panels, UL 8752/ULC-S8752, are being recirculated: 1. The Proposed First Edition of the Joint UL/ULC Standard for Organic Light Emitting Diode (OLED) Panels, UL 8752/ULC-S8752

UL 8752-2013, Standard for Safety for Organic Light Emitting Diode (OLED) Panels

The following changes in requirements to the Standard for Organic Light Emitting Diode (OLED) Panels, UL 8752/ULC-S8752, are being proposed for the United States and Canada: 1. Limit the scope of the standard to lighting applications 2. Clarify polymeric materials - Relative Thermal Index requirements for larger OLED panels 3. Allow for more than one power input connector in OLED panels 4. Provide alternate method for证券ness of soldered printed wiring board connections 5. Eliminate dual language for electrical input rating
UL 8753-2013, Standard for Safety for Field-Replaceable Light Emitting Diode (LED) Light Engines
The following topics for the Standard for Field-Replaceable Light Emitting Diode (LED) Light Engines, UL 8753/ULC-S8753, are being recirculated: 1. The Proposed First Edition of the Joint UL/ULC Standard for Field-Replaceable Light Emitting Diode (LED) Light Engines, UL 8753/ULC-S8753

UL 8753-2013a, Standard for Safety for Field-Replaceable Light Emitting Diode (LED) Light Engines
The following topics for the Standard for Field-Replaceable Light Emitting Diode (LED) Light Engines, UL 8753/ULC-S8753, are being recirculated: 1. The Proposed First Edition of the Joint UL/ULC Standard for Field-Replaceable Light Emitting Diode (LED) Light Engines, UL 8753/ULC-S8753

UL 8754-2014, Standard for Safety for Holders, Bases, and Connectors for Solid-State (LED) Light Engines and Arrays
The following changes in requirements to the Standard for Holders, Bases, and Connectors for Solid-State (LED) Light Engines and Arrays, UL 8754/ULC-S8754, are being proposed: 1. Revise Relative Thermal Index (RTI) requirements for polymeric materials used in Limited Application Devices (LAD). 2. Add exception to loading test for solid-state assembly holders. 3. Clarify requirements for lead pull tests for factory assembled solid-state assembly holders. 4. Clarify product marking allowances for lampholders

UL 879-2009 (R2014), Electric Sign Components

UL 879A-2016, Standard for Safety for LED Sign and Sign Retrofit Kits
The following changes in requirements to the Standard for LED Sign and Sign Retrofit Kits, UL 879A, are being proposed: 1. Deletion of Supplement SA 2. Markings for Kit Installation Instructions

UL 87A-2016, Standard for Safety for Power-Operated Dispensing Devices for Gasoline and Gasoline/Ethanol Blends with Nominal Ethanol Concentrations up to 85 Percent (EO-EB)
This proposal is being issued to revise the Moist Ammonia-Air Stress Cracking Test.

UL 87B-2016, Standard for Safety for Power-Operated Dispensing Devices for Diesel Fuel, Biodiesel Fuel, Diesel/Biodiesel Blends with Nominal Biodiesel Concentrations up to 20 Percent (B20), Kerosene, and Fuel Oil
The following topics are being proposed: 1) Revise the Moist Ammonia-Air Stress Cracking Test and 2) Addition of the Blending Cycling Test.

UL 884-2016, Standard for Safety for Underfloor Raceways and Fittings
Bulletin dated March 18, 2016 proposes the addition of a test program for epoxy coatings and revisions to installation instructions and corrections to Table 6.1.

UL 887-2004 (R2013), Standard for Safety for Delayed-Action Timelocks
The requirements cover delayed-action timelocks intended for attachment on the doors of safes, chests, vaults, and the like, to provide a means for locking the door for a predetermined length of time as protection against burglary or robbery or both. The timelocks covered by these requirements may be automatic, manual, or both, in operation depending upon their design.

UL 891-2012, Standard for Safety for Switchboards
Multiple changes are being proposed including: Revision based on panelboard changes in the 2008 NEC; Update wire bending space for compact stranded AA-8000 aluminum to match UL 67 and the National Electrical Code NFPA 70; Clarifying intent of front and rear accessible definitions; Update wire bending requirements to match the exception in UL 1558 for LV Switchgear; Add required Latch Pull Test to Enclosure Type test requirements; 6. 80% marking requirement location category identification; Clarifying requirements for the "service equipment" intended for use with multiple sources; Mounting orientation of circuit breakers or switches; etc.

UL 891-2012a, Standard for Safety for Switchboards (Proposal dated 03-30-12)
This recirculation proposal provides revisions to the identified Summary of Topics previously proposed in UL's bulletin dated 07-09-10.

UL 896-2004 (R2016), Standard for Safety for Oil-Burning Stoves
Reaffirm UL 896 as an American National Standard. UL 896 covers oil-burning flue-connected room heaters and ranges.

1. Revision to Minimum Qualifications for the Test Furnace. 2. Revision of Figure 3.3 - “T” Shaped Pressure Sensing Probe

This proposal provides clarification of test duct air flow.

UL 900-2012a, Standard for Safety for Air Filter Units 9 (Proposal bulletin dated 12/16/11)
This recirculation proposal includes revisions to 7.27 and Section 9 for Test Duct Air Flow.

UL 907-2006 (R2014), Standard for Safety for Fireplace Accessories
UL proposes a reaffirmation for ANSI approval of UL 907.

UL 913-2015, Standard for Safety for Intrinsicly Safe Apparatus and Associated Apparatus for Use in Class I, II, III, Division 1, Hazardous (Classified) Locations (Ballot dated 03-27-15)
Revisions to paragraph 7.1.4 to update the group listings to include Group E.

UL 913-2015a, Standard for Safety for Intrinsicly Safe Apparatus and Associated Apparatus for Use in Class I, II, III, Division 1, Hazardous (Classified) Locations (Proposal Ballot dated 05-01-15)
Revisions to Paragraphs 7.1.2, 9.4, and deletion of Table 7.1 per 2014 NEC

UL 913-2015b, Standard for Safety for Intrinsicly Safe Apparatus and Associated Apparatus for Use in Class I, II, III, Division 1, Hazardous (Classified) Locations (Ballot dated 08-28-15)
Revisions to clarify the issue of temperature classification for Class II and III intrinsically safe apparatus

UL 920001-2011 (R2015), Standard for Performance Requirements for Toxic Gas Detectors (proposal dated 05-08-15)

UL 921-2016, Standard for Safety for Commercial Dishwashers
It covers electric dishwashers rated 600 V or less; the gas-handling, burning, and control features of gas-fired dishwashers having inputs of 400,000 Btu (420 MJ) per hour or less, limited to 0.5 psig (3.45 kPa) inlet pressure, for use with natural, manufactured, mixed, propane, liquefied petroleum gases or LP gas-air mixtures. These requirements cover dishwashers intended for use in commercial establishments where they are not intended to be accessible to the public.

UL 923-2015a, Standard for Safety for Microwave Cooking Appliances
1. Addition of Requirements for Polymeric Materials
2. Standardization of UL 923 for Commercial Microwave Ovens with UL 197 for Commercial Electric Cooking Appliances
3. Deletion of the Maximum Temperature Rise of Diods

UL 923-2015b, Standard for Safety for Microwave Cooking Appliances

UL 923-2015c, Standard for Safety for Microwave Cooking Appliances
1. Addition of Requirements for Polymeric Materials

UL 923-2017, Standard for Safety for Microwave Cooking Appliances
1. Proposal to clarify the strain relief test requirement. 2. Proposal to add requirement of ISM band of microwave ovens. 3. Proposal to add requirements for electronic circuits.
UL 923-2017a, Standard for Safety for Microwave Cooking Appliances
1. Proposal to clarify the strain relief test requirement

Proposals for the addition of a definition and requirements for directly controlled luminaires, test switch exemption for equipment with self-test/self-diagnostic capability, clarification of battery standard references and compliance, separate shipment of batteries, revision to the battery discharge test, adjustment of the emergency luminaire and battery pack maximum mounting height identification, simplify the damp and wet location equipment humidity conditioning, clarify the indoor wet location equipment marking, and clarifications for minimum light output (Supplement SG).

UL 924-2017a, Standard for Safety for Emergency Lighting and Power Equipment
Proposals for the addition of a definition and requirements for directly controlled luminaires, clarification of battery standard references and compliance, separate shipment of batteries, adjustment of the emergency luminaire and battery pack maximum mounting height identification, and clarifications for minimum light output (Supplement SG).

UL 935-2014, Standard for Safety for Fluorescent-Lamp Ballasts
The following changes in requirements to the Standard for Fluorescent-Lamp Ballasts, UL 935, are being proposed: 1. Add requirements for ballasts intended to be dimmed using solid-state dimming controls electrically wired in series with the mains supply 2. Revise the arcing test method in Section 30

UL 935-2014a, Standard for Safety for Fluorescent-Lamp Ballasts
The following topics for the Standard for Fluorescent-Lamp Ballasts, UL 935, are being recirculated: 2. Revise the arcing test method in Section 30

This proposal covers the alignment of the Flame Spread Index Calculation provided in Section 10 of UL 94 with ASTM E 162-08.

UL 943-2016, Standard for Safety for Ground-Fault Circuit-Interrupters

UL 943B-2011 (R2016), Standard for Safety For Appliance Leakage-Current Interrupters
These requirements cover appliance leakage-current interrupters (ALCIs), intended for use only in 2- or 3-wire alternating-current circuits wherein one of the wires is grounded in accordance with the National Electrical Code, ANSI/NFPA 70. They are intended to interrupt the electric circuit to the load when a fault current to ground exceeds some predetermined value that is less than that required to operate the overcurrent protective device of the supply circuit. An ALCI trips when the current to ground reaches a value in the range of 4 - 6 mA.

UL 9540-2016, Standard for Safety for Energy Storage Systems and Equipment
1. The proposed first edition of the Standard for Energy Storage Systems and Equipment, UL 9540, including applicable requirements for Canada. These requirements cover energy storage systems that are intended to receive electric energy and then to store the energy in some form so that the energy storage system can provide electrical energy to loads or power conversion equipment when needed. The types of energy storage covered under this standard include electrochemical, chemical, mechanical and thermal.

UL 959-2006 (R2014), Standard for Safety for Medium Heat Appliance Factory-Built Chimneys
UL proposes a reaffirmation for ANSI approval of UL 959.

UL 96-2016, Standard for Safety for Lightning Protection Components
2. Copper alloys and content.

UL 961-2014, Standard for Safety for Electric Hobby and Sports Equipment
Cover electrically-powered hobby and sports equipment rated 250 volts or less, intended for the home entertainment and amusement of adults, in accordance with NFPA 70. These requirements do not cover toys and games intended to be used by children, amusement machines, or photographic equipment. A product that contains features, characteristics, components, materials, or systems new or different, and that involves a risk of fire or of electric shock or injury to persons shall be evaluated using appropriate additional component and end-product requirements, to maintain the level of safety as originally anticipated by the intent of this standard.

UL 962-2017, Standard for Household and Commercial Furnishings

UL 962-2017a, Standard for Household and Commercial Furnishings
The following topics for the Standard for Standard for Household and Commercial Furnishings, UL 962, are being recirculated: 1. Addition of Production Line Tests.

UL 969-2014a, Standard for Safety for Marking and Labeling Systems
The following topics for the Standard for Marking and Labeling Systems, UL 969, are being proposed: 6. Revise requirements for exposure conditions in Section 7

UL 969-2014b, Standard for Safety for Marking and Labeling Systems
The following changes in requirements to the Standard for Marking and Labeling Systems, UL 969, are being proposed: 1) Correction to the conversion of the adhesion value from lb/in to N/mm in Table 4.1. 2) Correction to the tolerance for standard atmosphere in Table 7.2.

UL 969-2017, Standard for Safety for Marking and Labeling Systems
1. Deletion of the pocket knife show in Figure 4.1. 2. Addition of Hydraulic Fluid Immersion as an additional exposure condition.

The requirements cover clear, translucent, or opaque glazing material intended for indoor and outdoor use principally as a substitute for plate glass show windows or show case panels. The material is intended to resist burglars attacks of the &\#178; hit and run&\#178; type. These requirements do not cover the glazing (mounting) methods used for the installation of burglary resisting glazing material.

UL 977-2012 (R2016), Standard for Safety for Fused Power-Circuit Devices (Proposal dated 06-03-16)

UL 98-2016, Standard for Safety for Enclosed and Dead-Front Switches (Proposal dated 02 -20-15)
The Proposed Fourteenth Edition of the Standard for Enclosed and Dead-Front Switches

UL 982-2016, Standard for Safety for Motor-Operated Household Food Preparing Machines
ANSI Z80.24-2007 (R2012), Information Interchange for Ophthalmic Optical Equipment
This International Standard establishes a method by which machines and computer software systems used in the fabrication of ophthalmic lenses can exchange information.

ANSI Z80.27-2014, Aqueous Shunts for Glaucoma Application
This standard applies to the physical and mechanical properties and performance of finished aqueous shunts, their biocompatibility properties, and describes elements of a clinical protocol that may be used to assess the clinical performance of these devices for treatment of glaucoma.

ANSI Z80.28-2016, Methods of Reporting Optical Aberrations of Eyes
This standard specifies standardized methods for reporting the optical aberrations of eyes.

ANSI Z80.29-2015, Accommodative Intraocular Lenses
This standard applies to any ocular implant whose primary indication is the correction of aphakia and is designed to provide vision over a continuous range of distances by affecting a change in the vergence power of the eye resulting from the implant design that changes eye optical power or implant position in response to a stimulus. For the purposes of this standard, these implants are referred to as accommodative intraocular lenses (AIOLs).

ANSI Z80.3-2015, Nonprescription Sunglass and Fashion Eyewear Requirements
This standard applies to all nonprescription sunglasses and fashion eyewear, normally used for casual, dress, and recreational purposes, having lenses of substantially plano power. This standard specifically excludes products covered by ANSI Z87.1, ANSI Z80.1, ASTM F803, and high-impact resistance eyewear designed exclusively for designated sports use. Sunglass needs for aphakics may not be met by this standard.

ANSI Z80.30-2010, Toric Intraocular Lenses
This standard applies to any monofocal intraocular lens (IOL) whose primary indication is the correction of astigmatism either with the correction of aphakia or the modification of the refractive power of a phakic eye. It does not include IOLs used to correct presbyopia

This Standard specifies the minimum requirements for complete single-vision ready-to-wear near-vision spectacles with positive power, without regard to luminous transmittance, available directly to the public without the prescription of a licensed professional.

ANSI Z80.36-2016, Light Hazard Protection for Ophthalmic Instruments
280.36 specifies fundamental requirements for optical radiation safety for ophthalmic instruments and is applicable to all current ophthalmic instruments that direct optical radiation into or at the eye. It is also applicable to all new and emerging ophthalmic instruments that direct optical radiation into or at the eye, as well as to those portions of therapeutic or surgical systems that direct optical radiation into or at the eye for diagnostic, illumination, measurement, imaging, or alignment purposes.

ANSI Z80.5-2010, Frames
This standard shall apply to the manufacture of all frames intended for street wear as ophthalmic eyewear with prescription lenses, excluding spectacle, cialty and novelty products such as lorgnettes and monocles. Specifically excluded are products designed to be occupational eyewear as defined in American National Standard Practice for Occupational and Educational Eye and Face Protection, ANSI Z87.1-2003, and frames for non-prescription sunglasses, and fashion eyewear as defined in American National Standard Requirements for Non-prescription Sunglasses and Fashion Eyewear, Z80.3-2009, and sport frames as defined in ASTM F803.

ANSI Z80.7-2013, Intraocular Lenses
This standard applies to monofocal intraocular lenses (IOLs) whose primary indication is the correction of aphakia. This standard addresses the vocabulary, optical properties and test methods, mechanical properties and test methods, biocompatibility, sterility, shelf-life and transport stability, and clinical investigations necessary for this type of device.

ANSI Z80.9-2010 (R2015), Devices for Low Vision
This Standard applies to optical and electro-optical devices specified by the manufacturer for use by visually impaired persons as low-vision devices. It specifies optical and mechanical requirements and test methods. It includes devices with optical and/or electrical and/or electronic components used for image capture or display.

ANSI/ISO 12870-2016, Spectacle Frames-Requirements and Test Methods
This International Standard specifies fundamental requirements for unglazed spectacle frames designed for use with all prescription lenses. It is applicable to frames at the point of sale by the manufacturer or supplier to the retailer. This International Standard is applicable to all spectacle frame types, including rimless mounts, semi-rimless mounts and folding spectacle frames. It is also applicable to spectacle frames made from natural organic materials. This International Standard is not applicable to complete custom-made spectacle frames or to products designed specifically to provide personal eye protection.

ANSI/ISO 7998-2016, Spectacle Frames- Lists of Equivalent Terms and Vocabulary
This International Standard defines commonly used terms relating to frames for spectacles and Eyeglasses.

ANSI/ISO 8624-2016, Spectacle Frames- Measuring System and terminology
This International Standard specifies a measuring system for spectacle frames. It applies to fronts which are intended to be symmetrical.

VITA (VMEbus International Trade Association (VITA))
ANSI/VITA 1-1994 (S2011), VME64
The VME64 specification establishes a framework for 8-, 16-, 32, and 64-bit parallel-bus computer architectures that can implement single and multiprocessor systems. It is based on the VMEbus specification released by the VMEbus Manufacturers Group (now VITA) in August of 1982. This bus includes the initial four basic subusses: (1) data transfer bus, (2) priority interrupt bus, (3) arbitration bus, and (4) utility bus. Other architectures with other subusses are possible within this VME framework.

ANSI/VITA 1.1-1997 (S2011), VME64 Extensions Provides extensions to ANSI/VITA 1, VME64.

ANSI/VITA 1.3-1997 (S2011), VME64x 9U x 400mm Format Specifies the mechanical circuit board format for 9U x 400mm circuit boards compatible with ANSI/VITA 1, and ANSI/VITA 1.1.

ANSI/VITA 1.5-2003 (S2014), 2eSST This standard defines a transfer protocol, based upon source synchronous concepts, that currently permits the VMEbus to operate at rates up to 320MB/sec.

ANSI/VITA 1.6-2000 (S2011), Keying for Conduction Cooled VME64x
This standard is an extension of the VME64x Standard, ANSI/VITA 1.1-1997, approved October 7, 1998. It defines a keying system that can be added to VME64x boards and backplanes in a conduction cooled environment (IEEE 1101.2) where keying as defined in the VME64 Extensions standard cannot be applied.

ANSI/VITA 1.7-2003 (S2014), Increased Current DIN Connector
This standard describes increased current levels, test methods, test data and compliance criteria for 3-row DIN and 5-row DIN connectors when used in VME, VME64 and VME64 Extension P1/P11 and P2/P12 pin out arrangements.

ANSI/VITA 12-1997 (S2012), M-Module Defines minimum mechanical and electrical characteristics of M-Modules, a method of implementing modular circuit boards with specific functions that can be used to add functionality to other larger printed circuit boards.
ANSI/VITA 17-1998 (S2011), Front Panel Data Port Specifications
This standard provides a specification of the protocol and mechanical characteristics of the Front Panel Data Port. This extension to the VME standard consists of a multidrop synchronous parallel non-addressable bus connection between multiple boards in a single chassis. The connection is made to a connector on the front panel of each board by means of an eighty conductor ribbon cable.

ANSI/VITA 17.1-2015, Serial Front Panel Data Port
Revise ANSI/VITA 17.1 to support higher data rates.

ANSI/VITA 20-2005 (R2011), Conduction Cooled PMC
This standard defines the methodology and implementation details to allow the creation of conduction cooled PMC modules to ensure electrical and physical compatibility with various host card modules onto which conduction cooled PMCs are mounted.

ANSI/VITA 23-1998 (S2011), VME64 Extensions for Physics and Other Applications
This document is intended to be used internationally in physics applications and in other fields with similar requirements. It provides implementation rules, recommendations, and guidelines that enhance the use of the VMEbus standard as specified in ANSI/VITA 1-1994, VME and ANSI/VITA 1.1, VME64 Extensions.

This standard describes a packet network protocol called Myrinet for communications between VME modules using interconnects either on a front panel or on a backplane. Networks may be module to module, subrack to subrack, and/or chassis to chassis.

ANSI/VITA 3-1995 (S2011), Board Level Live Insertion
This standard recommends practices to implement board level live insertion with existing VMEbus boards.

ANSI/VITA 30-2000 (S2011), 2mm Equipment Practice for Eurocard Systems
This standard defines an equipment practice based on a combination of 2 mm connectors, per IEC 61076-4-101, and subracks, racks and printed boards based on the Euroboard form factors.

ANSI/VITA 30.1-2008 (R2014), 2mm Connector Practice on Conduction Cooled Euroboards
This specification is applicable to, but not limited to, the CompactPCI bus standard, an internal interconnect (backplane) bus intended for connecting individual processing, memory, communications and I/O elements to additional resources.

ANSI/VITA 31.1-2003 (S2014), Gigabit Ethernet on VME64x Backplanes
This standard defines a pinout and interconnection methodology for implementing a 10/100/1000BASE-T Ethernet switched network on a VME64x backplane.

ANSI/VITA 32-2003 (S2014), Processor PMC
This standard incorporates a set of extensions to the IEEE 1386.1 PMC (PCI Mezzanine Card) standard which creates a new class of CPU-based PMC cards referred to in this standard as Processor PMC cards - standard retains electrical signaling compatibility with existing PMC cards.

ANSI/VITA 35-2000 (S2011), PMC-P4 Pin Out Mapping to VME-P0 and VME64x-P2
This standard defines pin assignments for PMC P4 connector to VME P0 and P2 connectors.

ANSI/VITA 38-2003 (S2013), System Management on VME
This standard describes a methodology for using IPMI for System Management of VME systems.

ANSI/VITA 39-2003 (S2014), PCI-X for PMC and Processor PMC
This standard integrates the PCI-X capability from PCI to PMC-based products, including standard PMCs as well as Processor PMCs.

ANSI/VITA 4-1995 (S2011), IP Modules
This standard defines a mezzanine board for use on VMEbus and other printed circuit boards.

ANSI/VITA 4.1-1996 (S2011), IP I/O Mapping to VME64x
This standard defines the pin assignments from IP Modules to the VME64x P0 and P2 connectors.

ANSI/VITA 40.0-2006 (R2011), VXS VMEbus Switched Serial Standard
This standard defines switched serial interconnects for VMEbus, coincident with the VMEbus parallel bus.

This standard describes a method for using the InfiniBand protocol on ANSI/VITA 41.0, VXS.

ANSI/VITA 41.2-2006 (R2011), VXS 4X Serial RapidIO Protocol Layer Standard
This standard describes a method for implementing Serial Rapid I/O on ANSI/VITA 41.0, VXS.

ANSI/VITA 41.6-2009 (R2016), VXS 1X Gigabit Ethernet Control Channel Layer Standard
This protocol layer document builds upon the VXS-based standard by describing how VXS boards may communicate using the existing data plane protocols with provisions for a separate control plane.

ANSI/VITA 42.0-2016, XMC Switched Mezzanine Card Auxiliary Standard
This specification defines an open standard for supporting high-speed, switched interconnect protocols on an existing, widely deployed form factor. This revision defines the use of the original Paste-On-Pad (POP) vs the preferred solderball connectors.

This standard defines the implementation of Parallel RapidIO on VITA 42.0, XMC.

ANSI/VITA 42.2-2006 (R2012), XMC Serial RapidIO Protocol Layer Standard
This standard defines the implementation of Serial RapidIO on VITA 42.0, XMC.

ANSI/VITA 42.3-2014, XMC PCI Express Protocol Layer Standard
This standard describes a method for implementing PCI Express on the VITA 42.0, XMC mezzanine form factor.

ANSI/VITA 42.6-2009 (R2015), XMC 10 Gigabit Ethernet 4-Lane Protocol Layer Standard
This protocol layer standard builds on the XMC base standard by describing how XMC carriers and XMC mezzanine cards may communicate in a standard way using the XAUI protocol.

ANSI/VITA 46.0-2013, VPX Baseline Standard
This standard describes VITA 46.0, VPX, for embedded systems, an evolutionary step forward for the provision of high-speed interconnects in modular embedded applications.

ANSI/VITA 46.1-2007 (R2013), VMEbus Signal Mapping on VPX
This standard defines a signal mapping for the VMEbus on ANSI/VITA 46.0, VPX Baseline Standard.

ANSI/VITA 46.10-2009 (R2015), Rear Transition Module for VPX
Define a rear transition module (RTM) for VPX applications.

ANSI/VITA 46.11-2015, System Management on VPX
This document defines a framework for System Management in VPX systems. It enables interoperability within the VPX ecosystem at the Field Replaceable Unit (FRU), chassis and system levels. The framework is based on the Intelligent Platform Management Interface (IPMI) specification and leverages many concepts and definitions from the AdvancedTCA® (ATCA®) specification by PICMG®.

ANSI/VITA 46.3-2012, Serial RapidIO on VPX Fabric Connector
The objectives of this standard are to assign Serial RapidIO ports to the VPX P1/J1 connector and to provide rules and recommendations for the use of the assigned Serial RapidIO ports.

ANSI/VITA 46.4-2012, PCIExpress (R) on the VPX Fabric Connector
Standardizes the implementation of the PCI Express (R) Fabric in the VITA46 environment and define the mapping of the PCI Express (R) Links on the VPX Connector.

ANSI/VITA 46.6-2013, Gigabit Ethernet Control Plane on VPX
The objectives of this standard are to assign Gigabit Ethernet Port mappings for the purpose of Control Plane communication onto the VPX connectors for both 3U and 6U form factors and to provide rules and recommendations for the interoperable implementation and use of said Gigabit Ethernet Port mappings.
ANSI/VITA 46.7-2012, Ethernet on VPX Fabric Connector

The objectives of this standard are to assign backplane Ethernet links to the VPX P1/P1 connector and to provide rules and recommendations for the use of Ethernet over backplane media.

ANSI/VITA 46.9-2010, PMC/XMC Rear I/O Fabric Signal Mapping on 3U and 6U VPX Modules Standard

This VITA 46 (VPX) subsidiary standard defines PMC or XMC mezzanine rear I/O pin mappings to VITA 46.0 plug-in module backplane connectors.

ANSI/VITA 47-2007, Environments, Design and Construction, Safety, and Quality for Plug-In Units Standard

This standard defines environmental, design and construction, safety, and quality requirements for commercial-off-the-shelf (COTS) plug-in units (cards, modules, etc.) intended for mobile applications.

Each of the lower level standards focuses on a specific cooling method and will define the mechanical requirements that are needed to ensure mechanical interchangeability in the sub-rack. This standard utilizes a common circuit board for all the cooling methods and incorporates the features required to achieve 2 Level Maintenance compatibility.

ANSI/VITA 48.1-2010, Mechanical Specification for Microcomputers Using REDI Air Cooling

To define the mechanical requirements that are needed to ensure the mechanical interchangeability of air cooled 3U and 6U plug-in units and define the features required to achieve 2 Level Maintenance compatibility.

ANSI/VITA 48.2-2010, Mechanical Specification for Microcomputers Using REDI Conduction Cooling Applied to VITA VPX

To define the mechanical requirements that are needed to ensure the mechanical interchangeability of conduction cooled 3U and 6U plug-in units and defines the features required to achieve 2 Level Maintenance compatibility.

ANSI/VITA 48.5-2010, Mechanical Standard for Electronic Plug-in units Using Air Flow Through Cooling

This standard establishes the design requirements for an air-flow-through cooled plug-in unit with a 6U form factor.

ANSI/VITA 48.7-2014, Mechanical Standard for Electronic Plug-In Units using Air Flow-by Cooling Technology

VITA 48.7 defines a detailed mechanical implementation for Air Flow-By cooling and sealing technologies applied to plug-in modules, backplanes, and sub-racks as defined in VITA 46/48.

Develop an open standard for the design requirements of an air-flow-through (AFT) cooled plug-in module having a 3U or 6U form factor, while retaining the VITA 46 connector layout. Both 3U and 6U standard form factors are offered using 3 defined pitch spacings, with an option to have alternate air flow intake and exhaust paths. The intention of this standard is to optimize SWAP.

ANSI/VITA 49.0-2015, VITA Radio Transport (VRT) Standard

Updates were made to clarify terminology related to timestamps, fix minor rule/observation conflicts in section 7.1.5, and to correct examples in Appendix D. A semantic change was made to the rules for Class Identifiers to permit a ‘de facto’ definition of &R8221; practice already in common use. An optional ‘Pad Bit Count’ &R8221; field was introduced to allow the number of pad bits at the end of the Data Packet to be reported and optional support was added for IEEE 754 half-precision floating-point values.

ANSI/VITA 49.1-2015, VITA Radio Link Layer Standard

Updates were made to the CRC computation examples in Appendix A to better-clarify the CRC computation used.

ANSI/VITA 49a-2015, Spectrum Survey Interoperability Specification

This document specifies an interoperability specification that is applicable to spectrum-survey applications. It is intended to foster high-throughput and adaptable processing in a large-scale environment. It specifically considers the needs of devices based around 32-64-bit general-purpose processors (GPP) and FPGAs that utilize Internet Protocol (IP) as the underlying transport between processing devices.

ANSI/VITA 5.1-1999 (S2011), Raceway Interlink

This standard provides a specification of the data link protocol and physical interface of a high performance extension to the VMEbus standard. This extension consists of high bandwidth, low latency interconnects across a VMEbus computer chassis backplane using the P2 connector. Bi-directional connectivity between boards in a VMEbus chassis is achieved through the use of a network of crossbar switches with point-to-point interconnects.

ANSI/VITA 5.10-2012, Reliability Prediction

This document provides a framework for electronics equipment reliability standards, and establishes a reliability Community of Practice. It addresses the limitations of existing prediction practices with a series of subsidiary specifications that contain the ‘best practices’ within industry for performing electronics reliability analysis. The development of VITA 5.10 and the subsidiary specifications is an effort to give harmony, consistency and repeatability to reliability practices.

ANSI/VITA 5.11-2013, Reliability Prediction MIL-HDBK-217 Subsidiary Specification

This specification provides standard defaults and methods to adjust the models in MIL-HDBK-217F Notice 2. This is not a revision of MIL-HDBK-217F Notice 2 but a standardization of the inputs to the MIL-HDBK-217F Notice 2 calculations to give more consistent results.

ANSI/VITA 5.2-2016, Physics of Failure Reliability Predictions

Establish uniform practices, take advantage of current developments, and clarify reliability prediction expectations using physics of failure methodologies. Revision 2015: Include Arrhenius, Equation, Revised Boltzmann’s constant usage, other editorial edits.

ANSI/VITA 5.3-2010 (R2016), Qualification and Environmental Stress Screening in Support of Reliability Predictions

This standard provides rules, permissions, and observations to assure that cost-effective qualification and environmental stress screening support valid reliability predictions and enhance electronics reliability. It includes a discussion of the systems engineering relationships between qualification, environmental stress screening, and reliability.

ANSI/VITA 5.4.0-2010, Standard for Commercial Technology Market Surveillance

This document defines an open standard for identification of obsolescence issues of commercial technologies at the lowest replaceable unit (LRU) level.

ANSI/VITA 57.1-2010, FPGA Mezzanine Card (FMC) Standard

This specification describes FMC IO modules and introduces an electro-mechanical standard that creates a low overhead protocol bridge between front panel IO, on the mezzanine module, and an FPGA processing device on the carrier card, which accepts the mezzanine module.

ANSI/VITA 58.0-2009 (R2014), Line Replaceable Integrated Electronics Chassis Standard

This standard provides common design and performance requirements for a family of integrated electronic chassis incorporating updated industry standard high speed electronic assemblies and designed for rugged environments.

This standard identifies requirements unique to a liquid cooled electronic chassis which supplement the general requirements identified in the Integrated Electronic Chassis Standard, ANSI/VITA 58.0.

ANSI/VITA 6-1994 (S2011), Signal Computing System Architecture (SCSA)

This standard defines an isochronous backbone bus for telephony applications on the VMEbus P2 connector.
ANSI/VITA 6.1-1996 (S2011), SCSA Extensions
This standard provides feature extensions to the ANSI/VITA 6 standard.

ANSI/VITA 60-2012, Alternative Connector for VPX
This proposed standard will provide an alternative connector for use on VPX modules.

ANSI/VITA 61.0-2014, XMC 2.0
This specification, based upon VITA 42.0 XMC, defines an open standard for supporting high-speed, switched interconnect protocols on an existing, widely deployed form factor, but utilizing an alternate, ruggedized, high-speed mezzanine interconnect known as VITA 61 XMC 2.0.

ANSI/VITA 62-2016, Power Supply Standard
This proposed standard will provide guidelines to building a power supply module that can be used to power a VPX chassis. The module will fit within the standard envelope defined for VPX modules using the VITA 48 specifications.

ANSI/VITA 63-2015, Hyperboloid Alternative Connector for VPX
VITA 63, Hyperboloid Alternative Connector for VPX, provides an alternative connector to the one specified in the VITA 46.0 VPX Baseline Standard.

ANSI/VITA 65-2012, OpenVPX
Define a set of system specifications and practices for VPX modules.

ANSI/VITA 65.1-2017, OpenVPX System Standard - Profile Tables
To standardize variations of Slot, Backplane, and Modules Profiles. As part of the Slot Profile Description, there are also some Connector Modules defined. This document is primarily tables which are referenced by VITA 65.0.

ANSI/VITA 66.0-2016, Optical Interconnect on VPX - Base Standard
This standard defines a family of blind mate Fiber Optic interconnects for use with VPX backplanes and plug-in modules.

ANSI/VITA 66.1-2012, Optical Interconnect on VPX - MT Variant
Defines a family of blind mate Fiber Optic interconnects for use with VPX backplanes and plug-in modules.

ANSI/VITA 66.2-2013, Optical Interconnect on VPX - ARINC 801 Termini Variant
The objective of this standard is to define a family of blind mate Fiber Optic interconnects for use with VPX backplanes and plug-in modules.

ANSI/VITA 66.3-2012, Optical Interconnect on VPX - Mini Expanded Beam Variant
The objective of this standard is to define a family of blind mate Fiber Optic interconnects for use with VPX backplanes and plug-in modules.

ANSI/VITA 66.4-2016, Optical Interconnect on VPX - Half Width MT Variant
The objective of this standard is to define a family of blind mate Fiber Optic interconnects for use with VPX backplanes and plug-in modules.

ANSI/VITA 67.0-2012, Coaxial Interconnect on VPX - Base Standard
The objective of this standard is to establish a structure for implementing blind mate analog coaxial interconnects with VPX backplanes and plug-in modules, and to define a specific family of interconnects and configurations within that structure.

ANSI/VITA 67.1-2012, Coaxial Interconnect on VPX, 3U, 4 Position SMPM Configuration
Details the configuration and interconnect within the structure of VITA 67.0 enabling a 3U VITA 46 interface containing multi-position blind mate analog connectors with up to 4 SMPM contacts.

ANSI/VITA 67.2-2012, Coaxial Interconnect on VPX, 8 Position SMPM
Details the configuration and interconnect within the structure of VITA 67.0 enabling a VITA 46 interface containing multi-position blind mate analog connectors with up to 8 SMPM contacts each able to be located in positions P2/PJ to P6/J6.

ANSI/VITA 76-2016, High Performance Cable Standard
Develop a standard cable scheme to implement copper to copper or copper to optical cabling for box to box interconnects.

ANSI/VITA 78-2015, SpaceVPX System Specification
This standard describes an open standard for creating high performance fault tolerant interoperable backplanes and modules to assemble electronic systems for spacecraft and other high availability applications. Such systems will support a wide variety of use cases across the aerospace community. This standard leverages the OpenVPX standards family and the commercial infrastructure that supports these standards.

WCMA (Window Covering Manufacturers Association)

ANSI/WCMA A100.1-2014, Standard for Safety of Cored Window Covering Products
A revision is being made to Appendix E, Figure E1, Row 3 only. This Standard applies to all interior drapery hardware and window covering products that incorporate bead chains, cords, or any type of flexible looped device in their operation.

ANSI/WCMA A101.1-2008, Corded Horizontal Louver Blinds with Metal Slat
This Standard contains minimum requirements for corded horizontal louver blinds made with metal slats.

WDMA (Window and Door Manufacturers Association)

WDMA 1.S.1A-11, Industry Standard for Interior Architectural Wood Flush Doors, defines the aesthetic grades and performance duty level requirements for interior wood flush doors used in commercial construction. It provides standard requirements and tests to ensure all products complying with the standard are evaluated on an equal basis, and provides a logical system of references, key to a guide specification checklist, to facilitate thorough, precise and accurate architectural specifications. This ballot includes revisions resulting from the previous balloting of this document.

WDMA 1.S.6A-11, Industry Standard for Interior Architectural Wood Stile and Rail Doors, defines the aesthetic grades and performance duty level requirements for interior wood stile and rail doors used in commercial construction. It provides standard requirements and tests to ensure all products complying with the standard are evaluated on an equal basis, and provides a logical system of references, key to a guide specification checklist, to facilitate thorough, precise and accurate architectural specifications. This ballot includes revisions resulting from the previous balloting of this document.

WMA (World Millwork Alliance)

ANSI/WMA 100-2016, Standard Method of Determining Structural Performance Ratings of Side-Hinged Door Systems and Procedures for Component Substitution
The AMD 100 was developed by WMA, formerly Association of Millwork Distributors (AMD), to provide door pre-hangers and distributors a means by which to test and rate the structural performance of a side-hinged exterior door system, and qualify components for substitution in that rated system. This review is limited in scope to additional revisions herein attached that have been incorporated in lieu of comments received during the initial ballot and public review period.

WMMA (ASC O1) (Wood Machinery Manufacturers of America)

ANSI O1.1-2013, Standard for Woodworking Machinery Safety Requirements
Covers the safety requirements for the design, installation, care and use of woodworking machinery and accessory equipment, used in industrial and commercial applications, having a total connected power of 5 hp (3.7 kw) or greater, or having 3-phase wiring.

ANSI WMMA O1.1-3-2014, Safety Requirements for CNC Machining Centers for the Woodworking Industry
Safety Requirements for CNC Machining Centers for the Woodworking Industry
ANSI Wmma O1.4-2015, Safety Requirements for Shapers

ANSI/Wmma O1.1-2015, Safety Requirements for Fixed Angle Jump Saws

X12 (ASC X12 Incorporated)

ANSI X12.1-2008 (R2013), Transaction Set Tables

This American National Standard is a compilation of transaction sets in the X12 family of American National Standards for electronic data interchange. A transaction set is the collection of data that is exchanged in order to convey meaning between the parties engaged in electronic data interchange. The ASC X12 Family of Standards is distributed as a single package. X12.1 is contained within the transaction Set Tables section.

ANSI X12.22-2008 (R2013), Segment Directory

This American National Standards contains the format and definitions of the segments used to construct the transaction sets of the X12 series of American National Standards on electronic data interchange. The ASC X12 Family of Standards is distributed as a single package. X12.22 is contained within the Segment Directory section.

ANSI X12.3-2008 (R2013), Data Element Dictionary

This draft proposed American National Standard contains the specifications of the data elements used to construct the segments that comprise the transaction sets of the X12 series of American National Standards for electronic data interchange. The ASC X12 Family of Standards is distributed as a single package. X12.3 is contained within the Data Element Dictionary section.

ANSI X12.5-2004 (R2013), X12.5 Interchange Control Structures

This draft proposed American National Standard defines the control segments used to envelope one or more encoded business transactions including the EDI (Electronic Data Interchange) encoded transaction of Accredited Standards Committee X12. The acknowledgment for the interchange control segment envelope is also provided. The ASC X12 Family of Standards is distributed as a single package. X12.5 is contained within the Control Standards section.

ANSI X12.56-2004 (R2013), Interconnect Mailbag Control Structures

This draft proposed American National Standard defines the control segments used to start and end a mailbag containing EDI data to be exchanged between two interconnecting entities. The purpose of this standard is to provide control structures and an audit mechanism to facilitate the exchange and receipt acknowledgment of EDI data between interconnecting entities. The ASC X12 Family of Standards is distributed as a single package. X12.56 is contained within the Control Standards section.

ANSI X12.58-2004 (R2013), Security Structures

This draft proposed American National Standard defines the data formats for authentication, encryption and assurances in order to provide integrity, confidentiality, and verification and non-repudiation of origin for two levels of exchange of Electronic Data Interchange (EDI) formatted data defined by Accredited Standards Committee ASC X12. The ASC X12 Family of Standards is distributed as a single package. X12.58 is contained within the Control Standards section.

ANSI X12.59-2004 (R2013), Implementation of EDI Structures - Semantic Impact

This draft proposed American National Standard is to describe the semantic relationships inherent in the implementation of those X12 structures where the relative positioning of segments provides semantic information in their implementation. This information may include the meaning that is to be associated with data due to their positioning within the exchange of X12 information, and the data relationships that can be inferred from the data structure. The ASC X12 Family of Standards is distributed as a single package. X12.59 is contained within the Control Standards section.

ANSI X12.6-2004 (R2013), X12.6 Application Control Structure

This draft proposed American National Standard defines the structure of business transactions for computer-to-computer interchange for use within the context of an Electronic Data Interchange (EDI) environment. This includes the control segments used to bound loops of data segments, transaction sets, and groups of related transaction sets. The ASC X12 Family of Standards is distributed as a single package. X12.6 is contained within the Control Standards section.

The Context Inspired Component Architecture (CICA) offers a method for building electronic business messages. The method presented employs a hierarchy of components designed to capture semantic business concepts in a manner that facilitates re-use. The architecture is syntax neutral by design. A complete set of attributes for describing the components and relationships of this architecture is defined. A specific syntactic representation for XML (Extensible Markup Language as defined by the W3C) is presented. The method represents CICA messages and components in XML Schema as defined by the W3C XML Schema 1.0 (XSD).

These design rules have been developed to assist in establishing uniformity in CICA business document development and maintenance efforts. The design rules are to be used as stated. There shall be no deviation from them, with all new development and maintenance expected to utilize them. These design rules and guidelines are based upon X12.7 Context Inspired Component Architecture (CICA) Technical Specification and XML Syntax Representation. If there is conflict between this document and X12.7, X12.7 takes precedence.
